The following is a list of electrics, and also of conductors, disposed according to the order of their perfection, beginning in each column with the most perfect of their class: thus glass is a more perfect electric than amber, and gold is a better conductor than silver.

ELECTRICS.

Glass of all kinds.
All precious stones, the most transparent the best.
Amber.
Sulphur.
All resinous substances.
Wax of all kinds.
Silk and cotton.
Dry external animal substances, as feathers, wool, and hair.
Paper.
Loaf sugar.
Air when dry.
Oils and metallic oxides.
Ashes of animal and vegetable substances.
Most hard stones.

CONDUCTORS.

All the metals in the following order: Gold; silver; platina; brass; iron; tin; quicksilver; lead.
The semi-metals.
Metallic ores.
Charcoal.
The fluids of the animal body.
Water, especially salt water, and other fluids, except oil.
Ice, snow.
Most saline substances.
Earthy substances.
Smoke, steam, and even a vacuum.

Substances of this kind may be excited, so as to exhibit the electric appearances of attracting and repelling light bodies, emitting a spark of light, attended with a snapping noise, and yielding a current of air, the sensation of which resembles that of a spider's web drawn over the face, &c. and a smell like that of phosphorus; and thus exciting may be either by friction, or by heating and cooling, or by melting, and pouring one melted substance into another.

The term is peculiarly applied to the electric, viz. the globe, or cylinder, &c. used in electrical machines, to collect the electrical matter by rubbing it.

Electrical apparatus, consists of glass tubes, about three feet long, and an inch and a half in diameter, one of which should be closed at one end, and furnished at the other end with a brass cap and stop-cock, to rarefy or condense the inclosed air; sticks of sealing wax, or tubes of rough glass, or glass tubes covered with sealing-wax, or cylinders of baked wood for producing the negative electricity; with proper rubbers, as black oiled silk, with amalgam upon it for the former, and soft new flannel, or hare skins, or cat skins, tanned with the hair on, for the latter; coated jars, or plates of glass, either single, or combined in a battery, for accumulating electricity; metal rods, as dischargers; an electrical machine; electrometers, and insulated stools, supported by pillars of glass, covered with sealing-wax, or baked wood, varnished or boiled in linseed-oil. See Battery, Conductors, Discharger, Leyden phial, &c.

Electrical battery, consists of a large number of coated jars, placed near each other in a convenient manner. These being charged, or electrified, and connected with each other, are then suddenly exploded or discharged, with a prodigious effect. See Battery.

We shall here hint at two or three circumstances, which should be attended to by those who make experiments with electrical batteries. The jars of a large battery are liable to be broken at the time of their discharge; and particularly if it be constructed of the thinner glass, which is capable of receiving a greater charge than the thicker. In order to avoid this inconvenience, Mr. Nairne never discharges a battery through a good conductor, unless the circuit be at least five feet long; but the length of the circuit, though it may preserve the battery, proportionably weakens the force of the shock. Care should also be taken not to touch the wires of a battery with the hand, nor even that of a single jar, after the discharge, before the discharging rod be repeatedly applied to its sides; as there generally remains a residuum of the charge, which is sometimes very considerable. This residuum is occasioned by the electricity, which, whilst the jar, or battery, is charging, spreads itself over the uncoated surface of the glass, near the coating; this will not be discharged at first, but gradually returns to the coating after their first discharge. An interesting account of improvements in electrical batteries, with a method of augmenting their power, &c. as given by Mr. Cuthbertson, may be seen in Nicholson's Journal, vol. ii. p. 525, 4to.

Electrical doubler, an instrument invented by Mr. Bennett, for accumulating electricity by doubling. It consisted of three metallic plates, capable of being applied to each other with their flat surface, but prevented from contact in this situation by a thin coating of varnish. They have insulating handles at the side, and may be brought into actual contact edgewise. The application of this instrument is somewhat tedious; and it is subject to various imperfections. The process of accumulating electricity by doubling was invented by Lichtenberg and Klincock, and greatly improved by Bennett in his doubler. In 1787 Dr. Darwin constructed a machine for performing the process, not entirely by the hand, as heretofore, but in part mechanically. In 1788, Mr. W. Nicholson made an instrument by which the whole act is reduced to the simple turning of a winch. This invention Mr. Nicholson has described under the appropriate name of the

Revolving doubler: it consists of the following parts. Two fixed plates of brass, A and C, (fig. 7. Pl. 59.) are separately insulated and disposed in the same plane, so that a revolving plate B may pass very near them, without touching. Each of these plates is two inches in diameter; and they have adjusting pieces behind, which serve to place them accurately in the required position. D is a brass ball, likewise of two inches diameter, fixed on the extremity of an axis that carries the plate B. Besides the more essential purpose this ball is intended to answer, it is so loaded within on one side, that it serves as a counterpoise to the revolving plate, and enables the axis to remain at rest in any position. The other parts may be distinctly seen in fig. 8. The shaded parts represent metal, and the white represent varnished glass. ON is a brass axis, passing through the piece M, which last sustains the plates A and C. At one extremity is the ball D already mentioned; and the other is prolonged by the addition of a glass stick, which sustains the handle L and the piece GH separately insulated. E, F, are pins rising out of the fixed plates A and C, at unequal distances from the axis. The cross piece GH, and the piece K, lie in one plane, and have their ends armed with small pieces of harpsichord-wire, that they may perfectly touch the pins E, F, in certain points of the revolution. There is likewise a pin I, in the piece M, which intercepts a small wire

proceeding from the revolving plate B. The touching wires are so adjusted by bending, that when the revolving plate B is immediately opposite the fixed plate A, the cross-piece GH connects the two fixed plates, at the same time that the wire and pin at I, form a communication between the revolving plate and the ball. On the other hand, when the revolving plate is immediately opposite the fixed plate C, the ball becomes connected with this last plate, by the touching of the piece K against F; the two plates, A and B, having then no connection with any part of the apparatus. In every other position the three plates and the ball will be perfectly unconnected with each other.

The action of this instrument is thus explained, by Mr. Nicholson: When the plates A and B are opposite each other, two fixed plates A and C may be considered as one mass; and the revolving plate B, together with the ball D, will constitute another mass. All the experiments yet made concur to prove, that these two masses will not possess the same electric state; but that, with respect to each other, their electricities will be plus and minus. These states would be simple and without any compensation, if the masses were remote from each other; but as that is not the case, a part of the redundant electricity will take the form of a charge in the opposed plates A and B. From other experiments it has been found that the effect of the compensation on plates opposed to each other, at the distance of one-fortieth part of an inch, is such that they require, to produce a given intensity, at least 100 times the quantity of electricity that would have produced it in either, singly and apart. The redundant electricities in the masses under consideration will, therefore, be unequally distributed: the plate A will have about 99 parts, and the plate C only 1; and for the same reason, the revolving plate B will have 99 parts of the opposite electricity, and the ball D only 1. The rotation, by destroying the contacts, preserves this unequal distribution, and carries B from A to C, at the same time that the tail K connects the ball with the plate C. In this situation, the electricity in B acts upon that in C, and produces the contrary state, by virtue of the communication between C and the ball; which last must, therefore, acquire an electricity of the same kind with that of the revolving plate. But the rotation again destroys the contact, and restores B to its first situation opposite A. Here, if we attend to the effect of the whole revolution, we shall find that the electric states of the respective masses have been greatly increased: for the 99 parts in A and in B remain, and the one part of electricity in C has been increased so as nearly to compensate 99 parts of the opposite electricity in the revolving plate B, while the communication produced an equal mutation in the electricity of the ball. A second rotation will, of course, produce a proportional augmentation of these increased quantities; and a continuance of turning will soon bring the intensities to their maximum, which is limited by an explosion between the plates. If one of the parts be connected with an electrometer, more especially that of Bennet, these effects will be very clearly seen. The spark is usually produced by a number of turns between 11 and 20, and the electrometer is sensibly acted upon by still fewer. (Nicholson's Journal, vol. iv. p. 96. 4to.)

This beautiful mechanism of Mr. Nicholson's has the inconveniency of bringing the plates towards each other edgewise, which will bring on a spark or communication sooner than may be desired; but this is no inconvenience whatever in any philosophical research; because, before this happens, the electricity has become very distinguishable as to its kind, and the degree of multiplication is little more than an amusement. The spark may even serve to give an indication of the original intensity, by means of the number of turns necessary for producing it. If the fine wires which form the alternate connections in so ingenious a manner could be tipped with little balls to prevent the dissipation, it would be a great improvement indeed. An alternate motion, like that of a pump handle, might be adopted with advantage. This would allow the plates to approach each other face to face, and admit a greater multiplication, if thought necessary.

ELECTRIC FLUID, a fine, rare fluid, which is supposed to issue from and surround electrical bodies. See ELECTRICITY.

ELECTRICAL KITE was contrived by Dr. Franklin, to verify his hypothesis of the identity of electricity and lightning. It consisted of a large, thin, silk handkerchief, extended and fastened at the four corners to two slight strips of cedar, and accommodated with a tail, loop, and string, so as to rise in the air like those of paper. To the top of the upright stick of the cross a very sharp pointed wire was fixed, rising a foot or more above the wood; and to the end of the twine, next the hand, a silk riband was tied. From a key suspended at the union of the twine and silk, when the kite is raised during a thunder-storm, a phial may be charged, and electric fire collected, as is usually done by means of a rubbed glass tube, or globe. Phil. Trans. vol. xlvii. p. 565, or Franklin's Letters, p. 111, 112.

Kites made of paper, covered with varnish, or with well boiled linseed-oil, in order to preserve them from the rain, with a stick and cane bow, like those of schoolboys, will answer the purpose extremely well, and are very useful in determining the electricity of the atmosphere. See CONDUCTOR.

ELECTRICAL MACHINE, is a part of the electrical apparatus, contrived for collecting a great quantity of electricity, and exhibiting its effects in a very sensible manner. It consists of the electric, the moving engine, the rubber, and the prime conductor. In the early state of this science, for the electric was used sealing-wax, sulphur, or rough glass; but, since the method of insulating the rubber, and so producing negative electricity, was introduced, smooth glass has been used. The form is commonly either that of a globe, or of a cylinder. Each figure has its advantages, and its inconveniences. Dr. Van Marum, a late German writer, has constructed a machine, in which gum-lac, in the form of a disc, is used as an electric instead of glass; which has the effect of depending very little on the temperature of the air; described in his Verhandeling over het Electrizeeren, &c. or a Treatise concerning the method of electrifying. Groningen, 1776. But he has since procured some others to be made by Mr. Cuthbertson, a very ingenious artist, of large discs, or round plates of glass: one of these is now placed in Teyler's Museum at Harlem, having two of these glass plates, of 65 inches diameter, excited, on both sides of them, by rubbers of waxed taffety; with which effects are produced that are truly astonishing and tremendous. See his description of this machine, and its effects, published in 4to. at Harlem, 1785, &c.

Mr. Nicholson has also given a description of this machine, with plates, in his Journal, vol. i p. 83, where he likewise institutes a comparison between electrical machines with a cylinder, and those which produce their effect by means of a circular plate of glass: he concludes that Dr. Van Marum's machine is at least equal in steady intensity, and much superior in power of charging to any cylinder machine which has ever been made.

There have been various contrivances for giving motion to the electric of a machine. Some have used multiplying wheels, which are easily turned by a winch. The common method is to fix a wheel, grooved round its circumference on the outside of the frame of the machine, which may be turned by a winch; and on the neck of the globe, or cylinder, to fix a pulley, whose diameter is about a third or fourth part of the diameter of the wheel; and a string of worsted, or a leathern strap, is put over both the wheel and the pulley; so that by turning the winch the electric may make three or four revolutions for one revolution of the wheel. As the string relaxes by use, it may be proper to make the wheel moveable from the frame, so that it may be fixed by means of a screw at a proper distance, for a sufficient tension of the string; or the pulley may have several grooves, forming circumferences of different diameters for this purpose. Instead of the pulley and string, some have used a wheel and pinion, or a wheel and endless screw, which renders the machine more neat and compact; though this construction is not without its inconveniences, which are not so easily remedied as those of the other. But Dr. Van Marum's machine seems to have as complete a movement as any, its operation being very uniform, and easily worked; it is kept in motion by a weight, which, after being wound up to the height of 12 feet, will continue the motion uniformly for 6 hours; yielding also a negative power, as well as the positive; and the conductors annexed to it serving easily to convey the electrical power wherever it is required, without the addition of any chain, or wires, &c.

The next principal part of a machine is the rubber, which excites the electric. Rubbers were formerly made of red basil skins, stuffed with hair, wool, flax, or bran; but Dr. Nooth has lately introduced silk cushions stuffed with hair, over which a piece of leather is to be laid, rubbed with amalgam, which are preferable to the others. If the rubber is fixed on a metal plate, the plate should be free from all edges and points, and covered with silk; it should rest on a spring, so that it may be made to suit any inequalities in the surface of the glass; which spring may, by means of a screw, be made to press more or less against the glass, at pleasure. The rubber should also be insulated in any way that may best suit the construction of the machine, and the disposition of the electric; and a chain or wire may be easily suspended from it, to communicate with the floor, whenever the insulation is not necessary; and thus positive and negative electricity may be produced at pleasure.

The prime conductor, which is a necessary appendage to the electrical machine, in order to collect the electricity from the electric, and the method of insulating it, have been already described. See PRIME CONDUCTOR.

To this general account of electrical machines, we shall subjoin a description of some of the principal now in use, illustrated by corresponding figures.

Fig. 1, Plate 59, is a plate-glass machine, of the most portable construction, with a double Leyden phial made square to suit the base, which answers all the purposes of medical electricity. ABC is a wooden frame to which the four rubbers are affixed, and by means of screws may be made to bear with proper pressure on the circular glass plate DF; this plate has a hole through its middle, to which an axis is firmly fixed, and it is turned by the winch L; GG is a Leyden phial (with the collectors *oo* fixed on the top) fixed in a larger one H: when a strong shock is wanted, the long pin I is let in to touch the bottom, by which means the large jar acts; but when drawn out, the small one acts alone, but much quicker, from being inclosed in the other. K is the electrometer. When this machine is constructed on a large scale for experiments, a prime conductor may be attached to the wooden frame opposite the axis of the plate-glass instead of the jar. Fig. 2, is a side view of the machine, with a clamp N to fix it to the table when used.

The advantages of this machine are, that it may be made portable, and is of so simple a construction, that any gentleman in the country, after procuring a plate of a reasonable thickness from a glass-house, may, by the aid of a common cabinet-maker, construct one for his own use; the conductor may be equally insulated by rosin, wax, silk, or any other electric or non-conducting substance.

The machine represented at figs. 3 and 4, Plate 59, was constructed by Dr. Priestley, and is well adapted to most purposes of the electrician. The frame consists of two boards of mahogany, *a*, *a*, parallel to one another, and about four inches asunder; the lower board may be fixed to a table by iron cranks; two upright pillars of baked wood are supported by this board, one of which, *b*, being let through the upper, is fixed immoveably to the lower board; but the other is made to slide in a groove, reaching almost the whole length of the upper board, so that it may be placed at any required distance from the other pillar, for the convenience of admitting globes, or cylinders, of different sizes; however, it is necessary only when an axis is used. In both pillars there are several holes, by means of which globes of different sizes may be mounted higher or lower, or two or more globes may be used at the same time; though it will be difficult to fix proper rubbers to them all. When a globe with one neck is used, a brass arm, with an open socket *c*, is necessary to support the axis beyond the pulley; and this part may be put higher or lower, together with the brass socket in which the axis turns. The axis *d*, is made to pass through the pillar *b*, so that it may be turned by a handle without the wheel. The frame being screwed to the table, may be placed nearer to, or farther from the wheel, as the length of the string in different states of the weather may require. The wheel is fixed in a frame by itself, as *e*, and thus it may have any situation with respect to the pulley, as may be most convenient; and it has several grooves for admitting more strings than one, if two or three globes, or cylinders, are used at once. The rubber *f*, consists of a hollow piece of

Fig. 1.

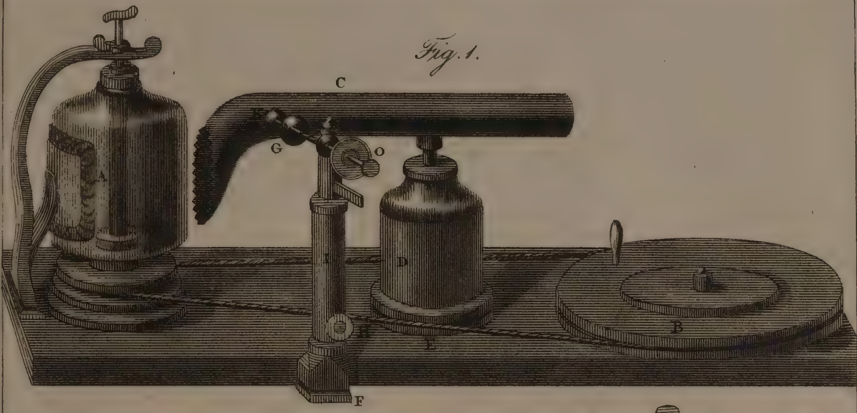

Fig. 2.

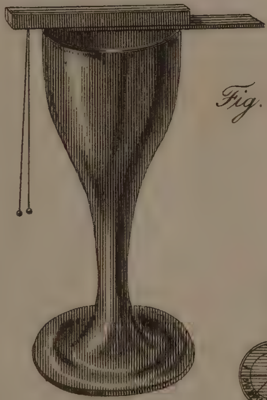

Fig. 3.

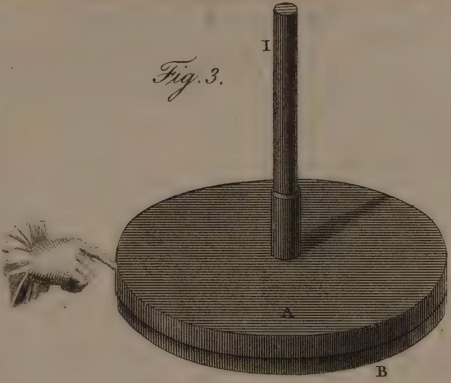

Fig. 4.

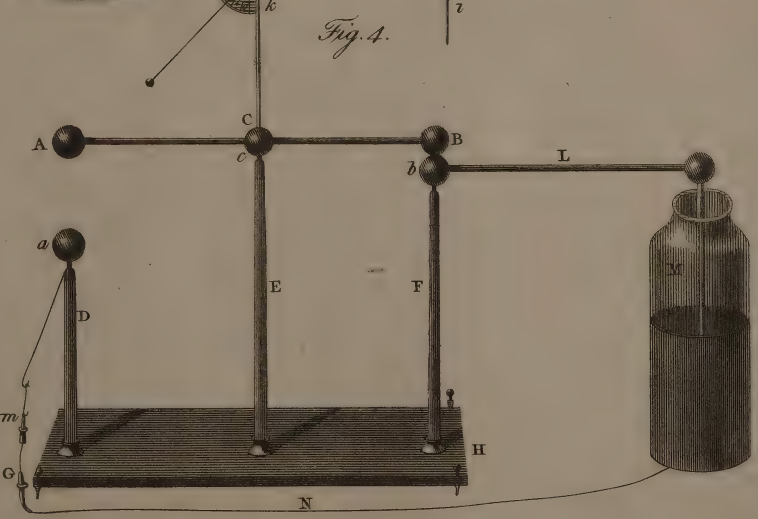

Mutlow Sc. Russell Ct.

Published by G. Kearsley, Fleet Street, July 2nd 1809.

copper filled with horse-hair, and covered with a basil skin; it is supported by a socket, which receives the cylindrical axis of a round plate of glass *g*, the opposite part of which is inserted into the socket of a bent steel spring *h*. These parts are easily separated, so that the rubber, or the plate of glass, serving to insulate it, may be changed at pleasure. The spring may be either slipped along the groove, or moved in the contrary direction, so as to give it every desirable position with respect to the globe or cylinder; and it is also furnished with a screw *i*, which makes it press harder or lighter, as the operator chooses: *klm* is the prime conductor, being a copper tube supported on a stand of glass, or baked wood.

Fig. 5, shews Mr. Nairne's patent machine for medical purposes. Its glass cylinder is about seven inches in diameter and twelve long, with two conductors parallel to it. The rubber is fastened to the conductor R; and consists of a cushion of leather stuffed, having a piece of silk glued to its under part. The conductors are of tin, covered with black lacker, each of them containing a large coated glass jar, and likewise a smaller one, or a coated tube, which are visible when the caps N, N, are removed. To each conductor is fixed a knob O, for the occasional suspension of a chain to produce positive or negative electricity. That part of the winch C, which acts as a lever in turning the cylinder, is of glass. Thus every part of the machine is insulated, the cylinder itself, and its brass-cap, not excepted; by which means very little of the electricity is dissipated; and hence, of course, the effects are likely to be the more powerful. To this machine the inventor has adapted some flexible conducting joints, a discharging electrometer, &c. for the practice of medical electricity.

Fig. 1. Plate 60, represents a very portable electrical machine, invented by Mr. Read, and improved by Mr. Lane. A is the glass cylinder, moved vertically, by means of the pulley at the lower end of the axis, the pulley being turned by the large wheel B, parallel to the table; there are several pulleys, of different sizes, either of which may be used according as the motion is required to be quicker or slower. The conductor C is furnished with points to collect the fluid, and is screwed to the wire of a coated jar D. The figure shews also the manner of applying Mr. Lane's electrometer to this machine. See ELECTROMETER.

Fig. 6, Plate 59, exhibits the electrical machine of the late ingenious and worthy Mr. George Adams; which we shall explain, and shew in what way it may be excited most powerfully. The parts of the machine which fall most immediately under our attention are, 1. The electric, or the glass cylinder, which is to be excited. 2. The mechanical contrivances by which it is put in motion. 3. The cushion and its appendages. 4. The conductor or conductors. The glass cylinder of the machine is put in motion by a simple winch. This is less liable to be put out of order than those that are turned with a multiplying wheel, and also enables us to excite the machine more powerfully. The cylinder FGHI, is supported by two strong perpendicular pieces DE. The axis of one cap of the cylinder moves in a small hole at the upper part of one of the supports. The opposite axis passes through the upper part of the other support. To this axis the winch or handle is fitted. The cushion is supported and insulated by a glass pillar; the lower part of which is fitted into a wooden socket, to which a regulating screw is adapted, to increase or diminish the pressure of the cushion against the cylinder. A piece of silk comes from the under edge of the cushion, and lies on the cylinder, passing between it and the cushion, and proceeding till it nearly meets the collecting points of the conductor. The more strongly this cylinder is made to adhere to the cylinder, the stronger is the degree of excitation. Before the cylinder, or opposite to the cushion, is a metallic tube YZ, supported by a glass pillar LM. This is sometimes called the prime conductor, often only the conductor. For the more conveniently trying experiments on the two powers, and exhibiting the different states of the cushion and conductor, there are two wires to be fixed occasionally, the one to the conductor, the other to the cushion; on the upper part of these are balls furnished with sliding wires, that they may be set apart from each other at different distances.

It will be necessary, before the electrical machine is put in motion, to examine those parts which are liable to wear either from the friction of one surface against another, or to be injured by the dirt that may insinuate itself between the rubbing surfaces. If any grating or disagreeable noise is heard, the place from whence it proceeds must be discovered, wiped clean, and rubbed over with a small quantity of tallow; a little of which should also be occasionally applied to the axis of the cylinder itself. The screws by which the frame is fixed should also be examined, and if they are loose, they should be tightened.

Having examined the different parts of the machine, and put them in order, the glass cylinder, and the pillars which support the cushion and conductor, should be well wiped with a dry old silk handkerchief, to free them from the moisture which glass attracts from the air, being particularly attentive to leave no moisture on the ends of the cylinder, as any damp on these parts carries off the electric fluid, and lessens the force of the machine: in very damp weather it will be proper to dry the whole machine, by placing it at some little distance from the fire.

Care should be taken that no dust, loose threads, or filaments, adhere to the cylinder, its frame, the conductors, or their insulating pillars, because these will gradually dissipate the electric fluid, and prevent the machine from acting powerfully. When you are satisfied of this, rub the glass cylinder first with a clean, coarse, dry, warm cloth, or a piece of wash leather, and then with a piece of dry, warm, soft silk; do the same to all the glass insulating pillars of the machine and apparatus; these pillars must be rubbed more lightly than the cylinder, because, being varnished, they may be damaged by too much friction.

It may be proper in some cases to place a hot iron on the foot of the conductor, in order to evaporate the moisture which would otherwise injure the experiments.

Observe that, 1. To excite the machine, it is requisite to clean the cylinder, and wipe the silk. 2. Grease the cylinder, by turning it against a greasy leather, till it is uniformly obscured. The tallow of a candle will answer this purpose. 3. Turn the cylinder till the silk flap has wiped off so much of the grease as to render it semi-transparent. 4. Spread some amalgam on a piece of leather, and apply this against the turning cylinder. By this the friction will immediately increase, and the leather must not be removed until it ceases to become greater. 5. Remove the leather, and then the action of the machine will be very powerful. 6. The pressure of the cushion cannot be too small, when the excitation is well conducted.

The best kind of amalgam is that of Dr. Higgins, composed of zinc and quicksilver; if a little of the latter be added to melted zinc, it renders it easily pulverable, and more quicksilver must be added to the powder, if we want to make a very soft amalgam. It is apt to crystallize by keeping, which seems in some measure to be prevented by triturating it with a small proportion of grease; and it is always of advantage to triturate it before using.

In Nicholson's Journal, vol. i. p. 506, 4to. there is a description of a useful portable electrical machine, by the rev. W. Pearson: and in vol. iii. p. 4, of the same journal, is described a pocket ribband machine, which may often be advantageously used in medicine, when a larger electrical machine is not at hand.

Electrical shock, denotes the explosion between the opposite sides of a charged electric; so called, because, if the discharge from one to the other be made through the body of an animal, it occasions a sudden motion by the contraction of the muscles through which it passes, and a disagreeable sensation. The force of the shock is proportioned to the quantity of coated surface, the thinness of the glass, and the power of the machine by which it is charged. Its velocity is almost instantaneous, as it has not been found to take up the least sensible space of time in passing to the greatest distances.

It has been observed that the electrical shock is weakened by being communicated through different persons in contact with one another. It is, indeed, obstructed in its passage, even through the best conductors; as it will prefer a short passage through the air to a long one through the most perfect conductors; and if the circuit be interrupted, either by electrics, or very imperfect conductors of a moderate thickness, the shock will rend them in its passage, disperse them in every direction, and exhibit the appearance of a sudden expansion of the air about the centre of the shock. A strong shock made to pass through or over the belly of a muscle, forces it to contract; and sent through a small animal body deprives it instantly of life, and hastens putrefaction. It gives polarity to magnetic needles, reverses their poles, and produces effects precisely similar, though inferior in degree, to those of lightning.

ELECTRICITY, or Electrical force, is that power or property, which was first observed in amber, the lyneurium, or tourmalin, and which sealing-wax, glass, and a variety of other substances, called electrics, are now known to possess, of attracting light bodies, when excited by heat or friction; and which is also capable of being communicated in particular circumstances to other bodies.

Electricity also denotes the science, or that part of natural philosophy, which proposes to investigate the nature and effects of this power. From ηλεκτρον, the Greek name for amber, is derived the term electricity, which is now very extensively applied, not only to the power of attracting light bodies inherent in amber, but to other similar powers, and their various effects, in whatever bodies they reside, or to whatever bodies they may be communicated.

Muschenbroek and Æpinus have observed a considerable analogy, in a variety of particulars, between the powers of electricity and magnetism; and they have also pointed out many instances in which they differ.

History of Electricity.—The property which amber possesses of attracting light bodies, was very anciently observed. Thales of Miletus, 600 years before Christ, concluded from hence that it was animated. But the first person who expressly mentioned this substance, was Theophrastus, about 300 years before Christ. The attractive property of amber is also occasionally noticed by Pliny, and other later naturalists, particularly Gassendus, Kenelm Digby, and sir Thomas Brown. But it was generally apprehended that this quality was peculiar to amber and jet, and perhaps agate, till W. Gilbert, a native of Colchester, and a physician in London, published his Treatise de Magnate, in the year 1600. Dr. Gilbert made many considerable experiments and discoveries, considering the then infant state of the science. He enlarged the list both of electrics, and of the bodies on which they act: he remarked, that a dry air was most favourable to electrical appearances, whilst a moist air almost annihilates the electric virtue: he also observed the conical figure assumed by electrified drops of water: he considered electrical attraction separately from repulsion, which he thought had no place in electricity, as a phenomenon similar to the attraction of cohesion, and he imagined, that electrics were brought into contact with the bodies on which they act by their effluvia, excited by friction.

The ingenious Mr. Boyle added to the catalogue of electric substances; but he thought that glass possessed this power in a very low degree: he found, that the electricity of all bodies, in which it might be excited, was increased by wiping and warming them before they were rubbed; that an excited electric was acted upon by other bodies as strongly as it acted upon them; that diamonds rubbed against any kind of stuff emitted light in the dark; and that feathers would cling to the fingers, and to other substances, after they had been attracted by electrics. He accounted for electrical attraction, by supposing a glutinous effluvia emitted from electrics, which laid hold of small bodies, in its way, and carried them back to the body from whence it proceeded.

Otto Guericke, the celebrated inventor of the air-pump, lived about the same time. This ingenious philosopher discovered, by means of a globe of sulphur, that a body once attracted by an electric, was next repelled, and continued in this state of repulsion till it should be touched by some other body: he also observed the sound and light produced by the excitation of his globe; and that bodies immerged in electrical atmospheres are themselves electrified with an electricity opposite to that of the atmosphere.

The light emitted by electrical bodies was, not long after, observed to much greater advantage by Dr. Wall, who ascribes to light the electrical property which they possess; and he suggests a similarity between the effects of electricity and lightning.

Sir Isaac Newton was not inattentive to this subject: he observed that excited glass attracts light bodies on the side opposite to that on which it is rubbed; and he ascribes the action of electric bodies to an elastic fluid, which freely penetrates glass, and the emission of it to the vibratory motions of the parts of excited bodies.

Mr. Hawksbee wrote on this subject in the year 1709, when a new æra commenced in the history of this science. He first took notice of the great electrical power of glass, and the light proceeding from it; though others had before observed the light proceeding from other electrified substances: he also noted the noise occasioned by it, with a variety of phenomena relating to electrical attraction and repulsion. He first introduced a glass globe into the electrical apparatus, to which circumstance it was that many of his important discoveries were owing.

After his time there was an interval of near twenty years in the progress of this science, till Mr. Stephen Grey established a new æra in the history of electricity. To him we owe the capital discovery of communicating the power of native electrics to other bodies, in which it cannot be excited, by supporting them on silken lines, hair lines, cakes of resin or glass; and a more accurate distinction than had hitherto obtained between electrics and non-electrics: he also shewed the effect of electricity on water much more obviously than Gilbert had done in the infancy of this science.

The experiments of Mr. Grey were repeated by M. du Fay, member of the Academy of Sciences at Paris, to which he added many new experiments and discoveries of his own. He observed, that electrical operations are obstructed by great heat; as well as by a moist air; that all bodies, both solid and fluid, would receive electricity, when placed on warm or dry glass, or sealing-wax; that those bodies which are naturally the least electric have the greatest degree of electricity communicated to them by the approach of the excited tube. He transmitted the electric virtue through a distance of 1256 feet; and first observed the electric spark from a living body, suspended on silken lines, and noted several circumstances attending it. M. du Fay also established a principle, first suggested by Otto Guericke, that electric bodies attract all those that are not so, and repel them as soon as they are become electric, by the vicinity or contact of the electric body. He likewise inferred from other experiments, that there were two kinds of electricity; one of which he called the *vitreous*, belonging to glass, rock crystal, &c. and the other *resinous*, as that of amber, gum lac, &c. distinguished by their repelling those of the same kind, and attracting each other. He observed, that communicated electricity had the same property as the excited; and that electric substances attract the dew more than conductors.

Mr. Grey, resuming his experiments in 1734, suspended several pieces of metal on silken lines, and found, that by electrifying them, they gave sparks, which was the origin of metallic conductors; and, on this occasion, he discovered a cone or pencil of electric light, such as is now known to issue from an electrified point. From other experiments he concludes, that the electrical power seems to be of the same nature with that of thunder and lightning.

Dr. Desaguliers succeeded Mr. Grey in the prosecution of this science. The account of his first experiments is dated in 1739. To him we owe those technical terms of *conductors*, or *non-electrics*, and *electrics per se*, which are explained in the course of this work. He first ranked pure air among the *electrics per se*, and supposed its electricity to be of the vitreous kind. After the year 1742, in which Dr. Desaguliers concluded his experiments, the subject was taken up and pursued in Germany: the globe was now substituted for the tube, which had been used ever since the time of Hawksbee, and a cushion was soon after used as a rubber instead of the hand. About this time, some used cylinders instead of globes; and some of the German electricians made use of more globes than one at the same time. By thus increasing the electrical power, they were the first who succeeded in setting fire to inflammable substances. This, indeed, was first done by Dr. Ludolf, in the beginning of the year 1744, who kindled, with sparks excited by the friction of a glass tube, the ætherial spirit of Frobenius. Mr. Winkler did the same by a spark from his own finger, and kindled French brandy and other spirits by previously heating them. Mr. Gralath fired the smoke of a candle just blown out, and lighted it again, and Mr. Boze fired gunpowder, by means of its inflammable vapour. Ludolf the younger, about this time, demonstrated, that the luminous barometer was made perfectly electrical by the motion of the quicksilver: the electrical star and electrical bells were also of German invention.

The most remarkable discovery that had yet been made in the science of electricity, was in the end of the year 1745, and beginning of 1746. This was the method of giving the electric shock, or the accumulation of the power of electricity in a vial. This had its name of the Leyden vial, from Mr. Cunæus, a native of Leyden, who exhibited it as he was repeating some experiments made by Messrs. Muschenbroek and Allamand, professors in the university of that city. It is said, he was not, however, the inventor. The merit of this discovery (if any merit can be ascribed to a discovery made by accident) belongs to Mr. Van Kleist, dean of the cathedral at Camin. Soon after this, however, a method of giving the shock was discovered in Holland, by Mr. Cunæus; and the discovery of this powerful effect of the electric fluid immediately raised the attention of all the philosophers in Europe. Many of them greatly exaggerated their accounts; either from a natural timidity, or their love of the marvellous. Mr. Muschenbroek, who tried the experiment with a very thin glass bowl, told Mr. Reaumur, in a letter written soon after the experiment, that he felt himself struck in his arms, shoulder, and breast, so that he lost his breath, and was two days before he recovered from the effects of the blow and the terror. He added, that he would not take a second shock for the whole kingdom of France. Mr. Allamand, who made the experiment with a common beer-glass, said, that he lost his breath for some moments; and then felt such an intense pain all along his right arm, that he was apprehensive of bad consequences, but it soon after went off without any inconvenience, &c. Other philosophers, on the contrary, shewed their heroism and magnanimity, by receiving a number of electric shocks as strong as they could possibly make them.

From the time of this discovery, electricity became the general subject of conversation. A number of people all over Europe got their livelihood by going about and showing the phenomena of it; and, at the same time, the passion for the marvellous strongly discovered itself in some effects of electricity, pretended to be found out in Italy and Germany. Mr. Nollet travelled into Italy, where he visited all the gentlemen who had published any account of these experiments. But though he engaged them to repeat their experiments in his presence, and upon himself; and though he made it his business to get all the information he could concerning them; he returned fully convinced, that many things alleged of the electrical fluid were totally groundless. He was convinced, however, that by electrification alone, several persons had found considerable relief in various disorders; particularly that a paralytic person had been cured at Geneva, and that one who was deaf of an ear, another who had a violent pain in his head, and a woman with a disorder in her eyes, had been cured at Bologna; so that from this time we may date the introduction of electricity into the medical art.

But the identity of the electrical matter with lightning was a discovery of more practical use to mankind than any other. From almost the first discovery of the electric light, and the crackling with which it is emitted, a similarity between it and the phenomena of thunder and lightning had been observed. This is taken notice of by Dr. Wall, one of the first who viewed the electric light in any perfect manner. The Abbé Nollet, Mr. Winkler, and others, also enumerated many resemblances between the phenomena of electricity and those of thunder; but they did not think of any method by which their suspicions could be brought to the test of experience. This was first proposed by Dr. Franklin, in 1750. He had before discovered the effects of pointed bodies in drawing off the electric matter more powerfully than others. This was suggested to him by one Mr. Thomas Hopkinson, who electrified an iron ball of three or four inches diameter with a needle fastened to it, expecting to draw a stronger spark from the point of it; but was surprised to find little or none. Dr. Franklin, improving on this hint, discovered that pointed rods of iron, fixed in the air when the atmosphere was loaded with lightning, drew from it the matter of the thunder-bolt, without noise or danger, into the body of the earth. Thus a new field was opened for philosophers; but it was soon found, that experiments of this kind were not always to be made without danger. In the same year, 1752, the Abbé Nollet published some cautions to those who tried experiments on lightning. He had been informed by letters from Florence and Bologna, that some people there had received violent shocks while they drew sparks from an iron bar electrified by thunder. One of his correspondents informed him, that once, as he was endeavouring to fasten a small chain with a copper ball at one of its extremities to a great chain which communicated with the bar at the top of the building, there came a flash of lightning which he did not see, but which affected the chain with a noise like that of wild-fire. The observer instantly received such a shock, that the ball fell out of his hands, and he was struck backwards four or five paces. The greatest instance of the danger of these experiments, however, was the death of Mr. Richman, professor at Petersburgh; which happened on the 6th of August 1753, as he was making experiments on lightning drawn into his own room. Since the discovery of the identity of lightning and the electric matter, long rods of iron or other metal have been made use of with a view to protect buildings from the danger of strokes of lightning. A considerable dispute has been carried on whether these rods ought to be pointed or not; but a committee of the Royal Society have determined it in favour of the former. See CONDUCTOR.

In the subsequent period of the history of this science, Mr. Canton in England, and Signior Beccaria in Italy, acquired distinguished reputation. They both discovered, independently of each other, that air is capable of receiving electricity by communication, and of retaining it when received. Mr. Canton also, towards the latter end of 1753, pursued a series of experiments, which prove that the appearances of positive and negative electricity, which had hitherto been deemed essential and unchangeable properties of different substances, as of glass and sealing wax, for instance, depend upon the surface of the electrics, and that of the rubber.

This hypothesis, verified by numerous experiments, occasioned a controversy between Mr. Canton and Mr. Delaval, who still maintained that these different powers depended entirely on the substances themselves. About this time too, some curious experiments were performed by four of the principal electricians of that period, viz. Dr. Franklin, and Messrs. Canton, Wilcke, and Æpinus, to ascertain the nature of electric atmosphere.

Many instances occur in the history of the science about this period, of the astonishing force of the electric shock, in melting wires, and producing other similar effects: but the most remarkable is an experiment of S. Beccaria, in which he thus revivified metals. Several experiments were also made by Dr. Watson, Mr. Smeaton, Mr. Canton, and others, on the passage of the electric fluid through a vacuum, and its luminous appearance, and on the power possessed by certain substances of retaining the light communicated to them by an electric explosion. Mr. Canton, S. Beccaria, and others, made many experiments to identify electricity and lightning, to ascertain the state of the atmosphere at different times, and to explain the various phenomena of the aurora borealis, water-spouts, hurricanes, &c. on the principles of this science.

Those who are desirous of farther information with respect to the history of electrical experiments and discoveries, may consult Dr. Priestley's History and Present State of Electricity. This author, however, is not merely an historian: his work contains many original experiments and discoveries made by himself. He ascertained the conducting power of charcoal, and of hot glass; the electricity of fixed and inflammable air, and of oil; the difference between new and old glass, with respect to the diffusion of electricity over its surface; the lateral explosion in electrical discharges; a new method of fixing circular coloured spots on the surfaces of metals, and the most probable difference between electrics and conductors, &c. The science is also greatly indebted to many other persons, either for their experiments and improvements of it, or for treatises and other writings upon it; as Mr. Henley, to whom we owe several curious experiments and observations on the electrical and conducting quality of different substances, as chocolate, vapour, &c. with the reason of the difference between them; the fusion of platina; the nature of the electric fluid, and its course in a discharge; the method of estimating the quantity of it in electrical bodies by an electrometer; the influence of points, &c. &c.

There have been, likewise, various treatises written on the subject of electricity, as by Adams, Cavallo, hon. Mr. Cavendish, Ferguson, lord Mahon, Morgan, Nairne, Van Marum, Van Swinden, &c. most of which may be consulted with advantage, for accounts of experiments, and the principles of the science. In the works of Mr. Cavendish, and lord Mahon, the authors have availed themselves of the susceptibility of electrical phenomena of mathematical discussion; and have thereby rendered essential service to the science. See also Haüy's Natural Philosophy, vol. i. p. 341—435.

According to the opinion of some philosophers, a new æra in the history of electricity commenced nearly twenty years ago: when the celebrated Galvani, professor of anatomy at Bologna, discovered an influence, which by him, and some other authors, has been called animal electricity. But we think it by no means proved, that the phenomena discovered by Galvani depend either upon the electric fluid, or upon any law of animal life: while that is the case, it is surely better to distinguish a new branch of science by the name of the inventor, than to give it an appellation, which may probably lead to an erroneous theory. We, therefore, reject the name animal electricity, and, for our account of this interesting subject, refer to the article GALVANISM.

Medical Electricity.—It is natural to imagine that a power of such efficacy as that of electricity would be applied to medical purposes; especially, since it has been found invariably to increase the sensible perspiration, to quicken the circulation of the blood, and to promote the glandular secretion: accordingly, many instances occur in the latter period of the history of this science, in which it has been applied with considerable advantage and success. And among the variety of cases in which it has been tried, there are none in which it has been found prejudicial except those of pregnancy and the venereal disease. In most disorders, in which it has been used with perseverance, it has given at least a temporary and partial relief, and in many it has effected a total cure. Of which numerous instances may be seen in the Philos. Trans. and the writings on this science by Messrs. Lovet, Westley, Ferguson, Cavallo, &c. &c.

Under this head of medical electricity, it may be proper just to mention those medicated tubes, the imaginary virtues of which were first discovered by Signior Pivati, at Venice, and which were much recommended in the years 1747 and 1748, both in Italy and by Mr. Winkler at Leipsick. These gentlemen imagined, that odorous substances, confined in excited glass vessels, would transpire through the pores of the glass, and communicate their medicinal virtue to the atmosphere of a conductor, and to all persons in contact with it; and that these substances would yield their virtues by being held in the hands of persons electrified; and they pretended that many cures were wrought in this way, by the operation of medicines, without being taken into the stomach: but the whole was soon discovered to be a fallacy; and it was incontestibly proved, that no effluvia could pass from the included substances through the pores of excited glass; and that no method was known for causing the power of medicine to insinuate itself into the human body by electricity. Dr. Franklin, by proving that glass was impermeable to the electric fluid itself, and that its electricity was collected from the rubber, &c. evinced the absurdity of every attempt to transmit the effluvia of any substances through the glass. See Franklin's Letters, p. 82, &c.

Theory of Electricity.—It is hardly necessary to recite the ancient hypotheses on this subject; such as that of the sympathetic powder of the Peripatetics; that of unctuous effluvia emitted by excited bodies, and returning to them again, adopted by Gilbert, Gassendus, sir Kenelm Digby, &c.; or that of the Cartesians, who ascribed electricity to the globules of the first elements, discharged through the pores of the rubbed substance, and in their return carrying with them those light bodies, in whose pores they were entangled: these hypotheses were framed in the infancy of the science, and of philosophy in general, and have long since been exploded. In the more advanced state of electricity, there have been two principal theories, each of which has had its advocates. The one, is that of two distinct electric fluids, repulsive with respect to themselves, and attractive of one another, adopted by M. du Fay, on discovering the two opposite species of electricity, viz. the vitreous and resinous, and since new-modelled by Mr. Symmer. It is supposed that these two fluids are equally attracted by all bodies, and exist in intimate union in their pores; and that in this state they exhibit no mark of their existence. But that the friction of an electric by a rubber separates these fluids, and causes the vitreous electricity of the rubber to pass to the electric, and then to the prime conductor of a machine, while the resinous electricity of the conductor and electric is conveyed to the rubber: and thus the quality of the electric fluid, possessed by the conductor and the rubber, is changed, while the quantity remains the same in each. In this state of separation, the two electric fluids will exert their respective powers; and any number of bodies charged with either of them will repel each other, attract those bodies that have less of each particular fluid than themselves, and be still more attracted by bodies that are wholly destitute of it, or that are loaded with the contrary. According to this theory, the electric spark makes a double current; one fluid passing to an electrified conductor from any substance presented to it, whilst the same quantity of the other fluid passes from it; and when each body receives its natural quantity of both fluids, the balance of the two powers is restored, and both bodies are unelectrified. For a further account of the explication of some of the principal phenomena of electricity by this theory, see Dr. Priestley's History, vol. ii. § 3.

The other theory is commonly distinguished under the denomination of *positive and negative electricity*, being first suggested by D. Watson, but digested, illustrated, and confirmed by Dr. Franklin: and since that it has been known by the appellation of the Franklinian hypothesis. It is here supposed, that all the phænomena of electricity depend on one fluid, *sui generis*, extremely subtile and elastic, dispersed through the pores of all bodies, by which the particles of it are as strongly attracted as they are repelled by one another. When bodies possess their natural share of this fluid, or such a quantity as they can retain by their non-attraction, it is then said they are in an unelectrified state; but when the equilibrium is disturbed, and they either acquire an additional quantity from other bodies, or lose part of their own natural share by communication to other bodies, they exhibit electrical appearances. In the former case it is said they are electrified positively, or plus; and in the other negatively, or minus. This electric fluid, it is supposed, moves with great ease in those bodies that are called conductors, but with extreme difficulty and slowness in the pores of electrics; whence it comes to pass, that all electrics are impermeable to it. It is farther supposed that electrics contain always an equal quantity of this fluid, so that there can be no surcharge or increase on one side without a proportionable decrease or loss on the other, and vice versa; and as the electric does not admit the passage of the fluid through its pores, there will be an accumulation on one side, and a corresponding deficiency on the other. Then when both sides are connected together by proper conductors, the equilibrium will be restored by the rushing of the redundant fluid from the overcharged surface to the exhausted one. Thus also, if an electric be rubbed by a conducting substance, the electricity is only conveyed from one to the other, the one giving what the other receives; and if one be electrified positively, the other will be electrified negatively, unless the loss be supplied by other bodies connected with it, as in the case of the electric and insulated rubber of a machine. This theory serves likewise to illustrate the other phænomena and operations in the science of electricity. Thus, bodies differently electrified will naturally attract each other, till they mutually give and receive an equal quantity of the electric fluid, and the equilibrium is restored between them. Beccaria supposes, that this effect is produced by the electric matter making a vacuum in its passage, and the contiguous air afterwards collapsing, and so pushing the bodies together.

The influence of points, in drawing or throwing off the electric fluid, depends on the less resistance it finds to enter or pass off through fewer particles than through a greater number, whose resistance is united in flat or round surfaces. The electric light is supposed to be part of the electric fluid, which appears when it is properly agitated; and the sound of an explosion is produced by vibrations, occasioned by the air's being displaced by the electric fluid, and again suddenly collapsing.

Mr. Æpinus of the Imperial academy of St. Petersburgh, struck with the resemblance of the electrical properties of the tourmalin to the proporties of a magnet, which have always been considered as the subject of mathematical discussion, remarked a wonderful similarity in the whole series of electrical and magnetical attractions and repulsions, and set himself seriously to the classification of them. Having done this with great success, and having maturely reflected on Dr. Franklin's happy thought of plus and minus electricity, and his consequent theory of the Leyden phial, he at last hit on a mode of conceiving the whole subject of magnetism and electricity, that bids fair for leading us to a full explanation of all the phænomena; in as far, at least, as it enables us to class them with precision, and to predict what will be the result of any proposed treatment. He candidly gives it the modest name of an hypothesis.

This was published at St. Petersburgh in 1759, under the title of Theoria Electritatis et Magnetismi, and is not only an ingenious, but a brilliant performance: it is a most excellent exposition of the Franklinian theory. According to Æpinus, the phænomena of electricity are produced by a fluid of a peculiar nature, and therefore called the Electric fluid, having the following properties:

1. Its particles repel each other, with a force decreasing as the distances increase.

2. Its particles attract the particles of some ingredient in all other bodies, with a force decreasing, according to the same law, with an increase of distance; and this attraction is mutual.

3. The electric fluid is dispersed in the pores of other bodies, and moves with various degrees of facility through the pores of different kinds of matter. In those bodies which we call non-electrics, such as water or metals, it moves without any perceivable obstruction; but in glass, resins, and all bodies called electrics, it moves with very great difficulty, or is altogether immoveable.

4. The phænomena of electricity are of two kinds; 1. Such as arise from the actual motion of the fluid from a body containing more into one containing less of it. 2. Such as do not immediately arise from this transference, but are instances of its attraction and repulsion.

These things being supposed, certain consequences necessarily result from them, which ought to be analogous to the observed phænomena of electricity, if this hypothesis be complete, or some farther modification of the assumed properties is necessary, in order to make the analogy perfect.

Suppose the body A (a figure may readily be conceived) to contain a certain quantity of fluid. Its particles adjoining to the surface, such as P, are attracted by the particles of common matter in the body, but repelled by the other particles of the fluid. The totality of the attractive forces acting on P may be equal to the totality of the repulsive forces, or may be unequal. If these two sums are equal, P is in equilibrio, and has no tendency to change its place. But there may be such a quantity of fluid in the body, that the repulsions of the fluid exceed the attractions of the common matter. In this case, P has a tendency to quit the body, or there is an expulsive force acting on it, and it will quit the body if it be moveable. Because the same must be admitted in respect of every other particle of moveable fluid, it is plain that there will be an efflux, till the attraction of the common matter for the particles of fluid is equal to the repulsion of the remaining fluid. On the other hand, if the primitive repulsion of the fluid acting on the particle P be less than the attractions of the common matter, there will be the same, or at least a similar, superiority of attraction acting on the fluid residing in the circumambient bodies; and there will be an influx from all hands, till an equilibrium be restored.

Hence it follows, that there may always be assigned to any body such a quantity of fluid that there shall be no tendency either to efflux or influx. But if the quantity be increased, and nothing prevent the motion, the redundant fluid will flow out; and if the proper quantity be diminished, there will be an influx of the surrounding fluid, if not prevented by some external force. This may be called the body's natural quantity; because the body, when left to itself, will always be reduced to this state.

If two bodies, A and B, contain each its natural quantity, they will not exert any sensible action on each other: for, because the fluid contained in B is united by attraction to the common matter, and is also repelled by the fluid in A, it necessarily follows, that the whole body B is repelled by the fluid in A. But, on the other hand, the matter in A attracts the fluid in B, and consequently attracts the whole body B: similar action is exerted by B on A. These contrary forces are either equal, and destroy each other, or unequal, and one of them prevails. This equality or inequality evidently depends on the quantity of fluid contained in one or both of the bodies. Now it is known that bodies left entirely to themselves neither attract nor repel; and it follows from the hypothetical properties of the fluid, that if there be either a redundancy or deficiency of fluid, there will be an efflux or influx, till the attractions and repulsions balance each other. Therefore the internal state of two bodies which neither attract nor repel each other, is that where each contains its natural quantity of electric fluid.

In order, therefore, to conceive distinctly the state of a body containing its natural quantity, and to have a distinct notion of this natural quantity, we must suppose that the quantity of fluid competent to a particle of matter in A repels the fluid competent to a particle of matter in B, just as much as it attracts that particle of matter; and also, that the fluid belonging to a particle of matter in A repels the fluid belonging to a particle of matter in B, just as much as the particle of matter in A attracts it. Thus the whole fluid in the one repels the whole fluid in the other as much as it attracts the whole matter.

Since this must be conceived of every particle of common matter, in a body, we must admit, that when a body is in its natural state, the quantity of electric fluid in it is proportional to the quantity of matter, every particle being united with an equal quantity of fluid. This, however, does not necessarily require that different kinds of matter, in their natural or saturated state, shall contain the same proportion of fluid. It is sufficient that each contained such a quantity, uniformly distributed among its particles, that its repulsion for the fluid in another body is equal to its attraction for the common matter in it. It is, however, more probable, that the quantity of electric fluid attached, or competent to a particle of all kinds of matter, is the same.

Since our hypothesis is accommodated to the fact, that bodies in their natural state, having their natural quantity of electric fluid, are altogether inactive on each other, by making this natural quantity such, that its mutual repulsion exactly balances its attraction for the common matter—it follows, that we must deduce all the electric dhænomena from a redundancy or deficiency of electric fluid. This accordingly is the Franklinian doctrine. The redundant state of a body is called by Dr. Franklin positive or plus electricity, and the deficient state is called negative or minus electricity.

This simple hypothesis is found to coincide perfectly, in its legitimate consequences, with all the general phænomena of attraction and repulsion; not only with those that are simple, but even such as are compounded of many others: we may, therefore, listen to the other evidences which may be offered for the materiality and mobility of the cause of those mechanical phænomena. The transference of electricity is desultory, and the change made in the electric state of the communicating bodies is always considerable. It appears to keep some settled ratio to the whole electric power of the body. When the form of the parts where the communication takes place, and other circumstances, remain the same, the transference increases with the size of the bodies; and all the phænomena are more vivid in proportion. When the conductor is very large, the spark is very bright, and the snap very loud.

1. This snap alone indicates some material agent. It is occasioned by a sonorous undulation of the air, or of some elastic fluid, which suddenly expands, and as suddenly collapses again. But such is the rapidity of the undulation, that when it is made in close vessels it does not exist long enough, in a very expanded state, to affect the column of water, supported in a tube by the elasticity of the air, for the purpose of a delicate thermometer or barometer; just as a musket-ball will pass through a loose hanging sheet of paper without causing any sensible agitation.

2. The spark is accompanied by intense heat, which will kindle inflammable bodies, will melt, explode, and calcine metals.

3. The spark produces some very remarkable chemical effects. It calcines metals even under water or oil; it renders Bolognan phosphorus luminous: it decomposes water, and makes new compositions and decompositions of many gaziform fluids; it affects vegetable colours; it blackens the calces of bismuth, lead, tin, luna cornea; it communicates a very peculiar smell to the air of a room, which is distinct from all others; and in the calcination of metals, it changes remarkably the smells with which this operation is usually accompanied; it affects the tongue with an acidulous taste; it agitates the nervous system. When we compare these appearances with similar chemical and physiological phænomena, which naturalists never hesitate in ascribing to the action of material substances, transferable from one body, or one state of combination, to another, we can see no greater reason for hesitating in ascribing the electric phænomena to the action of a material substance; which we may call a fluid, on account of its connected mobility, and the electric fluid, on account of its distinguishing effects. We are well aware, however, that these evidences do not amount to demonstration; and that it is possible, that the electric phænomena, as well as many chemical changes, may result from the mere difference of arrangement, or position, of the ultimate particles of bodies, and may be considered as the result of a change of modes, and not of things.

One of the most remarkable facts in electricity is the rapid dissipation by sharp points, and the impossibility of making any considerable accumulation in a body which has any such, projecting beyond other parts of its surface. The dissipation is attended with many remarkable circumstances, which have greatly the appearance of the actual escape of some material substance. A stream of wind blows from such a point and quickly electrifies the air of a room to such a degree, that an electrometer in the farthest corner of the room is affected by it. This dissipation in a dark place is, in many instances, accompanied by a bright train of light diverging from the point like a firework. Dr. Franklin, therefore, was very anxious to reconcile this appearance with his theory of plus and minus electricity, but does not express himself well satisfied with any explanation which had occurred to him. From the beginning, he saw that he could not consider the stream of wind as a proof of the escape of the electric fluid, because the same stream is observed to issue from a sharp negative point, which, according to his theory, is not dispersing, but absorbing it. Mr. Cavendish has, in our opinion, given the first satisfactory account of this phænomenon.

To see this in its full force, the phænomenon itself must be carefully observed. The stream of wind is plainly produced by the escape of something from the point itself, which hurries the air along with it; and this draws along with it a great deal of the surrounding air, especially from behind, in the same manner as the very slender thread of air from a blow-pipe hurries along with it the surrounding air and flame from a considerable surface on all sides. It is in this manner that it gathers the whole of a large flame into one mass, and, at last, into a very point. If the smoke of a little rosin thrown on a bit of live coal be made to rise quietly round a point projecting from an electrified body, continually supplied from an electrical machine, the vortices of this smoke may be observed to curl in from all sides, along the wire, forming a current of which the wire is the axis, and it goes off completely by the point. But if the wire be made to pass through a cork fixed in the bottom of a wide glass tube, and if its point project not beyond the mouth of the tube, the afflux of the air from behind is prevented, and we have no stream; but if the cork be removed, and the wire still occupy the axis of the tube, but without touching the sides, we have the stream very distinctly; and smoke which rises round the far end of the tube is drawn into it, and goes off at the point of the wire. Now it is of importance to observe, that whatever prevents the formation of this stream of wind prevents the dissipation of electricity (for we shall not say escape of electric fluid) from the point. If the point project a quarter of an inch beyond the tube, or if the tube be open behind, the stream is strong, and the dissipation so rapid, that even a very good machine is not able to raise a Henley's electrometer, standing on the conductor, a very few degrees. If the tube be slipped forward, so that the point is just even with its mouth, the dissipation of electricity is next to nothing, and does not exceed what might be produced by such air as can be collected by a superficial point. If the tube made to advance half an inch beyond the point which it surrounds, the dissipation becomes insensible. All these facts put it beyond a doubt that the air is the cause, or, at least, the occasion of the dissipation, and carries the electricity off with it, in this manner rendering electrical the whole air of a room. The problem is reduced to explain how the air contiguous to a sharp electrified point is electrified and thrown off.

It has been demonstrated, that two spheres, connected by an infinitely extended, but slender conducting canal, are in electrical equilibrium, if their surfaces contain fluid in the proportion of their diameters. In this case, the superficial density of the fluid and its tendency to escape are inversely as the diameters. Now if, in imagination, we gradually diminish the diameter of one of the spheres, the tendency to escape will increase in a greater proportion than any that we can name. We know, that when the prime conductor of a powerful table machine has a wire of a few inches in length projecting from its end, and terminating in a ball of half an inch in diameter, we cannot electrify it beyond a certain degree; for when arrived at this degree, the electricity flies off in successive bursts from this ball. Being much more overcharged than any other part of the body, the air surrounding the ball becomes more overcharged by communication, and is repelled, and its place supplied by other air, not so much overcharged, which surrounded the other parts of the body, and is pressed forwards into this space by the general repulsion of the conductor and the confining pressure of the atmosphere; otherwise, being also overcharged, it would have no tendency to come to this place. Half a turn of the cylinder is sufficient to accumulate to a degree sufficient for producing one of these explosions, and we have two of them for every turn of the cylinder. A point may be compared to an incomparably smaller ball. The constipation of the fluid, and its tendency to escape, must be greater in the same unmeasurable proportion. This density and mutual repulsion cannot be diminished, and must even be increased by the matter of the wire forming a cone, of which the point is the apex; therefore, if there were no other cause, we must see that it is almost impossible to confine a collection of particles, mutually repelling, and constipated, as these are in a fine point.

But the chief cause seems to be a certain chemical union which takes place between the electric fluid and a corresponding ingredient of the air. In this state of constipation, almost completely surrounded by the air, the little mass of fluid must attract and be attracted with very great force, and more readily overcome the force which keeps the electrified fluid attached to the last series of particles of the wire. It unites with the air, rendering it electric in the highest degree of redundancy. It is therefore strongly repelled by the mass of constipated fluid which succeeds it within the point. Thus is the electrified air continually thrown off, in a state of electrification, that must rapidly diminish the electricity of the conductor. Hence the uninterrupted flow, without noise or much light, when the point is made very fine. When the point is blunt, a little accumulation is requisite before it attains the degree necessary for even this minute explosion; but this is soon done, and these little explosions succeed each other rapidly, accompanied by a sputtering noise, and trains of bright sparks. The noise is undoubtedly owing to the atoms of the highly electrified fluid. These are, in all probability, rarefied of a sudden, in the act of electrification, and immediately collapse again in the act of chemical union, which causes a sonorous agitation of the air. This electrified air is thus thrown off, and its place is immediately supplied by air from behind, not yet electrified, and therefore strongly drawn forward to the point, from which they were thrown off in their turn. This rapid expansion and subsequent collapsing of the air is verified by the experiments of Mr. Kinnersly, related by Dr. Franklin, and is seen in numberless experiments made with other views in later times, and not attended to. Perhaps it is produced by the great heat which accompanies, or is generated in the transference of electricity, and it is of the same kind with what occasions the bursting of stones, splitting of trees, exploding of metals, &c. by electricity. The expansion is either inconsiderable, or it is successively produced in very small portions of the substance expanded; for when metal is exploded in close vessels, or under water, there is but a minute portion of gasseous matter produced; and in the dissipation by a very fine point, sufficiently great to give full employment to a powerful machine, the stream of wind is but very faint, and nine-tenths of this has been dragged along by the really electrified thread of wind in the middle.

From a collation of all the appearances of electricity, we must form the same conception of the forces which operate round a point that is negatively electrified, not dispersing, but drawing in electric fluid. It is more completely undercharged than any other part of a body, and attracts the fluid in the surrounding air, and the air in which it is retained, with incomparably greater force. It therefore deprives the contiguous air of its fluid, and then repels it, and then produces a stream like the overcharged point.

If a conducting body be brought near to any part of an overcharged body, the fronting part of the first is rendered undercharged; and this increases the charge of the opposite part of the overcharged body. It becomes more overcharged in that part, and sooner attains that degree of constipation that enables the fluid to quit the superficial series of particles, and to electrify strongly the contiguous air. The explosion is therefore made in this part in preference to any other; and the air thus exploded is strongly attracted by the fronting part of the other body, and must fly thither in preference to any other point. If, moreover, the fronting part of it be prominent or pointed, this effect will be produced in a superior degree; and the current of electrified air, which will begin very early, will increase this disposition to transference in this way, by rarefying the air; a change which the whole course of electric phænomena shows to be highly favourable to this transference, although we cannot, perhaps, form any very adequate notion how it contributes to this effect. This seems to be the reason why a great explosion and snap, with a copious transference of electricity, is generally preceded by a hissing noise like the rushing of wind, which swells to a maximum in the loud snap itself.

If two prominences, precisely similar, and electrified in the contrary way to the same degree, are presented to each other, we cannot say from which the current should take its commencement, or whether it should not equally begin from both, and a general dispersion of air laterally be the effect; but such a situation is barely possible, and must be infinitely rare. The current will begin from the side which has some superiority of propelling force. We are disposed to think that this current of material electrified substance must suffer great change during its passage by mixing with the current in an opposite electrical state coming from the other body. Any little mass of the one current must strongly attract a contiguous mass of the other, and certain changes should surely arise from this mixture. These may, in their turn, make a great change in the mechanical motions of the air; and, instead of producing a quaquaversum dispersion of air from between the bodies, as should result from the meeting of opposite streams, it may even produce a collapsing of the air, by the mutual strong attractions of the little masses. Many valuable experiments offer themselves to the curious enquirer. Two little balls may be thus presented to each other, and a smoke may be made with rosin to occupy the intervals between them. Motions may be observed which have certain analogies that would afford useful information to the mechanical enquirer. There must be something of this mixture of currents in all such transferences, and the most minute differences in the condition of a little parcel of the air may greatly affect the future motions. The most promising form of such experiment would be to use two points of the same substance, shape, and size, and electrified to the same degree in opposite senses.

After all care has been taken to ensure similarity, there remains one essential difference, that the one current is redundant in electric fluid, and the other deficient. This circumstance must produce characteristic differences of appearance. And are there not such differences? Is not the pencil and the star of light a characteristic difference? And does not this well-supported fact greatly corroborate the opinion of Dr. Franklin, that the electric phænomena result from the redundancy and deficiency of one substance, and not from two distinct substances operating in a similar manner? For the distinction in appearance is a mechanical distinction; in which are perceived motion, direction, velocity; and in which locomotive forces are concerned; but they are so implicated with forces which probably resemble chemical affinities, hardly operating beyond contact, that to extricate their effects from the complicated phænomenon, is a problem which, though not insurmountable, must not be entered into here; especially, as we have already extended this article to a greater length than we at first expected.

Mr. Cuthbertson, a very ingenious instrument-maker in London, gives the following account of an experiment by which the two kinds of electricity are distinguished, or the direction of the fluid is ascertained:—Insulate two wires, furnished at each end with a ball, three-fourths of an inch in diameter; connect one with the positive, and the other with the negative, conductor of a machine; the balls should be four inches asunder, and between them, at equal distances from each, place a lighted candle with the centre of its flame nearly on a level with the centres of the balls: if the machine be put into motion the flame will waver very much, and seem to incline rather more to the negative ball than to the positive one; after about fifty revolutions, the negative ball will grow warm, and the positive ball remain cold; if the revolution be continued to about 202, the negative ball will be too hot for the hand to touch, while the other remains as cold as at the beginning.

Notwithstanding the flattering testimony given by the great conformity of this doctrine of Franklin and Æpinus with the phænomena, we still choose to present it under the title of an hypothesis. We have never seen the electric fluid in a separate state; nor have we been able to say in what cases it abounds, or when it is deficient. After what we have seen in the late experiments of that philanthropic philosopher count Rumford on the production of heat by friction, we think that we cannot be too cautious on what grounds we admit invisible agents to perform the operations of nature. We think that all must acknowledge that those experiments tend very much to stagger our belief in the existence of a fluid *sui generis*, a fire, heat, caloric, or what we please to call it; and all will acknowledge, that no better proofs can be urged for the existence of an electric fluid.

Many acute and ingenious persons have started other theories; but we are not aware of any which need be mentioned here, except those of Mr. Russel and M. de Luc. The former considered the electrical phænomena as the results of the action of a substance which may be called the electric fluid. The characteristic ingredient of this fluid, Mr. Russel thinks, is electricity properly so called: this is supposed to be united with the elastic fluid by chemical affinity, or elective attraction, as it was called by Dr. Cullen and Dr. Black; which attraction is thought to extend to all distances. The electricity, moreover, attracts the particles of other bodies, but with certain elections, according as the bodies attracted fall under the class of electrics or of non-electrics. M. de Luc's theory does not differ very widely: he conceives that the electric phænomena are the operations of an expansive substance called the electric fluid, which consists of two parts; the electric matter, which is the gravitating part of the compound; and electric deferent fluid, or carrying fluid, by which alone the electric matter seems to be carried from one body to another. This hypothesis is illustrated in Idées sur la Meteorologie, par de Luc: an account and examination of it may be seen in the article Electricity in the Supplement to the Encyclo. Britannica, where also is a very copious account of Æpinus's theory, from which we have drawn some of the above particulars.

To **ELECTRIFY.** *v. a.* To communicate the electric energy.

ELECTRIFICATION, or **ELECTRISATION,** the manner of electrifying bodies; that is, of exciting in them, or communicating to them, the electric virtue.

ELECTROMETER, (formed of ηλεκτρον, and μετρω, I measure,) is an instrument contrived for measuring the quantity, and determining the quality of electricity in any electrified body. Mr. Canton, previous to the invention of instruments of this kind, estimated the quantity of electricity in a charged phial, by presenting the phial with one hand to an insulated conductor, and giving it a spark, which he took off with the other; and he proceeded in this manner till the phial was discharged, and then determined the height of the charge by the number of sparks.

The most simple electrometer is a linen thread called by Dr. Desaguliers the thread of trial; which if brought near to an electrified body, will be attracted by it; but this will do little more than determine whether the body is in any degree electrified or not; without determining with any precision its quantity, much less its quality. The Abbé Nollet used two threads, and shewed the degrees of electricity by the angle of their divergency exhibited in their shadow on a board placed behind them.

Mr. Canton's electrometer consisted of two balls of cork, or pith of elder, nicely turned in a lathe to about the size of a small pea, and suspended on fine linen threads, about six inches long, which may be wetted in a weak solution of salt. See fig. 2, Plate 60.

These may be kept in small boxes, of the length of the strings, that they may lie in them without being bent; and they may be thus carried in the pocket, and will be ready for use. See POCKET ELECTROMETER.

If the box containing these balls be insulated, by placing it on a drinking glass, or any other electric substance, and an excited smooth glass tube be brought near them, they will first be attracted by it, and then repelled both from the glass, and from each other; but on the approach of excited wax, they will gradually approach and come together; and vice versa. This apparatus will also serve to determine the electricity of the clouds and air, by holding them at a sufficient distance from buildings, trees, &c.; for if the electricity of the clouds or air be positive, their mutual repulsion will increase by the approach of excited glass, or decrease by the approach of amber or sealing-wax; on the contrary, if it be negative, their repulsion will be diminished by the former, and increased by the latter. See Philos. Trans. vol. xlviii. part 1, and 2, for an account of Mr. Canton's curious experiments with this apparatus.

If two balls of this kind be annexed to a prime conductor, they will serve to determine both the degree and quality of its electrification, by their mutual repulsion and divergency.

The Discharging Electrometer, fig. 1, Plate 60, was invented by Mr. Lane. It consists of brass work G, the lower part of which is inclosed in the pillar F, made of baked wood, and boiled in linseed oil, and bored cylindrically about two-thirds of its length; the brass work is fixed to the pillar by the screw H, moveable in the groove I; and through the same is made to pass a steel screw L, to the end of which, and opposite to K, a polished hemispherical piece of brass, attached to the prime conductor, is fixed a ball of brass M well polished. To this screw is annexed a circular plate O, divided into twelve equal parts. The use of this electrometer is to discharge a jar D, or any battery connected with the conductor, without a discharging rod, and to give shocks successively of the same degree of strength; on which account it is very fit for medical purposes. Then, if a person holds a wire fastened to the screw H, in one hand, and another wire fixed to E, a loop of brass wire passing from the frame of the machine to a tin plate, on which the phial D stands, he will perceive no shock, when K and M are in contact; and the degree of the explosion, as well as the quantity of electricity accumulated in the phial, will be regulated by the distance between K and M. Philos. Trans. vol. lvii. p. 451. Mr. Henley much improved Mr. Lane's electrometer, by taking away the screw, the double milled nut, and the sharp-edged graduated plate, and adding other contrivances in their stead. Mr. Henley's discharger of this kind has two tubes, one sliding within the other, to lengthen and accommodate it to larger apparatus.

The Quadrant Electrometer of Mr. Henley consists of a stem, terminating at its lower end with a brass ferrule and screw, for fastening it upon any occasion; and its upper part ends in a ball. Near the top is fixed a graduated semicircle of ivory, on the centre of which the index, being a very light rod with a cork ball at its extremity, reaching to the brass ferrule of the stem, is made to turn on a pin in the brass piece, so as to keep near the graduated limb of the semicircle. When the electrometer is not electrified, the index hangs parallel to the stem; but as soon as it begins to be electrified, the index, repelled by the stem, will begin to move along the graduated edge of the semicircle, and so mark the degree to which the conductor is electrified, or the height to which the charge of any jar or battery is advanced.

Cuthbertson's Electrometer is thus described by himself in the last number of the second volume of Nicholson's Philosophical Journal, 4to. GH (fig. 4, Plate 60), is an oblong piece of wood, about eighteen inches in length, and six in breadth, in which are fixed three glass supporters, D, E, F, mounted with brass balls, *a*, *c*, *b*. Of these supporters E and F are exactly of the same length; but D is four inches shorter. Under the brass ball *a* is a long brass hook; the ball *c* is made of two hemispheres, the under one being fixed to the brass mounting, and the upper turned with a groove to shut upon it, so that it can be taken off at pleasure. The ball *b* has a brass tube fixed to it, about three inches long, cemented on the top of F, and the same ball has a hole at the top, of about one-half inch diameter, corresponding with the inside of the tube. AB is a straight brass wire, with a knife-edged centre in the middle, placed a little below the centre of gravity, and equally balanced with a hollow brass ball at each end, the centre, or axis, resting upon a proper shaped piece of brass fixed in the inside of the ball *c*; that side of the hemisphere towards *c* is cut open, to permit the end *c*A of the balance to descend till it touches the ball *a*, and the upper hemisphere C is also cut open to permit the end *c*B to ascend; *i* is a weight, weighing a certain number of grains, and made in the form of a pin with a broad head; the ball B has two holes, one at the top, and the other at the bottom; the upper hole is so wide, as to let the head of the pin pass through it, but to stop at the under one, with its shank hanging freely in *b*; *k* is a common Henley's quadrant electrometer; and when in use it is screwed upon the top of *c*.

It is evident, from the construction, that if the foot stand horizontal, and the ball B be made to touch *b*, it will remain in that position without the help of the weight *i*; and if it should by any means receive a very low charge of electric fluid, the two balls *b*, B, will repel each other; B will begin to ascend, and, on account of the centre of gravity being above the centre of motion, the ascension will continue till A rest upon *a*. If the balance be set again horizontal, and the pin *i* be put into its place in B, it will cause B to rest upon *b*, with a pressure equal to that weight, so that more electric fluid must be communicated than formerly before the balls will separate; and as the weight in B is increased or diminished, a greater or less quantity of electric fluid will be required to effect a separation.

When this instrument is to be applied to a jar, or battery, one end of a wire L must be inserted into a hole in *b*, and the other end into a hole of any ball proceeding from the inside of a battery, as M. A chain, or wire, or any body through which the charge is to pass, must be hung to the hook at *m*, and carried from thence to the outside of the battery, as is represented by the line N. *k* must be screwed upon *c*, with its index towards A. The reason of this instrument being added, is to shew, by the index continuing to rise, that the charge of the battery is increasing, because the other part of the instrument does not act till the battery has received its required charge.

It is almost needless to observe, that this instrument consists of three electrometers, viz. Henley's electrometer, Lane's discharging electrometer considerably improved, and Brookes's steelyard electrometer improved likewise. By this combination and these improvements, we possess all that can be required in an electrometer for batteries and large jars; for, by *k*, we see the progress of the charge; by the separation of B*b*, we have the repulsive power in weight; and by the ball A, the discharge is caused when the charge has acquired the strength proposed.

In the journal from which this abstract is taken, the reader will find some curious experiments made with batteries by means of this electrometer; but one will be sufficient to explain its use. Prepare the electrometer in the manner shewn in the figure, with the jar M annexed, which contains about 168 square inches of coating. Take out the pin in B, and observe whether the ball B will remain at rest upon *b*; if not, turn the adjusting screw at C till it just remains upon A. Put into B the pin, marked *i*, weighing fifteen grains; take two inches of watch pendulum wire, fix to each end a pair of spring tongs, as is represented at G*m*, hook one end to *m*, and the other to the wire N, communicating with the outside of the jar; let the uncoated part of the jar be made very clean and dry; and let the prime conductor of an electrical machine, or a wire proceeding from it, touch the wire L; then, if the machine be put in motion, the jar and electrometer will charge, as will be seen by the rising of the index of *k*; and when charged high enough, B will be repelled by *b*, and A will descend and discharge the jar through the wire which was confined in the tongs, and the wire will be fused and run into balls. The ingenious author, by breathing through a glass pipe into the jar, damped it a little in the inside. Then loading B with a pin of thirty grains, he obtained such a charge as fused eight inches of watch-pendulum wire, disposed exactly as the two inches were disposed in the former experiment. By repeating and varying his experiments, he found that double quantities of electrical fluid, in the form of a discharge, will melt four times the length of wire of a certain diameter.

Mr. Cavallo likewise contrived several ingenious electrometers, for different uses: descriptions of them may be seen in his Treatise on Electricity, and in Phil. Trans. vol. lxvii. And Mr. Coulumb, of the Royal Acad. Scien. Paris, invented a very accurate and delicate instrument, but, as hitherto managed, it measures only repulsions: it is described in the first volume of Gregory's Translation of Haüy's Natural Philosophy.

ELECTROMICROMETER, the name given to an instrument invented by Veau de Launay, to indicate the smallest appreciable quantities of Galvanic energy. See GALVANISM.

ELECTROPHORUS, a machine, represented in Plate 60, fig. 3, the phænomena of which are somewhat singular. It consists of two plates, A and B, usually of a circular form; though they may be made square, or of the figure of a parallelogram, with more ease, and with equal advantage. At first the under plate was of glass, covered over with sealing wax; but there is little occasion for being particular either with regard to the substance of the lower plate, or the electric which is put upon it. A metallic plate, however, is perhaps preferable to a wooden one, though the latter will answer the purpose very well. This plate is to be covered with some electric substance. Pure sulphur answers very near as well as the dearer electrics, sealing-wax, gum-lac, &c.; but it hath this bad quality, that, by rubbing it, some exceeding subtle steams are produced, which infect the person's clothes, and even his whole body, with a very disagreeable smell, and will change silver in his pocket to a blackish colour. The upper plate of the electrophorus is a brass plate, or a board or piece of pasteboard covered with tinfoil or gilt paper, nearly of the same size with the electric plate, though it will not be the worse that it is somewhat larger. It is furnished with a glass handle (I), which ought to be screwed into the centre. The manner of using this machine is as follows. First, the plate B is excited by rubbing its coated side with a piece of new white flannel, or a piece of hare's skin. Even a common hard brush, having the hair a little greased, will excite sulphur extremely well. When this plate is excited as much as possible, it is set upon the table with the electric side uppermost. Secondly, the metal plate is laid upon the excited electric, as represented in the figure. Thirdly, the metal plate is touched with the finger or any other conductor, which, on touching the plate, receives a spark from it. Lastly, the metal plate A, being held by the extremity of its glass handle (I), is separated from the electric plate; and, after it is elevated above that plate, it will be found strongly electrified with an electricity contrary to that of the electric plate; in which case, it will give a very strong spark to any conductor brought near it. By setting the metal upon the electric plate, touching it with the finger, and separating it successively, a great number of sparks may be obtained apparently of the same strength, and that without exciting again the electric plate. If these sparks are repeatedly given to the knob of a coated phial, this will presently become charged.

Mr. Cavallo, in his account of the electrophorus, tells us, "that instead of laying the electric plate upon the table, it is set upon an electric stand, so as to be accurately insulated, then the metal plate set on it acquires so little electricity, that it can only be discovered by an electrometer." In what manner this gentleman came to mistake a plain fact so egregiously, is not easy to determine; but it is certain, that an electrophorus, instead of having its virtue impaired by being insulated, has it greatly increased, at least the sphere of its activity is greatly enlarged. When lying on the table, if the upper plate is put upon it without being touched with the finger, it will not shew much sign of electricity. But as soon as it is put on the electric stand, both the upper and under side appear strongly negative. A thread will be attracted at the distance of eight to ten inches. If both the upper and under side are touched at the same time, a strong spark will be obtained from both, but always of the same kind of electricity, namely, the negative kind. If the upper plate is now lifted up, a strong spark of positive electricity will be obtained from it; and on putting it down again, two sparks of negative electricity will be produced.

The singularity of this experiment is, that it produces always double the quantity of negative electricity that it doth of the positive kind; which cannot be done by any other method yet known. Another very surprising circumstance is, that when the electrophorus remains in its insulated situation, you need not always touch the upper and under side of the plates at once, in order to procure positive electricity from the upper plate: it is sufficient to touch both sides only once. On lifting up the upper plate, a spark of positive electricity is obtained as already mentioned. On putting it down again, a spark of the negative kind is obtained from the upper plate, even though you do not touch the lower one. On lifting up the upper plate, a spark of positive electricity is obtained, but weaker than it would have been had both sides been touched at once. Putting down the upper plate again without touching both, a still weaker spark, first of negative and then of positive electricity, will be obtained from the upper one. Thus, the sparks will go on continually diminishing, to the number perhaps of two or three hundred. But at last, when the electricity of the whole machine seems to be totally lost, if both sides are touched at once, it will instantly be restored to its full strength, and the double spark of negative, with the single one of positive electricity, will be obtained without intermission as before.

ELECTRUM. (*electrum*, ἠλεκτρον.) The ancient name of amber.

ELECTUARIUM CASSIÆ, in pharmacy. A very elegant, pleasant, and mild aperient, calculated for the feeble and for children.

Electuarium catechu. A very useful adstringent, and, perhaps, the most efficacious way of giving the catechu to advantage. Ten scruples of this electuary contain one grain of opium.

Electuarium opiatum, in pharmacy. This preparation, ordered in the Edinburgh pharmacopœia, is an excellent aromatic adstringent, and calculated for the debilitated, the aged, and nervous. One grain of opium is contained in about a drachm.

Electuarium scammonii, in pharmacy. This is a strong stimulating cathartic, and calculated to remove worms from the primæ viæ, with which view it is mostly exhibited.

Electuarium e sennæ, in pharmacy. A mild and elegant aperient: well adapted for pregnant women, and those whose bowels are easily moved.

ELECTUARY. (*electuarium*, from *eligo*, to choose.) A medicine containing several ingredients that are mixed together by a fluid into the consistence of honey.

ELEEMOSYNA CARUCARUM, or Eleemosyna regis, a penny which king Ethelred ordered to be paid for every plough in England towards the support of the poor.

ELEEMOSYNARIUS, in our old writers, is used for the almoner in religious houses.

ELEEMO'SYNARY. *a.* (ελεημοσυνη.) 1. Living upon alms; depending upon charity: not used (*Glanville*). 2. Given in charity.

E'LEGANCE. E'legancy. *s.* (*elegantia*, Lat.) 1. Beauty without grandeur (*Raleigh*). 2. Any thing that pleases by its nicety (*Spectator*).

E'LEGANT. *a.* (*elegans*, Latin.) 1. Pleasing by minuter beauties (*Pope*). 2. Nice; not coarse; not gross (*Pope*).

E'LEGANTLY. *ad.* (from *elegant.*) 1. In such a manner as to please (*Milton*). 2. Neatly; nicely; with minute beauty (*Pope*).

ELEGI'ACK. *a.* (*elegiacus*, Latin.) 1. Used in elegies. 2. Mournful; sorrowful (*Gay*).

ELEGY. (Ελεγεια.) A mournful and plaintive kind of poem. Vossius, after Didymus, derives the term from ἒ, ἒ, λεγειν, to say alas!

The first inventor of the elegy is not known: some say it was one Theocles of Naxus, or, according to others, of Eretria, who, in the heat of his phrensy, first produced this kind of composition. But there is no wonder that we are at this time in the dark as to the matter; Horace assures us it was a point not settled among the grammarians even in his time, who the author was.

> “Quis tamen exiguos elegos emiserit auctor,
> Grammatici certant, & adhuc sub judice lis
> est.”

The chief writers of elegy among the Greeks, are Callimachus, Parthenius, and Euphorion; and among the Latins, Ovid, Catullus, Tibullus, and Propertius.

As elegy, at its first institution, was intended for tears, it expressed no other sentiments, it breathed no other accents, but those of sorrow. With the negligence natural to affliction, it sought less to please than to move. By degrees, however, elegy degenerated from its original intention, and was employed upon all sorts of subjects, gay or sad, and especially upon love. Ovid's books of love, the poems of Tibullus and Propertius, are entitled elegies; and yet so far are they from being sad, that they are sometimes scarce serious: so that the same title was indiscriminately given to poems on different subjects, but which agreed in their verse and manner of writing. The chief subjects to which elegy owes its rise, are Death and Love: so that elegy ought to be esteemed the most perfect, which has somewhat of both at once; namely, where the poet bewails the loss of some youth, or damsel, falling a martyr to love. The next are those elegies full of that melancholy complaint which lovers seldom want matter for: the thoughts of elegy should be always natural, far from the affectation of wit; its sentiments tender and delicate; its expression simple and easy, always retaining that alternate inequality of measure which Ovid extols so much; and which gives the elegiac poetry of the ancients so much the advantage over the moderns. Elegy should flow in one even current, smooth, humble, and unaffected; and yet she is not abject in her humility, but becoming, elegant, and attractive.

The office of elegy is well delivered by M. Boileau:

> “La plaintive elegie en long habits de deuil,
> Scait, les cheveux epars, gemir sur un cercueil:
> Elle peint des aimans la joye, & la tristesse;
> Flate, menace, irrite, appaise une maîtresse.”
>
> In mourning weeds sad elegy appears,
> Her hair dishevell'd, and her eyes in tears:
> Her theme, the lover's joys, but more his pains;
> By turns she sings, sooths, threatens, and complains.

Among the ancients, hexameters and pentameters were so peculiar to elegy, that this kind of metre is usually styled elegiac. Instead of it, we, in our tongue, use the word heroic.

E'LEMENT. *s.* (*elementum*, Latin.) 1. The first or constituent principle of any thing (*Hooker*). 2. The four elements, usually so called, are earth, fire, air, and water (*Bacon*). 3. The proper habitation or sphere of any thing (*Baker*). 4. An ingredient; a constituent part (*Shakspeare*). 5. The letters of any language. 6. The lowest or first rudiments of literature or science (*Hooker*).

Elements, in astronomy, principles and numbers deduced from observations, and made the basis in the construction of tables of the planetary motions. Such are, the time of a planet's revolution; the position of the line of apsides, and the epoch of a passage through that line; the place of the nodes, and an epoch; the eccentricity of the orbit, or the relation of its axes; and the inclination of the orbit.

Element, in physiology, a term used by philosophers to denote the original component parts of bodies, or those into which they are ultimately resolvable.

It seems to have been an opinion established among philosophers in the remotest ages, that there are only four simple bodies; namely, fire, air, water, and earth. To these they gave the name of elements, because they believed that all substances are composed of these four. This opinion, variously modified indeed, was maintained by all the ancient philosophers. We now know that all these supposed elements are compounds: fire is composed of caloric and light; air of caloric, oxygen, and azotic gases; water of oxygen and hydrogen; and that earth includes nine different substances.

The doctrine of the four elements seems to have continued undisputed till the time of the alchemists. These men having made themselves much better acquainted with the analysis of bodies than the ancient philosophers had been, soon perceived that the common doctrine was inadequate to explain all the appearances that were familiar to them. They substituted a theory of their own in its place. According to them, there are three elements, of which all bodies are composed; namely, salt, sulphur, and mercury, which they distinguish by the appellation of the tria prima. These principles were adopted by succeeding writers, particularly by Paracelsus, who added two more to their number; namely, phlegm and caput mortuum.

It is not easy to say what the alchemists meant by salt, sulphur, and mercury; probably they had affixed no precise meaning to the words. Every thing which is fixed in the fire they seem to have called salt, every inflammable substance they called sulphur, and every substance which flies off without burning was mercury. Accordingly they tell us, that all bodies may by fire be decomposed into these three principles; the salt remains behind fixed, the sulphur takes fire, and the mercury flies off in the form of smoke. The phlegm and caput mortuum of Paracelsus were the water and earth of the ancient philosophers.

Mr. Boyle attacked this hypothesis in his Sceptical Chemist, and in several of his other publications; proving that the chemists comprehended under each of the terms salt, sulphur, mercury, phlegm, and earth, substances of very different properties; that there is no proof that all bodies are composed of these principles; and that these principles themselves are not elements but compounds. The refutation of Mr. Boyle was so complete, that the hypothesis of the tria prima seems to have been almost immediately abandoned by all parties.

Elements. Radicals. First principles. The minutest particles of any substance, which can no further be divided or decomposed by chemical analysis. Many substances cannot be farther decomposed by the chemist into constituent parts, but this alone does not entitle them to be ranked among the elements. Though they are not yet decomposed, it does not follow that they are undecomposable, but only, perhaps, that we have neither instruments nor means by which to produce a decomposition, nor senses to notice it when it has taken place. The bodies which are known to us at present, however, as simple substances, amount to forty-one; some of these may be sensibly exhibited in their simple state, uncombined with other matters: these are termed ostensible, producible, simple substances, to distinguish them from those whose existence or presence is only inferred from facts, and are called unostensible, unproducible, simple substances. The following is a list of simple substances at present known.

Unproducible simple Substances.

1. Phlogiston, or basis of light.
2. Oxygen.
3. Hydrogen.
4. Azotic. } Rad.
5. Carbonic. } Rad.
6. Sulphur. } Radical.
7. Phosphor. } Radical.
8. Muriatic. } Radical.
9. Fluoric. } Radical.
10. Boracic. } Radical.
11. Rad. of gold.

12. Rad. of platina.
13. —— silver.
14. —— mercury.
15. —— lead.
16. —— copper.
17. —— iron.
18. —— tin.
19. —— zinc.
20. —— bismuth.
21. —— antim.
22. Rad. of nickel.
23. —— cobalt.
24. —— arsenic.
25. —— mangan.
26. —— molybd.
27. —— wolfranc.
28. —— uranium.
29. —— titanium.
30. —— tellurium.
31. —— chrome.

Producible, ostensible, simple Substances.

32. Caloric.
33. Siliceous. } Earth.
34. Calcar. } Earth.
35. Magnesi. } Earth.
36. Ponder. } Earth.
37. Strontian. } Earth.
38. Argillac. } Earth.
39. Glucine. } Earth.
40. Vegetab. } Alk.
41. Mineral. } Alk.

Elements, a term also used for the first grounds and principles of arts and sciences; as the elements of geometry, elements of mathematics, &c. So Euclid's Elements, or simply the Elements, as they were anciently and peculiarly named, denotes the treatise on the chief properties of geometrical figures by that author.

The Elements of Mathematics have been delivered by several authors in their courses, systems, &c. The first work of this kind is that of Herigon, in Latin and French, and published in 1664, in ten tomes; which contains Euclid's Elements and Data, Apollonius, Theodosius, &c.; with the modern elements of arithmetic, algebra, trigonometry, architecture, geography, navigation, optics, spherics, astronomy, music, perspective, &c. The work is remarkable for this, that a kind of real and universal characters are used throughout; so that the demonstrations may be understood by such as only remember the characters, without any dependence on language or words at all.

Since Herigon, the elements of the several parts of mathematics have been also delivered by others; particularly the Jesuit Schottus, in his Cursus Mathematicus, in 1674; De Chales, in his Cursus, 1674; sir Jonas Moore, in his New System of Mathematics, in 1681; Ozanam, in his Cours de Mathematique, in 1699; Jones, in his Synopsis Palmariorum Matheseos, in 1706; and many others, but above all, Christ. Wolfius, or Wolf, in his Elementa Matheseos Universæ, in two vols. 4to. the first published in 1713, and the second in 1715; a very excellent work of the kind. Another edition of the work was published at Geneva, in five vols. 4to. of the several dates 1732, 1733, 1735, 1738, and 1741.

Other good elementary systems of mathematics are those of Bezout, Emerson, Hutton, Dalby, Vince, and Wood, Bossut, and Lacroix.

The Elements of Euclid, as they were the first, so they continue still the best system of geometry, are in fifteen books. There have been numerous editions and commentaries of this work. Proclus wrote a commentary on it. Orontius Fineus first gave a printed edition of the first six books, in 1530, with notes, to explain Euclid's sense. Peletarius did the same in 1557. Nic. Tartaglia, about the same time, made a comment on all the fifteen books, with the addition of many things of his own. And the same was also done by Billingsley in 1570; and by Flussates Candalla, a noble Frenchman, in the year 1578, with considerable additions as to the comparison and inscriptions of solid bodies; which work was afterwards republished with a prolix commentary, by Clavius. Other editions are mentioned under the word Euclid.

To E'lement. *v. a.* (from the noun.) 1. To compound of elements (*Boyle*). 2. To constitute; to make as a first principle (*Donne*).

ELEME'NTAL. *a.* (from *element.*) 1. Produced by some of the four elements (*Dryden*). 2. Arising from first principles (*Brown*).

ELEMENTA'RITY. *s.* (from *elementary.*) The simplicity of nature, or absence of composition; being uncompounded (*Brown*).

ELEME'NTARY. *a.* (from *element.*) 1. Uncompounded; having only one principle or constituent part (*Arbuthnot*). 2. Initial; rude.

ELEMI. (*elemi*; it is said this is its Ethiopian name.) Gum elemi. The parent plant of this resin is supposed to be the amyris elemifera; foliis ternis quinato-pinnatisque subtus tomentosis, of Linnéus. (See Amyris, as also Gardenia, one or two species of which secrete a similar resin.) See also Pistacia. Elemi is brought here from the Spanish West Indies: it is most esteemed when softish, somewhat transparent, of a pale whitish colour, inclining a little to green, and of a strong, though not unpleasant smell. It is only used in ointments and plasters, and is a powerful digestive.

ELENCHUS, in antiquity, a kind of earrings, set with large pearls.

Elenchus, in logic, a sophism.

ELEPHANT, in mastiology. See Elephas.

Elephant (American). See Mammoth.

Elephant's foot, in botany. See Elephantopus.

Elephant (Knights of the), an order of knighthood in Denmark, conferred upon none but persons of the first quality and merit. It is also called the order of St. Mary. Its institution is said to have been owing to a gentleman among the Danish croisees having killed an elephant, in an expedition against the Saracens, in 1184; in memory of which king Canutus instituted this order, the badge of which is a towered elephant, with an image of the Holy Virgin encircled with rays, and hung on a watered sky-coloured ribbon, like the George in England.

Elephant's tusks, in oryctology. See Zoolithus.

Elephant (Beetle). See Scarabœus.

ELEPHANTA, an island on the Malabar coast, in the East Indies, eight miles from the island of Bombay, which had its name from the figure of an elephant, carved out of stone, the natural size and colour of that animal.

ELEPHANTI'ASIS. (*elephantiasis*, ελεφαντιασις, from ελεφας, an elephant: so named from the legs of people affected with this disorder growing scaly, rough, and wonderfully large, like the legs of an elephant.) Elephas. Leprosy of the Arabians. A disease that mostly affects the feet, which appear somewhat like those of the elephant. It is known by the skin being thick, rough, wrinkly, unctuous, and void of hair, and mostly without the sense of feeling. It is said to be contagious. Cullen makes it a genus of disease in the class cachexiæ, and order impetigines.

ELEPHA'NTINE. *a.* (*elephantinus*, Lat.) Pertaining to the elephant.

Elephantine, in Roman antiquity, an appellation given to the books wherein were registered the transactions of the senate and magistrates of Rome, of the emperors or generals of armies, and even of the provincial magistrates; the births and classes of the people, and other things relating to the census. They are supposed to have been so called, as being made of leaves of ivory or elephant's tusks.

ELEPHANTO'PUS. Elephant's foot. Bastard scabius. In botany, a genus of the class syngenesia, order polygamia segregata. Calycle four-flowered; florets tongue-shaped, all hermaphrodite; receptacle naked; down bristly. Six species; one an oriental herbaceous plant; the rest West Indian.

ELEPHAS, Elephant, in zoology, a genus of the class mammalia, order bruta. Foretoothless in both jaws; tusk in the upper jaw elongate; tuskless in the lower; proboscis very long, prehensile; body nakedish. One species only, the largest of quadrupeds; sometimes weighing four thousand five hundred pounds; body cinereous, seldom reddish or white, thinly set with hairs; proboscis flat beneath, tip truncate; eyes small; tusks, which are only in the upper jaw, far extended beyond the mouth, resembling horns, marked with curled fibres, constituting the ivory of the shops, and sometimes weighing an hundred and fifty pounds each; ears large, pendulous, dentate; skin thick, callous, impenetrable by musket balls, and yet sensible of the sting of flies; teats two, near the breast; knees flexible; neck short; hoofs five on each fore-foot, four on each hind-foot.

Some writers have made the sukotyro a second species of the elephant: but incorrectly. He has a distinguishing property that ought to constitute him a distinct genus. See Sukotyro.

The elephant inhabits the torrid zone, in swampy places, and by the sides of rivers; feeds on the leaves and branches of young trees, particularly plantains, eating even the wood; devours grain voraciously; is gregarious, docile, long-lived, and sagacious, though the brain is small; hereby confuting the doctrine of those philosophers who contend that the intellect possessed depends upon the size of the brain compared with the size of the animal; drawing their doctrine from the human form and human brain alone.

The proboscis is long, extensile, contractile; furnished at the end with a hook, serving the purpose of a hand; with which it takes its food and drink; and which being cut off, the animal perishes. He is afraid of mice, lest when he sleeps they should creep into his trachea: urines backwards; copulates like other quadrupeds. The female is gravid a year; the young suck the mother with their lips. Carries houses on its back, its guider sitting upon the neck; moves quickly; swims dexterously; is armed for war by the natives of India; and was formerly armed by the Romans with scythes. The contrivances for taking wild elephants are various: the two most common are decoying them into places of security by means of female elephants properly instructed; and hunting, or rather frightening them forwards from one part of the wood to another, till they reach their place of imprisonment, which is strongly palisadoed all round, with a view of escaping from the noise, and torches employed on such occasions. When once they are caught, they are easily tamed, by observing the submission of other elephants. See Nat. Hist. Plate LXXXVIII.

The Ceylonese elephants are those most highly esteemed in India; and the mode of snaring them is peculiarly entertaining and curious. In Mr. Cordiner's Description of

Ceylon, there is a good account of this extraordinary decoy, and we shall present our readers with it, in as condensed a form as possible. The hunt alluded to took place near the elephant snare at Kotaway, only a few miles distant from Tengalle. The governor and his suite attended on this occasion, and the whole of the party employed was not fewer than three thousand persons. The whole of this multitude surrounded the forests in which elephants are discovered to abound, with a chain of fires placed on moveable stands, so as to be brought closer, according as the elephants are driven nearer to the centre. The distance between the fires may at first have been an hundred paces, which is gradually reduced to about ten paces. The more the elephants are confined, the more vigilant the hunters must become, and prepared to repel their efforts to escape, by advancing the fires, and by loud shouting. At the end of two months, they thus become enclosed in a circle, of which the wide entrance of the snare forms a part, and are at last brought so near to it, that by the exertions of the surrounding multitude, they can be made close prisoners in a few hours. It is now that all those who are desirous of witnessing the capture resort to the scene of action.

An idea of the inclosure may be formed by drawing, on a piece of paper, the outline of a wide funnel. A little way within the wide end, a palisade runs across, in breadth six hundred feet, containing four open gates, at which the elephants enter. A view of two of these is commanded from bungaloe, erected for spectators on pillars thirty feet from the ground. The enclosure is formed of the strongest trees on the island, from eight to ten inches in diameter, bending inwards, sunk four feet into the ground, and from sixteen to twenty feet high above it. They are placed at the distance of sixteen inches from each other, and crossed by four rows of powerful beams, bound fast to them with pliant canes. To this palisade are added supporters more inclined, several feet asunder, augmenting the strength of the fence. The part of it in which the elephants are first enclosed is eighteen hundred feet in circumference: but it communicates with a smaller fold, one hundred feet in length, and forty broad, through which a rivulet passes, five feet in depth, and nearly fills the enclosure. The elephants enter this place of confinement at only one gate; and beyond the water the fence gradually contracts, terminating in a strong passage, five feet broad, and one hundred feet long.

We give likewise, in our author's own words, the striking picture of the entrance of the elephants into the first snare.

"All things being ready for driving the elephants into the snare, the governor and his party repaired to the ground about seven o'clock in the evening, ascended the elevated bungaloe by a long ladder, and waited several dark and tedious hours; but the termination of the chase amply repaid their patience. It was necessary that silence, as well as darkness, should reign amongst us; and, in a situation where our eyes and ears were otherwise so attentively engaged, conversation would have been particularly irksome. The shouting of the hunters was incessant, muskets and rockets joined in the chorus, and the wild roaring of the elephants was heard at intervals, more distinctly warning us of their approach. At length the forest crashed, and the enormous herd pushed forward with fury, levelling instantaneously every tree which opposed their passage. The following up of the people with the lights and fireworks was truly grand. Every man waved in his hand a blazing torch, formed of a bundle of reeds, the feeble but effectual means of defence against a tremendous foe. The trees were nobly illuminated, and, towering aloft amidst the surrounding darkness, spread their glittering foliage in the air."

When the first enclosure is completely stocked, the four gates are closed and secured with strong stakes. Then another chain of fires and torches is formed within the enclosure, and the persecuted animals are driven forward in like manner into the smaller fold.

The line of flame once more began its terrifying movement. The people resumed their tumultuous noise, mingled with the din of trumpets, drums, and arms. The affrighted herd, again annoyed with impending horrors, renewed their tremendous flight; and rushing like an agitated torrent into the water snare, experienced still greater sorrows. As soon as seventy elephants had found their way into this place, it being sufficiently crammed, the cords were cut, and the barricading gate dropped down. The greater part of those which had entered were so closely wedged together, that many of them were motionless; and even the foremost, which were less confined, saw only a fallacious opening to lead them from this doleful labyrinth. Upwards of one hundred of the captured herd, cut off from their companions, were left for a time to range at greater liberty in the larger prison.

All this took place during the night.

"At sunrise, (continues Mr. Cordiner), we became spectators of a most extraordinary sight. So great a number of enormous animals crowded into so small a compass, is a spectacle rarely to be seen. Pressing heavily upon one another, incapable of almost any movement but convulsions of distress, their paroxysms of anguish could not be contemplated without emotion. No person could find language to express his feelings. All were struck dumb with a species of astonishment hitherto unexperienced. The most hazardous part of the business remains, that of seizing on the elephants at the end of the long passage, which is the only outlet from the water snare. They are driven in one by one, making furious efforts to regain their liberty on finding themselves prisoners. When they reach the gate at the end, strong beams are inserted across the passage behind, to prevent them from retreating. Men then approach, and bind their hind legs with great ropes, and five or six turns of smaller cordage are passed round their necks. While these operations are going on, a man stands before the gate of the passage, tickling the elephant's trunk, and diverting his attention. In this manner they are secured, yet accidents frequently happen at this time. On the present occasion, one unfortunate man tumbled into the passage, and was instantly trampled to death under the feet of an enraged elephant. They frequently press against one another in the water snare and the passage with so much violence, that some are squeezed to death, or drop down dead with fatigue."

When the wild elephant is completely harnessed, two tame elephants, trained to the business, are brought to the gate, and placed one on each side of it. These immediately survey the prisoner whom they have to conduct, feel his mouth to know whether or not he has tusks, and lay hold of his proboscis to ascertain what degree of resistance he is likely to make. Ropes are passed through the collar of the wild elephant, and made fast to similar collars on each side of the tame ones. The bars of the gate are then unloosed, and drawn out; and the wild captive darts forward directly between the two tame elephants: he can, however, only advance a little way, as the ropes securing his hind legs still continue fastened to the strong stakes of the toil. In this situation he remains, until the riders mounted on the tame elephants have drawn tight the cords, which bind him to the necks of his half reasoning conductors.

During this operation, he endeavours to undo with his trunk some of the knots which have been made, and often attempts to give a destructive blow to the diminutive creatures so actively engaged in confirming his captivity. But the two tame animals, who are vigilantly observant of all his motions, never fail to prevent him from doing any mischief, by gently lowering his proboscis with their own: if he continue long refractory, they batter him with their heads, and at last produce the most obsequious submission. The nooses of the ropes are then opened, leaving his hind legs at freedom, and himself entirely disengaged from the snare. The two tame elephants press close on each side of him, and proceed, in pompous procession, to the garden of stalls, where they deliver up their charge to experience another species of hardships. The marching off of this venerable trio is a sight truly magnificent, and exhibits a noble specimen of the skill of man, united with the sagacity of the elephant.

In this manner the prisoner is conducted to a grove, where, if he is of an ordinary size, he is sufficiently secured by being placed lengthways between two trees, to one of which his hind legs are bound, and one of his fore legs to the other. A more complicated apparatus of ropes and stakes is necessary for those which are remarkable for strength and fury. The tame conductors then move away to secure another captive. An elephant may frequently be tamed in eight or ten days, though in other instances, months are required. When tamed, they are marched round to Jaffnapatam, there sold by public auction, and thence exported to the opposite continent.

For many other curious particulars relative to the habits, manners, mode of dentition, and natural history of elephants, the reader may consult two memoirs by John Corse, esq. in the lxxxixth vol. of the Philosophical Transactions, or p. 444, 509, vol. xviii. of the New Abridgment of the Transactions, just completed by Drs. Hutton, Shaw, and R. Pearson.

ELEOSELI′NUM. (*eleoselinum*, ελεοσελινον, from ελος, a lake, and σελινον, parsley.) See APIUM.

ELETTARI PRIMUM. See AMOMUM VERUM.

To E′LEVATE. *v. a.* (*elevo*, Latin.) 1. To raise up aloft (*Woodward*). 2. To exalt; to dignify. 3. To raise with great conceptions (*Milton*). 4. To elate with vicious pride (*Milton*). 5. To lessen by detraction: not in use (*Hooker*).

E′LEVATE. *part. a.* Exalted; raised aloft (*Milton*).

ELEVA′TION. *s.* (*elevatio*, Lat.) 1. The act of raising aloft (*Woodward*). 2. Exaltation; dignity (*Locke*). 3. Exaltation of the mind by noble conceptions (*Norris*). 4. Attention to objects above us (*Hooker*). 5. The height of any heavenly body with respect to the horizon (*Brown*).

ELEVATION, in architecture, a draught of the principal face of a building.

ELEVATION OF THE POLE, in astronomy, is the altitude of that pole of the equator which is above the horizon: it is always equal to the latitude of the place of observation: and the complement of this is, the elevation of the equator, i. e. an arch of the meridian, between the equator, and the horizon of the place.

Apparent elevation of objects, whether celestial or terrestrial, is generally different from the real elevation. Celestial objects appear lower than they really are, on account of parallax (where the parallax is sensible); and they appear higher than they are in reality, on account of refraction; and where great accuracy is required, allowances must be made on both these accounts. Terrestrial objects also appear higher on account of refraction; and the increase of elevation occasioned by refraction is such, that the distance at which an object can be seen by refraction, is to the distance at which it could be seen without refraction (at a mean) as 14 to 13. It is well known, likewise, that on the borders of lakes, the banks of broad rivers, and the shore of bays, when the spectator is stationed in a high point of view, the opposite bank, with trees, &c. are seen as it were floating in the air. This phænomenon is commonly ascribed to refraction, but erroneously. The cause alone lies in the rays of light reflected from the vapours below, which, in consequence of this reflection, appear so dazzling to the eye, that they conceal the objects situated below, and present the same appearance as the heavens. Professor De Luc says, the presence of the sun is the principal condition of this phænomenon. In several observations made by this gentleman, he found, that the less dense part of the vapour, which did not reflect rays of the sun, but which always grew denser the lower his station became, acted like a veil, which interposed itself between his eye and the trees which had not yet disappeared; thus making him observe the distance, and causing the elevated trees to appear as if floating behind the row to which they belonged. De Luc's curious dissertation on this subject is given in Phil. Mag. No. 46.

Elevation (Angle of), in gunnery, that comprehended between the horizon and the line of direction of a cannon or mortar; or it is that which the chase of a piece, or the axis of its hollow cylinder, makes with the plane of the horizon.

ELEVA'TOR. *s.* (from *elevate.*) A raiser or lifter up.

Eleva'tor, (*elevator*, from *elevo*, to lift up.) A muscle is so called whose office is to lift up the part to which it is attached. Also a chirurgical instrument with which surgeons raise any depressed portion of bone, but chiefly those of the cranium.

Eleva'tor labii supsrioris proprius. See Levator labii superioris alæque nasi.

Eleva'tor labii inferioris proprius. See Levator labii inferioris.

Eleva'tor labiorum communis. See Levator anguli oris.

ELEVE, a term purely French, though of late used also in our language. Literally it signifies a disciple or scholar bred up under any one, being formed from the Italian *allievo*, an apprentice or novice. It was first used by the French writers in speaking of painters: such a painter was an eleve of Da Vinci, of Raphael, &c. From painting it came to be applied to such as studied or learned any other art under a master; and afterwards to certain members of the Royal Academy of Sciences, since called adjoints.

ELE'VEN. *a.* (ænꝺleꝼen, Saxon.) Ten and one.

ELE'VENTH. *a.* (from *eleven.*) The next in order to the tenth.

Eleventh, a musical interval, consisting of eleven diatonic sounds. It is the octave of the fourth.

ELEUSINIA, a great festival observed every fourth year by many of the Grecian states, but more particularly by the people of Athens, every fifth year, at Eleusis in Attica, where it was introduced by Eumolpus, B. C. 1356. It was the most celebrated of all the religious ceremonies of Greece, whence it is often called by way of eminence, μυστηρια, the mysteries. It was so superstitiously observed, that if any one ever revealed it, it was supposed that he had called divine vengeance upon his head, and it was unsafe to live in the same house with him. Such a wretch was publicly put to an ignominious death. This festival was sacred to Ceres and Proserpine, every thing contained a mystery, and Ceres herself was known only by the name of αχθεια, from the sorrow and grief (αχθος) which she suffered for the loss of her daughter. This mysterious secrecy was solemnly observed, and enjoined to all the votaries of the goddess; and if any one ever appeared at the celebration, either intentionally or through ignorance, without proper introduction, he was immediately punished with death. Persons of both sexes and all ages were initiated at this solemnity, and it was looked upon as so heinous a crime to neglect this sacred part of religion, that it was one of the heaviest accusations which contributed to the condemnation of Socrates. For a more minute and detailed description of all the ceremonies exercised in the celebration of this grand festival, the student is referred to Lempriere's Dictionary, Potter's Antiquities, or De Pauw on the Greeks, vol. ii. p. 147—158.

Some have supposed the principal rites at the Eleusinian festivals to have been obscene and abominable, and that from thence proceeded all the mysterious secrecy. They were carried from Eleusis to Rome in the reign of Adrian, where they were observed with the same ceremonies as before, though perhaps with more freedom and licentiousness. They lasted about 1800 years, and were at last abolished by Theodosius the Great.

ELEUSIS, a town of Attica, equally distant from Megara and the Piræus, celebrated for the festivals of Ceres. See Eleusinia.

Eleusis, now called Lepsina, once a considerable city of Achaia, the modern Livadia, in European Turkey.

ELEUTHERIA, a festival celebrated at Platæa in honour of Jupiter Eleutherius, or the assertor of liberty, by delegates from almost all the cities of Greece. Its institution originated in this: after the victory obtained by the Grecians under Pausanias over Mardonius the Persian general in the country of Platæa, it was agreed upon in a general assembly, that deputies should be sent every fifth year from the different cities of Greece, to celebrate festivals of liberty. Liberated slaves had, likewise, their Eleutheria. And the Samians had a festival of the same name in honour of the god of love.

Eleuthe'ria bark. See Cascarillæ cortex.

Eleuthe'riæ cortex. See Cascarillæ cortex.

ELF, a term now almost obsolete, formerly used to denote a fairy or hobgoblin; an imaginary being, the creature of ignorance, superstition, and craft. See Fairy.

Elf-arrows, in natural history, a name given to the flints anciently fashioned into arrow-heads, and still found fossile in Scotland, America, and several other parts of the world.

To Elf. *v. a.* To entangle hair in so intricate a manner that it is not to be unravelled (*Shakspeare*).

E'LFIN. *a.* (from *elf.*) Relating to fairies; elvish (*Spenser*).

E'LFLOCK. *s.* (*elf* and *lock.*) Knots of hair twisted by elves (*Shakspeare*).

ELGIN, the capital town of the county of Murray, in Scotland. Lat. 57. 37 N. Lon. 3. 15 W.

ELIAS (Matthew), an eminent painter, born at Cassel, in 1658, of poor parentage, and originally employed in attending cattle; but as Corbeen the painter passed the road, he saw the boy drawing a fortification on the ground, which led him to take him under his care and instruction. Elias soon gained the affection and esteem of his master, by evincing superior talents to his fellow-students. At the age of twenty, Corbeen sent him to Paris for further improvements. For some years he continued at Paris, but afterwards he went to Dunkirk, where he painted a grand altar-piece, representing the death of St. Barbe. Some of his portraits are in high estimation, but he failed in the draperies. He died at Dunkirk in 1741.

ELICHRYSUM. In the pharmacopœias. (*Elichrysum*, ηλιοχρυσον, from ελιος, the sun, and χρυσος, gold: so called from their shining yellow appearance.) Stæchas citrina. Goldilocks. This small downy plant is the gnaphalium stæchas of Linnéus. The flowers are warm, pungent, and bitter, and said to possess aperient and corroborant virtues.

Elichry′sum. Xeranthemum, Linn. In botany, a genus of the class syngenesia, order polygamia superflua. Receptacle naked; down simple or feathery; calyx imbricate, radicate; with the ray coloured. Twenty-four species: two herbaceous plants of New Zealand; the rest shrubs, or shrubby plants of the Cape.

To ELI′CITE. *v. a.* (*elicio*, Lat.) To strike out; to fetch out by labour or art (*Hale*).

ELI′CIT. *a.* (*elicitus*, Latin.) Brought into act (*Hammond*).

ELICITA′TION. *s.* (from *elicio*, Latin.) Excitement of the power of the will into act (*Bramhall*).

To ELI′DE. *v. a.* (*elido*, Latin.) To break in pieces; to crush (*Hooker*).

ELIGIBI′LITY. *s.* (from *eligible*.) Worthiness to be chosen (*Fiddes*).

E′LIGIBLE. *a.* (*eligibilis*, Latin.) Fit to be chosen; preferable (*Addison*).

E′LIGIBLENESS. *s.* (from *eligible*.) Worthiness to be chosen; preferableness.

ELIMINA′TION. *s.* (*elimino*, Latin.) The act of banishing; rejection.

Elimination, in algebra, the same as extermination.

ELIQUATION, in chemistry, an operation by which a more fusible substance is separated from one that is less so, by means of a heat sufficiently intense to melt the former, but not the latter. Thus an alloy of copper and lead may be separated by a heat capable of melting the latter, but not the former.

ELIS, a country of Peloponnesus at the west of Arcadia, and north of Messenia. It runs along the coast, and is watered by the river Alpheus. The capital of the country is called Elis. It was originally governed by kings, and received its name from Eleus, one of its monarchs. Elis was famous for the horses it produced, whose celerity was so often known and tried at the Olympic games. (*Virg. Strab.*, &c.).

ELI′SION. *s.* (*elisio*, Latin.) 1. The act of cutting off (*Swift*). 2. Division; separation of parts (*Bacon*).

Elision, in grammar, the cutting off or suppressing a vowel at the end of a word, for the sake of sound or measure, the next word beginning with a vowel. Elisions are pretty frequently met with in English poetry, but more frequently in the Latin, French, &c. They chiefly consist in suppressions of the *a*, *e*, and *i*; though an elision suppresses any of the other vowels.

ELIXATION, in pharmacy, the extracting the virtues of ingredients by boiling or stewing.

ELIXIR. (*elixir*, from *elekser*, an Arabic word signifying quintessence.) A term formerly applied to many preparations similar to compound tinctures. It is now very little employed.

ELIZABETH, queen of England, was the daughter of Henry VIII. by his second wife Anne Boleyn, and was born in 1533. Her mother at her death recommended her to the particular care of Dr. Parker, afterwards archbishop of Canterbury, who instructed her in the principles of true Christianity. At the accession of Mary she was committed to the Tower, and bishop Gardiner laboured earnestly to have her put to death, but Philip of Spain saved her life, with the prospect of marrying her in case his wife should die. She commenced her reign in 1558, and possessed all the accomplishments of person and mind necessary to render her the favourite of a gallant nation. The exiled protestants hastened home at the news of her accession, and all the friends of the reformation were elated with joy at having a princess who was known to be a favourer of that cause. Elizabeth, however, conducted herself with admirable prudence and moderation, not willing to irritate the ancient nobility too much at once. She even affected a desire to be on good terms with pope Paul IV. but that haughty pontiff treated her in so rude a manner, that she had a good pretence for breaking with the papal see entirely. Before she came to the crown, the king of Sweden made her an offer of marriage, which she declined accepting; and afterwards Philip of Spain made her proposals, which she also refused. Her declaration was to have inscribed on her tombstone, "Here lies a queen, who reigned so long, and lived and died a virgin." This aversion of the queen to matrimony has been a curious subject of investigation to historians. The real reason appears to be this, that she was unwilling to have any restraint upon her Amazonian mind. It is certain she was not constitutionally indifferent; for she was fond of being admired, and prided herself much upon her beauty, and the other accomplishments of her sex. We cannot here enter into the historical particulars of her reign; but must refer to our most celebrated histories of England. She reigned nearly 44½ years, and died April 3, 1603, aged 70.

Puttenham in his Art of English Poetry, speaking of his contemporary writers, says, "But, last in recital, and first in degree, is the queen, whose learned, delicate, and noble muse, easily surmounteth all the rest, for sense, sweetness, or subtility, be it in ode, elegy, epigram, or any kind of poem." Many specimens of her extemporaneous effusions in Latin and English poetry are preserved: we must content ourselves with mentioning one. Sir Walter Raleigh having written on a window,—

> " Fain would I climb, yet fear I to fall ;"

She immediately wrote underneath it,—

> " If thy heart fail thee, climb not at all."

Doubtless Elizabeth was a woman of singular capacity and extraordinary acquirements ; and if we could forget the story of the Scottish Mary, and of the unfortunate Essex, together with the burning of some baptists for the crime of worshipping God according to the dictates of their own conscience ; could we, in short, forbear to contemplate her character through the medium of morality and religion, we should class her amongst the most illustrious of illustrious women.

The character of this princess is thus given by Smollett : " Elizabeth in her person was masculine, tall, straight, and strong limbed, with an high round forehead, brown eyes, fair complexion, fine white teeth, and yellow hair ; she danced with great agility ; her voice was strong and shrill ; she understood music, and played upon several instruments. She possessed an excellent memory, and understood the dead and living languages, and made good proficiency in the sciences, and was well read in history. Her conversation was sprightly and agreeable, her judgment solid, her apprehension acute, her application indefatigable, and her courage invincible. She was the great bulwark of the protestant religion ; she was highly commendable for her general regard to the impartial administration of justice ; and even for her rigid economy, which saved the public money, and evinced that love for her people which she so warmly professed. Yet she deviated from justice in some instances when her interest and passions were concerned ; and notwithstanding all her great qualities, we cannot deny she was vain, proud, imperious, and in some cases cruel : her predominant passions were jealousy and avarice ; though she was also subject to such violent gusts of anger as overwhelmed all regard to the dignity of her station, and even hurried her beyond the common bounds of decency. She was wise and steady in her principles of government, and above all princes fortunate in a ministry."

ELIZABETH'S ISLANDS, several islands on the coast of Massachuset's Bay, in N. America. Lat. 42. 0 N. Lon. 69. 3 W.

ELK, in mastiology. See SERVUS.

ELL, ULNA, a measure of length, different in different countries : but those mostly used in England are the English and Flemish ells ; the former of which is three feet nine inches, or one yard and a quarter, and the latter only twenty-seven inches, or three quarters of a yard. In Scotland, the ell contains 37 2-10th English inches.

ELLEBORUM. See HELLEBORUS ALBUS.

ELLESMERE, a town of Shropshire, with a market on Tuesdays. Lat. 52. 53 N. Lon. 2. 52 W. Here are 5553 inhabitants.

ELLIPSE, or ELLIPSIS, is one of the conic sections, properly called an oval ; being called an ellipse or ellipsis by Apollonius, the first and principal author on the conic sections, because in this figure the squares of the ordinates are *less* than, or *defective* of, the rectangles, under the parameters and abscisses.

This figure is differently defined, either from some of its properties, from mechanical construction (see DIRECTRIX), or from the section of a cone. We here prefer the latter, and therefore say, an ellipse is a plane figure made by cutting a cone by a plane passing obliquely through the opposite sides of it.

There are various methods of describing an ellipse, which are deduced from its different properties ; we give the following, as one of the best :

If any two points, as A and B, be taken in any plane, and in them are fixed the extremities of a thread, whose length is greater than the distance between the points, and the thread extended by means of a small pin C, and if the pin be moved round from any point until it return to the place from whence it began to move, the thread being extended during the whole time of the revolution, the figure which the small pin by this revolution describes is an ellipse.

See also ELLIPTIC COMPASSES.

Most useful properties of the ellipse. 1. The rectangles under the abscisses are proportional to the squares of their ordinates : Or, again, as any diameter is to its parameter, so is the said rectangle under two abscisses of that diameter to the square of the ordinate.

2. The sum of two lines drawn from the foci to meet in any point of the curve, is always equal to the transverse axis ; consequently the line drawn from the focus to the end of the conjugate axis, is equal to the semi-transverse.

3. If from any point of the curve there be an ordinate to either axis, and also a tangent meeting the axis produced ; then half that axis will be a mean proportional between the distances from the centre to the two points of intersection. And consequently all the tangents meet in the same point of the axis produced, which are drawn from the extremities of the common ordinates of all ellipses described on the same axis.

4. Two lines drawn from the foci to any point of the curve, make equal angles with the tangent at that point.

5. All the parallelograms are equal to each other, that are circumscribed about an ellipsis ; and every such parallelogram is equal to the rectangle of the two axes.

6. The sum of the squares of every pair of conjugate diameters, is equal to the same con-

stant quantity, viz. the sum of the squares of the two axes.

7. If a circle be described upon either axis, and from any point in that axis an ordinate be drawn both of the circle and ellipsis; then shall the ordinate of the circle be to the ordinate of the ellipse, as that axis is to the other axis.

And in the same proportion is the area of the circle to the area of the ellipse, or any corresponding segments. Also the area of the ellipse is a mean proportional between the areas of the inscribed and circumscribed circles.

For other properties, with their demonstrations, we refer to the best treatises on conics, particularly Hamilton's, Hutton's, Simpson's, and Robertson's, and to our article CONICS.

Some ingenious authors have readily investigated the properties of the ellipse, by considering it as the oblique section of a cylinder. See De L'Hospital's Con. lib. 6. Maclaurin's Fluxions, vol. ii. p. 514, &c.

ELLIPSIS, in grammar, a figure of syntax, in which one or more words are not expressed: a deficiency from which it has derived the name of ellipsis.

ELLIPSOGRAPH, an instrument with which ellipses are described: elliptic compasses.

ELLIPSOID, a solid generated by the revolution of an ellipse about either axis. See SPHEROID.

ELLI'PTICAL. ELLI'PTIC. *a.* (from *ellipsis.*) Having the form of an ellipsis; oval (*Cheyne*).

ELLIPTIC LEAF. In botany. Folium ellipticum. Lanceolate, but with the breadth of an ovate leaf. Lanceolatum latitudini ovati folii. Delin. Pl.—In Philos. Bot. it is made synonymous with oval. Both the elliptic and oval leaf are in the form of an ellipse; and the former differs from the latter only in being more oblong; and yet broader than the lanceolate leaf.

ELLIPTIC COMPASSES. See COMPASSES.

ELLIPTICITY, of the terrestrial spheroid, is the difference between the major and the minor semiaxes; it is generally expressed in terms of the former, that is, of the radius of the equator. The quantity of the ellipticity has been variously assigned by different mathematicians: Sir Isaac Newton, supposing the earth of uniform density, gave $\frac{1}{230}$ for the ellipticity: Boscovich, from a mean of several admeasurements, stated it at $\frac{1}{248}$: La Lande, $\frac{1}{331}$: La Place, $\frac{1}{321}$: Sejour, $\frac{1}{307}$: Carouge, $\frac{1}{300}$: Krafft, $\frac{1}{297}$: and Playfair, from a theorem of Clairault applied to the heterogeneous spheroid, states it at $\frac{1}{304}$. Setting aside those which are deduced from the hypothesis of uniform density, $\frac{1}{310}$ may be admitted as the most probable value of the ellipticity. See EARTH.

ELLIPTOIDES, an infinite ellipsis, i. e. an ellipsis defined by the equation $ay^{m+n} = bx^m \times a - x^n$, wherein $m > 1$ or $n > 1$.

Of this there are several kinds or degrees; as the cubical elliptoid, wherein $ay^3 = bx^2 \times a - x$. A biquadratic or surdesolidal elliptoid, or that of the third order, wherein $ay^4 = bx^2 \times a - x^2$.

ELLISIA. In botany, a genus of the class pentandria, order monogynia. Corol funnelform, narrow; berry dry, two-celled, two-valved; seeds two, dotted, one upon the other. One species only; an annual plant of Virginia with a white flower.

ELM-TREE. See ULMUS.

Cit. Boucher, in a memoir read before la Société d'Emulation at Abbeville, has given some observations on elm-trees. These trees are frequently attacked by ulcers, from which, at length, a great number of them perish. Du Hamel had already endeavoured to find out the cause of this disease, and ascribed it to a plethora of the sap, an opinion which Cit. Boucher has confirmed by numerous experiments. He proposed at the same time a remedy, which he successfully applied to it. He observed that the local ulcer never attacked the trees on the north side, but always on the south side. It acts principally on trees planted in a boggy soil, and along the sides of rivers. Its seat is generally not far from the ground. This ulcer, owing to superabundant sap, differs from a similar one, described in Journal d'Histoire Naturelle, No. 5, 1789, as in this the liquor exposed to the air soon takes the consistency of a gum, and has the flavour of sugar. The remedy consists in boring every tree attacked by the disease at the ulcer itself; and in applying a tube in the hole, occasioned by the borer, penetrating about nine lines in depth. The sound trees, which are also bored, afford no liquor, whereas those that are ulcerated yield it in great abundance, increasing particularly in fine weather, and when the wound is exposed to the south. Stormy weather and great winds stop the infusion. In this manner, he remarks that the ulcers dry and heal in 48 hours. It is probable, that such a terebration, tried on other vegetables, and particularly on fruit trees, will produce the same effects. Pliny, Columella, and Palladius, have already mentioned this expedient being employed by the ancients, which, however, has not been practised for many years. Cit. Boucher concludes by remarking, that this tree is a native of Europe, and has not been lately introduced into France, as is commonly supposed; but the writings of the ancients prove that it existed there long ago. The chemical analysis which he made of the sap shewed that it contained a considerable quantity of acetite of potash, a little acetite of lime, a certain quantity of vegetable or muco-saccharine matter, and a considerable proportion of muriate of lime; slight traces of sulphate and muriate of potash were likewise perceived.

ELMACINUS (George) an Egyptian author of the 13th century. He wrote a history of the Saracens, from Mohammed to A.D. 1118. Though he was a Christian, he was honourably employed by the Mohammedan princes. On this account he speaks in such high terms of the Mussulmans, and even of Mohammed himself, as to have made some persons believe him not to have been a Christian. His history was translated from the Arabic into Latin by Erpenius, and printed in both languages at Leyden in 1625, folio.

ELMINTHES. (ελμινθες, from ειλεω, to involve.) Worms. See Helminthes, and Helminthics.

ELOCU'TION. *s.* (*elocutio*, Latin.) 1. The power of fluent speech (*Wotton*). 2. Power of speaking; speech (*Milton*). 3. The power of expression or diction; eloquence; beauty of words (*Dryden*).

Elocution, is defined by Tully, the choosing and adapting of words, and sentences, to the things, or sentiments, to be expressed. To the elocution then properly belongs the *delectus verborum*, or choice of words. That which treats of the several properties and ornaments of language in common is called general elocution, consisting of elegance, composition, and dignity; and particular elocution considers them as they are made use of to form different sorts of style.

Elegance consists in two things, purity and perspicuity: and both these, as well with respect to single words, as their construction in sentences. These properties in language give it the name of elegant, for a like reason that we call other things so which are clean and neat in their kind. But in the common use of our tongue, we are apt to confound elegance with eloquence; and say, a discourse is elegant, when we mean by the expression, that it has all the properties of fine language.

Composition, in the sense it is here used, gives rules for the structure of sentences, with the several members, words and syllables, of which they consist, in such a manner as may best contribute to the force, beauty, and evidence of the whole.

Dignity consists in the right use of tropes and figures. It is not sufficient for an orator to express himself with propriety and clearness, or in smooth and harmonious periods; but his language must likewise be suited to the nature and importance of the subject. And therefore, as elegance gives rules for the first of these, and composition for the second; so does dignity for the last of them. It is very evident, that different subjects require a different style and manner of expression; since, as Quintilian says, "What is magnificent in one discourse would be turgid in another; and those expressions which appear low upon a sublime subject, would suit lesser matters: and as in a florid harangue a mean word is remarkable, and like a blemish; so any thing lofty and bright upon a trivial argument is disproportionate, and like a tumour upon an even surface." Now this variety in the manner of expression arises in a great measure from tropes and figures, which not only enliven and beautify a discourse, but give it likewise force and grandeur; for which reason this part of elocution seems to have been called dignity.

Elocution is sometimes used more restrictedly to denote the just and graceful management of the voice, countenance, and gesture, in speaking; and in this sense it is the same with that which, in common language, is called a good delivery.

ELOGY. (*eloge*, French.) A praise or panegyric bestowed on any person or thing, in consideration of its merit. The beauty of elogy consists in an expressive brevity. Elogiums should not have so much as one epithet properly so called, nor two words synonymous. They should strictly adhere to truth; for extravagant and improbable elogies rather lessen the character of the person or thing they would extol.

ELOHI, Eloi, or Elohim, in scripture, one of the names of God. But it is to be observed, that angels, princes, great men, judges, and even false gods, are sometimes called by this name. The sequel of the discourse is what assists us in judging rightly concerning the true meaning of this word. It is the same as Eloha. One is the singular, the other the plural. Nevertheless, Elohim is often construed in the singular number, particularly when the true God is spoken of; but when false gods are spoken of, it is construed rather in the plural.

To E'LOIGNE. *v. a.* (*eloigner*, French.) To put at a distance: not in use (*Donne*).

To ELO'NGATE. *v. a.* (from *longus*, Latin.) 1. To lengthen; to draw out. 2. To put further off (*Brown*).

To Elo'ngate. *v. n.* To go off to a distance from any thing (*Brown*).

ELONGA'TION. *s.* (from *elongate.*) 1. The act of stretching or lengthening itself (*Arbuthnot*). 2. The state of being stretched. 3. (In medicine.) An imperfect luxation (*Qu.*). 4. Distance; space at which one thing is distant from another (*Glanville*). 5. Departure; removal (*Brown*).

Elongation, in astronomy, the distance of a planet from the sun, with respect to the earth; or the angle formed by two lines drawn from the earth, the one to the sun, and the other to the planet; or the arc measuring that angle: Or it is the difference between the sun's place and the geocentric place of the planet.

The *greatest elongation*, is the greatest distance to which the planets recede from the sun, on either side. This is chiefly considered in the inferior planets, Venus and Mercury; the greatest elongation of Venus being about 47½ degrees, and of Mercury only about 27½ degrees; which is the reason that this planet is so rarely seen, being usually lost in the light of the sun.

To ELO'PE. *v. a.* (*loopen*, to run, Dutch.) To run away; to break loose; to escape (*Addison*).

ELO'PEMENT. *s.* (from *elope.*) Departure from just restraint (*Ayliffe*).

ELO'PHORUS. In zoology, a tribe of coleopterous insects of the genus nitidula, thus called in the Fabrician entomology. See Nitidula.

ELOPS. Scar-fish. In zoology, a genus of the class pisces, order abdominalia. Head smooth; edges of the jaws and palate rough with teeth; gill-membrane thirty-rayed, and armed on the outside in the middle with five teeth. One species only; tail armed above and beneath. Inhabits Carolina; body long; and only differs from the salmon in wanting the fleshy back-fin.

E'LOQUENCE. *s.* (*eloquentia*, Latin.) 1. The power of speaking with fluency and elegance; oratory (*Shakspeare*). 2. Elegant language uttered with fluency (*Pope*).

If eloquence and rhetoric be distinguished, the latter may be considered as proposing and explaining the theory, and the former as the practice of the art; but they are generally used indiscriminately for each other.

Demosthenes and Cicero are the two patterns of ancient eloquence; the one among the Greeks, the other among the Romans. Their manner, however, was exceedingly different; the first being close, strong, nervous, concise, and severe, so that a word could not be spared; the latter copious, florid, and rich, so that a word could not be added.

It was objected to Cicero, that his eloquence was Asiatic, that is, redundant, or stuffed with superfluous words and thoughts.

True eloquence depends principally on the vivacity of the imagination. In strictness, it is not that which gives grace and ornament, but life and motion, to discourse.

The authors of the Art of Thinking remark, that the rules of eloquence are observed in the conversation of people naturally eloquent, though they never think of them while they practise them. They practise those rules because they are eloquent; not in order to be eloquent.

Eloquence, according to the modern ideas of it, appears to be the medium between the impetuosity which oratory admits, and which was highly characteristic of ancient oratory, and the studied artifice of the professed rhetoricians. The term is sometimes applied to composition, sometimes to delivery. When applied to both, it comprehends a certain degree of elegance, both in diction and manner. The want of that energy which approaches to violence is compensated by pertinency of language, fluency of utterance, and guarded chastity of address. In a word, its excellency consists in a pleasing adaptation of language to the subject, and of manner to both. It refuses too close an imitation of the turbid emotions, but it delights in animated description. It seems rather partial to the pathetic. The elegance and graces which it loves, harmonizing most easily and successfully with the softest and finest feelings of our natures.

The power of oratorial eloquence is almost irresistible. It penetrates into the inmost recesses of the soul. It is able to excite or to calm the passions of men at will; to drive the multitude forwards to acts of madness, or to say to the contending passions, "Peace, be still." It changes the whole current of our ideas, concerning the nature and importance of objects; and of our obligations and advantages respecting them: it rouses from pernicious indolence, and renders the sentiments and dispositions already formed most influential. In a word, it has made of the human species both monsters and angels, excited men to deeds of horror, and to the most noble and generous exertions. Since its powers are so varied, fascinating, and extensive, and sometimes so prejudicial, some men have argued for its extinction, or, at least, for its being discountenanced: but we recollect no arguments which they have brought forward, which might not with equal propriety be urged against the use of speech, or against many other of our blessings and advantages: for what blessings have we which may not, in consequence of the freedom and depravity of the human will, be abused? If the beauty, the delicacy and grace of the female form, are sometimes the means of engendering impure desires in the bosoms of men, shall we, therefore, wish for the extermination of women, and argue for the banishment of "God's last and best workmanship" from the face of creation?

ELPHIN, a town of Ireland, in the county of Roscommon, and the see of a bishop. Lat. 53. 46 N. Lon. 8. 30 W.

ELSE. *pronoun*, (elleꞅ, Saxon.) Other; one beside (*Denham*).

Else. *ad.* 1. Otherwise (*Tillotson*). 2. Beside; except that mentioned (*Dryden*).

E'LSEWHERE. *ad.* (*else* and *where*.) 1. In any other place (*Abbot*). 2. In other places; in some other place (*Tillotson*.)

ELSHEIMAR (Adam), an eminent painter, born at Frankfort upon the Maine, in 1574. He became excellent in painting landscapes, histories, and night-pieces, but his productions are scarce and valuable. He died in 1610.

ELSHOLTZIA. In botany, a genus of the class didynamia, order gymnospermia. Calyx tubular, five-toothed; corol two-lipped, the upper lip four-toothed; lower lip longer than the upper, undivided, slightly crenulate; stamens distant. Two species: one a native of Siberia, the other of the East Indies.

ELSINORE, a town of Zealand, in Denmark, seated at the entrance of the Baltic sea, where all ships that pass through the Sound pay a toll to the king of Denmark. It is 20 miles N.E. of Copenhagen. Lat. 55. 59 N. Lon. 12. 50 E.

ELTHAM, a town of Kent, having a market on Mondays. It is 8 miles E.S.E. of London, and 3 S. of Woolwich.

ELVAS, an episcopal town of Alentejo, in Portugal, defended by a strong castle. Lat. 38. 43 N. Lon. 7. 5 W.

To ELU'CIDATE. *v. a.* (*elucido*, Latin.) To explain; to clear; to make plain (*Boyle*).

ELUCIDA'TION. *s.* (from *elucidate.*) Explanation; exposition (*Boyle*).

ELUCIDA'TOR. *s.* (from *elucidate.*) Explainer; expositor; commentator (*Abbot*).

To ELU'DE. *v. a.* (*eludo*, Latin.) 1. To escape by stratagem; to avoid by artifice (*Rogers*). 2. To mock by an unexpected escape (*Pope*).

ELU′DIBLE. *a.* (from *elude.*) Possible to be defeated (*Swift*).

ELUL, in ancient chronology, the 12th month of the Jewish civil year, and the 6th of the ecclesiastical: it consisted of only 29 days, and answered to part of our August and September.

ELVELA, a genus of plants belonging to the cryptogamia class, and order of fungi. The fungus is turbinated, or like an inverted cone.

ELVELO′CK. *s.* Knot in the hair (*Brown*).

ELVES. The plural of *elf* (*Pope*).

E′LVISH. *a.* (from *elves.*) Relating to elves, or wandering spirits (*Drayton*).

ELU′MBATED. *a.* (*elumbis*, Latin.) Weakened in the loins.

ELU′SION. *s.* (*elusio*, Latin.) An escape from examination; an artifice (*Woodward*).

ELU′SIVE. *a.* (from *elude.*) Practising elusion; using arts to escape (*Pope*).

ELU′SORY. *a.* (from *elude.*) Tending to deceive; fraudulent (*Brown*).

To ELU′TE. *v. a.* (*eluo*, Latin.) To wash off (*Arbuthnot*).

To ELU′TRIATE. *v. a.* (*elutrio*, Latin.) To decant, or strain out (*Arbuthnot*).

ELUTRIATION. (*verwastchen*, German.) In chemistry, the ablution, or washing a compound substance with water so that the different parts of which it consists may be separated from each other, as consisting of different gravities. For this purpose the mixture is stirred up briskly with water, and when the heavier particles have again fallen to the bottom, the turbid water, containing the lighter ones still suspended, is poured off into another vessel. By this simple method a person accustomed to the business will separate three or four substances from each other with surprising exactness and expedition.

ELWANGEN, a town of Suabia, in Germany, 25 miles S. W. Anspach. Lat. 49. 2 N. Lon. 10. 28 E.

ELY, a town of Cambridgeshire, with a bishop's see, and a market on Saturday. It is seated on the river Ouse (which is navigable hence to Lynn) in the fenny and unwholesome tract called the Isle of Ely. The assizes are held here once a year only. It is a county of itself, including the territory around it, and has a distinct civil and criminal jurisdiction, of which the bishop is the head, in the same manner as the bishop of Durham is of that county. It has a very fine cathedral, but is otherwise a mean place. Lat. 52. 24 N. Lon. 0. 9. E. This see has given two saints and two cardinals to the church of Rome; and to the English nation, 9 lord chancellors, 7 lord treasurers, 1 lord privy seal, 1 chancellor of the exchequer, the chancellor to the university of Oxford, 2 masters of rolls, and 3 almoners.

Ely (Isle of), a fenny district in Cambridgeshire. See CAMBRIDGESHIRE.

ELYMAIS, the capital city of the land of Elam, or the ancient Persia. It was situated upon the Eulæus.

ELYMUS. Lime-grass. In botany, a genus of the class triandria, order digynia. Calyx lateral, two-valved, aggregate, many flowered. Twelve species; scattered over the globe, of which three are common to the woods or sandy shores of our own country. See botany, Pl. LXXXIX.

One of the most valuable of the lime-grasses is e. arenarius, upright sea lime-grass, with close erect spike; lanceolate calyx the length of the spikelets; leaves with a spinous point. This grass is truly useful as binding the loose sand together on sea-coasts by means of its long creeping roots. It is frequently found on our own shores.

ELY′SIAN. *a.* (*elysius*, Lat.) Deliciously; soothing; exceedingly delightful (*Milton*).

ELYSIUM, and Elysii campi, in the ancient mythology, a place or island in the infernal regions, where, according to the mythology of the ancients, the souls of the virtuous were placed after death. There happiness is complete, the pleasures are innocent and refined. Bowers for ever green, delightful meadows with pleasant streams, are the most striking objects. The air is wholesome, serene, and temperate; the birds continually warble in the groves, and the inhabitants are blessed with another sun and other stars. The Elysian fields were, according to some, in the fortunate islands on the coast of Africa. Others place them in the island of Leuce; and, according to the authority of Virgil, they were situate in Italy. According to Lucian, they were near the moon; or in the centre of the earth, if we believe Plutarch. (*Virg. Homer*, &c.)

ELYTROCELE. (*elytrocele*, ελυτροκηλη; from ελυτρον; the vagina, and κηλη, a tumour. A hernia in the vagina.

ELYTROID. (*elytroides*, ελυτροειδης, from ελεῦτρον, a sheath, and ειδος, form.) The tunica vaginalis is so called by some writers, because it includes the testis like a sheath.

ELZEVIRS, famous printers at Amsterdam and Leyden. There were five of this name, Lewis, Bonaventure, Abraham, Lewis, and Daniel. Lewis began to be known at Leyden in 1595, and was the first who made the distinction between the v consonant and the u vowel. Daniel died in 1680. He published a good catalogue of books printed by his family; it was printed at Amsterdam in 7 vols. 12mo. 1674. Their Virgil, Terence, and Greek Testament, have been reckoned their master-pieces.

'EM. A contraction of *them* (*Hudibras*).

To EMA′CIATE. *v. a.* (*emacio*, Lat.) To waste; to deprive of flesh (*Graunt*).

To Ema′ciate. *v. n.* To lose flesh; to pine; to grow lean (*Brown*).

EMACIA′TION. *s.* (*emaciatus*, Latin.) 1. The act of making lean. 2. The state of one grown lean (*Graunt*).

Emacia′tion. (from *emacio*, to make lean.) Decay; innutrition; atrophy; consumption.

EMACULA′TION. *s.* (*emaculo*, Latin.) The act of freeing any thing from spots or foulness.

E′MANANT. *a.* (*emanans*, Latin.) Issuing from something else (*Hale*).

To E'MANATE. *v. n.* (*emano*, Latin.) To issue or flow from something else.

EMANA'TION. *s.* (*emanatio*, Latin; from *e* out of, and *manare*, to flow or stream.) 1. The act of issuing or proceeding from any other substance (*South*). 2. That which issues from another substance; an efflux; effluvium (*Taylor*).

EMA'NATIVE. *a.* (from *emano*, Latin.) Issuing from another.

To EMA'NCIPATE. *v. a.* To set free from servitude.

EMANCIPATION, in the Roman law, was the act of setting a son free from the power and subjection of his father. The word is formed from the Latin *ex*, of, and *mancipium*, a slave. Emancipation differs from manumission; as the latter was the act of a master in favour of a slave, the former that of a father in favour of his son.

EMANCIPATION is now used, conformably to its etymology, for the act of setting free in general, or deliverance from slavery.

EMARGINATE. (*emarginatum.*) In botany. Notched at the end. End-nicked. Applied to the leaf: to the corol in agrostemma coronaria, &c.: and to the stigma: in the class didynamia.

To EMA'RGINATE. *v. a.* (*margo*, Lat.) To take away the margin or edge of any thing.

To EMA'SCULATE. *v. a.* (*emasculo*, Lat.) 1. To castrate; to deprive of virility (*Graunt*). 2. To effeminate; to vitiate by unmanly softness (*Collier*).

EMASCULA'TION, *s.* (from *emasculate.*) 1. Castration. 2. Effeminacy; womanish qualities.

To EMBA'LE. *v. a.* (*emballer*, French.) 1. To make up into a bundle. 2. To bind up; to enclose (*Spenser*).

To EMBA'LM. *v. a.* (*embaumer*, French.) To impregnate a body with aromaticks, that it may resist putrefaction (*Donne*).

EMBA'LMER. *s.* (from *embalm.*) One that practises the art of embalming (*Bacon*).

EMBALMING (Art of). The object of this art is, by means of antiseptics, and a peculiar mode of preparation, to prevent the putrefaction of an animal body, so that it may be preserved for a long period of time. Under some form or other this art has been practised from the earliest ages of the world, but chiefly in oriental countries. The honour of its invention has been uniformly ascribed to the Egyptians; and the short account communicated to us, in the Mosaic writings, of the embalming the body of the patriarch Jacob, sufficiently confirms the common opinion.

According to Diodorus Siculus, the ancient Egyptians were accustomed equally to embalm human bodies and the bodies of those animals their superstitions had rendered holy, thus preserving them from spontaneous decomposition, under the name of *mummies*, which is an Arabic, and was probably an Egyptian term. From this writer, as well as from Herodotus, we learn that the Egyptians had several methods of embalming the human body, three of which have descended to us; and to this difference in the process, Leonhardi attributes the different opinions physicians and chemists have had of this ancient operation. 1. A hole was made through the nostrils into the cranium, the brain extracted, and the brain was filled with the embalming substance. The thorax and abdomen were then deprived of their viscera, except the heart and kidneys; they were washed with Phœnician wine, and filled with sweet scented resins and aromatics; the opened parts having been afterwards sewed up, the body was well washed and cleansed, and placed in natron, which is supposed to have been the mineral alkali united with common salt, and found native in Egypt. In this alkali it remained about 30 days; it was taken out and washed a second time, besmeared over with a gum or resin, carefully enveloped with cotton bandages, and placed in a coffin. This method was very expensive, but is the only one that merits the name of embalming.

2. A cheaper way of preserving the body was to introduce various resins, particularly that from the cedar, by the anus, without opening either the belly or thorax; the body was then dried in natron, and afterwards the resin with the corroded intestines were taken away.

3. The cheapest method consisted merely in washing the body, and its exposure to the action of natron, which we are informed destroyed the flesh and only left the skin and bones.

With respect to the embalming substance employed on these occasions there are various opinions. Some, as Rouelle and Vandermonde, look upon it to have been asphaltum mixed with the oil of the cedar seed; whilst Hardley thinks, with the ancients, it was the resin of this tree, or some other vegetable resin. Belloni and Blumenbach are of opinion that asphaltum was used in common operations as being the cheapest, and that, on particular occasions, the odoriferous vegetable resins were chosen; and the latter chemist, on the examination of ten different mummies, found no asphaltum, but very evident traces of vegetable resins. It is, however, certain that the substances for this purpose were not always of the same kind.

The art of embalming the human body has likewise been attempted by some of the moderns, but the mere action of saline bodies, and filling the cavities of the body with aromatic herbs, were found not to be sufficient to preserve it from putrefaction. The best and perhaps the only method worth attention is that pointed out by Dr. Hunter. As soon as the corps is become cold and stiff, and before any symptoms of putrefaction appear, it is to be well washed with warm water; one of the large arteries is then to be laid open, and the following injection to be forcibly made to enter the smallest vessels, even those of the cellular membrane. Two parts of the oil of chamomile are to be mixed with eight parts of oil of lavender, and sixteen of oil of rosemary; likewise the oil of turpentine may be either used alone or mixed with a little of the oils of rosemary and lavender; or, to give it a colour, a little cinnabar may be united with the oil of turpentine. The different viscera are in a short time after to be extracted, the intestines to be carefully cleansed of their contents, and the rest of the viscera to be deprived of their moisture by wiping them repeatedly with dry towels; the body is likewise internally to be cleansed of its blood and injected oils, by squeezing the vessels; the arteries are then to be injected as well as the other large vessels that have been cut, with a mixture composed of six pounds of oil of turpentine, five ounces of turpentine, eleven ounces of cinnabar, two ounces of camphor, and three pounds of strong spirit of wine; with this likewise the fleshy parts that have been well deprived of any moisture are to be carefully anointed, the vessels of the intestines to be injected, and then to be replaced in their former situation, scattering a sufficient quantity of a powder about them, composed of ten pounds of yellow resin or pitch, six pounds of saltpetre, and five ounces of pulverized camphor, so that every vacancy may be perfectly replete with it. Afterwards, when a little of the injecting liquor above mentioned has been poured into the thorax and belly, the skin is to be closed, the mouth, pharynx, and larynx syringed and filled with the powder, together with the cavities of the ears, nose, anus, parts of generation, eyes and eye-lids, and the whole body, after having been previously washed and rubbed dry, is to be well rubbed with alcohol and camphor, and finally with the oils of rosemary and lavender. The body being thus embalmed, in order to deprive it of any remaining moisture, it is to be laid in a coffin upon some calcined and finely pulverized gypsum, so as to be on all sides about half covered with it; pieces of camphor are to be strewed about, and a range of open bottles filled with volatile oils; the coffin is then to be well closed, having a lid with a glass in it. In about four years the gypsum should be renewed, and when the body is perfectly dry, it may be dispensed with altogether.

To EMBA'R. *v. a.* (from *bar.*) 1. To shut; to enclose (*Fairfax*). 2. To stop; to hinder by prohibition (*Donne*).

EMBARCADERO, in commerce, a Spanish term, signifying a place which serves some other considerable place farther within land for a port: thus Calao is the embarcadero of Lima.

EMBARCA'TION. *s.* (from *embark.*) 1. The act of putting on shipboard (*Clarendon*). 2. The act of going on shipboard.

EMBARGO, in commerce, an arrest on ships or merchandise, by public authority; or a prohibition of state commonly on foreign ships, in time of war, to prevent their going out of port, sometimes to prevent their coming in, and sometimes both for a limited time.

To EMBA'RK. *v. a.* (*embarquer*, French.) 1. To put on shipboard (*Clarendon*). 2. To engage another in any affair.

To EMBA'RK. *v. n.* 1. To go on shipboard (*Philips*). 2. To engage in any affair.

To EMBA'RRASS. *v. a.* (*embarrasser*, French.) To perplex; to distress; to entangle (*Spectator*).

EMBA'RRASSMENT. *s.* (from *embarrass.*) Perplexity; entanglement (*Watts*).

To EMBA'SE. *v. a.* (from *base.*) 1. To vitiate; to depauperate; to lower; to deprave; to impair (*Wotton*). 2. To degrade; to vilify (*Spenser*).

EMBA'SSADOR. *s.* (*embaxador*, Spanish.) One sent on a public message. See AMBASSADOR.

EMBASSADRESS. See AMBASSADRESS.

E'MBASSAGE. E'MBASSY. *s.* 1. A public message (*Dryden*). 2. Any solemn message (*Taylor*). 3. An errand, in an ironical sense (*Sidney*).

To EMBA'TTLE. *v. a.* (from *battle.*) To range in order or array of battle (*Prior*).

To EMBA'Y. *v. a.* (from *baigner*, French.) 1. To bathe; to wet; to wash (*Spenser*). 2. (from *bay.*) To enclose in a bay; to landlock (*Shakspeare*).

EMBDEN, a strong town of Westphalia, capital of E. Friesland, with a good harbour. It is divided into three parts, the Old Town, the Faldren, and the two Suburbs. Lat. 53. 26 N. Lon. 7. 25 E. This is the ancient Amisia.

To EMBE'LLISH. *v. a.* (*embellir*, French.) To adorn; to beautify (*Locke*).

EMBE'LLISHMENT. *s.* (from *embellish.*) Ornament; adventitious beauty; decoration; adscititious grace (*Addison*).

E'MBERING. *s.* The ember days (*Tusser*).

E'MBERS. *s.* without a singular (æmyꞃia, Saxon.) Hot cinders; ashes not yet extinguished (*Bacon*).

EMBER WEEKS, OR DAYS, in the established churches, certain seasons originally set apart, for imploring God's blessing, by prayer and fasting, upon the ordinations performed at such times. These ordination fasts are observed four times in the year; namely, the Wednesday, Friday, and Saturday, after Quadragesima Sunday, after Whitsunday, after Holy-rood day in September, and after St. Lucia's day in December: which four times answer well enough to the four quarters of the year, spring, summer, autumn, and winter. Skinner supposes the word *ember* taken from the ashes, *embers*, then strewed on the head. These ember-weeks are now chiefly taken notice of, on account of the ordination of priests and deacons; because the canon appoints the Sundays next succeeding the ember-weeks for the solemn times of ordination: though the bishops, if they please, may ordain on any Sunday or holiday.

EMBERIZA. Bunting. In zoology, a genus of the class aves, order passeres. Bill conic; mandibles receding from each other from the base downwards; the lower with the sides narrowed in, the upper with a hard knob within. Seventy-seven species: scattered over the four quarters of the globe; but chiefly found in Europe and America; six inhabitants of our own country. The following are the chief:

1. E. nivalis. Snow-bunting. Snow-bird. Quill-feathers white; the primaries black on the outer edge; tail-feathers black, the three lateral ones white. There are three other varieties, from a trifling variation in the colours. Yet in all of them the colours vary with age, sex, or climate; most of them being, however, nearly white in the winter, but the back and middle coverts black. Inhabits during summer in vast flocks the north of Europe, Asia, and America; in winter migrates to a warmer climate; appears in England before the setting in of frost and snow: builds in holes of rocks, and lays five white eggs spotted with brown.

2. E. hortulana. Ortolan. Quill-feathers brown, the first three whitish at the edges; tail-feathers brown, the two lateral ones black on the outer side. Three or four other varieties from a variation or different disposition of the colours. The bill is naked; eyelids and legs yellowish; head and neck olive ash; chin yellowish, surrounded with a cinereous line; feathers of the back and scapulars brownish bay, black in the middle; body beneath reddish. Female; head and neck cinereous, each feather with a narrow blackish line. Inhabits Europe; six and a quarter inches long; feeds chiefly on panic-grass, and grows prodigiously fat, when it is esteemed a delicacy, and was so regarded by the Greeks and Romans; lays twice a year four or five grey eggs in a low hedge or on the ground.

3. E. citrinella. Yellow-hammer. Tail-feathers blackish, the two outer ones on the inner edge with a pointed white spot. Bill black; crown, cheeks and body beneath yellow; eye-brows brownish; nape greenish; feathers of the neck and back blackish down the middle, rufous at the sides and edged with grey: two middle-tailed feathers edged with grey; lateral ones olive without, the tip edged with white; legs yellowish brown. Inhabits Europe; six and a quarter inches long; enters into houses in winter; builds on the ground in meadows; eggs whitish purple with irregular blackish spots and streaks.

4. E. miliaria. Common-bunting. Brown; spotted beneath with black; orbits rufous: bill and legs brownish; quill-feathers dusky, the outer-edges pale-yellow; tail a little-forked, edged with white; legs yellowish, Inhabits in flocks most parts of Europe during the autumn and winter: size of the yellow-hammer; makes its nest in the grass.

5. E. orizivora. Rice-bunting. Black; crown reddish; belly black; tail-feathers daggered. Another variety; colour olive-brown, yellowish beneath; yellow rump, greater wing-coverts and quill-feathers black, edged with white. Inhabits Cuba, and migrates to Carolina as the rice crops advance, committing great ravages: whence its name. It afterwards travels to New York to feed on the young Indian corn; sings well, and is six and three-quarters inches long.

6. E. schœniclus. Reed-bunting. Head black; body grey and black; outermost tail-feathers with a white wedged spot. There are two other varieties; one brown, cinereous beneath; the other white, with dusky wings. Inhabits Europe and Southern Siberia; the second variety, the Cape; the third, Astrachan; in marshy and reedy places; suspends its nest on four reeds like a hammock, whence its specific name; builds it three feet above the water; lays four or five bluish white eggs with irregular purplish veins; sings in the night, and is much admired for its song; five and three-quarters inches long.

To EMBE'ZZLE. *v. a.* (from *imbecile.*) 1. To appropriate by breach of trust (*Hayward*). 2. To waste; to swallow up in riot (*Dryden*).

EMBE'ZZLEMENT. *s.* (from *embezzle.*) 1. The act of appropriating to himself that which is received in trust for another. 2. The thing ill appropriated.

To EMBLA'ZE. *v. a.* (*blasonner*, French.) 1. To adorn with glittering embellishments (*Pope*). 2. To blazon; to paint with ensigns armorial (*Milton*).

To EMBLA'ZON. *v. a.* (*blasonner*, Fr.) 1. To adorn with figures of heraldry. 2. To deck in glaring colours (*Hakewill*).

EMBLA'ZONRY. *s.* (from *emblazon.*) Pictures upon shields (*Milton*).

E'MBLEM. *s.* (εμβλημα.) 1. Inlay; enamel. 2. An occult representation; an allusive picture; a typical designation (*Addison*).

According to lord Bacon, emblems are of use in the art of memory, as sensible objects strike the mind stronger than what is intellectual. Thus it is easier to retain the image of a sportsman hunting a hare, of an apothecary ranging his boxes, an orator making a speech, a boy repeating verses, or a player acting his part; than the corresponding notions of invention, disposition, elocution, memory, and action.

EMBLEMA'TICAL. EMBLEMA'TICK. *a.* (from *emblem.*) 1. Comprising an emblem; allusive; occultly representative (*Prior*). 2. Dealing in emblems; using emblems.

EMBLEMA'TICALLY. *ad.* In the manner of emblems; using emblems (*Swift*).

EMBLE'MATIST. *s.* (from *emblem.*) A writer or inventor of emblems (*Brown*).

EMBOLISMUS. (εμβολισμος.) In chronology, signifies intercalation. The word is formed of εμβαλλειν, to insert. As the Greeks made use of the lunar year, which is only 354 days, in order to bring it to the solar, which is 365 days, they had every two or three years an embolism, i. e. they added a 13th lunar month every two or three years, which additional month they called *embolimæus*, εμβολιμαιος, because inserted, or intercalated.

E'MBOLUS. *s.* (εμβολος.) Any thing inserted and acting in another, as the sucker in a pump (*Arbuthnot*).

EMBOLY, a town of Macedonia, with a Greek archbishop's see. It is the ancient Amphipolis, and is sometimes called Christopolis, Lat. 40. 59 N. Lon. 23. 55 E.

To EMBO′SS. *v. a.* (from *bosse*, French.) 1. To form with protuberances (*Milton*). 2. To engrave with relief, or rising work (*Dryden*). 3. (from *emboister*, French.) To enclose; to include; to cover (*Spenser*). 4. (*emboscare*, Italian.) To enclose in a thicket (*Milton*). 5. To hunt hard (*Shakspeare*).

EMBO′SSMENT. *s.* (from *emboss.*) 1. Any thing standing out from the rest; jut; eminence (*Bacon*). 2. Relief; rising work (*Addison*).

EMBOTHRIUM, in botany, a genus of the class tetrandria, order monogynia. Calyxless; petals four, bearing the stamens on the border; follicle round, one-celled, many-seeded; seeds winged. Eight species; elegant shrubs of New Holland or South America, with white or red flowers, in some species racemed, in others umbelled.

To EMBO′TTLE. *v. a.* (*bouteille*, French.) To include in bottles; to bottle (*Philips*).

EMBOUCHURE, a French word, properly signifying the mouth or entrance of a river. It is sometimes used to denote the mouth of a cannon or of a furnace; but more frequently, in music, for the mouth-piece of a flute, flageolet, clarionet, &c.

To EMBO′WEL. *v. a.* (from *bowel.*) To eviscerate; to deprive of the entrails (*Milton*).

To EMBRA′CE. *v. a.* (*embrasser*, French.) 1. To hold fondly in the arms; to squeeze in kindness (*Dryden*). 2. To seize ardently or eagerly; to lay hold on; to welcome (*Tillotson*). 3. To comprehend; to take in: as, *natural philosophy* embraces *many sciences.* 4. To comprise; to enclose; to contain; to encircle (*Denham*). 5. To admit; to receive (*Locke*). 6. To find; to take (*Shakspeare*). 7. To squeeze in a hostile manner.

To EMBRA′CE. *v. n.* To join in an embrace (*Shakspeare*).

To EMBRACE THE VOLT, in the manage, is used when a horse, in working upon volts, makes a good way every time with his fore-legs. The opposite term to embracing a volt is to beat the dust, which is putting his fore-feet near the place from whence he lifted them up. *Embracing the ground* is used in the same sense as embracing the volt. A horse cannot take in too much ground, provided his croup does not throw out, that is, does not go out of the volt.

EMBRA′CE. *s.* (from the verb.) 1. Clasp; fond pressure in the arms; hug (*Denham*). 2. A hostile squeeze; crush.

EMBRA′CEMENT. *s.* (from *embrace.*) 1. Clasp in the arms; hug; embrace (*Sidney*). 2. Hostile hug; grabble (*Sidney*) 3. Comprehension (*Davies*). 4. State of being contained; enclosure (*Bacon*). 5. Conjugal endearment (*Shakspeare*).

EMBRA′CER. *s.* (from *embrace.*) The person embracing (*Howel*).

EMBRASURE, in architecture, an enlargement of the gap or aperture of a door, or window, within-side the wall.

EMBRASURES, in fortification, are the holes or apertures through which the cannons are pointed; whether in casemates, in batteries, or in the parapets of walls. See CANNON, ORDNANCE, BATTERY, &c.

The embrasures are generally about fifteen feet apart, from six to nine or ten feet wide without, and from two to three within. Their height from the platform is usually three feet on the inside, and a foot and half on the outside; that so the muzzle, on occasion, may be sunk, and the piece brought to shoot low.

The best embrasures are those made with a neck, whereby a part of the opening becomes more contracted, and consequently is better adapted to preserve the gunners and cannon from the enemy's shot, than when the cheeks of the embrasures are made strait.

To EMBRA′VE. *v. a.* (from *brave.*) To decorate; to embellish.

To E′MBROCATE. *v. a.* (εμϐρεχω, Greek.) To rub any diseased part with medicinal liquids.

EMBROCA′TION. (*embrocatio*, from εμϐρεχω, to moisten or soak in.) A fluid application to rub any part of the body with.

To EMBROI′DER. *v. a.* (*broder*, French.) To border with ornament; to decorate with figured work (*Waller*).

EMBROI′DERER. *s.* (from *embroider.*) One that adorns clothes with needlework (*Ecc.*).

EMBROIDERY, a work in gold, or silver, or silk thread, wrought by the needle upon cloth, stuffs, or muslin, into various figures. In embroidering stuffs, the work is performed in a kind of loom; because the more the piece is stretched, the easier it is worked. As to muslin, they spread it upon a pattern ready designed; and sometimes, before it is stretched upon the pattern, it is starched, to make it more easy to handle. Embroidery on the loom is less tedious than the other, in which, while they work flowers, all the threads of the muslin, both lengthwise and breadthwise, must be continually counted; but, on the other hand, this last is much richer in point, and susceptible of greater variety. Cloths too much milled are scarcely susceptible of this ornament, and in effect we seldom see them embroidered. The thinnest muslins are chosen for this purpose; and they are embroidered to the greatest perfection in Saxony: in other parts of Europe, however, they embroider very prettily, and especially in France.

There are several kinds of embroidery: as, 1. Embroidery on the stamp; where the figures are raised and rounded, having cotton or parchment put under them to support them. 2. Low embroidery; where the gold and silver lie low upon the sketch, and are stitched with silk of the same colour. 3. Guimped embroidery: this is performed either in gold or silver; they first make a sketch upon the cloth, then put on cut vellum, and afterwards sew on the gold and silver with silk thread; in this kind of embroidery they often put gold and silver cord, tinsel, and spangles. 4. Embroidery on both sides; that which appears on both sides of the stuff. 5. Plain embroidery; where the figures are flat and even, without cord, spangles, or other ornaments.

By stat. 22 Geo. II. c. 36. no foreign embroidery, or gold and silver brocade, shall be imported upon pain of being forfeited and burnt, and penalty of 100*l.* for each piece. No person shall sell, or expose to sale, any foreign embroidery, gold or silver thread, lace, fringe, brocade, or make up the same into any garment, on pain of having it forfeited and burnt, and penalty of 100*l.* All such embroidery, &c. may be seized and burnt; and the mercer, &c. in whose custody it was found, shall forfeit 100*l.*

To EMBRO'IL. *v. a.* (*brouiller*, French.) 1. To disturb; to confuse; to distract (*King Charles*). 2. To perplex; to entangle (*Add.*).

To EMBRO'THEL. *v. a.* (*brothel, brodel.*) To enclose in a brothel (*Donne*).

EMBRUN, an ancient and strong city of France, in the department of the Upper Alps, and late province of Dauphiny. It is seated near the river Durance, on a high craggy rock. Lat. 44. 34 N. Lon. 6. 34 E.

EMBRYO. (*embryo*, εμβρυων; from εμβρυω, to bud forth.) The fetus in utero is so called before the fifth month of pregnancy, because its growth resembles that of the budding of a plant.

EMBRYO, is used figuratively, to denote the state of any thing yet unfinished.

EMBRYOTOMY. (*embryotomia*; εμβρυοτομια, from εμβρυον, a fetus, and τεμνω, to cut.) The separating of any part of the fetus whilst *in utero*, to extract it.

EME. *s.* (eame, Saxon.) Uncle: obsolete (*Spenser*).

EME'NDABLE. *a.* (*emendo*, Latin.) Capable of emendation; corrigible.

EMENDA'TION. *s.* (*emendo*, Latin.) 1. Correction; alteration of any thing from worse to better (*Grew*). 2. An alteration made in the text by verbal criticism.

EMENDA'TOR. *s.* (*emendo*, Latin.) A corrector; an improver; an alterer for the better.

E'MERALD. See GEMMA.

To EME'RGE. *v. n.* (*emergo*, Latin.) 1. To rise out of any thing in which it is covered (*Boyle*). 2. To issue; to proceed (*Newton*). 3. To rise; to mount from a state of depression or obscurity; to rise into view (*Pope*).

EME'RGENCE. EME'RGENCY. *s.* (from *emerge.*) 1. The act of rising out of any fluid by which it is covered (*Brown*). 2. The act of rising into view (*Newton*). 3. Any sudden occasion; unexpected casualty (*Glanville*). 4. Pressing necessity; exigence. A sense not proper (*Addison*).

EME'RGENT. *a.* (from *emerge.*) 1. Rising out of that which overwhelms or obscures it (*Ben Jonson*). 2. Rising into view, or notice (*Milton*). 3. Issuing from any thing (*South*). 4. Sudden; unexpectedly casual (*Clarendon*).

E'MERODS. E'MEROIDS. *s.* (*hemorrhoids.*) Painful swellings of the hemorrhoidal veins; piles (*Samuel*).

EMERSION, in astronomy, is the re-appearance of the sun, moon, or a planet, after having been eclipsed by the interposition of the moon, earth, or other body.

EMERSION is also used when a star, after being hid by the sun, begins to reappear, and to get out of his rays.

EMERSION (Minutes or Scruples of), an arc of the moon's orbit, which her centre passes over, from the time she begins to emerge out of the earth's shadow, to the end of the eclipse.

EMERSON (William), an English mathematician, born in 1701, at Hurworth in the county of Durham. He kept a school for some time, but afterwards left it off, contented with a small paternal estate of about 70*l.* a year. He was a general scholar, and a profound mathematician; but a man of singular and uncouth character and habits. He had but one coat, which he always wore open before, except the lower button; no waistcoat; his shirt quite different from those commonly used, having no opening before, and being buttoned close at the collar behind; a sort of flaxen wig, without a crooked hair in it. One hat lasted him nearly the whole of his life. He always walked to London when he had any thing to publish, and carefully revised every sheet himself. He was wont to study hard for a considerable time, and then would betake himself to the alehouse, to get some person to drink with and to talk to. The duke of Manchester was extremely fond of his conversation, and used frequently to visit him. Sometimes he would ask him to go into his coach, but Emerson always answered, in his rough manner, "D——n your whim-wham, I had rather walk." This ingenious, but eccentric and profane man, died in 1782, at his native village.

The following is a list of Mr. Emerson's works; all of them printed in 8vo., excepting his Mechanics and his Increments in 4to. and his Navigation in 12mo. 1. The Doctrine of Fluxions. 2. The Projection of the Sphere, orthographic, stereographic, and gnomonical. 3. The Elements of Trigonometry. 4. The Principles of Mechanics. 5. A Treatise of Navigation on the Sea. 6. A Treatise on Arithmetic. 7. A Treatise on Geometry. 8. A Treatise of Algebra, in 2 books. 9. The Method of Increments. 10. Arithmetic of Infinites, and the Conic Sections, with other Curve Lines. 11. Elements of Optics and Perspective. 12. Astronomy. 13. Mechanics, with Centripetal and Centrifugal Forces. 14. Mathematical Principles of Geography, Navigation and Dialling. 15. Commentary on the Principia, with the Defence of Newton. 16. Tracts. 17. Miscellanies.

Dr. Horsley very ably and justly characterises the works of Mr. Emerson, when he says they are "composed with great depth of knowledge, with great brevity, and upon sound principles; but without elegance, without order, and without perspicuity." (*Tracts*, p. 356.)

EMERY, in natural history. See SMIRIS.

EMESIA. (εμεσια; from εμεω, to vomit.) In medicine, the act of vomiting.

trade, but is now neglected for Canton. Lon. 116. 27 E. Lat. 24. 30 N.

To EMPA'LE. *v. a.* (*empaler*, French.) 1. To fence with a pale (*Donne*). 2. To fortify (*Raleigh*). 3. To enclose; to shut in (*Cleaveland*). 4. To put to death by spitting on a stake fixed upright (*Southern*).

EMPALEMENT, in botany. See Calyx.

EMPA'NNEL. *s.* (from *panne*, Fr.) The writing or entering the names of a jury into a schedule, by the sheriff, which he has summoned to appear (*Cowell*).

To Empa'nnel. *v. a.* (from the noun.) To summon to serve on a jury (*Government of the Tongue*).

EMPA'RLANCE. *s.* (from *parler*, Fr.) In common law, a desire or petition in court of a day to pause what is best to do (*Cowell*).

EMPA'SM. *s.* (εμπασσω.) A powder to correct the bad scent of the body.

To EMPA'SSION. *v. a.* (from *passion.*) To move with passion; to affect strongly (*Milton*).

EMPEDOCLES, a philosopher, poet, and historian, of Agrigentum, in Sicily, who flourished 444 B. C. He warmly adopted the doctrine of transmigration, and wrote a poem upon the opinions of Pythagoras, very much commended, in which he spoke of the various bodies which nature had given him. He was first a girl, afterwards a boy, a shrub, a bird, a fish, and lastly Empedocles. His poetry was bold and animated, and his verses were so universally esteemed, that they were publicly recited at the Olympic games with those of Homer and Hesiod. He showed himself an inveterate enemy to tyranny, and refused to become the sovereign of his country. It is reported that his curiosity to visit the flames of the crater of Ætna proved fatal to him. Some maintain that he wished it to be believed that he was a god, and that his death might be unknown, he threw himself into the crater, and perished in the flames. His expectations, however, were frustrated, and the volcano, by throwing up one of his sandals, discovered to the world that Empedocles had perished by fire. Others report that he lived to an extreme old age, and that he was drowned in the sea. Empedocles was the first who, combining the opinions of earlier philosophers into one system, admitted four elements, fire, water, earth, and air.

Whatever be thought of the philosophical attainments, or the magical skill of Empedocles, his poetical powers are attested by the remaining fragments of his works, and the eulogium of ancient writers who possessed them entire. His books on nature, and his expiations, contained, as we are told by Laertius, five thousand verses; and a work on medicine six hundred. Lucretius places him above all the wonders of the island in which he dwelt. (Lucret. de Nat. i. 717.)

To EMPE'OPLE. *v. a.* (from *people.*) To form into a people or community (*Spenser*).

E'MPERESS, or Empress. *s.* (from *emperour.*) 1. A woman invested with imperial power (*Davies*). 2. The queen of an emperour (*Shakspeare*).

E'MPEROUR. (*imperator.*) Among the ancient Romans, signified a general of an army, who for some extraordinary success had been complimented with this appellation. Thus Augustus, having obtained no less than twenty famous victories, was as often saluted with the title of emperour. And Titus was denominated emperour by his army after the reduction of Jerusalem. Afterwards it came to denominate an absolute monarch, or supreme commander of an empire. In this sense it was applied to Julius Cæsar, to Octavius, Tiberius, &c. afterwards it became elective. In strictness, this title does not add any thing to the rights of sovereignty: its effect is only to give precedence and pre-eminence over other sovereigns, and, as such, it raises those invested with it to the summit of all human greatness.

In the East, the title of Emperour is more frequently applied than among Europeans; it is given to the sovereigns of China, Japan, Mogul, Persia, &c. In the West it has been for a long time restrained to the emperours of Germany. (See Empire.) The chief rights of the German emperours were in 1437 reduced to the following: That of conferring all dignities and titles, except the privilege of being a state of the empire; of *preces primariæ*, or of appointing once during their reign a dignitary in each chapter or religious house; of granting dispensations with respect to the age of majority; of erecting cities, and conferring the privilege of coining money; of calling the meetings of the diet, and presiding in them.

To these some have added, 1. That all the princes and states of Germany are obliged to do them homage, and swear fidelity to them. 2. That they or their generals, have a right to command the forces of all the princes of the empire, when united together. 3. That they receive a kind of tribute from all the princes and states of the empire, for carrying on a war which concerns the whole empire, which is called the Roman month. For the rest, there is not a foot of land or territory annexed to his title: but ever since the reign of Charles IV. the emperours have depended entirely on their hereditary dominions as the only source of their power, and even of their subsistence. The emperour of Germany has been lately compelled by the emperour of the French to assume the new name of emperour of Austria in its stead; what title or what dignity he will next assign him, the great teacher, time, alone can inform us.

E'MPERY. *s.* (*empire*, French.) Empire; sovereignty: not in use (*Shakspeare*).

E'MPETRUM. Crow-berry. Crake-berry. Berry-bearing heath. In botany, a genus of the class diœcia, order triandria. Calyx three-parted; petals three. Male; stamens from three to nine, capillary, very long. Female; stigmas nine; berry superior; from three to nine-seeded. Two species.

1. E. album; with erect stems, pubescent branchlets, and white berries or fruit; a native of Portugal.

2. E. nigrum, with procumbent stems, and black berries; four on our own heaths; the berries eaten by grouse, and some other birds, but generally refused by quadrupeds.

E'MPHASIS, in rhetoric, a force, stress, or energy, in expression, action, gesture, or the like, which performs the same office in sentences as the accent does in words. The word is Greek, εμφασις, which signifies the same. See ENERGY.

By emphasis is usually meant a stronger and fuller sound of voice, by which we distinguish some word or words, on which we design to lay particular stress, and to show how they affect the rest of the sentence. Sometimes the emphatic words must be distinguished by a particular tone of voice, as well as by a particular stress.

Emphasis may be divided into the superior and the inferior emphasis. The superior emphasis determines the meaning of a sentence with reference to something said before, presupposed by the author as general knowledge, or removes an ambiguity, where a passage may have more senses than one. The inferior emphasis enforces, graces, and enlivens, but does not fix the meaning of any passage.

The superior emphasis finds place in the following short sentence, which admits of four distinct meanings, each of which is ascertained by the emphasis only.

"Do you ride to town to-day?"

The following examples illustrate the nature and use of the inferior emphasis:

"Many persons mistake the *love* for the *practice* of virtue."

"Shall I reward his services with *falsehood?* Shall I forsake *him* who cannot forget *me?*

"If his principles are *false*, no apology from *himself* can make them *right*: if founded in *truth*, no censure from *others* can make them *wrong*."

The superior emphasis, in reading as in speaking, must be determined entirely by the sense of the passage, and always made alike; but as to the inferior emphasis, taste alone seems to have the right of fixing its situation and quantity.

It is a great error to multiply emphatical words too much, and use the emphasis indiscriminately. It is only by a prudent reserve and distinction in the use of emphatical words, that we can give them any weight. To crowd every sentence with such words, is like crowding all the pages of a book with Italic characters; which, as to the effect, is just the same as to use no distinctions at all.

EMPHA'TICAL. EMPHA'TICK. *a.* (from εμφαινω.) 1. Forcible; strong; striking (*Garth*). 2. Striking the sight (*Boyle*).

EMPHA'TICALLY. *ad.* (from *emphatical.*) 1. Strongly; forcibly; in a striking manner. 2. According to appearance (*Brown*).

EMPHRA'CTICS. (εμφρακτικα, from εμφραττω, to obstruct.) Cutaneous astringents. Medicines that obstruct the cutaneous pores.

EMPHYSE'MA. (*emphysema*, εμφυσημα, from εμφυσαω, to inflate.) Air in the cellular membrane. See PNEUMATOSIS.

EMPHYSE'MATOUS. *a.* (from εμφυσημα.) Bloated; puffed up; swollen (*Sharp*).

To EMPIE'RCE. *v. a.* (from *pierce.*) To pierce into; to enter into by violent appulse (*Spenser*).

EMPI'GHT. *part.* (from *to pitch.*) Set; fixed; fastened (*Spenser*).

E'MPIRE. *s.* (*empire*, French.) 1. Imperial power; supreme dominion (*Rowe*). 2. The region over which dominion is extended (*Temple*). 3. Command over any thing.

EMPIRE. (*imperium.*) In political geography, a large extent of land, under the jurisdiction or government of an emperour. (See EMPEROUR.) In ancient history we read of four great monarchies or empires, viz. that of the Babylonians, Chaldeans, and Assyrians; that of the Medes and Persians; that of the Greeks; and that of the Romans. The first subsisted from the time of Nimrod, who founded it in the year of the world 1800, according to the computation of Usher, to Sardanapalus their last king, in 3257, and consequently lasted above 1450 years. The empire of the Medes commenced under Arbace, in the year of the world 3257, and was united to that of the Babylonians and Persians under Cyrus, in the year 3468, and it closed with the death of Darius Codomannus, in 3674. The Grecian empire lasted only during the reign of Alexander the Great, beginning in the year of the world 3674, and terminating with the death of this conqueror in 3681, his conquests being divided among his captains. The Roman empire commenced with Julius Cæsar, when he was made perpetual dictator, in the year of the city 708, and of the world 3956, forty-eight years before Christ. The seat of the empire was removed to Byzantium by Constantine, in the year of our Lord 334; the east and west were then united under the title of the Roman empire, till the Romans proclaimed Charlemagne emperour, A.D. 800.

EMPIRE, or *The Empire*, used absolutely and without any addition, signifies the empire of Germany; called also, in juridical acts and laws, the holy Roman empire. It had its beginning with the ninth century; Charlemagne being created first emperor by pope Leo III. who put the crown on his head in St. Peter's church, on Christmas day, in the year 800.

EMPIRIC. (*empiricus*, εμπειρικος, from εν, in, and πειρα, experience.) One who practises the healing art upon experience, and not theory. This is the true meaning of the word, and the sense in which it was originally applied in opposition to the methodists, or methodic practitioners, who were actuated by some system or other, but it is now applied, in a very opposite sense, to those who deviate from the line of conduct pursued by scientific and regular practitioners, and vend nostrums, or sound their own praise in the public appers.

EMPI′RICAL. Empi′rick. *a.* (from the noun.) 1. Versed in experiments (*Milton*). 2. Known only by experience; practised only by rote (*Shakspeare*).

EMPI′RICALLY. *ad.* (from *empirical.*) 1. Experimentally; according to experience. 2. Without rational grounds; charlatanically.

EMPI′RICISM. *s.* (from *empirick.*) Dependence on experience without knowledge or art; quackery.

E′MPIS, in zoology, a genus of the class insecta, order diptera. Mouth with an inflected sucker and proboscis; sucker with a single-valved sheath, and three bristles; feelers short, filiform; antennas setaceous. This is one of the many tribes of insects that live by sucking out the blood and juices of other animals. Twenty-nine species: a few have been observed in Barbary; the rest are inhabitants of Europe, five of them common to our own country. See Nat. Hist. Plate XC.

EMPLA′STER, *s.* (εμπλαστρον.) An application to a sore of an oleaginous or viscous substance, spread upon cloth (*Wiseman*).

To Empla′ster. *v. a.* (from the noun.) To cover with a plaster (*Mortimer*).

EMPLA′STIC. *a.* (εμπλαστικος.) Viscous; glutinous (*Wiseman*).

EMPLASTRA, in pharmacy, plasters, or emplasters, as above: combinations of fixed oil, or animal fat, with other substances, of such a consistency that when cold, the preparation does not adhere to the fingers, but becomes soft and plastic when gently heated. The following are those chiefly in use.

Emplastrum ammoniaci cum hydrargyro. This mixture of ammoniacum, hydrargyrus, and sulphurated oil, is said to possess resolvent virtues, and the plaster is recommended with this view to be applied to nodes, tophs, indurated glands, and tumours.

E. asafœtidæ. This plaster, ordered by the Edinburgh pharmacopœia, is said to possess anodyne and antispasmodic virtues. It is, therefore, occasionally directed to be applied to the umbilical region in hysterical cases.

E. cantharidis. The virtues of this plaster are enumerated under the title of Cantharides.

E. ceræ compositum. This is a gently drawing preparation, calculated to promote a moderate discharge from a blistered surface, with which intention it is mostly used. Where the stronger preparations irritate, this will be found, in general, to agree.

E. cumini. A warm stomachic plaster, which, when applied to the stomach, expels flatulency. To indolent scrophulous tumours, where the object is to promote suppuration, this is an efficacious plaster.

E. ladani compositum. This may be used with the same intentions as the cumin plaster, to which it is in no way superior, though composed of more expensive materials.

E. lithargyri. Excoriations of the skin, slight burns, and the like may be covered with this plaster: but it is in more general use as a defensitive, where the skin becomes red from lying a long time on the part.

E. lithargyri compositum. This is a warm, stimulating, and supparative plaster, calculated to promote maturation of indolent or scirrhous tumours, and to allay the pains of sciatica, arthodynea, &c.

E. lithargyri cum hydrargyro. Plasters of this compound are frequently applied to resolve venereal bubos, nodes, tophs, and swelled joints from the same cause.

E. lithargyri cum resina. This is the common adhesive plaster used by surgeons to retain dressings in their places, and to keep together the edges of wounds, ulcers, &c.

E. picis Burgundicæ compositum. From the slight degree of redness this stimulating application produces, it is adapted to gently irritate the skin, and thus relieve rheumatic pains. Applied to the temples it is sometimes of use in pains of the head.

E. saponis. Discutient properties are attributed to this elegant plaster, with which view it is applied to lymphatic and other indolent tumours. It forms an admirable, defensitive, and soft application, spread on linen, to surround a fractured limb.

E. thuris compositum. This plaster is said to possess strengthening, as well as adhesive powers. By keeping the skin firm, it may give tone to the relaxed muscles it surrounds, but cannot in any other way impart more strength than the common adhesive plaster.

To EMPLE′AD. *v. a.* To endict; to prefer a charge against; to accuse (*Hayward*).

EMPLE′URUM, in botany, a genus of the class monœcia, order tetrandria. Male: calyx four-cleft; corolless. Fem. calyx four-cleft, inferior; corolless; stigmas cylindrical, placed on the lateral tooth of the germ; capsule opening on the side: seed one-coated. One species: a Cape shrub, with wandlike branches, and lateral few-flowered peduncles.

To EMPLO′Y. *v. a.* (*emploier*, French.) 1. To busy; to keep at work (*Temple*). 2. To use as an instrument (*Gay*). 3. To use as means (*Dryden*). 4. To use as materials (*Locke*). 5. To commission; to intrust with the management of any affairs (*Watts*). 6. To fill up with business (*Dryden*). 7. To pass or spend in business (*Prior*).

Emplo′y. *s.* (from the verb.) 1. Business; object of industry (*Pope*). 2. Publick office (*Addison*).

EMPLO′YABLE. *a.* (from *employ.*) Capable to be used; proper for use (*Boyle*).

EMPLO′YER. *s.* (from *employ.*) 1. One that uses or causes to be used (*Child*). 2. One that sets others to work.

EMPLO′YMENT. *s.* (from *employ.*) 1. Business; object of industry; object of labour. 2. Business; the state of being employed. 3. Office; post of business (*Atterbury*). 4. Business intrusted (*Shakspeare*).

To EMPO′ISON. *v. a.* (*empoisonner*, Fr.) 1. To destroy by poison; to destroy by venomous food or drugs (*Sidney*). 2. To taint with poison; to envenom.

EMPO'ISONER. *s.* (*empoisonneur*, Fr.) One who destroys another by poison (*Bacon*).

EMPO'ISONMENT. *s.* (*empoisonnement*, French.) The practice of destroying by poison (*Bacon*).

EMPORE'TICK. *a.* (εμποριτικος.) That is used at markets, or in merchandise.

EMPORIUM, in ancient geography, two cities near Placentia; one well fortified, and guarded by a strong garrison, at which Hannibal met a repulse; the other, Hannibal took and plundered. Now thought to be Pont-Nura, in the duchy of Placentia.

EMPO'RIUM. *s.* (εμποριον.) A place of merchandise; a mart; a commercial city (*Dryden*).

EMPORIUM, in medicine, is often used for the common sensory in the brain.

To EMPO'VERISH. *v. a.* (*pauvre*, Fr.) 1. To make poor; to depauperate; to reduce to indigence (*South*). 2. To lessen fertility.

EMPO'VERISHER. *s.* (from *empoverish.*) 1. One that makes others poor. 2. That which impairs fertility (*Mortimer*).

EMPO'VERISHMENT. *s.* (from *empoverish.*) Cause of poverty; drain of wealth (*Swift*).

To EMPO'WER. *v. a.* (from *power.*) 1. To authorize; to commission (*Dryden*). 2. To give natural force; to enable (*Baker*).

E'MPRESS. *s.* (contracted from *emperess.*) 1. The queen of an emperour. 2. A female invested with imperial dignity; a female sovereign (*Milton*).

EMPRI'SE. *s.* (*emprise*, Fr.) Attempt of danger; undertaking of hazard; enterprise (*Pope*).

EMPROSTHOTONUS. (*emprosthotonus*, εμπροσθοτονος, from εμπροσθεν, before, or forwards, and τεινω, to draw.) A tonic spasm of several muscles, so as to keep the body in a fixed position and bent forward. Cullen considers it as a species of tetanus. See TETANUS.

E'MPTIER. *s.* (from *empty.*) One that empties; one that makes any place void (*Nahum*).

E'MPTINESS. *s.* (from *empty.*) 1. Absence of plenitude; inanity (*Philips*). 2. The state of being empty (*Shakspeare*). 3. A void space; vacuity; vacuum (*Bentley*). 4. Want of substance or solidity (*Dryden*). 5. Unsatisfactoriness; inability to fill up the desires (*Atterbury*). 6. Vacuity of head; want of knowledge (*Pope*).

E'MPTION. *s.* (*emptio*, Lat.) The act of purchasing; a purchase (*Arbuthnot*).

E'MPTY. *a.* (æmꞇıᵹ, Saxon.) 1. Void; having nothing in it; not full (*Shakspeare*). 2. Evacuated; no longer full (*Spenser*). 3. Devoid; unfurnished (*Newton*). 4. Unsatisfactory; unable to fill the mind or desires (*Pope*). 5. Without any thing to carry; unburdened; unfreighted (*Dryden*). 6. Hungry (*Shakspeare*). 7. Vacant of head; ignorant; unskilful (*Raleigh*). 8. Unfruitful; barren (*Genesis*). 9. Without substance; vain (*Dryden*).

To E'MPTY. *v. a.* (from the adjective.) To evacuate; to exhaust (*Arbuthnot*).

To EMPU'RPLE. *v. a.* (from *purple.*) To make of a purple colour (*Milton*).

EMPUSA, among the ancients, a kind of hobgoblin, or bugbear, under the direction of Hecate, sent to frighten people who laboured under misfortunes.

To EMPU'ZZLE. *v. a.* (from *puzzle.*) To perplex; to put to a stand (*Brown*).

EMPYE'MA. (*empyema*, εμπυημα, from εν, within, and πυον, pus.) A collection of pus in the cavity of the thorax. It is one of the terminations of pleuritis.

EMPY'REAL. *a.* (εμπυρος.) Formed of the element of fire; refined beyond aerial (*Milton*).

EMPYRE'AN *s.* (εμπυρος.) The highest heaven, where the pure element of fire is supposed to subsist (*Milton*).

EMPYREUM, a term used by divines for the highest heaven, where the blessed enjoy the beatific vision. The word is formed of εν, and πυρ, fire, because of its splendour.

EMPYRE'UMA (*empyreuma*, εμπυρευμα, from εμπυρευω, to kindle, and πυρ, fire.) The offensive smell that distilled waters and other substances receive from being too much exposed to ignition.

EMPYREUMATIC. Smelling as it were burnt: thus empyreumatic oils are those distilled with a great heat, and impregnated with a smell of the fire.

EMPYRO'SIS. *s.* (εμπυροω.) Conflagration; general fire (*Hale*).

EMRODS. See HEMORRHOIDS.

To E'MULATE. *v. a.* (*æmulor*, Latin.) 1. To rival; to propose as one to be equalled or excelled. 2. To imitate with hope of equality, or superiour excellence (*Ben Jonson*). 3. To be equal to; to rise to equality with (*Pope*). 4. To imitate; to copy (*Arbuthnot*).

EMULA'TION, a generous ardour kindled by the praiseworthy examples of others, which impels us to imitate, to rival, and, if possible, to excel them. This passion involves in it esteem of the person whose attainments or conduct we emulate, of the qualities and actions in which we emulate him, and a desire of resemblance; together with a joy springing from the hope of success. The word comes originally from the Greek αμιλλα, dispute, contest; whence the Latin *æmulus*; and thence our emulation. Plato observes of emulation, that it is the daughter of envy; if so, there is a great difference between the mother and the offspring; the one is a virtue and the other a vice. Emulation admires great actions, and strives to imitate them; envy refuses them the praises that are their due; emulation is generous, and only thinks of surpassing a rival; envy is low, and only seeks to lessen him. It must be confessed, however, that there is great danger of emulation degenerating into envy; and it, therefore, becomes indispensably necessary for those concerned in the important work of education, to take care lest they have recourse to improper motives, and thereby, instead of producing the generous sentiments of emulation, engender the baleful propensities of envy and malignity.

E'MULATIVE. *a.* (from *emulate.*) Inclined to emulation; rivalling; disposed to competition.

EMULA'TOR. *s.* (from *emulate.*) A rival; a competitor (*Bacon*).

To EMU'LGE. *v. a.* (*emulgeo*, Latin.) To milk out.

EMU'LGENT. *a.* (*emulgens*, Latin.) 1. Milking or draining out.

EMULGENT VESSELS. (*vasa emulgentia*, from *emulgeo*, to milk out: applied to the veins and arteries which go from the aorta and vena cava to the kidneys, because the ancients supposed they strained, and, as it were, milked the serum through the kidneys.) Renal vessels. The vessels of the kidneys are so termed. The emulgent artery is a branch of the aorta. The emulgent vein evacuates its blood into the ascending cava.

E'MULOUS. *a.* (*æmulus*, Latin.) 1. Rivalling; engaged in competition (*Jonson*). 2. Desirous of superiority; desirous to rise above another; desirous of any excellence possessed by another (*Prior*). 3. Factious; contentious (*Shakspeare*).

E'MULOUSLY. *ad.* (from *emulous.*) With desire of excelling or outdoing another (*Granville*).

EMULSIO ARA'BICA. Emulsion of gum Arabic. This cooling and demulcent emulsion, ordered in the Edinburgh pharmacopœia, may be drank *ad libitum* to mitigate ardor urinæ, whether from the venereal virus, or any other cause. In difficult and painful micturition and strangury, it is of infinite service.

EMULSIO CAMPHORATA. A much more useful form of giving camphire than that directed by the London pharmacopœia; yet a great quantity of the camphire is unnecessarily lost in this preparation. It is calculated for the stomachs of those who can only bear small quantities of camphire.

EMULSION. (*emulsio.*) A soft and somewhat oily medicine, resembling milk; formed by an imperfect combination of oil with water, by means of mucilage, &c.

EMUNCTORY. (*emunctorium*, from *mungo*, to drain off.) The excretory ducts of he body are so termed: thus the exhaling ar- ries of the skin constitute the great emunctory the system.

EN, an inseparable particle borrowed by us m the French, and by the French formed m the Latin *in.* Many words are uncer- nly written with *en* or *in.* In many words is changed into *em* for more easy pronuntion.

To ENA'BLE. *v. a.* (from *able.*) To make e; to empower (*Rogers*).

To ENA'CT. *v. a.* (from *act.*) 1. To act; perform: not in use (*Spenser*). 2. To establish by law; to decree (*Temple*). 3. To represent by action (*Shakspeare*).

ENA'CT. *s.* (from the verb.) Purpose; determination.

ENA'CTOR. *s.* (from *enact.*) 1. One that forms decrees, or establishes laws (*Atterbury*). 2. One that practises or performs any thing: not used (*Shakspeare*).

ENÆ'MA. (εναιμα, from εν and αιμα, blood.) A styptic. Any medicine appropriated to bleeding wounds.

ENA'LLAGE. *s.* (εναλλαγη.) A figure in grammar, whereby some change is made in the common modes of speech, as when one mood or tense of a verb is put for another.

To ENA'MBUSH. *v. a.* (from *ambush.*) To hide in ambush; to hide with hostile intention (*Chapman*).

To ENA'MEL. *v. a.* (from *amel.*) 1. To inlay; to variegate with colours (*Pope*). 2. To lay upon another body so as to vary it (*Milton*).

To ENA'MEL. *v. n.* To practise the use of enamel (*Boyle*).

ENA'MEL. *s.* (from the verb.) 1. Any thing enamelled, or variegated with colours fixed by fire (*Fairfax*). 2. The substance inlaid in other things.

ENAMEL, in anatomy. See DENTES and TEETH.

ENAMEL, in general, signifies a vitrified matter, interspersed with some solid substance; and possessing all the properties of glass, excepting that of transparency.

The basis of enamels is a pure crystal glass or frit, ground together with a fine calx of lead and tin, prepared for that purpose, with the addition of a small proportion of the white salt of tartar. These form the principal ingredients of all enamels, which are made by adding various pulverised colours, and thoroughly incorporating the whole in a furnace. For white enamel, it is sufficient to add manganese to the matter which constitutes the basis; for azure, zaffre mixed with calx of brass; for green, calx of brass with scales of iron, or crocus martis; for black, zaffre with manganese or crocus martis, or manganese with tartar; for red, manganese, or calx of copper with red tartar; for purple, manganese with calx of brass; for yellow, tartar and manganese; lastly, for violet-coloured enamel, manganese with brass, that has been three times calcined.

Enamels are used either for the counterfeiting or imitating of precious stones, and for painting; or by enamellers and artists working in gold, silver, and other metals. That species of enamel which jewellers employ, is imported from Holland, or Venice, in small cakes of various sizes, which are in general about four inches in diameter, and have the mark of the maker indented on them. It pays a duty of 3*s*. 8*d*. per pound on importation; and is allowed a drawback of 1*s*. 6*d*. per pound on being again exported.

ENA'MELLER. *s.* (from *enamel.*) One that practises the art of enamelling.

ENAMELLING.

ENAMELLING, the art of laying enamel upon metals, as gold, silver, copper, &c. and of melting it at the fire, or of making divers curious works in it at a lamp. It signifies also to paint in enamel.

The delicate and beautiful art of enamelling consists in the application of a smooth coating of vitrified matter (transparent or opaque, and with or without colour, figures, and other ornaments), to a bright polished metallic substance. It is, therefore, a kind of varnish made of glass, and melted upon the substance to which it is applied, and affording a fine uniform ground for an infinite variety of ornaments which are also fixed on by heat.

The general principles on which enamelling is founded, are on the whole very simple, but, perhaps, there is none of all the chemico-mechanical arts which requires, for the finer parts, a greater degree of practical skill and dexterity, and of patient and accurate attention to minute processes.

The concealment observed by those who profess this art, is proportioned to the difficulty of acquiring it; the general chemist must, therefore, content himself with the general principles of enamelling, and the detail of those particulars that are commonly known.

Though the term enamelling is usually confined to the ornamental glazing of metallic surfaces, it strictly applies to the glazing of pottery or porcelain, the difference being only, in the latter, the surface is of baked clay. With regard to the composition of coloured enamels (which are all tinged by different metallic oxyds) a very general account of the substances used will suffice in this place, and the rest of the subject may be properly referred to the article of coloured GLASS. The enamelling on metals, therefore, will only be noticed in this place. The only metals that are enamelled, are gold and copper; and with the latter, the opaque enamels are only used. Where the enamel is transparent and coloured, the metal chosen should be of that kind, as not only to have its surface unalterable when fully red hot, but also to be in no degree chemically altered by the close contact of melted glass, containing an abundance of some kind of metallic oxyd. This is the chief reason why coloured enamelling on silver is impracticable, though the brilliance of its surface is not impaired by mere heat, for if (for example) an enamel made yellow with oxyd of lead or antimony is laid on a surface of bright silver, and kept melted on it for a certain time, the silver and the enamel act on each other so powerfully, that the colour soon changes from a yellow to an orange, and lastly to a dirty olive. Copper is equally altered by the coloured enamels, so that gold is the only metal which can bear the long contact of the coloured glasses at a full red heat, without being altered by them.

The simplest kind of enamel is that fine white opaque glass, which is applied to the dial-plate of watches. The process of laying it on (which may serve as a general example of the art) is the following.

A piece of thin copper sheet, hammered of the requisite convexity, is first accurately cut out, a hole drilled in the middle for the axis of the hands, and both the surfaces made perfectly bright with a scratch brush.

A small rim is then made round the circumference, with a thin brass band rising a little above the level, and a similar rim round the margin of the central hole. The use of these is to confine the enamel when in fusion, and keep the edges of the plate quite neat and even. The substance of the enamel is a fine white opaque glass, the material of which will be presently mentioned. This is bought in lump by the enamellers, and is first broken down with a hammer, then ground to a sufficiently fine powder, with some water in an agate mortar; the superfluous water being then poured off, the pulverised enamel remains of about the consistence of wetted sand, and is spread very evenly over the surface of the copper plate by many dexterous manipulations. On most enamellings, and especially on this, it is necessary also to counter-enamel the under concave surface of the copper plate, to prevent its being drawn out of its true shape, by the unequal shrinking of the metal and enamel on cooling. For this kind of work, the counter-enamel is only about half the thickness on the concave as on the convex side. For flat plates, the thickness is the same on both sides.

The plate, covered with the moist enamel powder, is warmed and thoroughly dried, then gently set upon a thin earthen ring, that supports it only by touching the outer rim, and put gradually into the red hot muffle of the enameller's furnace. This furnace is constructed somewhat like the assay furnace, but the upper part alone of the muffle is much heated, and some peculiarities are observed in the construction, to enable the artist to govern the fire more accurately.

The precise degree of fire to be given here as in all enamelling, is that at which the particles of the enamel run together into an uniform pasty consistence, and extend themselves evenly over the surface, showing a fine polished face, carefully avoiding on the other hand so great a heat as would endanger the melting of the thin metallic plate. When the enamel is thus seen to sweat down, as it were, to an uniform glossy glazing, the piece is gradually withdrawn and cooled, otherwise it would fly by the action of the cold air.

A second coating of enamel is then laid on and fired as before, but this time the finest powder of enamel is taken, or that which remains suspended in the washings. It is then ready to receive the figures and division marks, which are made of a black enamel, ground in an agate mortar, with much labour, to a most impalpable powder, worked up on a pallet with oil of lavender, or spike, and laid on with an extremely fine hair brush. The plate is then stoved to evaporate the essential oil, and the figures burnt in as before. The polishing with tripoli, and minuter parts of the process, need not be here mentioned.

If the enamel be chipped off a dial plate (which may be done with the utmost ease by bending it backwards and forwards, as the adhesion between the metal and glazing is very slight) the part immediately in contact with the copper will be found deeply and nearly uniformly browned, which shows how unfit copper alone would be for the transparent enamels.

The regulation of the fire appears to be the most difficult of all the parts of this nice process, particularly in the fine enamelling of gold for ornamental purposes, of designs, miniatures, and the like, where three, four, or sometimes five separate firings are required. If the heat is too low, the enamel does not spread and vitrify as it ought; if too high, it may be enough to melt the metal itself, whose fusing point is but a small step above that of the enamel, or else (what is an equal mortification to the artist) the delicate figures, laid on with so much care and judgment, melt down in a moment, and the piece exhibits only a confused assemblage of lines, and fragments of designs.

The exact composition of the opaque white enamel, is a matter of considerable importance, and is procured by the enamellers from persons whose business it is to prepare it. A good enamel of this kind, fit to be applied to porcelain and metals, should be of a very clear fine white, so nearly opaque, as only to be translucent at the edges; and at a moderate red heat it should run into that kind of paste, or imperfect fusion which allows it to extend itself freely and uniformly, and to acquire a glossy even surface, without, however, fully melting into a thin glass. The opaque white of this enamel is given by the oxyd of tin, which possesses, even in a small proportion, the property of rendering vitrescent mixtures white and opaque, or in still less proportion, milky; and when otherwise coloured, opalescent. The oxyd of tin is always mixed with three or four times its quantity of oxyd of lead; and it appears necessary that the metals should be previously mixed by melting, and the alloy then calcined. The following are the directions given by Clouet for the composition of this enamel. Mix 100 parts of pure lead with from 20 to 25 of the best tin, and bring them to a low red heat in an open vessel. The mixture then burns nearly as rapidly as charcoal, and oxydates very fast. Skim off the crusts of oxyd, successively formed, till the whole is thoroughly calcined. It is better then to mix all the skimmings, and again heat as before, till no flame arises from them, and the whole is of an uniform grey colour. Take 100 parts of this oxyd, 100 of sand, and 25 or 30 of common salt, and melt the whole in a moderate heat. This gives a greyish mass, often porous and apparently imperfect, but which, however, runs to a good enamel when afterwards heated. This is the enamel used for porcelain, but for metals and finer works the sand is previously calcined in a very strong heat with a fourth of its weight, or, if a more fusible compound is wanted, as much of the oxyd of tin and lead as of salt is taken, and the whole melted to a white porous mass. This is then employed instead of the rough sand as in the above-mentioned process. The above proportions, however, are not invariable, for if more fusibility is wanted, the dose of oxyd is increased, and that of the sand diminished, the quantity of common salt remaining the same. The sand employed in this process, according to Mr. Clouet, is not the common sort, however fine, but a micaceous sand, in which the mica forms about one-fourth of the mixture.

Neri, in his valuable treatise on glass-making, has given long ago the following proportions for the common material of all the opaque enamels, which Kunckel and other practical chemists have confirmed. Calcine 30 parts of lead, with 33 of tin, with the precautions mentioned above. Take of this calcined mixed oxyd 50 pounds, and as much of powdered flints (prepared by being thrown into water when red hot, and then ground to powder), and eight ounces of salt of tartar; melt the mixture in a strong fire kept up for ten hours, after which reduce the mass to powder. This is the common material for the opaque enamels, and is of a grey white. To make this fine enamel quite white, mix six pounds of this material with 48 grains of the best black oxyd of manganese, and melt in a clear fire. When fully fused, throw it into cold water, then re-melt and cool as before two or three times, till the enamel is quite white and fine. Kunckel observes on this process, that he tried it without the oxyd of manganese, but the enamel, instead of being milk white, was blueish and not good, so that there is no doubt but that this oxyd is highly important. If too much is used, the enamel becomes of a rose purple. For further observations on the use of manganese in vitrescent mixtures, see the article Glass. Coloured enamels are composed of a common basis, which is a fusible mixture of vitrifiable materials, and of some metallic oxyd. In general, the coloured enamels are required to be transparent, in which case the basis is a kind of glass composed of borax, sand, and oxyd of lead, or other vitrescent mixtures, in which the proportion of saline or metallic flux is more or less according to the degree of heat that the colouring oxyd will bear without decomposition. When the coloured enamel is to be opaque, or opalescent, a certain portion of the white opaque enamel, or of the oxyd of tin, is added to the mixture. The most beautiful and costly colour known in enamelling is an exquisitely fine rich red, with a purplish tinge, given by the salts and oxyds of gold, especially the purple precipitate, formed by tin in one form or other, and nitro-muriat of gold, and also by the fulminating gold. This beautiful colour requires much skill in the artist to be fully brought out. It is said that when most perfect it should come from the fire quite colourless, and afterwards receive its colour by the flame of a candle. Gold colours will not bear a violent fire.

Other and common reds are given by the oxyd of iron, but this requires the mixture of alumine, or some other substance refractory in the fire, otherwise at a full red heat the colour will degenerate into black.

Yellow is given either by the oxyd of silver alone, or by the oxyds of lead and antimony, with similar mixtures to those required for iron. The silver is as tender a colour as gold, and readily injured or lost in a high heat.

Green is given by the oxyd of copper, or it may also be procured by a mixture of blue and yellow colours.

Blue is given by cobalt; and this seems of all enamel colours the most certain, and easily manageable.

Black is produced by a mixture of cobalt and manganese.

Under the article of coloured Glasses, this subject will be noticed more at length.

The reader may conceive how much the difficulties of this nice art are increased, when the object is not merely to lay an uniform coloured glazing on a metallic surface, but also to paint that surface with figures and other designs, that require extreme delicacy of outline, accuracy of shading, and selection of colouring. The enamel painter has to work, not with actual colours, but with mixtures, which he only knows from experience will produce certain colours after the delicate operation of the fire; and to the common skill of the painter, in the arrangement of his pallet and choice of his colours, the enameller has to add an infinite quantity of practical knowledge of the chemical operation of one metallic oxyd on another, the fusibility of his materials, and the utmost degree of heat at which they will retain not only the accuracy of the figures which he has given, but the precise shade of colour which he intends to lay on.

Painting in enamel requires a succession of firings; first of the ground which is to receive the design, and which itself requires two firings, and then of the different parts of the design itself. The ground is laid on in the same general way as the common watch face enamelling already described. The colours are the different metallic oxyds, melted with some other vitrescent mixture, and ground to extreme fineness. These are worked up with an essential oil (that of spike is preferred, and next to it oil of lavender) to the proper consistence of oil colours, and are laid on with a very fine hair brush. The essential oil should be very pure, and the use of this, rather than any fixed oil, is probably that the whole may evaporate completely in a moderate heat, and leave no carbonaceous matter in contact with the colour when red hot, which might affect its degree of oxydation, and thence the shade of colour which it is intended to produce. As the colour of some vitrified metallic oxyds (such as that of gold) will stand only at a very moderate heat, whilst others will bear, and even require, a higher temperature to be properly fixed, it forms a great part of the technical skill of the artist to supply the different colours in proper order; fixing first those shades which are produced by the colours that will endure the highest heat, and finishing with those that demand the least heat. The outline of the design is first traced on the enamel, ground and burnt in; after which the parts are filled up gradually with repeated burnings, to the last and finest touches of the tenderest enamel.

Transparent enamels are scarcely ever laid upon any other metal than gold, on account of the discoloration produced by other metals, as already explained. If, however, copper is the metal used, it is first covered with a thin enamel coating, over which gold leaf is laid and burnt in, so that, in fact, it is still this metal that is the basis of the ornamental enamel. With regard to the vast number of important minutiæ in the selection and order of applying the colours, the management of the fire, &c. &c. almost the whole of what is known on this subject is confined to the practical artist, nor could this knowledge, if obtained, interest the general reader.

To ENA'MOUR. *v. a.* (*amour*, French.) To inflame with love; to make fond (*Dryden*).

ENA'RGEA. In botany, a genus of the class hexandria, order monogynia. Calyxless; corol six-petalled, every other petal with two glands at the base; stigma simple; berry three-celled, many-seeded; superior. One species only: a shrub indigenous to the straits of Magellan; with terminate, solitary, penduncled flowers.

ENARRA'TION. *s.* (*enarro*, Latin.) Explanation; exposition.

ENARTHRO'SIS, (*enarthrosis*, εναρθρωσις; from εν, in, and αρθρον, a joint.) The ball and socket joint. A species of diarthrosis, or moveable connexion, in which the round head of one bone is received into the deep cavity of another, so as to admit of motion in every direction; as the head of the os femoris with the acetabulum of the os innominatum. See Articulation.

ENATA'TION. *s.* (*enato*, Latin.) The act of swimming out; escape by swimming.

ENA'UNTER. *ad.* An obsolete word explained by *Spenser* himself to mean *lest that.*

To ENCA'GE. *v. a.* (from *cage.*) To shut up in a cage; to coop up; to confine (*Donne*).

ENCALY'PTA. In botany, a genus of the class cryptogamia, order musci. Capsule cylindrical; fringe simple, of linear, erect, distinct teeth; veil campanulate, inflated, lax. Six species; all common to our own country.

To ENCA'MP. *v. n.* To pitch tents; to sit down for a time in a march (*Bacon*).

To Enca'mp. *v. a.* To form an army into a regular camp; to order to encamp (*Kings*).

ENCA'MPMENT. *s.* (from *encamp.*) 1. The act of encamping or pitching tents. 2. A camp; tents pitched in order (*Grew*).

In the regulations published by authority are particularly enjoined the following.

Attentions relative to encampments. On the arrival of a brigade, or a battalion, on the ground destined for its camp, the quarter and rear guards of the respective regiments will immediately mount; and when circumstances require them, the advanced picquets will be posted. The grand guards of cavalry will be formed, and the horses picketed. The men's tents will then be pitched, and till this duty is completed, the officers are on no account to quit their troops or companies, or to employ any soldier for their own accommodation. Necessaries are to be made in the most convenient situations, and the utmost attention is required in this, and every other particular, to the cleanliness of the camp.

If circumstances will allow the ground on which a regiment is to encamp to be previously ascertained, the pioneers should make these and other essential conveniences, before the corps arrives at its encampment.

Whenever a regiment remains more than one night in a camp, regular kitchens are to be constructed. No tents, or huts, are to be allowed in front, or between the intervals of the battalions. A spot of ground for this purpose should be marked by the quarter-master, with the approbation of the commanding officer.

On arriving in a camp which is intersected by hedges, ditches, unequal or boggy ground, regiments will immediately make openings of communication, of 60 feet in width. The ground in front of the encampment is to be cleared, and every obstacle to the movement of the artillery and troops is to be removed. Commanding officers of regiments must take care that their communication with the nearest grand route is open and free from impediments.

ENCA'NTHIS. (*encanthis*, εγκανθις; from εν, in, and κανθος, the angle of the eye.) An excrescence or intumescence of the lachrymal caruncle, which is situated in the inner angle or canthus of the eye.

To ENCA'VE. *v. a.* (from *cave.*) To hide as in a cave (*Shakspeare*).

ENCAUMA. (*encauma*, εγκαυμα; from εν, in, and καιω, to burn.) *Encausis.* A pustule produced from a burn.

ENCAUSIS. (εγκαυσις, from εν, and καιω, to burn.) The cardialgia or heart-burn.

ENCAUSTIC and ENCAUSTUM, the same with enamelling and enamel. See ENAMELLING and ENAMEL.

ENCAUSTIC PAINTING, a method of painting made use of by the ancients, in which wax was employed to give a gloss to their colours, and to preserve them from the injuries of the air.

This ancient art, after having been long lost, was restored by count Caylus, a member of the Academy of Inscriptions in France; and the method of painting in wax was announced to the Academy of Painting and Belles Lettres, in the year 1753; though M. Bachelier, the author of a treatise De l'Histoire et du Secret de la Peinture en Cire, had actually painted a picture in wax in 1749; and he was the first who communicated to the public the method of performing the operation of inustion, which is the principal characteristic of the encaustic painting. The count kept his method a secret for some time, contenting himself with exhibiting a picture at the Louvre in 1754, representing the head of Minerva, painted in the manner of the ancients, which excited the curiosity of the public, and was very much admired. In the interval of suspense, several attempts were made to recover the ancient method of painting. The first scheme adopted was that of melting wax and oil of turpentine together, and using this composition as a vehicle for mixing and laying on the colours. But this method did not explain Pliny's meaning, as the wax is not burnt in this way of managing it. In another attempt, which was much more agreeable to the historian's description of encaustic painting, the wax was melted with strong lixivium of salt of tartar, and with this the colours were ground. When the picture was finished, it was gradually presented to the fire, so as to melt the wax; which was thus diffused through all the particles of the colours, so that they were fixed to the ground, and secured from the access of air or moisture. But the method of count Caylus is much more simple: the cloth or wood which he designed for the basis of his picture is waxed over, by only rubbing it simply with a piece of bees-wax; the wood or cloth, stretched on a frame, being held horizontally over, or perpendicularly before, a fire, at such a distance, that the wax might gradually melt, whilst it is rubbed on, diffuse itself, penetrate the body, and fill the interstices of the texture of the cloth, which, when cool, is fit to paint upon; but as water colours, or those that are mixed up with common water, will not adhere to the wax, the whole picture is to be first rubbed over with Spanish chalk or white, and then colours are applied to it; when the picture is dry, it is put near the fire, whereby the wax melts and absorbs all the colours.

Mr. J. H. Muntz, in a treatise on this subject, has proposed several improvements in the art of encaustic. When the painting is on cloth, he directs it to be prepared by stretching it on a frame, and rubbing one side several times over with a piece of bees-wax, or virgin-wax, till it is covered with a coat of wax of considerable thickness. In fine linen this is the only operation necessary previous to painting; but coarse cloth must be rubbed gently on the unwaxed side with a pumice-stone, to take off all those knots which would prevent the free and accurate working of the pencil. Then the subject is to be painted on the unwaxed side with colours prepared and tempered with water; and when the picture is finished it must be brought near the fire, that the wax may melt and fix the colours. This method, however, can only be applied to cloth or paper, through the substance of which the wax may pass; but in wood, stone, metals or plaster, the former method of count Caylus must be observed.

Mr. Muntz has also discovered a method of forming grounds for painting with crayons, and fixing these, as well as water-colours, employed with the pencil. On the unwaxed side of a linen cloth, stretched and waxed as before, lay an even and thick coat of the colour proper for the ground; having prepared this colour by mixing some proper pigment with an equal quantity of chalk, and tempering them with water. When the colour is dry, bring the picture to the fire that the wax may melt, pass through the cloth, and fix the ground. An additional quantity of wax may be applied to the back of the picture, if that which was first rubbed on should not be sufficient for the body of colour; but as this must be laid on without heat, the wax should be dissolved in oil of turpentine, and applied with a brush, and the canvas be again exposed to the fire, that the fresh supply of wax may pass through the cloth, and be absorbed by the colour; and thus a firm and good body will be formed for working on with the crayons. If cloth and paper are joined together, the cloth must be first fixed to the straining frame, and then the paper must be pasted to it with a composition of paste made with wheaten flour, or starch, and water, and about a twelfth part of its weight of common turpentine. The turpentine must be added to the paste when it is almost sufficiently boiled, and the composition well stirred, and left to simmer over the fire for five or six minutes; let wax be dissolved in oil of turpentine to the consistence of a thin paste; and when the cloth and paper are dry, let them be held near a fire; and with a brush lay a coat of the wax and turpentine on both sides the joined cloth and paper, to such a degree of thickness, that both surfaces may shine throughout without any appearance of dull spots. Then expose the cloth to the fire or to the sun; by which means the oil will evaporate, and the wax become solid, and be fit to receive any composition of colour proper for a ground, which is to be laid on as above directed in the case of cloth without paper.

Almost all the colours that are used in oil-painting may be also applied in the encaustic method. Mr. Muntz objects, indeed, to brown, light pink, and unburnt terra di Sienna; because these, on account of their gummy or stony texture, will not admit such a cohesion with the wax as will properly fix them; but other colours which cannot be admitted in oil-painting, as red lead, red orpiment, crystals of verdigris, and red precipitate of mercury, may be used here. The crayons used in encaustic painting are the same with those used in the common way of crayon painting, excepting those that in their composition are too tenacious; and the method of using them is the same in both cases.

The encaustic painting has many peculiar advantages: though the colours have not the natural varnish or shining which they acquire with oil, they have all the strength of paintings in oil, and all the airiness of water-colours, without partaking of the apparent character or defects of either; they may be looked at in any light and in any situation, without any false glare: the colours are firm, and will bear washing; and a picture, after having been smoked, and then exposed to the dew, becomes as clean as if it had been but just painted. It may also be retouched at pleasure, without any detriment to the colours; for the new colours will unite with the old ones, without spots, as is the case in common size-painting; nor is it necessary to rub the places to be retouched with oil as in oil-pictures; it is not liable to crack, and easily repaired, if it should chance to suffer any injury. The duration of this painting is also a very material advantage; the colours are not liable to fade or change; no damp can affect them, nor any corrosive substance injure them; nor can the colour fall off in shivers from the canvas. However, notwithstanding all these and other advantages enumerated by the abbé Mazeas and Mr. Muntz, this art has not yet been much practised. Many of these properties belong to a much higher species of encaustic painting afterwards discovered in England, the colours of which are fixed by a very intense heat; nor are the colours or grounds on which they are laid liable to be dissolved or corroded by any chemical menstruum; nor, like the glassy colours of enamel, to run out of the drawing on the fire. This method is described in the second part of the xlixth volume of the Philosophical Transactions, N° 100. Yet, notwithstanding the ingenuity of this communication, we find the ancient or some similar method of painting in wax remained a desideratum upwards of twenty-five years; and till, in 1787, a method was communicated to the Society of Arts by Miss Greenland. The ground of her information she received at Florence, through the acquaintance of an amateur of painting, who procured her the satisfaction of seeing some paintings in the ancient Grecian style, executed by signora Parenti, a professor at that place, who had been instructed by a jesuit at Pavia, the person who made the farthest discoveries in that art. Miss Greenland's friend, knowing she was fond of painting, informed her what were the materials the paintress used, but could not tell her the proportions of the composition; however, from her anxiety to succeed in such an acquisition, she made various experiments, and at last obtained such a sufficient knowledge of the quantities of the different ingredients as to begin and finish a picture, which she afterwards presented to the Society for their inspection.

Her method is as follows: "Take an ounce of white wax, and the same weight of gum mastich powdered. Put the wax in a glazed earthen vessel over a very slow fire; and when it is quite dissolved, strew in the mastich, a little at a time, stirring the wax continually until the whole quantity of gum is perfectly melted and incorporated: then throw the paste into cold water; and when it is hard, take it out of the water, wipe it dry, and beat it in one of Mr. Wedgwood's mortars, observing to pound it at first in a linen cloth to absorb some drops of water that will remain in the paste, and would prevent the possibility of reducing it to a powder, which must be so fine as to pass through a thick gauze. It should be pounded in a cold place, and but a little while at a time, as after long beating the friction will in a degree soften the wax and gum, and instead of their becoming a powder they will return to a paste.

"Make strong gum arabic water, and when you paint, take a little of the powder, some colour, and mix them together with the gum water. Light colours require but a small quantity of the powder, but more of it must be put in proportion to the body and darkness of the colours; and to black there should be almost as much of the powder as colour.

"Having mixed the colours, and no more than can be used before they grow dry, paint with fair water, as is practised in painting with water colours, a ground on the wood being first painted of some proper colour prepared in the same manner as is described for the picture; walnut-tree and oak are the sorts of wood commonly made use of in Italy for this purpose. The painting should be very highly finished; otherwise, when varnished, the tints will not appear united.

"When the painting is quite dry, with rather a hard brush, passing it one way, varnish it with white wax, which is put into an earthen vessel, and kept melted over a very slow fire till the picture is varnished, taking great care that the wax does not boil. Afterwards hold the picture before a fire, near enough to melt the wax, but not to make it rum; and when the varnish is entirely cold and hard, rub it gently with a linen cloth. Should the varnish blister, warm the picture again very slowly, and the bubbles will subside. When the picture is dirty, it need only be washed with cold water."

The opinion given by the Society upon the above is. The method made use of by Miss Greenland provides against all inconveniences; and the brilliancy of the colours in the picture painted by her, and exhibited to the Society, fully justifies the opinion, that the art of painting in wax, as above described, highly merited the reward of a gold palette voted to her on this occasion.

Another lady, Mrs. C. J. Hooker, of Rottingdean near Brighton, laid before the Society of Arts, in 1807, the following method of preparing and applying a composition for painting in imitation of the ancient encaustic painting.

"Put into a glazed earthen vessel four ounces and a half of gum arabic, and eight ounces (or half a pint wine measure) of cold spring water; when the gum is dissolved, stir in seven ounces of gum-mastich, which has been washed, dried, picked, and beaten fine. Set the earthen vessel containing the gum-water, and gum-mastich, over a slow fire, continually stirring and beating them hard with a spoon, in order to dissolve the gum-mastich: when sufficiently boiled, it will no longer appear transparent, but will become opaque, and stiff, like a paste. As soon as this is the case, and that the gum-water and mastich are quite boiling, without taking them off the fire, add five ounces of white wax, broken into small pieces, stirring and beating the different ingredients together, till the wax is perfectly melted and has boiled. Then take the composition off the fire, as boiling it longer than necessary would only harden the wax, and prevent its mixing so well afterwards with water. When the composition is taken off the fire, and in the glazed earthen vessel, it should be beaten hard, and whilst hot (but not boiling) mix with it by degrees a pint (wine measure) or sixteen ounces more of cold spring water, then strain the composition, as some dirt will boil out of the gum-mastich, and put it into bottles: the composition, if properly made, should be like a cream, and the colours when mixed with it as smooth as with oil. The method of using it is to mix with the composition, upon an earthen palette, such colours in powder as are used in painting with oil, and such a quantity of the composition, to be mixed with the colours as to render them of the usual consistency of oil colours; then paint with fair water. The colours when mixed with the composition may be laid on either thick or thin, as may best suit your subject, on which account, this composition is very advantageous, where any particular transparency of colouring is required; but in most cases it answers best, if the colours be laid on thick, and they require the same use of the brush as if painting with body colours, and the same brushes as used in oil painting. The colours, if grown dry, when mixed with the composition, may be used by putting a little fair water over them; but it is less trouble to put some water when the colours are observed to be growing dry. In painting with this composition the colours blend without difficulty when wet, and even when dry the tints may easily be united by means of a brush and a very small quantity of fair water. When the painting is finished, put some white wax into a glazed earthen vessel over a slow fire, and when melted, but not boiling, with a hard brush cover the painting with the wax; and when cold take a moderately hot iron, such as is used for ironing linen, and so cold as not to hiss, if touched with any thing wet, and draw it lightly over the wax. The painting will appear as if under a cloud till the wax is perfectly cold, as also whatever the picture is painted upon is quite cold: but if, when so, the painting should not appear sufficiently clear, it may be held before the fire, so far from it as to melt the wax but slowly; or the wax may be melted by holding a hot poker at such a distance as to melt it gently, especially such parts of the picture as should not appear sufficiently transparent or brilliant; for the oftener heat is applied to the picture, the greater will be the transparency and brilliancy of colouring; but the contrary effect would be produced if too sudden or too great a degree of heat was applied, or for too long a time, as it would draw the wax too much to the surface, and might likewise crack the paint. Should the coat of wax put over the painting when finished appear in any part uneven, it may be remedied by drawing a moderately hot iron over it again as before mentioned, or even by scraping the wax with a knife: and should the wax by too great or too long an application of heat form into bubbles at particular places, by applying a poker heated, or even a tobacco-pipe made hot, the bubbles would subside; or such defects may be removed by drawing any thing hard over the wax, which would close any small cavities.

"When the picture is cold, rub it with a fine linen cloth. Paintings may be executed in this manner upon wood (having first pieces of wood let in behind, across the grain of the wood, to prevent its warping), canvas, card, or plaster of Paris. The plaster of Paris would require no other preparation than mixing some fine plaster of Paris in powder with cold water the thickness of a cream; then put it on a looking-glass, having first made a frame of bees-wax on the looking-glass the form and thickness you would wish the plaster of Paris to be of, and when dry take it off, and there will be a very smooth surface to paint upon. Wood and canvas are best covered with some gray tint mixed with the same composition of gum-arabic, gum-mastich, and wax, and of the same sort of colours as before mentioned, before the design is begun, in order to cover the grain of the wood or the threads of the canvas. Paintings may also be done in the same manner with only gum-water and gum-mastich, prepared the same way as the mastich and wax; but instead of putting seven ounces of mastich, and when boiling, adding five ounces of wax, mix twelve ounces of gum-mastich with the gum-water, prepared as mentioned in the first part of this receipt: before it is put on the fire, and when sufficiently boiled and beaten, and is a little cold, stir in by degrees twelve ounces, or three quarters of a pint (wine measure) of cold spring water, and afterwards strain it. It would be equally practicable painting with wax alone, dissolved in gum-water in the following manner. Take twelve ounces, or three quarters of a pint, wine measure, of cold spring water, and four ounces and a half of gum-arabic; put them into a glazed earthen vessel, and when the gum is dissolved, add eight ounces of white wax. Put the earthen vessel with the gum-water and wax upon a slow fire, and stir them till the wax is dissolved and has boiled a few minutes: then take them off the fire and throw them into a bason, as by remaining in the hot earthen vessel the wax would become rather hard; beat the gum-water and wax till quite cold. As there is but a small proportion of water, in comparison to the quantity of gum and wax, it would be necessary in mixing this composition with the colours, to put also some fair water. Should the composition be so made as to occasion the ingredients to separate in the bottle, it will become equally serviceable if shaken before used to mix with the colours.

"I had lately an opportunity of discovering that the composition which had remained in a bottle since the year 1792, in which time it had grown dry and become as solid a substance as wax, returned to a cream-like consistence and became again in as proper a state to mix with colours as when it was first made, by putting a little cold water upon it, and suffering it to remain on a short time. I also lately found some of the mixture composed of only gum-arabic water and gum-mastich, of which I sent a specimen to the Society of Arts in 1792; it was become dry, and had much the appearance and consistency of horn. I found, on letting some cold water remain over it, that it became as fit for painting with as when the composition was first prepared."

ENCEINTE, in fortification, the wall or rampart which surrounds a place, sometimes composed of bastions or curtains, either faced or lined with brick or stone, or only made of earth. The enceinte is sometimes only flanked by round or square towers, which is called Roman wall.

ENCEPHALI. An obsolete term in medicine, to signify worms supposed to have been generated in the brain, causing great pain and distraction. The old writers state these worms or larves to have been very rare, but to have swarmed in some diseases, and to have produced pestilential fevers. Upon the dissection of one who died of this fever, a little, short, red worm was pretended to have been found in the head, which Malmsey wine, wherein horse-radish had been boiled, could only destroy. This medicine was afterwards tried on the sick, most of whom we are told it cured.

The like worms have also we are told been taken out by trepanning, and the patient cured. Those worms that generate in the nose, ears, and teeth, are also called encephali. The whole assertion is now justly exploded.

ENCEPHALON, (*encephalon*, εγκεφαλον; from εν, in, and κεφαλη, the head.) Encephalum. By some writers the cerebrum only is so called; while others express by this term the whole contents of the cranium.

To ENCHA'FE. *v. a.* (*eschauffer*, French.) To enrage; to irritate; to provoke (*Shakspeare*).

To ENCHA'IN. *v. a.* (*enchainer*, French.) 1. To fasten with a chain; to hold in chains; to bind; to hold in bondage (*Dryden*). 2. To link together; to concatenate (*Howel*).

To ENCHA'NT. *v. a.* (*enchanter*, Fr.) 1. To give efficacy to any thing by songs of sorcery (*Granville*). 2. To subdue by charms or spells (*Sidney*). 3. To delight in a high degree (*Pope*).

ENCHA'NTER. *s.* (*enchanteur*, French.) A magician; a sorcerer (*D. of Piety*).

ENCHA'NTINGLY. *ad.* (from *enchant.*) With the force of enchantment (*Shakspeare*).

ENCHA'NTMENT. *s.* (*enchantement*, Fr.) 1. Magical charms; spells; incantation (*Knolles*). 2. Irresistible influence; over-powering delight (*Pope*).

ENCHA'NTRESS. *s.* (*enchanteresse*, Fr.) 1. A sorceress; a woman versed in magical arts (*Tatler*). 2. A woman whose beauty or excellencies give irresistible influence (*Thomson*).

To ENCHA'SE. *v. a.* (*enchasser*, French.) 1. To infix; to inclose in any body so as to be held fast, but not concealed (*Felton*). 2. To adorn by being fixed upon it (*Dryden*). 3. To adorn by raised work (*Ben Jonson*).

ENCHASING, INCHASING, or CHASING, the art of enriching and beautifying gold, silver, and other metal-work, by some figures represented thereon, in low relievo.

Enchasing is practised only on hollow thin works, as watch-cases, cane-heads, tweezer-cases, &c. It is performed by punching or driving out the metal, to form the figure from within-side, so as to stand out prominent from the plane or surface of the metal. In order to do this, they provide a number of fine steel-blocks, or puncheons, of divers sizes; and the design being drawn on the surface of the metal, they apply the inside upon the heads or tops of these blocks, directly under the lines or parts of the figures; then, with a fine hammer striking on the metal, sustained by the block, the metal yields, and the block makes an indenture, or cavity, on the inside, corresponding to which there is a prominence on the outside, which is to stand for that part of the figure.

Thus the workman proceeds to chase and finish all the parts by successive application of the block and hammer to the several parts of the design; and it is surprising to consider with what beauty and justness, by this simple piece of mechanism, the artists in this kind will represent foliages, grotesques, animals, histories, &c.

ENCHE'ASON. *s.* (*encheson*, old law Fr.) Cause; occasion (*Spenser*).

ENCHELIS. In zoology, a genus of the class vermes, order infusoria. Worm invisible to the naked eye, very simple, cylindrical. Fifteen species; generally found in stagnant water, putrid water, or that has been kept several days, and in marshes: yet two or three in dunghills; and one, e. fusus, in pure water, with a cylindrical body, narrow and truncate at both extremities, slow in motion, with a longitudinal slightly-curved intestine, filled with a bluish fluid and blackish molecules.

ENCHORIC. ENCHORIOUS. (εγχωριος, from εν, in, and χωρος, a place.) Endemic: peculiar to a country.

To ENCI'RCLE. *v. a.* (from *circle.*) To surround; to environ; to enclose in a ring (*Pope*).

ENCI'RCLET. *s.* (from *circle.*) A circle; a ring (*Sidney*).

ENCLITICA, of εγκλινω, I incline, in the Greek and Latin grammar, certain particles, united so closely to the preceding word, that they only seem to form one word; while the word which sustains them generally likewise bear the accent that governs them, especially when the enclitic is a monosyllable; as in dominusque, κυριοστε.

There are three enclitic particles in the Latin, viz. *que*, *ne*, and *ve*; but in the Greek many, as του, μου, μοι, με, σου, σοι, σε, ϖως, ϖη, τε, γε, φημι, ειμι, ποτε, and others.

To ENCLO'SE. *v. a.* (*enclos*, French.) 1. To part from things or grounds common by a fence (*Hay.*). 2. To environ; to encircle; to surround; to encompass; to include (*Pope*).

ENCLO'SER. *s.* (from *enclose.*) 1. One that encloses or separates common fields into several distinct properties (*Herbert*). 2. Any thing in which another is enclosed.

ENCLO'SURE. *s.* (from *enclose.*) 1. The act of enclosing or environing any thing (*Wilkins*). 2 The separation of common grounds into distinct possessions (*Hayward*). 3. The appropriation of things common (*Taylor*). 4. State of being shut up in any place (*Burnet*). 5. The space enclosed (*Addison*). 6. Several; ground enclosed; ground separated from the common (*South*).

ENCLYSMA. (εγκλυσμα; from εν, and κλυζω, to cleanse out.) A clyster.

ENCO'MIAST. *s.* (εγκωμιαστης.) A panegyrist; a proclaimer of praise: a praiser (*Locke*).

ENCOMIA'STICAL. Encomia'stic. *a.* (εγκωμιαστικος.) Panegyrical; laudatory; containing praise; bestowing praise.

ENCO'MIUM. *s.* (εγκωμιον.) Panegyrick; praise; elogy (*Gov. of the Tongue*).

To ENCO'MPASS. *v. a.* (from *compass.*) 1. To enclose; to encircle (*Shakspeare*). 2. To shut in; to surround; to environ (*Shakspeare*). 3. To go round any place.

ENCO'MPASSMENT. *s.* (from *encompass.*) Circumlocution; remote tendency of talk.

ENCO'RE. *ad.* (Fr.) Again; once more (*Pope*).

ENCO'UNTER. *s.* (*encontre*, French.) 1. Duel; single fight; conflict (*Dryden*). 2. Battle; fight in which enemies rush against each other (*Milton*). 3. Eager and warm conversation, either of love or anger (*Shakspeare*). 4. Accidental congress; sudden meeting (*Pope*). 5. Unexpected address (*Shakspeare*). 6. Casual incident; occasion (*Pope*).

To Enco'unter. *v. a.* (from the noun.) 1. To meet face to face; to front (*Shakspeare*). 2. To meet in a hostile manner; to rush against in conflict (*Knolles*). 3. To meet with reciprocal kindness (*Shakspeare*). 4. To attack; to meet in the front (*Tillotson*). 5. To oppose; to oppugn (*Hale*). 6. To meet by accident (*Shakspeare*).

To Enco'unter. *v. n.* 1. To rush together in a hostile manner; to conflict (*Shakspeare*). 2. To engage; to fight (*Knolles*). 3. To meet face to face. 4. To come together by chance.

ENCO'UNTERER. *s.* (from *encounter.*) 1. Opponent; antagonist; enemy (*More*). 2. One that loves to accost others (*Shakspeare*).

To ENCO'URAGE. *v. a.* (*encourager*, Fr.) 1. To animate; to incite to any thing (*Psal.*). 2. To give courage to; to support the spirits; to embolden (*K. Charles*). 3. To raise confidence; to make confident (*Locke*).

ENCO'URAGEMENT. *s.* (from *encourage.*) 1. Incitement to any action or practice. 2. Increase of confidence (*Philips*). 3. Favour; countenance; support (*Otway*).

ENCOU'RAGER. *s.* (from *encourage.*) One that supplies incitements to any thing; a favourer (*Dryden*).

ENCRA'NIUM. (εγκρανιον; from εν, within, and κρανιον, the scull.) The cerebellum: the whole contents of the scull.

ENCRATITES, or Continentes, in church-history, a sect of Christians who appeared towards the end of the second century, and gloried in abstaining from marriage and the use of wine.

ENCRINITE. Encrinus. In oryctology. See Helmintholithus.

To ENCRO'ACH. *v. a.* (*accrocher*, from *croc*, a hook, French.) 1. To make invasions upon the right of another; to put a hook into another man's possessions to draw them away (*Spenser*). 2. To advance gradually and by stealth upon that to which one has no right (*Herbert*).

To Encro'ach. *v. n.* 1. To creep on gradually without right (*Hooker*). 2. To pass bounds (*Milton*).

ENCRO'ACHER. *s.* (from *encroach.*) 1. One who seizes the possession of another by gradual and silent means (*Swift*). 2. One who makes slow and gradual advances beyond his rights (*Clarissa*).

ENCRO'ACHMENT. *s.* (from *encroach.*) 1. An unlawful gathering in upon another man (*Cowell. Milton*). 2. Advance into the territories or rights of another (*Addison*).

To ENCU'MBER. *v. a.* (*encombre*, Fr.) 1. To clog; to load; to impede (*Hooker*). 2. To entangle; to embarrass (*Dryden*). 3. To load with debts.

ENCU'MBRANCE. *s.* (from *encumber.*) 1. Clog; load; impediment (*Temple*). 2. Excrescence; useless addition (*Thomson*). 3. Burden upon an estate (*Ayliffe*).

ENCY'CLICAL. *a.* (εγκυκλιος.) Circular; sent round through a large region (*Stilling.*).

ENCYCLOPÆDIA, a term nearly synonymous with cyclopædia, but adopted in preference to it by most editors of general dictionaries. According to the late learned printer, Mr. Bowyer, the preposition en makes the meaning of the word more precise. For *cyclopædia* may denote the instruction of a circle, and to make the sense complete must imply the expression *in the form*; i. e. "knowledge in the form of a circle." Whereas in *encyclopædia*, the preposition determines the word to be from the dative of *cyclus*, instruction in a circle. And Vossius, in his book, De vitiis sermonis, has observed, that *cyclopædia* is used by some authors, but *encylopædia* by the best.

The following concise but interesting history of general dictionaries we extract from a contemporary periodical publication.

A dictionary, in its original sense, is a collection of words arranged alphabetically, to assist the researches of those who are studying a new language, or to explain the mythology, customs, geography, and biography, of those to whom that language is common. This is all that was aimed at by Hesychius and by Suidas, in their respective lexicons; the former of which was composed about the end probably of the fourth century, and first printed at Venice in 1514; the latter, it is commonly supposed, was written in the twelfth century, and was printed at Milan, as early as 1499. In 1573, a dictionary of science appeared under this title, Λεξικον, seu Dictionarium mathematicorum, in quo definitiones et divisiones continentur scientiarum mathematicarum arithmeticæ, &c. M. Conrado Dasypodio, authore: a very remarkable book for the time in which it was published, and of which a new edition appeared at Strasburg in 1579. The two Stephani compiled dictionaries of words only; a class of publications which naturally abounded, soon after the revival of letters, and especially in the 16th century. The Medical Dictionary of H. Stephanus is confined to the explanation of the language of Hippocrates and Galen. Cooper's Latin Thesaurus was published in 1587. The first work we have seen under the title of Encyclopædia, is J. H. Alstedii Encyclopædia, which was published in 1632, in 2 vols. folio: an elaborate performance, which was followed in 1657, by Erhardi Weigelii Idea Encyclopædiæ Mathematico-philosophicæ, a work not superlatively interesting, even for that period. Hoffman, whose Lexicon Universale Historicum Sacrum et Profanum, was published in four folio volumes, at Basle, in 1677, chiefly expanded the geography, mythology, and ancient history of the Jews, Greeks, and Romans, from the Dictionary of Lloyd, published in 1659. We need not dwell on the Lexicon of Pitiscus, of Du Cange and Charpentier, of d'Herbelot, nor upon the Dictionnaire Mathematique of Ozanam, nor the Thesaurus of Hickes. The next important step was made by Dr. Harris, in his Lexicum Technicum, published, the first volume in 1704, the second in 1710. This is the earliest English work, which assumes to good purpose the systematic form of a General Dictionary, and attempts to allot to each article its comparative portion in the scale of human knowledge. It is, altogether, a very valuable performance; and may even now be advantageously consulted, on various topics which have been neglected by later lexicographers. The author possessed very considerable general knowledge; but his attainments as a mathematician and philosopher were most conspicuous. His judicious labours much facilitated the progress of all who followed in the same department, for the next half century; though, with a mean reserve of which most of them are guilty, they seldom venture to acknowledge their obligations to him. It is indeed truly extraordinary, that Dr. Harris's name does not occur either in Bayle, in the General Dictionary, in the Biographia Britannica, nor even in the Mathematical and Philosophical Dictionary of Hutton; though he was much too far removed from the authors of the two last publications, to leave any room for the operation of jealousy. To the fifth edition of Harris's Lexicon, in 1736, a supplement was added: the aim of its compilers was rather to supply the omissions in other branches of science than in mathematics and philosophy, which had made, however, an immense progress from 1704 to that time.

Various Dictionaries were published between Harris's Lexicon, and the Cyclopædia of Chambers: such, for example, as the Great Dictionary of the French academy, the Dictionary of the Jesuits of Trevoux, the Chemical Dictionary of Johnson, the Medical ones of Blanchard, and Castellus, the Mathematical Dictionaries of Stone and Wolfius, the Sea Dictionary of Mainwaring, the Dictionary of the Bible by Calmet, the Lexicon Philosophicum of Chauvin, the Lexicon of J. Burkard Menkens, published at Leipsic in 1715, Jablonski's Lexicon, in 1721, and Collier's Great Historical Dictionary, begun in 1694, and finished in 1727. Chauvin's Lexicon is, indeed, a work of importance. It contains some very correct diagrams, and a good illustration of philosophy, so far as the ancients were acquainted with it. The view of the mathematical science of the ancients, which it exhibits, is very interesting. It is sadly contaminated with the jargon of the schools; and those parts of it, which are in this respect objectionable, have been transcribed by later writers with a most disgraceful servility.

The first edition of Chambers's Cyclopædia made its appearance in folio, in 1727. Such was the excellence of its plan and the general correctness of its execution, that the public demand occasioned a second edition to be published in 1738, a third in 1739, a fourth in 1741, and a fifth in 1746. This unprecedented success induced the proprietors to engage Mr. G. L. Scott and Dr. Hill to prepare a Supplement to the sixth edition, which was accordingly published in two additional volumes. The seventh edition, completed in 1786, in four thick folio volumes, removed the disadvantage of the double alphabets, by incorporating them into one. The editor of this edition was Dr. Abraham Rees, a gentleman every way qualified for the task he had undertaken, and who, with the assistance of Dr. Price, and other eminent men, rendered this work by far the most useful of the kind which had been published, the pride of booksellers, and an honour to the literature and science of this country. We must not omit to mention, that Mr. Chambers himself was much more than a mere compiler: he was a man of very considerable erudition, of correct taste, and of vigorous intellect. We consider the preface to his Dictionary as one of the finest specimens of sound reasoning and comprehensive thinking which have ever appeared in any language.

From this period, dictionaries devoted to arts and sciences, as well as general dictionaries, comprising the whole circle of arts and sciences, have increased very rapidly both in number and importance. Though we shall not attempt to embody the shadows of a shade, or to swell this account into a catalogue, yet we cannot forbear mentioning the Medical Dictionaries of Motherby, Quincy, James, Turton, and the Edinburgh Dictionary; the Chemical Dictionaries of Macquer, Nicholson, and the Aikins; the Dictionaries of Gusseme and Rasches, on Numismatology; those of Miller, Martyn, and Dickson, on Gardening; those of Burn, Cunningham, and Jacob, since edited by Tomlins, on Law; the Marine Dictionaries of Chapman and Falconer; the Builder's Magazine, and Felibien's Dictionary of Architecture: Jombert's Dictionnaire de l'Engenieur et de l'Artilleur, and James's Military Dictionary; Pilkington's Dictionary of Painters; Mortimer's and Postlethwaite's Dictionaries of Trade and Commerce; Rousseau's, Hoyle's, and Busby's Dictionaries of Music; the Mathematical and Philosophical Dictionary of Dr. Hutton, and the Dictionnaire de Physique of M. Libes. The diligence exerted by the authors of these and a few other dictionaries appropriated to separate branches of science, and by the editors of encyclopædias, has operated reciprocally to improve both; and hence it has happened, that many both of particular and general dictionaries, published during the last fifty years, have greatly contributed to the improvement and diffusion of human knowledge.

The labours of the continental encyclopædists, during this period, have been too important to be omitted in this survey. Among the works of the Germans, we may specify the Universal Lexicon of Ludwig, published in 1732—1750, in 64 volumes; the Œkonomische Encyclopädie, by Krünitz, in 1773: the Encyclopädia der Historischen, Philosophiscen, und Mathematischen Wissenchaften, by Büsch, in 1775, and 1795; Klügel's Encyclopädie, in 1782 and 1784; and the Encyclopädie aller Mathematischen Wissenschaften, ihrer Geschichte und Litteratur, by Rosenthal, in 1790. To these may be added, the Swedish Encyclopædia, published at Stockholm, by Giorwell, in 1785; and the Enciclopedia Italiana ovvero Bibliotheca universale della umane cognizioni, published at Naples in 1788.

Our neighbours the French, also, have the Dictionnaire universel de Mathematiques et de Physique, by M. Savérien, in 1753; the Encyclopedie, ou Dictionnaire raisonné des Sciences, des Arts, et des Metiers, by Diderot, D'Alembert, &c. in 1751—1757; the Dictionnaire Portatif, in 1760; the Dictionnaire de Physique Portatif, in 1763; the new edition of the Encyclopedie, by Diderot, &c. in 39 volumes, in 1768—1779; and the Encyclopedie Methodique, by D'Alembert, Bossut, Condorcet, Lalande, &c. which commenced in 1785, and consists of separate alphabets or dictionaries for the respective arts and sciences. Of the two last and most celebrated of these works, it is almost unnecessary for us to say, that their authors made them the vehicles of artful, insidious attacks upon revealed religion, and established governments. But, alas! these generous and enlightened philanthropists, who laboured so diligently for the perfection of the human species by trying to persuade them that they were not superior, either in essential nature, or ultimate destiny, to dogs or sheep, were persecuted!—for so we are told by one of the fraternity. Diderot, it seems, hoped—"à travers une multitude inevitable d'articles insignificans, faire passer quelques traits utiles aux progrés de la raison, qui seraient facilemente démêlés par les esprits préparés pour les saisir, et qui échapperaient aux regards de la sottise. Son espérance ne fut pas réalisée: la sottise a, pour la défense de son empire, les yeux beaucoup plus perçans qu'on ne croit, et sut prévoir le coup que la philosophie allait lui porter. La persécution commença des lors contre les philosophes, qui reçurent le nom d'Encyclopédistes; et la persécution compte sur un succés, quand elle a trouvé un nom pour designer ses victimes." (*Lacroix sur L'Enseign*).

We must now glance rapidly at the labours of British encyclopædists since the time of Chambers: passing over the productions of Owen, Proctor, Castieau, Hall, Howard, and Kendal, with a mere notice of their names; the only one of which that we do not feel desirous to forget is Owen. We must however mention, with commendation, the Dictionary of Arts and Sciences published in 1766, by Crowder, in 3 vols. 4to. The editors were, Rev. J. Scott, Trinity College, Cambridge; Mr. Charles Green, of the royal observatory, Greenwich; Mr. James Meader; and Falconer, the unfortunate author of the Shipwreck. This is a truly respectable performance, both as to substance and appearance; the plates are well executed; and those, especially, on which the signs of the zodiac are delineated, are superior to any we have seen in a Dictionary.

The work just mentioned, however, is far inferior to Chambers, who has hitherto had no such formidable rival in Britain as the Encyclopædia Britannica, published at Edinburgh, first we believe in 1768, in 10 vols. 4to. This was also, as far as we have been able to learn, the earliest work that attempted the innovation of incorporating systems or treatises with the usual articles in the alphabetical arrangement. The third edition of this encyclopædia, superintended by Dr. Gleig, was finished in 1800; the whole, including a Supplement of 2 vols., being comprised in twenty quarto volumes. It contains, beside the general matters treated in Chambers's Dictionary, the additional subjects of biography, history, and geography. It is a publication, in many respects, of considerable excellence. It commonly explains the principles and practices in the various sciences and arts with great perspicuity and correctness. Its theology is generally sound; and its politics apparently the result of honest conviction, though often delivered in the intemperate tone which marked most political disquisitions ten years ago. Many of the treatises it contains were drawn up by some of the most eminent Scotch professors; those especially which were written by the late Dr. Robison, though composed in the desultory manner which characterises all the productions of that distinguished philosopher, stamp a particular value upon the work in which they are found, and render it decidedly superior in all points connected with the physical sciences to any other encyclopædia yet published in Britain. We are sorry to add, that the style of the engravings, which is truly execrable, puts it completely out of our power to say that this dictionary is elegant as well as useful.

The English Encyclopædia was completed in 10 vols. 4to. in 1803. The names of its conductors are not mentioned; but they are commonly understood to have been Dr. Aikin and Mr. Houlston. Its general plan is much like that of the Encyclopædia Britannica; but its execution no where superior, except in the engraving, and the departments of biography and geography. The readers of this publication, however, will not be disgusted with tedious descriptions of obscure towns and villages, with minute histories of fabulous heroes and divinities, or with tiresome and uninteresting biography. The plates possess a striking superiority over those of any preceding encyclopædia. (*Eclectic Review*).

Such is the general diffusion of knowledge in this country, and so prevalent is the desire to possess a library in one work, that beside two General Dictionaries just finished, no less than six others are now in course of publication, viz. The Encyclopædia Londinensis, a new edition of the Encyclopædia Perthensis, Brewster's Edinburgh Encyclopædia, our own work the Pantologia, a new edition of the Encyclopædia Britannica, and Dr. Rees's New Cyclopædia. Of the comparative merits of these works it would not become us to speak: we are not writing as reviewers but as historians.

ENCY'STED. *a.* (κυστις.) Enclosed in a vesicle or bag (*Sharp*).

END. *s.* (enꝺ, Saxon.) 1. The extremity of the length of any thing materially extended (*Locke*). 2. Extremity or last part in general (*Locke*). 3. The last particle of any assignable duration (*Donne*). 4. The conclusion or cessation of any action (*Genesis*). 5. Ultimate state; final doom (*Psalms*). 6. The point beyond which no progression can be made (*Psalms.*) 7. Final determination; conclusion of debate or deliberation (*Shakspeare*). 8. Death; fate; decease (*Roscommon*). 9. Cessation; period (*Matthew*). 10. Limit; termination (*Nahum*). 11. Abolition; total loss (*Locke*). 12. Cause of death; destroyer (*Shakspeare*). 13. Consequence; conclusive event (*Shakspeare*). 14. Fragment; broken piece (*Shakspeare*). 15. Purpose; intention (*Clarendon*). 16. Thing intended; final design (*Suckling*). 17. *On* End. Upright; erect: as, his hair stands *on end*.

To End. *v. a.* (from the noun.) 1. To terminate; to conclude; to finish. 2. To destroy; to put to death (*Shakspeare*).

To End. *v. n.* 1. To come to an end; to be finished (*Fairfax*). 2. To terminate; to conclude (*Taylor*). 3. To cease; to fail (*Locke*).

End-nicked, in botany. See Emarginate.

To ENDA'MAGE. *v. n.* (from *damage.*) To mischief; to prejudice; to harm (*South*).

To ENDA'NGER. *v. a.* (from *danger.*) 1. To put into hazard; to bring into peril (*Til.*). 2. To incur the danger of; to hazard (*Bacon*).

To ENDE'AR. *v. a.* (from *dear.*) To make dear; to make beloved (*Wake*).

ENDE'ARMENT. *s.* (from *endear.*) 1. The cause of love; means by which any thing is endeared (*Thomson*). 2. The state of being endeared; the state of being loved (*South*).

ENDE'AVOUR. *s.* (*devoir, endevoir,* Fr.) Labour directed to some certain end (*Till.*).

Endeavour strait, a strait of the S. Pacific Ocean, which separates New Guinea from New Holland.

To Ende'avour. *v. n.* (from the noun.) To labour to a certain purpose (*Pope.*)

To Ende'avour. *v. a.* To attempt; to essay (*Milton*).

ENDE'AVOURER. *s.* (from *endeavour.*) One who labours to a certain end (*Rymer*).

ENDE'CAGON. *s.* (ενδεκαγον.) A plain figure of eleven sides and angles.

ENDEMIC. (*endemicus*, ενδημικος; from εν, in, and δημος, people.) A disease so termed that is peculiar to a certain class of persons, or country: thus struma is endemial to the inhabitants of Derbyshire and the Alps; scurvy to seafaring people; and the plica polonica is only to be met with in Poland.

To ENDE'NIZE. *v. a.* (from *denizen.*) To make free; to enfranchise (*Camden*).

To ENDI'CT. *To* Endi'te. *v. a.* (*enditer*, French.) 1. To charge any man by a written accusation before a court of justice: as *he was* endited *for felony*. 2. To draw up; to compose; to write (*Gay*).

To Endi'te. *v. n.* To compose (*Waller*).

ENDI'CTMENT. Endi'tement. *s.* (from *endite.*) A bill or declaration made in form of law, for the benefit of the commonwealth (*Hooker*).

ENDIVE, or Endivia, in botany. See Cichorum.

E'NDLESS. *a.* (from *end.*) 1. Having no end; being without conclusion or termination (*Pope*). 2. Infinite in longitudinal extent

(*Tillotson*). 3. Infinite in duration; perpetual (*Hooker*). 4. Incessant; continual (*Pope*).

Endless rolls and screw. See the substantives.

E'NDLESSLY. *ad.* (from *endless.*) 1. Incessantly; perpetually (*Decay of Piety*). 2. Without termination of length.

E'NDLESSNESS. *s.* (from *endless.*) 1. Extension without limit. 2. Perpetuity; endless duration. 3. The quality of being round without an end (*Donne*).

E'NDLONG. *ad.* (*end* and *long.*) In a straight line (*Dryden*).

E'NDMOST. *a.* (*end* and *most.*) Remotest; furthest; at the further end.

ENDOR, in ancient geography, a town of Galilee, four miles to the south of Mount Tabor, in the tribe of Manasseh. This is the place where the Pythoness was consulted by Saul. It is at this day a large village.

To ENDO'RSE. *v. a.* (*endorser*, French.) 1. To register on the back of a writing; to superscribe. 2. To cover on the back: not used.

ENDORSEMENT, of *in* and *dorsum, back*, is particularly used in commerce, for a writing on the back of a bill of exchange by the proprietor or bearer, either thereby to transfer it to some other, or to render it payable to the order of some other, or else to serve for an acquittance or receipt.

To ENDO'W. *v. a.* (*indotare*, Latin.) 1. To enrich with a portion (*Exodus*). 2. To supply with any external goods (*Addison*). 3. To enrich with any excellence (*Swift*). 4. To be the fortune of any one (*Shakspeare*).

ENDO'WMENT. *s.* (from *endow.*) 1. Wealth bestowed to any person or use. 2. The bestowing or assuring a dower (*Cowley*). 3. Appropriation of revenue (*Dryden*). 4. Gifts of nature (*Addison*).

Endowment, in law, denotes the settling a dower on a woman: though sometimes it is used figuratively, for settling a provision upon a parson, on the building of a church; or the severing a sufficient portion of tithes for a vicar, when the benefice is appropriated.

To ENDU'E. *v. a.* (*induo*, Latin.) To supply with mental excellencies (*Common Pray.*).

ENDU'RANCE. *s.* (from *endure.*) 1. Continuance; lastingness (*Spenser*). 2. Patience; sufferance (*Temple*). 3. State of suffering (*South*). 4. Delay; procrastination: obsolete (*Shakspeare*).

To ENDU'RE. *v. a.* (*endurer*, French.) 1. To bear; to sustain; to support (*Bacon*). 2. To bear with patience (*Milton*). 3. To undergo; to sustain (*Dryden*).

To Endu're. *v. a.* 1. To last; to remain; to continue (*Locke*). 2. To brook; to bear; to admit (*Davies*).

ENDU'RER. *s.* (from *endure.*) 1. One that can bear or endure; sustainer; sufferer (*Spenser*). 2. Continuer; laster.

E'NDWISE. *ad.* (*end* and *wise.*) Erectly; uprightly; on end (*Ray*).

ENDYMION, in fabulous history, a shepherd, son of Æthlius and Calyce. It is said that he required of Jupiter to grant to him to be always young, and to sleep as much as he would; whence came the proverb of *Endymionis somnum dormire*, to express a long sleep. Diana saw him naked as he slept on mount Latmos; and was so struck with his beauty, that she came down from heaven every night to enjoy his company. Endymion married Chromia daughter of Itonus; by whom he had three sons, Pæon, Epeus, and Æolus, and a daughter called Eurydice. The fable of Endymion's amours with Diana, or the moon, arose from his knowledge of astronomy; whence as he passed the night on such high mountain to observe the heavenly bodies, it came to be reported that he was courted by the moon. Some suppose that there were two of this name; the son of a king of Elias, and the shepherd or astronomer of Caria. The people of Heraclea maintained that Endymion died on mount Latmos, and the Eleans pretended to show his tomb at Olympia in Peloponnesus.

To E'NECATE. *v. a.* (*eneco*, Latin.) To kill; to destroy (*Harvey*).

E'NEMA. (*enema*, ενεμα; from ενειμι, to inject.) Clyster. Injection.

E'NEMY. *s.* (*ennemi*, French.) 1. A public foe (*Davis*). 2. A private opponent; an antagonist (*Matthew*). 3. Any one who regards another with malevolence; not a friend (*Shakspeare*). 4. One that dislikes (*Prior*). 5. The fiend; the devil (*Common Prayer*).

ENERGE'TICK. *a.* (ενεργητικος.) 1. Forcible; active; vigorous (*Harvey*). 2. Operative; active; working (*Grew*).

E'NERGY. *s.* (ενεργεια.) 1. Power not exerted in action (*Bacon*). 2. Force; vigour; efficacy (*Smalridge*). 3. Faculty; operation (*Bentley*). 4. Strength of expression; force of signification; spirit; life (*Roscommon*).

To ENE'RVATE. *v. a.* (*enervo*, Latin.) To weaken; to deprive of force (*Bacon*).

ENERVA'TION. *s.* (from *enervate.*) 1. The act of weakening; emasculation. 2. The state of being weakened; effeminacy.

To ENE'RVE. *v. a.* (*enervo*, Latin.) To weaken; to break the force of; to crush (*Digby*).

To ENFA'MISH. *v. a.* (from *famish.*) To starve; to famish; to kill with hunger.

To ENFEE'BLE. *v. a.* (from *feeble.*) To weaken; to enervate (*Taylor*).

To ENFE'OFF. *v. a.* (*feoffamentum*, low Latin.) To invest with any dignities or possessions. A law term (*Hale*).

ENFE'OFFMENT. *s.* (from *enfeoff.*) 1. The act of enfeoffing. 2. The instrument or deed by which one is invested with possessions.

To ENFE'TTER. *v. a.* To bind in fetters; to enchain: not in use (*Shakspeare*).

ENFIELD, a town in Middlesex, with a market on Saturdays. It was once famous for an extensive royal chase, disforested in 1779. It is 10 miles N. of London.

Enfield (William), LL.D. an able dissenting minister, was born at Sudbury, in March, 1741. He was educated at Daventry academy, under Dr. Caleb Ashworth, and in 1763 was ordained minister of a congregation at Liverpool, where he married. While here he published two volumes of sermons, which met with a good reception. About 1770 he removed to Warrington, where he discharged the office of tutor in the academy established there for the instruction of dissenters; and at the same time performed the functions of a pastor to the dissenting congregation which assembled at that place. During the period of his residence here he composed some useful works, particularly, The Speaker, and the Sequel to it, both well-known school books; and Institutes of Natural Philosophy, 4to., a clear and well-arranged compendium of the leading principles, theoretical and experimental, of the philosophical sciences. A new and improved edition of this work has been lately published. In 1785, two years after the dissolution of the Warrington academy, Dr. Enfield received an invitation from the congregation at the Octagon Chapel, Norwich, which he accepted. In this city and its neighbourhood he resided during the remainder of his life. Much of his leisure was occupied in preparing for the press an abridgment of Brucker's History of Philosophy; this task he completed in 1791, and the work appeared in 2 vols. 4to. Here the tenets of philosophy, and the lives of its professors, are depicted in a pleasing form, and with much clearness and elegance. The last two or three years of his life were employed, in conjunction with Dr. Aikin, and others, in compiling a General Biographical Dictionary; a work which, as far as we can judge from the volumes already published, bids fair to be one of the most complete on this subject in any language. Dr. Enfield died, after a short illness, on the 3d of November, 1797.

The doctor was not only an able but an amiable man; his public writings have ensured him the character of an ingenious, perspicuous, and correct writer, though they exhibit not many traces of profound thinking, or original genius. His conduct as a father, a tutor, and a minister, was such as caused him to be beloved, admired, and imitated.

ENFILADE, a French term, signifying a series or continuation of several things, disposed, as it were, in the same thread or line: as an enfilade of rooms, of buildings, &c.

To **Enfila'de.** *a.* (from the noun.) To pierce in a right line.

To ENFI'RE. *v. a.* (from *fire.*) To fire; to set on fire; to kindle: obsolete (*Spenser*).

To ENFO'RCE. *v. a.* (*enforcir*, French.) 1. To give strength to; to strengthen. 2. To make or gain by force (*Spenser*). 3. To put in act by violence (*Shakspeare*). 4. To instigate; to provoke; to urge on (*Spenser*). 5. To urge with energy (*Clarendon*). 6. To compel; to constrain (*Davies*). 7. To press with a charge (*Shakspeare*).

To **Enfo'rce.** *v. n.* To prove; to evince; to show beyond contradiction (*Hooker*).

Enfo'rce. *s.* (from *force.*) Power; strength: not used (*Milton*).

ENFO'RCEDLY. *ad.* (from *enforce.*) By violence; not voluntarily; not spontaneously; not by choice (*Shakspeare*).

ENFO'RCEMENT. *ad.* (from *enforce.*) 1. An act of violence; compulsion; force offered (*Raleigh*). 2. Sanction; that which gives force to a law (*Locke*). 3. Motive of conviction; urgent evidence (*Hammond*). 4. Pressing existence (*Shakspeare*).

ENFO'RCER. *s.* (from *enforce.*) Compeller; one who effects by violence (*Hammond*).

ENFO'ULDRED. *a.* (from *foudre*, Fr.) Mixed with lightning: obsolete (*Spenser*).

To ENFRA'NCHISE. *v. a.* (from *franchise.*) 1. To admit to the privileges of a freeman (*Davies*). 2. To set free from slavery (*Temple*). 3. To free or release from custody (*Shakspeare*). 4. To denizen; to endenizen (*Watts*).

ENFRANCHI'SEMENT. *s.* 1. Investiture of the privileges of a denizen (*Cowell*). 2. Release from prison or from slavery (*Shak.*).

ENFRO'ZEN. *part.* (from *frozen.*) Congealed with cold: not used (*Spenser*).

To ENGA'GE. *v. a.* (*engager*, French.) 1. To make liable for a debt to a creditor (*Shakspeare*). 2. To impawn; to stake (*Hudibras*). 3. To enlist; to bring into a party (*Tillotson*). 4. To embark in an affair (*Digby*). 5. To unite; to attach; to make adherent (*Addison*). 6. To induce; to win by pleasing means; to gain (*Waller*). 7. To bind by any appointment or contract (*Atterbury*). 8. To seize the attention. 9. To employ; to hold in business (*Dry.*). 10. To encounter; to fight (*Pope*).

To **Enga'ge.** *v. n.* 1. To conflict; to fight (*Clarendon*). 2. To embark in any business; to inlist in any party (*Dryden*).

ENGA'GEMENT. *s.* (*engagement*, Fr.) 1. The act of engaging, impawning, or making liable to a debt. 2. Obligation by contract (*Atterbury*). 3. Adherence to a party, or cause; partiality (*Swift*). 4. Employment of the attention (*Rogers*). 5. Fight; conflict; battle (*Dryden*). 6. Obligation, motive (*Hammond*).

To ENGA'OL. *v. a.* (from *gaol.*) To imprison; to confine (*Shakspeare*).

To ENGA'RRISON. *v. a.* (from *garrison.*) To protect by a garrison (*Howel*).

ENGASTRIMYTHI. (εγγαστριμυθοι, literally, *ventriloquists.*) In pagan theology, the Pythians, priests or priestesses of Apollo, who delivered oracles from within, without any action of the mouth or lips. The ancient philosophers, &c. are divided upon the power pretended to by the engastrimythi. Hippocrates mentions it as a disease; others will have it a kind of divination; others attribute it to the possession of an evil spirit; and others to art and mechanism. M. Scottus maintains, that the engastrimythi of the ancients were poets, who, when the priests could not speak, supplied the defect by explaining in verse what Apollo dictated in the cavity of the bason on the sacred tripod.

ENGELBRECHTSEN (Cornelius), a celebrated painter, born at Leyden in 1468, and was the first who painted in oil in that country. Several noble pictures by this artist are still preserved in the churches of Leyden and Utrecht. He died in 1533.

To ENGE'NDER. *v. a.* (*engendrer*, Fr.) 1. To beget between different sexes (*Sidney*). 2. To produce; to form (*Davies*). 3. To excite; to cause; to produce (*Addison*). 4. To bring forth (*Prior*).

To Enge'nder. *v. n.* To be caused; to be produced (*Dryden*).

ENGERS, a town in the circle of the Lower Rhine, Germany. Lat. 50. 35 N. Lon. 7. 32 E.

ENGHELRAMS (Cornelius), an eminent painter in water colours, born at Malines in 1527. His chief works are in the church of St. Rombont, where he has represented the works of mercy. Several of his paintings are scattered throughout Germany, but they are all of the religious kind. He died in 1583.

ENGHIEN, a town of Hainault, in the Netherlands, famous for a battle which was fought near it in 1692, between the French and English troops, in which the former gained the victory. This is generally called the battle of Steinkirk. It is 15 miles N. of Mons. Lat. 50. 42 N. Lon. 4. 5 E.

ENGIA, Engina, or Oegina, an island of European Turkey, lying on a gulph of the same name, between Livadia and the Morea. It is 22 miles S. of Athens. Lat. 37. 45 N. Lon. 23. 59 E.

E'NGINE. *s.* (*engin*, French.) 1. Any mechanical complication, in which various movements and parts concur to one effect. 2. A military machine (*Fairfax*). 3. Any instrument (*Raleigh*). 4. Any instrument to throw water upon burning houses (*Dryden*). 5. Any means used to bring to pass, or to effect (*Duppa*). 6. An agent for another (*Daniel*).

Engine, in mechanics, a compound machine, made of one or more mechanical powers, as levers, pulleys, screws, &c. in order to raise, cast, or sustain any weight, or produce any effect which could not be easily effected otherwise. The word is formed of the French *engin*, from the Latin *ingenium*, wit; from the ingenuity exerted in the invention of engines to augment the effect of moving powers.

Engine for extinguishing fire. See Hydrostatics, and Fire engine.

Engine (Pile), one contrived for driving piles. See Pile engine.

Engine (Steam), a machine to raise water and communicate motion to other machinery by the force of steam. See Steam engine.

Engines (Pressure), for raising water by the pressure and descent of a column enclosed in a pipe, have been lately erected in different parts of this country. The principle now adverted to was adopted in some machinery executed in France, about 1731, (see Belidor de Arch. Hydraul lib. iv. c. 1.) and was likewise adopted in Cornwall more than 40 years ago. Engines of this kind have been proposed by Mr. Close, Mr. Trevithick, and others; (see Gregory's Mechanics, vol. ii. p. 383). We shall here describe a water pressure engine, designed by the late Mr. John Smeaton, in 1770, to be erected at Temple Newsham, Yorkshire, the seat of lord Irwin: and we must here return our most sincere acknowledgements to sir Joseph Banks, for indulging our draughtsman with Mr. Smeaton's original drawings, from which our Plate 61 was made. Fig. 1. is a section of the engine, through the middle of the cylinder and water pipes, and fig. 2. is a plan looking down upon the engine.

The engine is worked by a small stream of water brought to it by a pipe A: it falls from the surface of the engine 54 feet, and is conveyed from the engine by a pipe H, which has 12 feet fall from the engine to the surface of the water of the well, where it delivers. The engine works a pump which throws back part of the water to a reservoir 80 feet above the engine, and consequently 26 feet above the level of the head. The pipe A conducts the water to the pump B by one branch, and to the top of the cylinder D, which works the engine, by the other. The cylinder is of brass truly bored, and furnished with a solid piston, whose rod passes through a close stuffing box in the cylinder lid, where leather is packed round it so close that no water can leak by it. The upper end of the piston rod is keyed into a small box, which connects it with an iron rod *a*, sliding through a guide to make it move steadily. E is the working beam moving round a centre at *e*: it has an arch head at its outer end which is a segment of a circle struck from the centre *e*: it receives a chain by which the piston rod *a* is suspended. *d* is the pump rod jointed to the beam, and moving up and down with it. The forcer of the pump B is fixed to it at the lower end. *f* is a pipe which forms a communication between the top and bottom of the cylinder. It leads down into a chest, upon which the cylinder is placed, and to which it is open at bottom: a short cylindrical pipe is fixed across withinside this chest, communicating with the pipe *f* at top, and with the pipe H (which conveys the water away from the engine) at the bottom. This short pipe has a water-tight division in the middle of it, so that there is no passage through it from *f* to H; but there are four square holes made in the pipe at equal distances round it, both above and below the division. One of the square holes below the division is represented by a dark square in fig. 1. A ring of brass is fitted upon the cylindric pipe, and slides up and down upon it, being packed with leather that no water may pass between the two cylinders. The sliding cylinder is just half the length of the other; and when it is slid up, as in the figure, it covers the four holes in the fixed pipe which are above the division, and opens the four holes below, allowing a passage from the bottom of the cylinder to the pipe H; on the contrary, when the slider is put down, the lower holes are closed and the upper ones are opened, making a passage from *f* to the bottom of the cylinder. The

Smeaton's design for a Water Preſsure Engine.

sliding valve has a pin projecting from each side, the pins being included between clifts made at the end of a forked lever *i*, moveable upon an axis which passes through the sides of the chest, and has a long lever (shown by dotted lines behind the cylinder) fastened to it. By moving the upper end of this lever towards the engine, the sliding valve will be raised up, and by moving it in a contrary direction, the valve will be gushed down. *k* is a small iron rod jointed to the end of the long lever by one of its ends, and suspended by a hook from a spindle turning upon pivots. This spindle has several levers upon it: *mno* is a three armed lever, the arm *m* has a weight at the end, and is called the tumbling bob: *n* and *o* are two other arms made in the same piece with *m*: these two arms strike against a pin fixed across in the end of the rod *k*; *p* and *q* are two crooked levers by which the spindle is moved: these levers are struck by pins fixed in a wooden rod *r*, which is jointed to the beam and works up and down with it. *x* is a piece of wood fixed to the upright beam of the frame having pins projecting from it, which catch the tumbling bob *m*, and prevent its moving too far. S is a stop-cock in the main pipe, which regulates the quantity of water coming to the engine, and consequently the velocity with which the engine will work.

To describe the operation of the engine, we will suppose every thing to be in the position represented in the figure, except that the pipes, cylinder, and pump are full of water. The engine is then at the top of its stroke, which is determined by the top of the arch, on the end of the beam, meeting a bolt put across the frame. The whole column of water 54 feet always presses upon the top of the piston; and in the present position of the sliding valve, the water contained in the lower part of the cylinder can get into the eduction pipe H, and thence away from the engine. This pressure added to the 12 feet fall below the engine causes the piston to descend, bringing down the beam and pump-rod *d* with it. The valve in the bottom of the pump now shut, and the water in the pump barrel being pressed by the piston, opens the other valve at X, and goes up the pipe Y to the reservoir, overcoming a column of water of 80 feet. When the engine gets to the middle of its stroke, a pin in the other side of the wooden rod *r* takes the lever *q* and forces it down, raising the tumbling bob *m* at the same time. By the time the piston arrives at the bottom of the cylinder, the tumbling bob is brought past the vertical position, and suddenly oversets by its own weight. The lever *n* now runs against the pin across the end of the rod *k*, and shoves it from the engine moving the long lever of the sliding valve, and the short lever *i* down, just in the contrary manner to what it is in the drawing. This closes the four lower holes in the fixed cylinder, and prevents the water going down the pipe H, and at the same instant opens the four upper holes, forming a communication between the top and bottom of the cylinder. The pressure of 66 feet, which caused the piston to descend, is now removed, and the column of water of 54 feet coming down the pipe A, forces open the lower valve of the pump (the valve at *x* closing and taking the bearing of the column of 80 feet), presses the underside of the pump bucket and raises it up, moving the beam and piston with it. There being now an equal pressure both above and below the piston, it will be moved up easily. When the piston arrives at the middle of its stroke, the pin *y* in the rod *r* takes the lever *p*, and raises it with it, until it arrives at the top of its stroke, when it passes the vertical position, and instantly falls over into the position represented in the figure. The lever *o* taking the end of the rod *k*, and putting it toward the engine, raises the sliding valve, opens the passage to the pipe H. The whole column of 66 feet now presses upon the piston and forces it down, overcoming a column of 80 feet upon the pump, though the diameter of the pump is larger than that of the cylinder: this happens from the chain of the piston acting upon a much longer lever than the pump. K and L are two air vessels upon the pipes A and Y.

Engines at London Bridge, for supplying the metropolis with water. These, by reason of their great magnitude and importance, deserve particular notice. They are worked by the water of the river Thames, which at that part is so contracted in the narrow passages between the sterlings or wooden piers upon which the stone piers of the bridge are built, as to occasion a considerable fall at all times except at high or low water. The first five arches of the London end of the bridge are devoted to the water engines which supply the city with water. The largest of these machines is shown in Plate 62 and 63. Plate 62 is an elevation of the engine taken from the sixth pier of the bridge, and Plate 63 is an elevation taken from the upper side of the bridge; the same letters of reference are used in both plates. AA, Plate 62, represents the sterling of the fifth pier of the bridge composed of a vast body of piles driven into the bed of the river, and the interstices filled up with chalk and gravel; upon the heads of these a set of horizontal beams are laid in the manner of joists, and all is made level by chalk and gravel. The fourth pier (BB, Plate 63) is made in the same manner. The water wheel EEFF is made of such a length as to fill the space between the two sterlings as exactly as possible without touching, and the bearings for the pivots of its axis are supported upon headstocks DD resting upon the sterlings. The water wheel has four rings EEEE, each having six arms morticed into the axis: each ring has 24 starts *ee* morticed into it, to which are nailed boards, upon which the water acts when turning the wheel round. FF is the main axis, upon the ends of which are fixed two large wooden wheels GG, round which cast-iron rings of cogs are fixed in segments. The wheels turn two trundles, which give motion to the pumps, of which there are six, three on each side of the water wheel. Only one of the sets of pumps are shown in Plate 63; but as the other is exactly the same, one is sufficient. The axis on which the trundle H is fixed is of cast-iron; it has three cranks, *ab*, Plate 62, and another head behind the frame; *fgh* are cast-iron rods jointed to the cranks at their lower ends, and to the ends of the great levers or regulators IKL at the upper ends. The regulators have arches *ikl* at the other ends, struck from the centres of the beams, upon which chains are laid to give motion to the rods of the pumps MNO. By the motion of the water, the water-wheel is made to revolve on its axis, and the large cog-wheel G with it: by its cogs it turns the trundle H and cranks *ab*, which being arranged round the axis at equal intervals, successively elevate and depress the crank-rods *fgh* and regulators IKL, and give to the pump-rods a vertical motion.

The joints of the crank-rods *fgh* are made to screw together round the crank neck with brass between; by which means they work very pleasantly, and when worn can be screwed up tight again that they may have no shake. The crank-rods have a flaunch *m* in the middle of them, and are held together by four screws, so as they may be taken apart occasionally without difficulty when the pump buckets are to be drawn out of the barrels to new leather them. The joints at the end of the beam are made with brasses and screws to adjust them.

The beams or regulators are admirably well designed to be strong, with but little timber: they are formed of two pieces of timber, between which the cast-iron axes on which they turn are placed, and then the ends are bent to touch, and kept together by hoops and screw bolts. At the ends square pieces of wood *n* are let into both timbers; and thus when they are firmly bound together and held from sliding endwise upon each other, they form an excellent truss-beam, which cannot bend without stretching one timber and compressing the other. The pump-rods are attached to the arches at the ends of the beams by four iron chains each, as is shown in Plate 63. The rod has a cross piece *o* fixed on the top of it, to which the two outside chains are screwed, and the lower ends of the same chains are fastened to the lower end of the arch. These chains act to push down the piston rods: the other two chains which raise the rods are fastened to the top of the arch and to the rods at lower ends, as shown in the beam *l*. The pumps are forcing-pumps. *p* is a square iron pipe screwed down upon the groundsills of the engine frame; it has a flaunch at each end, on one of which a lid is screwed, and the other joins it to the section pipe Q, which brings the water on the top of the pipe. The three barrels MNO are screwed, having a valve in the joint, which allows water to enter the barrels, but prevents its return. From the bottom of each barrel proceeds a crooked pipe *p*, which communicates with another square pipe R, having valves at the joint to prevent any water getting back into the barrels. On the top of the pipe over each valve a lid is screwed, which can be removed to clean the valves when necessary (similar lids are screwed on the pipe P at the back towards the cranks). At the ends of the pipe R are flaunches, one of which receives a lid like the lower pipe P, and the other flaunch the pipe *r*, which conveys the water away from the pumps. The pistons or buckets of the pumps are solid, that is, without valves in them; and their action is as follows: When the pistons are drawn up they make a vacuum in the barrels, and the pressure of the atmosphere on the surface of the water from which the pipe Q draws raises the valves in the bottom of the barrels, and fills them. At the descent of the buckets the lower valves shut, and the water contained in the barrels can find no passage but through the valves in the pipe R; and when the pistons are drawn up again, these valves close, and the lower ones open to give a fresh supply of water to the barrels. By the position of the cranks it always happens that one or other of the barrels is forcing the water into the force pipe; and as the strokes of the other set of pumps at the other end of the water-wheel are contrived to be intermediate or alternating to these, a constant succession is kept up. The pipe *r* is continued to the shore to convey the water into the streets, &c. A wooden cistern S is placed over the pumps to hold water, and keep a constant supply of it above the pistons. The whole engine is surrounded by a strong timber fence, which guards it from the injuries it might receive from vessels striking it at high water, when the liquid rises above the level of the sterlings nearly to the axis of the water-wheel. On the tops of these piles a large stage is built to serve as a road from the shore to the engine, and the underside of it supports the pipes *r*, Plate 63, which convey the water ashore. There are also other stages in different parts of the machine to support workmen when repairing it; these prevent the whole engine from being seen from the bridge at one view, and for this reason they are omitted in the drawing. The original engine was contrived by Mr. Beighton; but its present improvements are by Mr. Smeaton.

ENGINEER. *n. s.* (*engingnier*, Fr.) One who manages engines; one who directs the artillery of an army.—

For 'tis the sport to have the *engineer*
Hoist with his own petard.

Shaksp. Hamlet.

An engineer, in the military art, should be possessed of a perfect knowledge in mathematics, so as to delineate upon paper, or mark upon the ground, all sorts of forts, and other works proper for offence and defence. He should understand the art of fortification, so as not only to be able to discover the defects of a place, but to find a remedy proper for them; as also how to make an attack upon, as well as to defend, the place. Engineers should therefore be brave as well as ingenious. When at a siege they have narrowly surveyed the place, they are to make their report to the general, by acquainting him which part they judge the weakest, and where approaches may be made with most success. Their business is also to delineate the lines of circumvallation and contravallation, taking all the advantages of the ground; to mark out the trenches, places of arms, batteries, and lodgments, taking care that none of their works be flanked or discovered from the place.

E'NGINERY. *s.* (from *engine.*) 1. The art of managing artillery (*Milton*). 2. Engines of war; artillery (*Milton*).

To ENGI'RD. *v. a.* (from *gird.*) To encircle; to surround (*Shakspeare*).

ENGLAND, the southern and most considerable part of the island of Great Britain; bounded on the N. by Scotland, on the N.E. and E. by the German ocean, on the S. by the English channel, and on the W. by St. George's channel, the principality of Wales, and the Irish sea. It lies between 2° E and 7° W. lon. and between 49° and 56° N. lat. It is of a triangular form. From the S. Foreland in Kent, which may be termed the E point of the triangle, to Berwick-upon-Tweed, which is the N. its length in a straight line is 345 miles; from that point to the Lands-end, in Cornwall, which is the W. it is 425; and the breadth thence to the S. Foreland is 340. But the breadth diminishes, in general, as we approach the north; and, on the other hand, the length would be considerably more, if we were to follow all the windings of the sea-coast. "The face of the country in England," says Dr. Aikin, in his England Delineated, "affords all that beautiful variety which can be found in the most extensive tracts of the globe. In some parts, verdant plains extend as far as the eye can reach, watered by copious streams, and covered by innumerable cattle. In others, the pleasing vicissitudes of gently-rising hills and bending vales, fertile in corn, waving with wood, and interspersed with meadows, offer the most delightful landscapes of rural opulence and beauty. Some tracts abound with prospects of a more romantic kind; lofty mountains, craggy rocks, deep narrow dells, and tumbling torrents. Nor are there wanting, as a contrast to so many agreeable scenes, the gloomy features of black barren moors and wide uncultivated heaths. On the whole, however, few countries have a smaller proportion of land absolutely steril and incapable of culture." The richest parts are, in general, the midland and southern. Towards the N. it partakes of the barrenness of the neighbouring Scotland. The E. coast is, in many parts, sandy and marshy. A range of rude and elevated land, sometimes rising into lofty mountains, extends from the borders of Scotland to the very heart of England, running from N. to S. and forming a natural division between the E. and W. sides of the kingdom. Cornwall is also a rough hilly tract; and a similar character prevails in part of the adjacent counties. These mountainous tracts abound with various mineral treasures. The rivers are numerous; but the comparatively small extent of England will not permit them to vie, in length of course, with the great rivers on the continent. The most considerable of them are, the Thames, Severn, Medway, Trent, Ouse, Tyne, Tees, Eden, Avon, Derwent, Dee, Mersey, &c. which, with many others, are described under their respective heads. The lakes are neither numerous nor extensive. They are chiefly in the N.W. counties; and those of Westmoreland and Cumberland, in particular, exhibit such varieties of beautifully romantic and picturesque scenery, as to have become, for some years past, the fashionable object of summer excursions from the metropolis, and every part of the country.

England, including Wales, when first invaded by the Romans, was divided into 17 petty states. 1. The Danmonii, Dunmonii, or Donmonii, inhabited Cornwall and Devonshire. 2. The Durotriges possessed Dorsetshire. 3. The Belgæ Somersetshire, Wiltshire, and the greater part of Hampshire. 4. The Atrebates inhabited Berkshire. 5. The Regni inhabited Surrey, Sussex, and part of the coast of Hampshire. 6. The Cantii inhabited and gave name to Kent. 7. The Dobuni are placed by Ptolemy on the N. side of the Thames, near its head, in Gloucestershire and Oxfordshire. 8. The Cattieuchlani, Calyeuchlani, Cattidudani, or Cathicludani, inhabited Buckinghamshire, Bedfordshire, and Hertfordshire. 9. The Trinobantes possessed Essex and Middlesex. 10. The Iceni, whose country comprehended Suffolk, Norfolk, Cambridge, and Huntingdonshire, are by Ptolemy called Simeni, and by others Tigeni. Cambden is of opinion, that they were the people whom Cæsar calls Cenomagni. 11. The Coritani inhabited Northamptonshire, Leicestershire, Rutlandshire, Lincolnshire, Nottinghamshire, and Derbyshire. 12. The Cornavii possessed Warwickshire, Worcestershire, Staffordshire, Shropshire, and Cheshire. 13. The Silures inhabited Radnorshire, Brecknockshire, Glamorganshire, Herefordshire, and Monmouthshire. 14. The Demetæ inhabited part of Caermarthenshire, Pembrokeshire, and Cardiganshire. 15. The country of the Ordovices comprehended Montgomeryshire, Merionethshire, Caernarvonshire, Denbighshire, and Flintshire. 16. The Brigantes possessed Yorkshire, Durham, Lancashire, Westmoreland, and Cumberland. 17. Northumberland was held by the Ottadini, Ottadeni, or Ottalini. Their country, according to some, reached from the Tyne to the Forth; though the most common opinion is, that it reached only to the Tweed. The above names are plainly Roman, but their etymology is doubtless British, though any attempts to trace their derivation from words in the old British language must now be attended with great uncertainty and obscurity. See Britain.

The total quantity of land in England and Wales is estimated at 37,265,855 acres; or, according to Dr. Grew, 46 millions: of this, in the year 1800, 11,350,501 acres were in tillage, 16,796, 458 acres in pasturage, and the remainder uncultivated, including woodlands, and the sites of towns, roads, rivers, &c. The amount of the population in the same year was about 9½ millions: the number of inhabited houses was 1,598,278, of uninhabited houses 58,962, and of families 1,917,232. The number of parishes, churches, and chapels in England is about 10,500, in Wales about 1100. At the same period the total of his majesty's army, including regulars, fencibles, and militia, was 186,773: the navy and marines, 126,279: royal artillery 11,618. Since the above period our military establishment has considerably increased.

The government of this country is a limited monarchy; the legislative power residing in the king, the house of lords, and the house of commons; and the executive power in the king, the great officers of state, the judges, and all the inferior gradations of magistracy. Under this free constitution we have enjoyed a degree of prosperity and happiness, so uniform and uninterrupted, as to be the admiration of surrounding nations. The civil division of the country is into circuits, and shires, or counties; these last are subdivided into wapentakes, or hundreds, and parishes. The circuits (which are six in number, and through each of which, for the most part, two of the judges administer justice twice a-year) contain 38 counties. They are, 1. The Home Circuit, which contains the counties of Essex, Herts, Kent, Surrey, and Sussex 2. The Norfolk Circuit, containing the counties of Bucks, Bedford, Huntingdon, Cambridge, Suffolk, and Norfolk. 3. The Oxford Circuit, containing the counties of Oxford, Berks, Gloucester, Worcester, Monmouth, Hereford, Salop, and Stafford. 4. The Midland Circuit, containing the shires of Warwick, Leicester, Derby, Nottingham, Lincoln, Rutland, and Northampton. 5. The Northern Circuit, containing the counties of York, Durham, Northumberland, Lancaster, Westmorland, and Cumberland. 6. The Western Circuit, containing Hants, Wilts, Dorset, Somerset, Devon, and Cornwall. Middlesex being the seat of the supreme court of justice, and Cheshire being a county palatine, are not included in any circuit. The established religion of England is the reformed, and its doctrines, as contained in the 39 articles, differ in little or nothing from those of the church of Scotland, though some of the English clergy give a different explanation of several of them than what is commonly offered. The late celebrated earl of Chatham said of the church of England, "We have a popish liturgy, a Calvinistic creed, and an Arminian clergy." It is one of the blessings of the British constitution, that all religions are tolerated in England, in consequence of which, people of all principles and professions are to be found in it. The only drawback is the Test Act, which, to the disgrace of the present liberal age, still excludes conscientious people of all professions from civil offices. This is the more illiberal, because no restriction of this kind takes place in Scotland. Since the reign of Henry VIII. the sovereign of England has been called, in public writs, the supreme head of the church; but this title conveys no spiritual meaning, as it only denotes the regal power to prevent any ecclesiastical differences, or in other words, substitutes the king in place of the pope, with regard to temporalities and the internal economy of the church. The kings of England never intermeddle in ecclesiastical disputes. They only give a sanction to the legal rights of the clergy. The church of England, under this description of the monarchical power, is governed by two archbishops, and 24 bishops, besides the bishop of Sodor and Man, who, not being possessed of an English barony, does not sit in the house of peers. (See ARCHBISHOP and BISHOP.) England contains about 60 archdeacons. Subordinate to them are the rural deacons, formerly styled archpresbyters, who signify the bishop's pleasure to his clergy, the lower class of which consists of parish priests (who are called rectors or vicars), deacons and curates. (See CURATE, DEACON, PARSON, and VICAR.) The ecclesiastical government of England is, properly speaking, lodged in the convocation; which is a national representation or synod, and answers pretty nearly to the idea of a parliament. They are convoked at the same time with every parliament; and their business is to consider of the state of the church, and to call those to an account who have advanced new opinions inconsistent with the doctrines of the church of England. Some high-flying clergymen during the reign of queen Anne, and in the beginning of that of George I., raised the powers of the convocation to a height that was inconsistent with the principles of religious toleration, and indeed of civil liberty: so that the crown was obliged to exert its prerogative of calling the members together, and of dissolving them; and ever since they have not been permitted to sit for any time, in which they could do business.

The house of commons since the late Irish union (see IRELAND) consists of 658 members: that is, 513 English representatives, 45 Scots, 100 Irish.

The chief mountains in England are the hills of Westmoreland, the Malvern hills in Worcester, the Peak in Derby, Snowdon and Plenlimmon in Wales.

The chief ports for the navy are, Portsmouth, Plymouth, Deptford, and Chatham.

The chief trading towns are London, Liverpool, Bristol, and Hull; Birmingham is famous for hard-ware manufactures, buttons, buckles, &c.; Sheffield, for cutlery; Manchester, for cottons, checks, dimities, &c.; Norwich, for druggets and camblets; Colchester, for its bays and serges, &c.; Cornwall and Devonshire supply tin and lead, &c.

There are five harbours on the coast of Sussex and Kent, namely, Hastings, Dover, Hythe, Romney, and Sandwich, which are called cinque-ports. These had anciently very considerable privileges, on account of their fitting out ships for the defence of the coast against any invader. They are still under the government of the constable of Dover castle. The five cinque-ports, with their three dependents, Rye, Winchelsea, and Seaford, send 16 members to the British parliament, who are styled Barons of the cinque-ports.

With respect to animals, wild and tame, we think it unnecessary to enter into any particular enumeration here; our readers in general are well acquainted with them, and where they are not we refer to the appropriate articles in this dictionary. And as to climate and seasons, we are unwilling to enter into a detail of our own opinions, as they might probably differ much from those of others: we would just observe, though, that the descriptions of foreigners are too often *unjustly unfavourable*; we say this on the authority of a Spanish nobleman, who arrived in England about midsummer 1802, and who was much delighted to find both climate and soil far more temperate and agreeable than most foreigners have asserted. Without, however, laying much stress upon the declaration of the noble Spaniard, we have found in our personal experience abundant reason for attachment to our native country; and we doubt not that our readers in general as well as ourselves can with pleasure adopt the language of the admirable poet with which we close this article:—

> England, with all thy faults, I love thee still—
> My country! and, while yet a nook is left
> Where English minds and manners may be found,
> Shall be constrain'd to love thee. Though thy clime
> Be fickle, and thy year most part deform'd
> With dripping rains, or wither'd by a frost,
> I would not yet exchange thy sullen skies,
> And fields without a flow'r, for warmer France
> With all her vines; nor for Ausonia's groves
> Of golden fruitage, and her myrtle bow'rs.
> To shake thy senate, and from heights sublime
> Of patriot eloquence to flash down fire
> Upon thy foes, was never meant my task:
> But I can feel thy fortunes, and partake
> Thy joys and sorrows, with as true a heart
> As any thund'rer there. COWPER.

ENGLAND (New), a large country of North America, settled by the English. It comprehended four parts, viz. Massachuset's, New Hampshire, Connecticut, Rhode Island, and Providence Plantation. In 1783, when the independency of America was acknowledged, these parts were erected into four independent provinces. See each respective article.

ENGLECERIE, ENGLECHERIE, or **ENGLESCHYRE**, a term of great import among our ancestors, though now obsolete; properly signifying the quality of an Englishman. If a man were privately slain, or murdered, he was anciently accounted *francigena* (which comprehended every alien, especially the Danes) till englecerie was proved, i. e. till it was made to appear that he was an Englishman. Bracton, lib. iii.

E'NGLISH. *a.* (enʒleꞅ, Saxon.) Belonging to England (*Shakspeare*).

To **E'NGLISH.** *v. a.* To translate into English (*Brown*).

ENGLISH LANGUAGE (History of). This, though a very intricate, is a very interesting subject, which we cannot persuade ourselves to omit. As the dissertations upon this topic of inquiry in the introduction to Dr. Johnson's Dictionary are, doubtless, in the hands of most of our learned readers, we shall prefer inserting here the result of the able investigations of Dr. Wallis; incorporating occasionally a few additions.

Dr. Wallis, after speaking of the old British tongue, and proving its great affinity with the eastern languages, shows how it came to be disused in Gaul and in England; and then points out the modifications occasioned by intermixture with the Saxon and the Norman languages. He then proceeds, as follows.

Thus, partly by these mixtures, partly by length of time, which causes strange alterations in all languages, the old Anglo-Saxon tongue was changed into the present English; which hath been received likewise into the chief parts of Scotland, which I believe chiefly happened when the Normans invaded England; for several of the English royal family, nobility and commonalty, being driven out of England, did with themselves carry their language into Scotland, which being improved by continual commerce, did so far prevail that the English and Scotch tongues are now the same; unless we should rather say, that the more polite part of Scotland, and that which is nearest England, has got the same inhabitants with those of England, who were descended from the Saxons, and formerly made part of the kingdom of Northumberland: for the Scotch Highlanders called the Lowlanders as well as the English, Sassons, that is, Saxons; but they formerly called themselves Gael, and Gaiothel; but the Highlanders and islanders, that is, the inhabitants of the isles adjacent, who inhabit a great, though the more uncultivated, part of Scotland, which lies north-west, retain to this day the ancient British, or rather Irish tongue: for they are the remainders of the Picts, that is, the most ancient Britains, who, disdaining the Roman yoke, fled into the mountainous and rough countries, and mingled with the Scots (the descendants of the Scythians or Goths), who came thither out of Ireland. Mr. Edmond Spenser, our famous poet, in his view of the state of Ireland, says, that there were two kinds of Scots (as may be gathered from Buchanan) the one Irin, or Irish Scots, the other Albin Scots; for those Scots are Scythians who arrived in the north parts of Ireland, where some of them after passed into the next coast Albine, now called Scotland, which after much trouble they possessed, and of themselves named Scotland; but in process of time (as it is commonly seen) the dominion of the part prevaileth in the whole, for the Irish Scots putting away the name of Scots, were called only Irish, and the Albine Scots, leaving the name of Albine, were called only Scots. Therefore it cometh thence that of some writers, Ireland is called Scotia Major, and that which now is called Scotland, Scotia Minor. And he says that the Scythians did from themselves name what we call Scotland, Scuttenland, which by contraction became Scutland, or Scotland. And we learn from the Chronicum Saxonicum, or Saxon Chronicle, and from Bede's Ecclesiast. Hist. 1. 1. That Ireland was anciently called Scotta Ea, the Scots island; and the learned Bp. Gibson, in his explication of the names of places at the end of the Chronicum Saxonicum, p. 43, under the word Scottas, says, Scoti quo nomine apud Historicos nonnunquam appellantur Hiberni, ut et Scotiæ nomine vocatur Hibernia. That is, among some historians, the Irish are called by the name of Scots, as Ireland is by the name of Scotland. The English language then which we are to treat of, is a branch of the Teutonick, as is the present German, Dutch, Danish, and those that are a-kin to them; and our language differs from them, just as they do from one another. But I am afraid I have already exceeded the bounds of a preface, yet I cannot pass by two or three things, which if not necessary, may notwithstanding be entertaining to some persons; namely, some account of the mother tongues; and of the various changes that our language has undergone for several ages: afterwards we shall answer an objection made against our language, and then give our reasons for undertaking this work.

Because we have had occasion to make mention of the mother tongues, it may not be disagreeable to some readers if I give some account of them. Tongues then are either mother tongues, or dialects: mother tongues, are those out of which many dialects, like so many branches, are drawn. These branches of one mother tongue have some affinity one with another; but between the mother tongues themselves there is no affinity at all. The mother tongues, which are so wholly different one from another, are in number eleven; of which four are more noble, the other seven of less dignity; those we call the greater, these the less mother tongues. The same word in the original tongue, by diverse inflections and changes makes diverse dialects; as the same word in Latin, diversely varied, produces the Italian, Spanish, and French dialect: so the Latin calls a son-in-law, Gener; the Italian, Genero: the Spanish, Yerno; the French, Gendre; all which are Latin in their original, but according to the variation, are respectively appropriated to the aforesaid several dialects or sublanguages.

The four chief mother tongues are, Greek, Latin, Teutonick, and Sclavonick.

1. The Greek was anciently of very great extent, not only in Europe, but in Asia too, and Afric, where several colonies of that nation were planted; by which dispersion and mixture with other people, it did degenerate into several dialects. Besides those four that are commonly noted, the Doric, Ionic, Æolic, Attic; Herodotus doth mention four several dialects of the Ionic: the inhabitants of Rhodes, Cyprus, and Crete, had each of them some peculiarity in their language; and the present Coptic or Egyptian, seems both from the words and the character, to be a branch of this family, and was probably spread amongst that people in the days of Alexander the Great, upon his conquering of them: though some conceive that there were at least 30,000 families of Greeks planted in that country long before his time.

2. The Latin, though this be much of it a derivation from the Greek, (of which the present French, Spanish, and Italian are several offsprings and derivations), had anciently four several dialects, as Petrus Crinitus shows out of Varro.

3. The Teutonick or German, is now distinguished into Upper and Lower. The Upper hath two notable dialects. 1. The Danish, Scandian, or perhaps the Gothic, to which belongs the language used in Denmark, Norway, Swedeland, and Iceland. 2. The Saxon, to which appertain the several languages of the English, the Scots, the Frisian, and those on the north of the Elbe.

4. The Sclavonic is extended, though with some variation, through many large territories, Muscovy, Russia, Poland, Bohemia, Vandalia, Croatia, Lithuania, Dalmatia; and is said to be the vulgar language used amongst sixty several nations.—The languages of less extent are, 1. The Albanese, or old Epirotic, now used in the mountainous parts of Epirus.—2. The European Tartar, or Scythian, from which some conceive our Irish to have had its original.

As for the Turkish tongue, that is originally no other than the Asiatic Tartar, mixed with Armenian and Persian, some Greek, and much Arabic. 3. The Hungarian, used in the greatest part of that kingdom. 4. The Finnic, used in Finland and Lapland. 5. The Cantabrian, used among the Biscainers, who live near the ocean on the Pyrenean hills, bordering both upon France and Spain. 6. The Irish in Ireland, and from thence brought over into some parts of Scotland; though Mr. Camden would have this to be a derivation from the Welch. 7. The old Gaulish or British, which is yet preserved in Wales, Cornwall, and Britain in France. To this number Mr. Brerewood doth add four others, viz. 1. Arabic, now used in the steep mountains of Granata, which is yet a dialect from the Hebrew, and not a mother tongue. 2. The Cauchian in East Friseland. 3. The Illyrian, in the isle of Veggia. 4. The Jazygian, on the north side of Hungary. Besides this difference of languages in their first derivation, every particular tongue hath its several dialects. Though Judæa were a region of a very narrow compass, yet was it not without its varieties of this kind, witness the story concerning Shibboleth and Sibboleth; and that of the Levite, who was discovered by his manner of speech; and St. Peter being known for a Galilean (Judges xii. 18. and Matth. xxvi. 21). It is so generally in other countries, and particularly with us in England, where the northern and western inhabitants do observe a different dialect from other parts of this nation, as may appear from that particular instance mentioned by Verstegan: whereas the inhabitants about London would say, "I would eat more cheese if I had it;" a northern man would speak it thus, "Ay sud eat mare cheese gyn ay hed et; and a western man thus, "Chud eat more cheese an chad it." Every one of these reputed mother tongues, except the Arabic (and perhaps the Hungarian), was used in Europe during the time of the Roman empire. But whether they were all of them so ancient as the confusion of Babel doth not appear; there wants not great probability to the contrary for some of them.

It hath been the opinion of some, particularly Boxhornius, that the Scythian tongue was the common mother from which the Greek, Latin, German, and Persian were derived, as so many dialects; and Salmasius in his treatise, De re Hellenisticâ, inclines to this opinion [P. 366.] "Scythia igitur quæ ad Septentrionem, omnes fermè gentes evomuit cum suis Linguis quæ Europam et Asiam inundârant." That is, most of the nations, with their languages, which over-ran Europe and Asia, came from northern Scythia. And Philip Cluverius conjectures, that Germans, Gauls, Spaniards, Britains, Swedes, and Norwegians, did anciently use the same language. One principal argument used for this is, the agreement of those remote nations in some radical words. Joseph Scaliger observes, that the words father, mother, brother, bond, &c. are used in the Persian tongue, with some little variety, in the same sense and signification as they are used with us. The learned Monsieur Pezron, in his Antiquities of Nations, seems to give a tolerable account of this matter. The Persian language, says he, is in many things like the Teutonic, or the High-Dutch; and this likeness is sometimes so apparent, that very learned men have stood amazed at it; which they needed not to be, had they well considered that those two nations, I mean the Persian and German, had anciently received very numerous colonies, that came from the same people, such as lived in Upper Asia, known by the name of Daes, in Latin Daæ, or Dai. For when they passed into Europe, they were called Dacians, and were the Daci of the Romans, who were often intermixed with the Getae, and that made the ancients sometimes confound the two nations. The Teutones had their origin from these Dacians that came from Asia, but more particularly from the Phrygians. These Dacians had several times sent colonies amongst the Parthians and Persians, their neighbours; and it may be said, that the Arsacidan Parthians reigned in Asia mainly by their help. These things considered, it is not to be wondered that the Persian language, notwithstanding the changes it may have undergone, had anciently, and even still retains, so much likeness in many things to the Teutonic.

Having thus done with what we had to say about the mother tongues, we shall now proceed to give some examples of the changes which our own language has suffered. Now, besides the common fate and corruption to which languages, as well as all other human things, are subject, there are many particular things which may occasion the changes of a language: the mixture with other nations in commerce; marriages in royal families, which do usually bring some common words into a court-fashion; that affectation incident to some eminent men in all ages, of coining new words, and altering the common forms of speech for greater elegancy; the necessity of making other words, according as new things and inventions are discovered: besides the laws of foreign conquests usually extended to letters and speech, as well as territories; the conqueror commonly endeavouring to propagate his own language, as far as his dominions; which is the reason why the Greek and Latin are so universally known. For as no person in the provinces could enjoy the benefit of the Roman freedom with any honour, and remain ignorant of the Roman tongue: so in embassies, suits, appeals, or whatever provincial business happened, nothing was allowed to be handled or spoken in the Senate at Rome but in the Latin tongue. The laws also whereby the provinces were governed were all written in that language, as being in all of them, except the municipal cities, the ordinary Roman law. Moreover the pretors of the provinces were not allowed to deliver their judgments but in that language: and we read, in Dion Cassius, of a principal man in Greece, that by Claudius was put from the order of judges for being ignorant of the Latin tongue: and to the same effect in Valerius Maximus, l. 2. c. 2. that the Roman magistrates would not give audience to the Grecians (therefore much less to the barbarous nations) but in the Latin tongue. Besides this there were public schools erected in sundry cities of the provinces, which we find mentioned in Tacitus, Hierom, and others, in which schools the Roman tongue was the ordinary and allowed speech: these things were no small furtherance to that language. But instead of following these brave examples, we, for the advancement of our language, send our boys and girls to learn French, a custom, especially as it relates to the female sex, very ridiculous and nonsensical; but of this we may have an occasion to speak in another place. But to return to our point.

When a nation is over-spread with several colonies of foreigners, though this does not always prevail to abolish the former language, yet if they make any long abode, this must needs make such a considerable change and mixture of speech as will very much alter it from its original purity. Those learned languages which have now ceased to be vulgar, and remain only in books, by which the purity of them is regulated, may, whilst those books are extant and studied, continue the same without change. But all languages that are vulgar or common, as those learned ones formerly were, are upon the fore-mentioned occasions subject to so many alterations, that, in tract of time, they will appear to be quite another thing than what they were at first.

The liturgies of St. Basil, and St. Chrysostom, which are yet used in the Greek churches in their public worship, the one for solemn, the other for common days, have been a long time unintelligible to that people; so much is the vulgar Greek degenerated from its former purity. Brerewood's Enquiries, c. 2. and 6.

And Polybius, l. 3. c. 22. testifies, that the articles of truce between the Romans and Carthaginians could scarce be understood by the most learned Roman antiquaries 350 years after the time of their making. If any Englishman should now write or speak as our fore-fathers did about six or seven hundred years past, we should as little understand him as he would a foreigner. But I shall now proceed to give some specimens of our old language. What the Saxon language was at their first arrival into England about the year 440 doth not appear; but it is most probable that the changes and differences of it have been somewhat proportionable in several ages. The most ancient Saxon that we can meet with is in the ancient Saxon glossed Evangelists, which were wrote about the year of Christ 700, by Eadfride the eighth bishop of Lindiffarne, or Holy-Island; these Evangelists are divided according to the ancient canon of Eusebius, not into chapters; for Stephen Langton, archbishop of Canterbury, first divided the Holy Scriptures into chapters, about the year 1200, or some little time after; as Robert Stephens did into verses, who lived about the middle of the fifteenth century.

But the Rev. Dr. Prideaux, in his valuable and learned performance called the Connection of the History of the Old and New Testament, part 1st. l. 5, makes Hugo de Sancto Caro the author of this invention, who being from a Dominical monk advanced to the dignity of a cardinal, and the first of that order that was so, is commonly called Hugo Cardinalis. The Psalms indeed were always divided as at present. For St. Paul, Acts xiii. 33, in his Sermon at Antioch, in Pisidia, quotes the second Psalm. But as to the rest of the Holy Scriptures, the division of them into such chapters as at present is what the ancients never knew of. Belæus Cent. 3 p. 275. The Greek bibles among Christians anciently had their τιτλοι, and κεφαλαια, but the intent of them was rather to point out the sum or contents than to divide the books; and they were vastly different from the present chapters, for many of them contained only a very few verses, and some of them no more than one.

The Saxon is thus,

Fader uren thu arth or thu bist in heofnum or
Father our thou art or thou beest in Heaven,
in heofnas, sie gehalgud noma thin to cymeth ric
be hallowed name thine come kingdom
thin. Sie willo thin sune is in heofne and in
thine. Be will thine as is in Heaven and in
eortha. Hlaf userne oferwistlic sel us to-daeg;
Earth. Bread our over-substantial give us to day;
and forgef us Scyldu usra, sune ue foregefon
and forgive us debts ours, as we forgive
Scyldgum usum. And ne inlead usith in
debtor our. And not lead in us into
Costunge, ah gefrig usich from Yfle.
temptation, but deliver us from evil.

The next oldest copy of the Lord's Prayer is the Dano-Saxon one, called Rushworth's. V. Wanley, p. 81. The age is about 900.

Fader ure thu the in heofunum earth. Beo
Father our thou who in Heaven art. Be
gehalgud thin noma. Cume to thine rice, weorthe
hallowed thine name. Come thy kingdom, be done
thin willa swa swa on heofune swilc on eorthe.
thy will as in Heaven as in earth.
Hlaf userne or ure daeghwamlicu or istondenlice
Bread our our daily hourly
sel us to-daeg and forlete us ure scylde swa swa
give us to day and forgive us our debts as
we ec forleten thaem the scyldigat with us and ne
we forgive them who trespass against us and not
gelaet us geleade in costnungae. Ah gelefe us
let us be led into temptation. But deliver us
of Yfle.
from evil.

About the year 960, Elfrick, who was made abbot of Malmesbury, by king Edgar, thus writeth to one Sigeferth, against the marriage of priests; for one Ankor, who lived with Sigeferth, defended the marriage of priests, affirming it to be lawful. The epistle begins thus,

Ælfric abb, gret Sigeferth freondlice; me is gesaed that thu saedest be me that ic other taehte on Engliscen gewriten other eower Ancor aet ham med eow taehth; fortham the he swutelice saegth, that hit seo alefd that Maesse-preostas wel mot wifygon, and mine gewriten withcwetheth thysen. That is, *Elfric Abbot, greets Sigeferth friendly;* me is gesaed, *to me it is said,* that thu, *that thou,* saedest be me, *readest or speakest by me,* that ic other taehte, *that I other teach,* on Engliscen eowriten, *in my English writing,* other gower Ancor, *other or than your Ancor,* aet ham med eow taehth, *at home with you teacheth;* fortham the he swutelice saegth, *for then, or because that he soothly saith,* that hit seo alefd, *that it is allowed,* that maesse-preostas, *that mass-priests,* wel motan wifigon, *may take wives,* and mine gewriten *and my writings,* withcwetheth thysen, *gainsayeth this.* Here any one may perceive a great many English words.

And in the Saxon homilies there is this remarkable expression; whence we may perceive, that Rome, at that time, had not resolved to derive her church from St. Peter. Seint Pouel the is the hegest lareow the we habbeth inne haelig kirk. *St. Paul who is the highest teacher we have in holy church.*

The charter that William the Conqueror gave to the city of London, which was about the year 1066, ran thus;

Williem king, greets Williem Bisccop and Godfred Porterefan, and ealle ya Burghwarn binnen London, Frencisce & Englise Frendlice, & ic kiden eoy, yeet ic wille yeet git ben ealra weera lagayweord, ye get weeran on Edwaerds daege kings. And ic will yeet aelc child by his fader Yrtnume, aefter his faders daege. And ic nelle ge wolian, yeet aenig man eoy aenis wrang beode. God eoy heald. That is,

William king greets William bishop, and Godfrey Portgreve [lord mayor] and all the Burgesses [citizens] within London, French and English friendly. And I make known to you, that I will that ye be all your law-worth that ye were in Edward's days the king. And I will that each child be his father's heir after his father's day. And I nill [will not] suffer that any man you any wrong beode [be done]. God save you, or keep.

In the famous psalter of Trinity College, written, as Mr. Wanley judges, in the time of king Stephen, (Wanley, p. 168.) the Lord's Prayer is thus; which a learned doctor places A. D. 1130.

Fader ure the art on heofone sy gebletsob name thin, swa swa on heofone and on eorthan bread (hlaf) ure degwamlich geof us to daeg, and forgeof us ageltes ura, swa swa we forgeofen agiltendum urum. And ne led us on costunge, ac alys us fram yfele swa beo hit.

About the year 1160 in the time of king Henry the Second, the Lord's Prayer was rendered thus, and sent over from Rome by pope Adrian, an Englishman, turned into rhime, that the people might more easily learn and remember it:

Ure fadyr in Heven rich,
Thy name be halyed ever lich,
Thou bring us thy michell blisse:
Als hit in Heaven y-doe,
Evar in Yearth beene it also:
That holy bread that lasteth ay,
Thou send it us this ilk day,
Forgive ous all that we have don,
As we forgivet uch other mon:
Ne let us fall into no founding,
Ac shield ous fro the fowle thing. *Amen.*

About a hundred years after, in the time of Henry the Third, it was rendered thus:

Fadir that art in Heven riche,
Thin helge nam it wurth the bliss,
Cumenan mot thy kingdom,
Thin holy will hit be all don,
In Heaven and in erdth also,
So sal it bin full well ic tro.
Gif us all bread on this day,
And forgif us ure sinnes,
As we do ure wider winnes:
Let us not in fonding fall,
Oac fro ifele thu syld us all. *Amen.*

About the year 1180, the Lord's Prayer was thus, as a learned gentleman transcribed it from the manuscript in Trinity College, the same manuscript that Mr. Wanley gives an account of, p. 169.

The salm that is cleped Pater-Noster.

Fader ure thu ert in hevene. Bledsed be thi name. cume thi rixlinge. Wurthe thi wil on eorthe swo hit is on hevene. Gif us to dai ure dailgwamliche bread. And forgive us ure gultes swo we don hem here the us agult habbeth shild us fram elche pine of helle aeles us of alle ivele. *Amen.* Swo hit wurthe.

About the year 1250.

Fadir ur that es in hevene,
Halud be thi nam to nevene:
Thou do us thi rich rike,
Thi will erd be wroght elk:
Als it es wroght in heven ay,
Ur ilk day brede give us to day:
Forgive thou all us dettes urs,
Als we forgive till ur detturs:
And ledde us in na fanding,
But sculd us fra ivel thing.

Wickliff's about 1380, Richard II.

Oure Fadir that art in hevenes, halowid be thi name. Thi kingdom come to. Be thi will doon in erthe as in hevene. Geve to us this dai our breed over othir substaunce. And forgeve to us oure dettis as and we forgeven to oure dettouris. And lede us not into temptacioun but deliver us from yvel. *Amen.* Evang. Matt. vi.

About two hundred years after this, in the time of Henry VI. (as appears by a large manuscript vellum Bible in the Oxford library, said to have been this king's, and by him to have been given to the Carthusians in London) it was rendered thus:

Our fadir that art in hevenes, halewid be thi name, thi kingdom come to thee, be thy will don in eerthe, as in hevene, give to us this day our breed over othre substanc, and forgive to us oure dettis, as we forgiven our dettouris, and lede us not into temptation, but delivere us from ivel. *Amen.*

In another manuscript of Wickliffe's translation, who lived in Richard the Second's time, about the year 1377, it is rendered with very small difference from this. And Michael Drayton, in his Polyolb. Cant. 8. hath these words out of Robert of Gloucester, concerning London's being walled by Lud.

Walls he let make al about, and yates up and doun,
And after Lud that was is name he cluped it Luds town;
The herte yate of the toun that yout stout ther and is,
He let hie clupie Ludgate after is o name i wis.
He let him tho' he was ded burie at thulk yate,
Theruore yut after him me clupeth it Ludgate.

About the year 1400, flourished the famous Chaucer, whose chief fault was the mixing too many French and Latin words with the English. I shall give you a taste of his style, in the description of the sudden stir and fear that happened upon the cock's being carried away by a fox.

The sely widowe and her daughters two
Herde the hennes crie and make wo,
And at the dore sterte they anon,
And saw the fox towarde the wood gon,
And bare upon his back the cocke away,
And cried out Harow and well away.
Aha, the foxe, and after hem they ran,
And eke with staves many another man:
Ran, Coll our dog, Talbot and eke Garlonde,
And Malkin with her distaffe in her honde.
Ran cow and calfe, and eke the very hogges,
For they so sore aferde were of the dogges,
And shouting of men, and of women eke,
They ran so, her herte thought to breke.
They yellen as fendes do in hell:
The duckes cried as men would them quell.

And the Wife of Bath's Tale begins thus:

In the old daies of king Artour,
(Of which the Bretons speaken great honour),
All was this lond fulfilled of fairy,
The elfe quene, with her joly company,
Daunsed full oft in many a grene mede:
This was the old opinion as I rede.
I speake of many an hundred yere ago,
But now can no man se elfes mo,
For now the great charite and praieres,
Of limitours and other holy freres,
That serchen every land, and every streme,
As thicke as motes in the sunne beme;
Blissing halles, chambers, kitchens and boures,
Citees, borowes, castelles and hie toures,
Thropes, bernes, shepens, and deiries,
This maketh that there been no fairies.

The Liber Festialis, about 1500.

Fader eure that arte in hevynes, halowed be thy name, thy gingdome come, thy wyl be doon in erth as it is in hevyn, our every daies brede gyve us to daye, and forgive us our trespasses as we forgyve theym that trespasse agaynste us, and lede us nat in temptacion but delyver us from all evyll.

Tyndale, A. D. 1526.

Our father which art in heaven, halowed be thy name. Let thy kingdom come. Thy will be fulfilled as well in earth as it is in heven. Geve us this daye ur dayly bred and forgeve us oure dettes as we forgeve ur detters. And leade us not into temptation, but delyver us from evyll. For thyne is the kyngdom and the power and the glorye for ever. *Amen.*

N. B. This is the first Lord's Prayer with the doxology in the close, being taken from the Greek, whereas those before were taken from the Latin, and want that part.

The Athanasian Creed in old English verse.

Who so wil be sauf to blis — *Whosoever will be saved.*
Before alle thinges nede to is
That he hald with alle his miht
The heli trauthe and leue it riht
Whilk bot ilken to queme — *Which Faith except.*

In fire lastend withouten ende
This is the trauht that heli isse. *This is the truth.*
Whilk bot ilkon with miht hisse
Trewlic and fastlic trowe he
Saufe ne mai he never be.

In a Bible set forth with the king's licence, translated by Thomas Mathews, and printed in the year 1537, the Lord's Prayer is rendered thus:

O oure father which arte in heven, halowed be thy name. Let thy kingdome come. Thy will be fulfiled, as well in erth, as it is in heven. Geve us this daye oure dayly bred. And forgeve us our treaspases, even as we forgeve oure trespacers. And lead us not into temptacion, but deliver us from evyl. *Amen.*

We shall now present the reader with a passage or two, out of Gawin Douglas bishop of Dunkel, who flourished in the fourteenth and fifteenth centuries. And though some persons may blame me, that in producing specimens of the alteration of the English tongue, I quote a Scotch author; yet if those persons will give themselves the trouble of considering him more heedfully, they will perceive that his language, if it be not old English, is very near a-kin to it; and sir David Lindsay, in his prologue of the Complaint of Papingo, published at Edinburgh, 1592, seems to be of this opinion; for speaking of this author, he has these expressions:

Alace for ane, quhilk lamp was in this land,
Of eloquence the flow and balmy strand;
And in our Inglis [English] rhetorick the rose,
As of rubeis the carbunckle bin chose,
And as Phebus dois Cynthia precel,
So Gawin Douglas bishop of Dunkell.

And since I have cited this testimony of sir David Lindsay, concerning the bishop, I shall give you one more, and the rather because it relates to my present design, and has not been mentioned by the publishers of the last edition of this author: and it is that of William Lisle, esq. in his preface to a Saxon Treatise De veteri novo Testamento. Ed. Lond. 1623. I lighted on Virgil Scottished by the reverend Gawin Douglas, bishop of Dunkel, and uncle to the earl of Angus, the best translation of that poet that ever I read: And though I found that dialect more hard than any of the former (as nearer the Saxon, because farther from the Norman) yet with help of the Latin, I made shift to understand it, and read the book more than once, from the beginning to the end; whereby I must confess I got more knowledge of that I sought than by any of the other: for as at the Saxon invasion many of the Saxons fled into Scotland, preserving in that realm unconquered, as the line royal, so also the language, better than the inhabitants here, under conquerors law and custom, were able.

Thus far Mr. Lisle. We shall now come to our good bishop. His conclusion to the translation of Virgil is in these words:

Thus up my pen and instrumentis full zore,
On Virgillis post I fix for euermore!
Neuir from thens sic matteris to discriue:
My muse sal now be clene contemplatiue,
And solitare, as doith the bird in cage;
Sen fer by worn all is my chyldis age,
And of my day is nere passit the half date,
That nature suld me granting, weill I wate.
Thus sen I feile doun sweyand the ballance,
Here I resigne up zoungkeris observance,
And wyl derek my labaouris euermoir,
Vnto the commoun welth and Goddis gloir.
A dew, gud readeris, God gif zou al gud nycht,
And eftir deith grant vs his hevinly lycht.

These verses need no explanation, since with a little change of a few letters they will appear to be clean English. But, however, I will explain a word or two; zore, ready; sic, such matters to describe; sen, since far outworn; suld, should; sweyand, swaying down; inclining, weighing; zoungkeris, young men; z, being frequently used among the old writers, and especially in this author, for y. I shall add a few verses more, wherein he desires that neither his rhyme nor words may be changed.

Ze writaris al, and gentle readaris eik,
Offendis not my volume, I beseik,
Bot rede lele, and tak gude tent in tyme,
Ze nouthir magil, nor mismeter my ryme,
Nor alter not my wourdis, I zou pray:
Lo this is all, bew schirris, have gude day.

In the fifteenth century lived the famous Edmond Spenser: we will present you with the 28th and 29th stanzas of the 9th canto of his Fairy Queen, b. 1. concerning Despair, for which sir Philip Sydney gave him 200*l.* and so conclude this head:

From whom returning sad and comfortless,
As on the way together we did fare,
We met the villain (God from him me bless)
That cursed wight, from whom I scap't whyl'ere,
A man of hell, that calls himself Despair,
Who first us greets, and after fair areeds
Of tydings strange, and of adventures rare;
So creeping close, as snake in hidden weeds,
Inquireth of our states and knightly deeds.
Which when he knew, and felt our feeble hearts,
Embost with bale, and bitter byting grief,
Which love had launced with his deadly darts,
With wounding words and terms of foul reprief,
He pluckt from us all hope of due relief,
That earst us held in love of lingring life;
The hopeless, hartless, gan the cunning thief
Perswade to die, to stint all further strife,
To me he lent this rope, to him a rusty knife.
With which sad instrument of hasty death,
That woful lover, loathing lenger light,
A wide way made to let forth living breath.
But I more fearful, or more lucky wight,
Dismay'd with that deformed dismal sight;
Fled fast away, half dead with dying fear, &c.

I should now proceed to give some instances of the change of our language from Shakspeare, Ben Jonson, my lord Bacon, Milton, Waller, Cowley, &c. But they being books that are almost in every bodies hands, and my preface beginning already to swell, I shall defer it to a more convenient opportunity. I shall therefore endeavour to answer, an objection that is made against our tongue, that it is made up of too many monosyllables: but this is a proof of its antiquity, if what Salmasius says be true, Certum quippe est, linguas omnes quæ monosyllabis constant esse cæteris antiquiores. Multis abundavit monosyllabis antiqua Græca, cujus vestigia, apud poetas qui antiquitatem affectârunt, remansêre non pauca. *De Re Hellenisticâ*, p. 390. For it is certain, that all those languages which consist of monosyllables are ancienter than the others; the Greek tongue abounded in monosyllables, of which there remain many instances among the ancient Greek poets. And indeed we have this advantage from our monosyllables, or words of one syllable, that we can express more matter in fewer words than any other language whatever; and though the monosyllables are not so fit for numbers, yet that happiness of composition, which is peculiar to our language with the Greek, makes our poetry as musical and harmonious as that of any nation in the world. And Mr. Dennis, who is a very good judge, says, the English is more strong, more full, more sounding, more significant, and more harmonious than the French. I know, says he, very well, that a great many will be unwilling to allow the last; but he alleges this as a convincing proof of it, that we have blank verse which is not inharmonious, and the French pretend to no poetical numbers, without the assistance of rhime. And the learned and ingenious Mrs. Elstob has given variety of instances from our own poets, which sufficiently prove that there is a secret sweetness and harmony in verses made up of monosyllables artfully placed. Preface to her Saxon Grammar, p. 13. I shall give three examples as brought by that lady from Mr. Dryden.

Arms and the man I sing who forc'd by fate.

From Mr. Creech.

Nor could the world have born so fierce a flame.

From sir John Denham's Coopers-Hill.

Tho' deep yet clear; tho' gentle yet not dull,
Strong without rage, without o'er flowing full.

And indeed there are no subjects but what may be nobly and beautifully clothed in an English dress; for our language has whatever is necessary to the making a language complete; for it is significant, easy, copious, and sweet. But we must not enlarge on these matters. I will however trespass a little more on your patience, and give you a specimen of the copiousness of our language in these two words, Anger and Striking. Anger, to express which passion, we use these following words, wrath, passion, passionate, sharpness, rage, fury, outrage, pet, choler, gaul, fume, storm, fret, pelt, chafe, vex, take-on, inflame, kindle, irritate, enrage, exasperate, incense, provoke, move, sullen, hasty, furious, outrageous, mad, look big, placable, appease, stomach, animosity, heart-burning, rough, hot, snappish, curst, snarl, snuffle, &c. So for the word Striking we use, smite, bang, beat, bast, buffet, cuff, dash, hit, swinge, thump, thwack, blow, stripe, slap, flap, rap, tap, kick, wince, spurn, bob, box, fillip, whirret, yerke, pummel, punch, rebuff, percussion, repercussion, collision, &c. So we say to seeth, or boil broth, to stew prunes, poach eggs, coddle apples, bake bread, for which expressions to seeth, stew, poach, coddle, bake, the Latins have only the word *coquere*, for *pinsere* is neither to make bread nor bake it. "In pistrino autem pinsuntur farta, uti prodeat farina, unde panes confiant in furno, quo sint esui demum coquendi;" as our learned Gataker hath rightly observed. See, farther, our article GRAMMAR.

To ENGLU'T. *v. a.* (*engloutir*, French.) 1. To swallow up (*Shakspeare*). 2. To glut; to pamper (*Ascham*).

ENGONASIS, in astronomy. See HERCULES.

To ENGO'RE. *v. a.* (from *gore*.) To pierce; to prick: not used (*Spenser*).

To ENGO'RGE. *v. a.* (from *gorge*, Fr.) To swallow; to devour; to gorge (*Spenser*).

To ENGO'RGE. *v. n.* To feed with eagerness and voracity (*Milton*).

ENGRAFTING. See GARDENING and GRAFTING.

To ENGRA'IL. *v. a.* (from *grele*, French.) To indent in curve lines (*Carew*).

To ENGRA'IN. *v. a.* from *grain*.) To die deep; to die in grain (*Spenser*).

To ENGRA'PPLE. *v. n.* (from *grapple*.) To close with; to contend with hold on each other (*Daniel*).

To ENGRA'SP. *v. a.* (from *grasp*.) To seize; to hold fast in the hand (*Spenser*).

To ENGRA'VE. *v. a.* pret. *engraved*; part. pass. *engraved* or *engraven*. (*engraver*, Fr.) 1. To picture by incisions in any matter (*Pope*). 2. To mark wood or stone (*Exodus*). 3. To impress deeply; to imprint (*Locke*). 4. (from *grave*.) To bury; to inter (*Spenser*.)

ENGRA'VER. *s.* (from *engrave*.) A cutter in stone or other matter (*Hale*).

ENGRAVING, the art of cutting metals, precious stones, woods, &c. and representing thereon figures, letters, or whatever device or design the artist fancies. Engraving is properly a branch of sculpture, and is divided into several other branches, according to the matter whereon it is employed, and the manner of performing it.

History of Engraving.—Engraving is an art chiefly of modern invention; having its rise no earlier than the middle of the fifteenth century. The ancients, indeed, practised engraving on precious stones and crystals with very good success; and there are still many of their works remaining equal to any production of the later ages. But the art of engraving on plates and blocks of wood, to afford prints or impressions, was not known till after the invention of painting in oil. Of these last, the most ancient mode is that on wood; the first impressions on paper having been taken from carved wooden blocks. For this invention we are indebted to the brief-malers, or makers of playing cards, who practised the art in Germany about the beginning of the fifteenth century. From the same source may perhaps be traced the first idea of moveable types, which appeared not long after; for these brief-malers did not entirely confine themselves to the printing and painting of cards, but produced also subjects of a more devout nature; many of which, taken from holy writ, are still preserved in German libraries, with the explanatory text facing the figures; the whole engraved in wood. Thus a species of books was formed; such as, Historia sancti Johannis, ejusque Visiones Apocalypticæ; Historia Veteris & Novi Testamenti, known by the name of the Poor Man's Bible. These short mementos were printed only on one side; and two of them being pasted together, had the appearance of a single leaf. The earliest date on any of these wooden cuts is 1423. The subject is St. Christopher carrying the infant Jesus over the sea, preserved in a convent at Buxheim near Menningen. It is of a folio size, illuminated in the same manner as the playing cards; and at the bottom is this inscription:

> "Cristoferi faciem die quacunque tueris.
> Illa nempe die morte mala non morieris.
> Millesimo CCCC° XX° tertio."

Upon the invention of moveable types that branch of the brief-malers business, so far as it regarded the making of books, was gradually discontinued; but the art itself of engraving on wood continued in an improving state; and towards the end of the fifteenth and beginning of the sixteenth century, it became customary for almost every one of the German engravers on copper to engrave on wood also. The works of Albert Durer in this style of engraving are justly held in the highest esteem. Italy, France, and Holland, have produced many capital artists of this kind; but for boldness and spirit we must see the prints of Christopher Jegher, who worked under the direction of Rubens, and was without doubt assisted by that great master. The invention of that species of engraving distinguished by the appellation of *chiaro-scuro*, seems also to be justly claimed by the Germans, and first practised by Mair; one of whose prints of this kind is dated 1499. Many excellent works in chiaro-scuro have been produced in France; and in Italy it was honoured with the performances of Titian and Parmegiano; but the attempts of Jackson, Kirkall, and others in England, have not been equally successful. A set of excellent prints in this way have lately been published by J. Skippe, esq. a connoisseur and dillettante. In Germany, about A. D. 1450, prints from engraved copper first made their appearance. The earliest date of a copperplate print is indeed only 1461; but however faulty this print may be with respect to the drawing, or defective in point of taste, the mechanical part of the execution of it has by no means the appearance of being one of the first productions of the graver. We have also several other engravings evidently the work of the same master; in which the impressions are so neatly taken from the plates, and the engravings so clearly printed in every part, that, according to all appearance, they could not be executed in a much better manner in the present day, with all the conveniences which the copperplate printers now possess, and the additional knowledge they must necessarily have acquired in the course of more than three centuries. Hence we may fairly conclude, that if they were not the first specimens of the engraver's workmanship, they were much less the first efforts of the copperplate printer's ability. It is likewise to be observed, that Martin Shoen, who is said to have worked from 1460 to 1486, was apparently the scholar of Stoltzhirs; for he followed his style of engraving, and copied from him a set of prints representing the passion of our Saviour. Now, allowing Stoltzhirs to have preceded his disciple only ten years, this carries the era of the art back to 1450, as was said above. There is no ground to suppose that it was known to the Italians till at least ten years afterwards. The earliest prints that are known to be theirs are a set of the seven planets, and an almanac by way of frontispiece; on which are directions for finding Easter from 1465 to 1517 inclusive: and we may be assured that the engravings were not antedated, as the almanac would have thus been less valuable. These prints must therefore have been executed in 1464, which is only four years later than the Italians claim. The three earliest Italian engravers are Finiguerra, Boticelli, and Baldini. If we are to refer these prints to any of the three, we shall naturally conclude them to be the work of Finiguerra or Baldini; for they are not equal either in drawing or composition to those ascribed to Boticelli, which we know at least were designed by him; and as Baldini is expressly said to have worked from the designs of Boticelli, it will appear most probable that they belong to Finiguerra. With respect to the invention of etching, it seems to be not well known to whom it is to be ascribed. One of the most early specimens is the print by Albert Durer, known by the name of the Cannon, dated 1518, and thought by some, with little foundation, to have been worked on a plate of iron. Another etching by the same artist is Moses receiving the tables of the law, dated 1524. It was also practised in Italy soon after this by Parmegiano, in whose etchings we discover the hand of the artist working out a system as it were from his own imagination, and striving to produce the forms he wanted to express. We see the difficulty he laboured under; and cannot doubt, from the examination of the mechanical part of the execution of his works, that he had no instruction; and that it was something entirely new to him. If the story is true, that he kept an engraver by profession in his house, the novelty of the art is rendered so much the more probable. He died in 1540. As to that species of engraving in which the modes of etching and cutting with the graver are united, it must have been found necessary immediately upon the invention of etching; it was, however, first carried to perfection by G. Audran, and is now almost universally practised, whether the work is in strokes or in dots. Engraving in dots, the present fashionable method, is a very old invention, and the only mode discovered by the Italians. Agostino de Musis, commonly called Augustine of Venice, a pupil of Marc Antonio, used it in several of his earliest works, but confined it to the flesh, as in the undated print of an old man seated upon a bank, with a cottage in the back ground. He flourished from 1509 to 1536. We also find it in a print of a single figure standing, holding a cup and looking upwards, by Giulio Campagnola, who engraved about the year 1516. The back ground is executed with round dots, made apparently with a dry point. The figure is outlined with a stroke deeply engraved, and finished with dots, in a manner greatly resembling those prints which Demarteau engraved at Paris in imitation of red chalk. The hair and beard are expressed by strokes. Stephen de Laulne, a native of Germany, followed the steps of Campagnola; and many of his slight works are executed in dots only. John Boulanger, a French artist, who flourished in the middle of the last century, and his contemporary Nicholas Van Plattenberg, improved greatly on this method, and practised it with much success. It is only, however, of late that it has been considered as an object worthy of general imitation. John Lutma executed this kind of work with a hammer and a small punch or chisel. Engraving in mezzotinto was invented about the middle of the seventeenth century; and the invention has generally been attributed to prince Rupert. (See MEZZOTINTO.) Engraving in aquatinta is quite a recent invention, and seems at once to have been carried to perfection by Sandby, and other artists of the present age. (See AQUATINTA.) Engraving with the tool was the kind originally practised, and it is yet retained for many purposes. For though etching be more easy, and other advantages attend it; yet where great regularity and exactness of the stroke or lines are required, the working with the graver is much more effectual: on which account it is more suitable to the precision necessary in the execution of portraits; as there every thing the most minute must be made out and expressed, according to the original subject, without any licence to the fancy of the designer in deviating from it, or varying the effect either by that masterly negligence and simplicity in some parts, or those bold sallies of the imagination and hand in others, which give spirit and force to history painting.

Historical engravings for the port-folio and furniture seemed at one period to advance rapidly towards perfection, to which the late alderman Boydell greatly contributed; but the death of Strange, Hall, and Woollet, have been almost fatal to the hopes of the amateur, which rest, in a great measure, upon Heath, Sharp, Bromley, and a few others, as in this particular instance we do not include those eminent foreigners who have, or do at present reside in England. Whatever deficiencies we may discover in the prosecution of the arts in this country, is fortunately not to be attributed to want of genius, or relaxation from study in the artist; the chill of apathy in the rich, who view a wretched coloured aquatint with the same or more pleasure than the most laboured production of the graver, is the baleful cause of the languishing state of historical engraving. When persons capable of affording patronage are taught discrimination, future Woollets will fascinate the best judges of engraving. We have, however, some very fine engravers, in different departments, among whom it would be unjust not to specify the names of Milton, Scott, Lowry, and Mrs. Griffiths.

ENGRAVING ON COPPER, the making, correspondently to some delineated figure or design, such concave lines on a smooth surface of copper, either by cutting or corrosion, as render it capable, when charged properly with any coloured fluid, of imparting by compression an exact representation of the figure or design to paper or parchment. Whether we consider this branch of engraving, with regard to its utility, the pleasure it affords, or the difficulty that attends its execution, we cannot but confess, that on all these accounts it merits a distinguished rank among the polite arts. By this art the cabinets of the curious are adorned with the portraits of the greatest men of all ages and nations; and their memories, their most remarkable and most glorious actions, are transmitted to the latest posterity. By this art, also, the paintings of the greatest masters are multiplied to a boundless number; and the lovers of the polite arts, however widely diffused, are enabled to enjoy those beauties, from which their distant situations would otherwise have for ever debarred them. Persons of moderate fortunes are hereby enabled to become possessed of all the spirit, and all the poetry, contained in those miracles of art, which seemed to have been reserved for the temples of Italy, or the cabinets of princes. When we reflect, that the engraver, beside the beauties of poetic composition, and the artful ordinance of design, is to express, merely by the means of light and shade, all the various tints of colours and clair-obscure; to give a relief to each figure, and a truth to each object; that he is now to paint a sky serene and bright, and then loaded with dark clouds; now the pure tranquil stream, and then the foaming, raging sea; that here he is to express the character of the man strongly marked in his countenance, and there the minutest ornament of his dress; in a word, that he is to represent all even the most difficult objects in nature; we cannot sufficiently admire the vast improvements in this art, and that degree of perfection to which it is at this day arrived. See PRINTS.

Different modes of engraving on copper.—These are as follow: 1. In strokes cut through a thin wax, laid upon the copper with a point, and these strokes bitten or corroded into the copper with aquafortis. (See ETCHING). 2. In strokes with the graver alone, unassisted by aquafortis. In this instance, the design is traced with a sharp tool, called a dry point, upon the plate; and the strokes are cut or ploughed upon the copper with an instrument distinguished by the name of a graver. 3. In strokes first etched and afterwards finished with a graver: by this expedient the two former methods are united. 4. In dots without strokes, which are executed with the point upon the wax or ground, bitten in with the aquafortis, and afterwards harmonized with the graver, by which instrument small dots are made; or with the graver alone, as in the flesh and finer parts, unassisted with the point. 5. In dots first etched and afterwards harmonized with the dry point, performed by a little hammer, called *opus mallei*, or the work of the hammer, as practised by Lutma, and others. 6. In MEZZOTINTO. 7. In AQUATINTA. See these articles.

Instruments used in engraving on copper.—The principal instruments used in engraving with the tool are, gravers, scrapers, a burnisher, an oilstone, and a cushion for bearing the plates. Gravers are made in several forms with respect to the points, some being square, others lozenge; the square graver for cutting broad and deep, and the lozenge for more delicate and fine strokes and hatches. La Bosse recommends, as the most generally useful, such as are of a form betwixt the square and lozenge: and he advises, that they should be of a good length; small towards the point but stronger upwards, that they may have strength enough to bear any stress there may be occasion to lay upon them: for if they be too small and mounted high, they will bend; which frequently causes their breaking, especially if they be not employed for very small objects. The burnisher is used to assist in the engraving on some occasions, as well as to polish the plates. It is seven inches long, and made of fine steel well polished. The burnisher is formed at one end, and a scraper on the other, each about an inch and a half long from the point: betwixt them about four inches of the instrument is made round, and serves as a handle; and is thicker in the middle than at the necks, where the burnisher and scraper begin, which necks are only one quarter of an inch in diameter. The principal application of it in engraving, besides its use in polishing the plates, is to take out any scratches or accidental defacings that may happen to the plates during the engraving; or to lessen the effect of any parts that may be too strongly marked in the work, and require to be taken down. A cushion, as it is called, is generally used for supporting the plate in such a manner, that it may be turned every way with ease. It is a bag of leather filled with sand, which should be of the size that will best suit the plates it is intended to bear. They are round and about nine inches over, and three inches in thickness. The dry point, or needle, which has been of late much used in engraving, is a tool like an etching point, which being drawn hard on the copper, cuts a stroke, and raises a burr; the burr is scraped off, and there remains a stroke more soft and delicate than can be produced in any other way.

Method of engraving on copper.—The cushion being laid on the table, the plate must be put upon it; and the graver being held in the hand in a proper manner, the point must be applied to the plate, and moved in the proper direction for producing the figures of the lines intended: observing, in forming straight lines, to hold the plate steady on the cushion; and where they are to be finer, to press more lightly, using greater force where they are to be broader and deeper. In making circular or other curve lines, hold your hand and graver steadily; and as you work, turn your plate upon the cushion against your graver, otherwise it will be impossible for you to make any circular or curved line with that neatness and command of hand you by this means may. After part of the work is engraved, it is necessary to scrape it with the scraper or graver, passed in the most level direction over the plate, to take off the roughness formed by the cutting of the graver; but great care must be taken not to incline the edge of the scraper or tool used, in such a manner that it may take the least hold of the copper, as it would otherwise produce false strokes or scratches in the engraving; and that the engraved work may be rendered more visible, it may afterwards be rubbed over with a roll of felt dipped in oil. In using the graver, it is necessary to carry it as level as possible with the surface of the plate; for otherwise, if the fingers slip betwixt them, the line that will be produced, whether curve or straight, will become deeper and deeper in the progress of its formation; which entirely prevents strokes being made at one cut, that will be fine at their extremities, and larger in the middle; and occasions the necessity of retouching to bring them to that state. For this reason, it is very necessary for those who would learn to engrave in perfection, to endeavour, by frequent trials, to acquire the habit of making such strokes both straight and curving, by lightening or sinking the graver with the hand, according to the occasion. If, after finishing the design, any scratches appear, or any part of the engraving be falsely executed, such scratches, or faulty parts, must be taken out by the burnisher, and further polished, if necessary, by the above-mentioned roll. The plate being thus engraved, it is proper to round off the edges, by using first a rough file, and afterwards a smoother; and to blunt the corners a little by the same means: after which, the burnisher should be passed over the edges to give it a farther polish. In the conduct of the graver and dry point consists all the art; for which there are no rules to be given: all depending on the habitude, disposition, and genius, of the artist. However, besides the explanations already given, some general observations and directions may not be improper. As the principles of engraving are the same with those of painting, a person cannot expect to attain any considerable degree of perfection in this art who is not a good master of design; and therefore he ought to be well acquainted both with perspective and architecture: for the former, by the proper gradations of strong and faint colours, will enable him to throw backwards the figures and other objects of the picture or design which he purposes to imitate; and the latter will teach him to preserve the due proportion of its several orders, which the painter often entrusts to the discretion of the engraver. In order to preserve equality and union in his works, the engraver should always sketch out the principal objects of his piece before he undertakes to finish them. In working, the strokes of the graver should never be crossed too much in a lozenge manner, particularly in the representation of flesh, because sharp angles produce the unpleasing effect of lattice-work, and take from the eye the repose which is to it agreeable in all kinds of picturesque designs: we should except the case of clouds, tempests, waves of the sea, the skins of hairy animals, or the leaves of trees, where this method of crossing may be admitted. But in avoiding the lozenge, it is not proper to get entirely into the square, which would give too much of the hardness of stone. In conducting the strokes, the action of the figures, and of all their parts, should be considered; and it should be observed how they advance towards, or recede from the eye; and the graver should be guided according to the risings or cavities of the muscles or folds, making the strokes wider and fainter in the light, and closer and firmer in the shades. Thus the figures will not appear jagged; and the hand should be lightened in such a manner, that the outlines may be formed and terminated without being cut too hard; however, though the strokes break off where the muscle begins, yet they ought always to have a certain connection with each other, so that the first stroke may often serve by its return to make the second, which will show the freedom of the engraver. In engraving the flesh, the effect may be produced in the lighter parts and middle tints by long pecks of the graver, rather than by light lines; or by round dots; or by dots a little lengthened by the graver; or, best of all, by a judicious mixture of these together. In engraving the hair and the beard, the engraver should begin his work by laying the principal grounds, and sketching the chief shades in a careless manner, or with a few strokes; and he may finish it at leisure with finer and thinner strokes to the extremities. When architecture or sculpture is to be represented, except it be old and ruinous buildings, the work ought not to be made very black; because, as edifices are commonly constructed either of stone or white marble, the colour, being reflected on all sides, does not produce dark or brown shades as in other substances. White points must not be put in the pupils of the eyes of figures, as in engravings after paintings; nor must the hair or beard be represented as in nature, which makes the locks appear flowing in the air; because in sculpture there can be no such appearances. In engraving cloths of different kinds, linen should be done with finer and closer lines than other sorts, and be executed with single strokes. Woollen cloth should be engraved wide, in proportion to the coarseness or fineness of the stuff, and with only two strokes; and when the strokes are crossed, the second should be smaller than the first, and the third than the second. Shining stuffs, which are generally of silk or satin, and which produce flat and broken folds, should be engraved more hard and more straight than others, with one or two strokes, as their colours are bright or brown; and between the first strokes others smaller must be joined, which is called interlining. Velvet and plush are expressed in the same manner, and should always be interlined. Metals, as armour, &c. are also represented by interlining, or by clear single strokes. In architecture, the strokes which form the rounding object should tend to the point of sight; and when whole columns occur, it is proper to produce the effect as much as possible by perpendicular strokes. If a gross stroke is put, it should be at right angles, and wider and thinner than the first stroke. In engraving mountains, the strokes ought to be frequently discontinued and broken, for sharp and craggy objects; and they should be straight, in the lozenge manner, and accompanied with long points or dots; and rocks should be represented by cross strokes more square and even. Objects that are distant towards the horizon should be kept very tender, and slightly charged with black. Waters that are calm and still are best represented by strokes that are straight, and parallel to the horizon, interlined with those that are finer; omitting such places as, in consequence of gleams of light, exhibit the shining appearance of water; and the form of objects reflected from the water, at a small distance upon it, or on the banks of the water, are expressed by the same strokes, retouched more strongly or faintly as occasion may require, and even by some that are perpendicular. For agitated waters, as the waves of the sea, the first strokes should follow the figure of the waves, and may be interlined, and the cross strokes ought to be very lozenge. In cascades, the strokes should follow the fall, and be interlined. In engraving clouds, the graver should sport when they appear thick and agitated, in turning every way according to their form and their agitation. If the clouds are dark, so that two strokes are necessary, they should be crossed more lozenge than the figures, and the second strokes should be rather wider than the first. The flat clouds, that are lost insensibly in the clear sky, should be made by strokes parallel to the horizon, and a little waving; if second strokes are required, they should be more or less lozenge; and when they are brought to the extremity, the hand should be so lightened that they may form no outline. The flat and clear sky is represented by parallel and straight strokes, without the least turning. In landscapes, the trees, rocks, earth, and herbage, should be etched as much as possible; nothing should be left for the graver but perfecting, softening, and strengthening. The dry point produces an effect more delicate than the graver can, and may be used to great advantage in linen, skies, distances, ice, and often in water, especially in small engravings. In most things it is proper to etch the shadows, only leaving the lighter tints for the dry point, graver, &c.

To imitate drawings with chalk on copper.—In performing this, a mixture is used of varied and irregular dots, made more or less soft, so as to resemble the grain produced by the chalks on paper. Every stroke of the chalks on paper may be considered as an infinite number of adjoining points, which are the small eminences of the grain of the paper touched by the chalk in passing over it. When the copper-plate has been polished and varnished, or properly prepared, as in the common method of engraving, the drawing to be imitated may be counterproved on the varnish of the plate. If this cannot be conveniently done, black lead pencil, or red chalk, must be applied to varnished or oiled paper; and by means of this chalk or pencil, all the traces of the original will be transmitted to varnish. The outlines of the object must be formed in the etching by points, whose magnitude and distance must be determined by the quality of the strokes in the original drawing. The artist may be provided with pointed instruments or needles of various sizes with single or double points. In forming the light and shade, he should distinguish between those hatches which serve to express the perspective of the object, and those which form the ground of it. The principal hatches should be more strongly marked: the middle tints, if etched, should be marked lightly, or they may be left till the varnish is taken off, and be perfected with a greater degree of softness, by needles or the point of the graver, as the original may require. There is nothing peculiar in the method of applying the aquafortis in this kind of engraving; but it may be observed, that it should not be left so long as to corrode the lighter parts too much: if the light parts are sufficiently corroded, they may be stopped out with turpentine varnish and lamp-black mixed together, and the aquafortis may be applied again to the stronger parts; for it will be no detriment to them if the points which compose the shade burst into one another, provided the extreme be avoided. When the work of the aquafortis is finished, and the varnish taken off the copper, it will be necessary in the softest parts, such as the flesh, &c. to interstipple with proper points; as an effect will be thus produced more delicate than it is possible to attain with the aquafortis only; and the strongest shades will require additional strength to be given them with small strokes of the graver. Drawings made with chalks of different colours may be imitated in this manner, if a plate be provided for every colour.—This method of engraving is intended to form a kind of deception, so that the connoisseur may not be able, on the first inspection, to distinguish between the original drawing and the engraving made in imitation of it; and it is extremely useful, as it serves to multiply copies of drawings left by those masters who excelled in the use of chalks, and thus to form and improve young artists, who could not have access to the originals in the practice of drawing.

Engraving on glass is performed exactly by the same process as etching on copper; only using the fluoric instead of the nitrous acid. See ETCHING.

Engraving on precious stones is the representing of figures, or devices in relievo or indented, on divers kinds of hard polished stones. The ancients excelled in this art; there being divers antique agates, cornelians, and onyxes, which surpass any thing of that kind the moderns have produced. Pyrgoteles among the Greeks, and Dioscorides under the first emperors of Rome, are the most eminent engravers we read of: the former was so esteemed by Alexander, that he forbad any body else to engrave his head; and Augustus's head, engraven by the latter, was deemed so beautiful, that the succeeding emperors chose it for their seal. All the polite arts having been buried under the ruins of the Roman empire, the art of engraving on stones met with the same fate. It was retrieved in Italy at the beginning of the fifteenth century, when one John of Florence, and after him Dominic of Milan, performed works of this kind no way to be despised. From that time, such sculptures became common in Europe, and particularly in Germany, whence great numbers were sent into other countries: but they came short of the beauty of those of the ancients, especially those on precious stones; for, as to those on crystal, the Germans, and after their example the French, &c. have succeeded well enough. In this branch of engraving either the diamond or emery may be used. The diamond, which is the hardest of all stones, is only cut by itself, or with its own matter. The first thing to be done in this branch of engraving is, to cement two rough diamonds to the ends of two sticks big enough to hold them steady in the hand, and to rub or grind them against each other till they be brought to the form desired. The dust or powder that is rubbed off serves afterwards to polish them, which is performed with a kind of mill that turns a wheel of soft iron. The diamond is fixed in a brass dish; and, thus applied to the wheel, is covered with diamond dust, mixed up with the oil of olives; and when the diamond is to be cut facetwise, they apply first one face, then another, to the wheel. Rubies, sapphires, and topazes, are cut and formed the same way on a copper wheel, and polished with tripoli diluted in water. As to agates, amethysts, emeralds, hyacinths, granites, rubies, and others of the softer stones, they are cut on a leaden wheel, moistened with emery water, and polished with tripoli on a pewter wheel. Lapis lazuli, opal, &c. are polished on a wooden wheel. To fashion and engrave vases of agate, crystal, lapis lazuli, or the like, a kind of lathe, like that used by pewterers, is used to hold the vessels, which are to be wrought with proper tools: that of the engraver generally holds the tools, which are turned by a wheel; and the vessel is held to them to be cut and engraved, either in relievo or otherwise; the tools being moistened from time to time with diamond dust and oil, or at least emery and water. To engrave figures or devices on any of these stones, when polished, such as medals, seals, &c. they use a little iron wheel, the ends of whose axis are received within two pieces of iron, placed upright, as in the turner's lathe; and to be brought closer, or set further apart, at pleasure; at one end of the axis are fitted the proper tools, being kept tight by a screw. Lastly, The wheel is turned by the foot, and the stone applied by the hand to the tool, and is shifted and conducted as occasion requires. The tools are generally of iron, and sometimes of brass; their form is various, but they generally bear some resemblance to chisels, gouges, &c. Some have small round heads, like buttons, others like ferrels, to take the pieces out, and others flat, &c. When the stone has been engraven, it is polished on wheels of hair brushes and tripoli.

Engraving on steel is chiefly employed in cutting seals, punches, matrices, and dyes, proper for striking coins, medals, and counters. The method of engraving with the instruments, &c. is the same for coins as for medals and counters: all the difference consists in their greater or less relievo; the relievo of coins being much less considerable than that of medals, and that of counters still less than that of coins. Engravers in steel commonly begin with punches, which are in relievo, and serve for making the creux orcavities of the matrices and dyes; though sometimes they begin with the creux or hollowness; but then it is only when the intended work is to be cut very shallow. The first thing that is done is designing the figures; the next is the moulding them in wax, of the size and depth they are to lie, and from this wax the punch is engraven. When the punch is finished they give it a very high temper, that it may the better bear the blows of the hammer with which it is struck, to give the impression to the matrice. The steel is made hot to soften it, that it may the more readily take the impression of the punch; and after striking the punch on it in this state, they proceed to touch up or finish the strokes and lines, where, by reason of their fineness, or the too great relievo, they are any thing defective, with steel gravers of different kinds; chisels, flatters, &c. being the principal instruments used in graving on steel. The figure being thus finished, they proceed to engrave the rest of the medal, as the mouldings of the border, the engrailed ring, letters, &c. with little steel punches, well tempered, and very sharp.

Engraving on wood. (See CUTTING). It is performed in three different modes, viz. 1. With a single block, on which the design is traced with a pen, and those parts which should be white carefully hollowed out. This block is afterwards printed by the letter-press printers, in the same manner as they print a book. 2. With two, three or more blocks; the first having the outlines cut upon it; the second is reserved for the darker shadows; and the third for the shadows which terminate upon the lights; and these are substituted in their turn, each print receiving an impression from every block. This mode of engraving is called chiaro-scuro, and was designed to represent the drawings of the old masters. 3. On wood and on copper: in these the outline is engraved in a bold dark style upon the copper: and two or more blocks of wood are substituted to produce the darker and lighter shadows, as before.

To ENGRI'EVE. *v. a.* To pain, to vex (*Spenser*).

To ENGRO'SS. *v. a.* (*grossir*, French.) 1. To thicken; to make thick (*Spenser*). 2. To increase in bulk (*Wotton*). 3. To fatten; to plump up (*Shakspeare*). 4. To seize in the gross (*South*). 5. To purchase the whole of any commodity for the sake of selling at a high price. 6. To copy in a large hand (*Pope*).

ENGRO'SSER. *s.* (from *engross.*) He that purchases large quantities of any commodity, in order to sell it at a high price (*Locke*).

ENGRO'SSMENT. *s.* (from *engross.*) Appropriation of things in the gross; exorbitant acquisition (*Swift*).

To ENGUA'RD. *v. a.* (from *guard.*) To protect; to defend: not used (*Shakspeare*).

ENGYTHECA, in antiquity, a cupboard.

To ENHA'NCE. *v. a.* (*enhausser*, French.) 1. To lift up; to raise on high: obsolete (*Spenser*). 2. To raise; to advance (*Locke*). 3. To raise in esteem (*Atterbury*). 4. To aggravate (*Hammond*).

ENHA'NCEMENT. *s.* (from *enhance.*) 1. Increase; augmentation of value (*Bacon*). 2. Aggravation; increase of ill (*Government of the Tongue*).

ENHARMONIC, in the ancient music, one of their genera, so called from its superior excellence. This genus, says Brossard, was greatly used in the Greek music, especially in dramatic performances; but as those almost insensible elevations and fallings of the voice wherein it consists are too difficult, and as they sometimes make the concord false, it has been laid aside, and even lost, though many great authors have attempted to recover it. Others say it is a species of music, the modulation whereof proceeds by intervals less than semitones, as the semitone minor, enharmonic diesis, and third major.

ENIF, an Arabic word signifying nose: in astronomy, it is applied to the star ε in Pegasus, called *Enif Alfaras*, the Horse's Nose.

ENI'GMA. *s.* (*ænigma*, Latin.) A riddle; an obscure question; a position expressed in remote and ambiguous terms. See ÆNIGMA.

ENIGMA'TICAL. *a.* (from *enigma.*) 1. Obscure; ambiguously or darkly expressed (*Brown*). 2. Cloudy; obscurely conceived or apprehended (*Hammond*).

ENIGMA'TICALLY. *ad.* In a sense different from that which the words in their familiar acceptation imply (*Brown*).

ENI'GMATIST. *s.* (from *enigma.*) One who deals in obscure and ambiguous matters; a maker of riddles (*Addison*).

To ENJO'IN. *v. a.* (*enjoindre*, French.) To direct; to order; to prescribe (*Tillotson*).

ENJO'INER. *s.* One who gives injunctions.

ENJO'INMENT. *s.* Direction; command (*Brown*).

To ENJO'Y. *v. a.* (*enjouir*, French.) 1. To feel or perceive with pleasure (*Addison*). 2. To obtain possession or fruition of (*Milton*). 3. To please; to gladden; to exhilarate; to delight (*More*).

To ENJO'Y. *v. n.* To live in happiness (*Milton*).

ENJO'YER. *s.* One that has fruition.

ENJO'YMENT. *s.* Happiness; fruition (*Tillotson*).

ENIXUM, among the older chemists, a natural sulphat of soda. The sal enixum of Paracelsus is the residuum, or caput mortuum, resulting from a distillation of spirit of nitre, with sulphuric acid of a white colour, and pleasant subacid taste.

To ENKI′NDLE. *v. a.* (from *kindle.*) 1. To set on fire; to inflame (*Shakspeare*). 2. To rouse passions (*Shakspeare*). 3. To incite to any act or hope (*Shakspeare*).

To ENLA′RGE. *v. n.* (*enlargir*, French.) 1. To make greater in quantity or appearance. 2. To increase any thing in magnitude; to extend (*Locke*). 3. To increase by representation; to magnify. 4. To dilate; to expand (*Corinthians*). 5. To set free from limitation (*Shakspeare*). 6. To extend to more purposes or uses (*Hooker*). 7. To amplify; to aggrandize (*Locke*). 8. To release from confinement (*Shakspeare*). 9. To diffuse in eloquence (*Clarendon*).

To Enla′rge. *v. n.* To expatiate; to speak in many words (*Clarendon*).

ENLA′RGEMENT. *s.* (from *enlarge.*) 1. Increase; augmentation; further extension (*Hayward*). 2. Release from confinement (*Shakspeare*). 3. Magnifying representation (*Pope*). 4. Expatiating speech; copious discourse (*Clarendon*).

ENLA′RGER. *s.* Amplifier; one that increases or dilates any thing (*Brown*).

To ENLI′GHT. *v. a.* (from *light.*) To illuminate; to supply with light (*Pope*).

To ENLI′GHTEN. *v. a.* (from *light.*) 1. To illuminate; to supply with light (*Psalms*). 2. To quicken in the faculty of vision (*Samuel*). 3. To instruct; to furnish with increase of knowledge (*Rogers*). 4. To cheer; to exhilarate; to gladden. 5. To illuminate with divine knowledge.

ENLI′GHTENER. *s.* (from *enlighten.*) 1. Illuminator; one that gives light (*Milton*). 2. Instructor.

To ENLI′NK. *v. a.* (from *link.*) To chain to; to connect (*Shakspeare*).

To ENLI′VEN. *v. a.* (from *life, live.*) 1. To make quick; to make alive; to animate 2. To make vigorous or active (*Swift*). 3. To make sprightly or vivacious. 4. To make gay or cheerful in appearance.

ENLI′VENER. *s.* That which animates; that which invigorates (*Dryden*).

To ENLU′MINE. *v. a.* (*enluminer*, Fr.) To illumine; to illuminate: not in use (*Spenser*).

ENMANCHE, in heraldry, is when lines are drawn from the centre of the upper edge of the chief to the sides, to about half the breadth of the chief; signifying sleeved, or resembling a sleeve, from the French *manche*.

E′NMITY. *s.* (from *enemy.*) 1. Unfriendly disposition; malevolence; aversion (*Locke*). 2. Contrariety of interests or inclinations; mutual malignity (*Milton*). 3. State of opposisition (*James*). 4. Malice; mischievous attempts (*Atterbury*).

To ENMA′RBLE. *v. a.* (from *marble.*) To turn to marble: obsolete (*Spenser*).

To ENME′SH. *v. a.* (from *mesh.*) To net; to entangle; to entrap (*Shakspeare*).

ENNEADECATERIS, in chronology, a cycle, or period of nineteen solar or lunar years.

E′NNEAGON. *s.* (εννεα and γωνια.) A figure of nine angles. See Polygon.

ENNEAHEDRIA, in natural history, a genus of columnar, crystalliform, and double-pointed spars, composed of a trigonal column, terminated at each end by a trigonal pyramid. Of this genus there are several species, distinguished by the length or shortness of the column and pyramids, none of which give fire with steel, but all of them ferment with aquafortis. See Spar.

ENNEANDRIA. (εννεα, nine, and ανηρ, a husband.) In botany, nine-stamened. The name of the ninth class in the Artificial System of Linnéus; comprehending such plants as bear hermaphrodite flowers with nine stamens, Also of an order in the classes monadelphia and diœcia.

ENNEAPE′TALATE COROL, in botany, a nine-petalled corol: or, a flower of nine petals; as in thea viridis, magnolia, and liriodendron.

ENNEA′TICAL. *a.* (εννεα.) Enneatical days, are every ninth day of a sickness; and enneatical years, every ninth year of one's life.

ENNIS, a borough of Ireland, in the county of Clare. It is large and populous, and situate on the Fergus. Lat. 52. 49 N. Lon. 8. 54 W.

ENNISCORTHY, a borough of Ireland, in the county of Wexford. It has a manufacture of coarse woollen cloth, and some considerable iron works. Lat. 52. 28 N. Lon. 6, 48 W.

ENNIUS (Quintus), an ancient poet, born at Rudii, in Calabria. His stile is rough and unpolished, but his defects, which are more particularly attributed to the age in which he lived, have been fully compensated by the energy of his expressions, and the fire of his poetry. Ennius wrote in heroic verse the annals of the Roman republic, and displayed much knowledge of the world in some dramatical and satirical compositions. He died of the gout, contracted by his frequent intoxication, about 169 years before the Christian era, in the 70th year of his age. Scipio, on his death-bed, ordered his body to be buried by the side of his poetical friend. Conscious of his merit as the first epic poet of Rome, Ennius bestowed on himself the appellation of the Homer of Latium. Of all his writings, nothing now remains but fragments, happily collected from the quotations of ancient authors.

To ENNO′BLE. *v. a.* (*ennoblir*, French.) 1. To raise from commonalty to nobility (*Shakspeare*). 2. To dignify; to aggrandize; to exalt; to raise (*South*). 3. To elevate; to magnify (*Waller*). 4. To make famous or illustrious (*Bacon*).

ENNO′BLEMENT. *s.* (from *ennoble.*) 1. The act of raising to the rank of nobility. 2. Exaltation; elevation; dignity (*Glanville*).

ENOCH. (חנוך, Heb. i. e. dedicated.) The son of Cain, in honour of whom

Enoch, the first city taken notice of in

Scripture, was so called by Cain, who built it. It was situated east of Eden, Gen. iv. 17.

Enoch, the son of Jared, and father of Methuselah, was born A.M. 622. At the age of sixty-five he begat Methuselah, and lived 300 years after, and had several sons and daughters. Enoch walked with God; and after that he had lived 365 years, "he was not, for God took him." Some construe these last words, as if they intimated that Enoch died a natural death, because in reality he lived not near so long as the other patriarchs of those times; as if God, to secure him from corruption, had taken him early out of this world. But the generality of the fathers and commentators assert that he died not, but was translated out of the sight of men, as Elijah was. The apostle Paul shows very clearly that Enoch was translated, and did not see death, Heb. xi. 5.

Enoch (The prophecy of), an apocryphal book, ascribed to Enoch. The apostle Jude, ver. 14, 15, cites a passage from the book of Enoch, which has very much exercised interpreters. The question is, whether the apostle took this passage out of any particular book written by Enoch, which might be extant in the first ages of the church? whether he received it by tradition? or lastly, by some particular revelation? It is thought probable, that he read it in the book ascribed to Enoch, which, though apocryphal, might contain several truths that St. Jude, who was favoured with a supernatural degree of understanding, might make use of to the edification of the faithful. The ancients greatly esteemed this work. Tertullian expresses his concern that it was not generally received. That father, on the authority of this book, deduces the original of idolatry, astrology, and unlawful arts, from the revolted angels, who married with the daughters of men. St. Augustin allows, indeed, that Enoch wrote something divine, because he is cited by St. Jude; but he says, it was not without reason that this book was not inserted in the canon, which was preserved in the temple at Jerusalem. This father sufficiently insinuates, that the authority of this book is doubtful, and that it cannot be proved that it was really written by Enoch. Indeed, the account it gives of giants engendered by angels, and not by men, has manifestly the air of a fable, and the most judicious critics believe it ought not to be ascribed to Enoch.

ENODA'TION. *s.* (*enodatio*, Latin.) 1. The act of untying a knot. 2. Solution of a difficulty.

ENODOUS, in botany, knotless. Without knots or joints: in opposition to nodous or knotted.

ENO'RMITY. *s.* (from *enormous.*) 1. Deviation from rule; irregularity. 2. Deviation from right; depravity; corruption (*Hooker*). 3. Atrocious crime; flagitious villany (*Swift*).

ENO'RMOUS. *a.* (*enormis*, Latin.) 1. Irregular; out of rule (*Milton*). 2. Excursive; beyond the limits of a regular figure (*Newton*). 3. Disordered; confused (*Shakspeare*). 4. Wicked beyond the common measure. 5. Exceeding in bulk the common measures (*Pope*).

ENO'RMOUSLY. *ad.* Beyond measure.

ENO'RMOUSNESS. *s.* Immeasurable wickedness (*Decay of Piety*).

ENOS, the son of Seth, and father of Cainan, was born in the year of the world 235.

ENO'UGH. *a.* plural *enow.* (ȝenoh, Sax.) In a sufficient measure; so as may satisfy (*Locke*).

Eno'ugh. *s.* 1. Something sufficient in greatness or excellence (*Temple*). 2. Something equal to a man's powers or faculties (*Bacon*).

Eno'ugh. *ad.* 1. In a sufficient degree; in a degree that gives satisfaction. 2. It notes a slight augmentation of the positive degree: *I am ready* enough *to quarrel.* 3. Sometimes it notes diminution: *the song is well* enough. 4. An exclamation noting fulness or satiety (*Shakspeare*).

ENO'W. The plural of *enough.*

EN PASSANT. *ad.* (French.) By the way.

To ENRA'GE. *v. a.* (*enrager*, French.) To irritate; to make furious (*Walsh*).

To ENRA'NGE. *v. a.* (from *range.*) To place regularly; to put in order (*Spenser*).

To ENRA'NK. *v. a.* (from *rank.*) To place in orderly ranks (*Shakspeare*).

To ENRA'PT. *v. a.* (from *rapt.*) To throw into an ecstacy; to transport with enthusiasm (*Shakspeare*).

To ENRA'PTURE. *v. a.* (from *rapture.*) To transport with pleasure; to delight highly.

To ENRA'VISH. *v. a.* (from *ravish.*) To throw into ecstacy (*Spenser*).

ENRA'VISHMENT. *s.* (from *enravish.*) Ecstacy of delight (*Glanville*).

To ENRI'CH. *v. a.* (*enricher*, French.) 1. To make wealthy; to make opulent (*Shakspeare*). 2. To fertilize; to make fruitful (*Blackmore*). 3. To store; to supply with augmentation of any thing desirable (*Raleigh*).

ENRI'CHMENT. *s.* 1. Augmentation of wealth. 2. Amplification; improvement by addition (*Bacon*).

To ENRI'DGE. *v. a.* To form with longitudinal protuberances or ridges (*Shakspeare*).

To ENRI'NG. *v. a.* (from *ring.*) To bind round; to encircle (*Shakspeare*).

To ENRI'PEN. *v. a.* (from *ripe.*) To ripen; to mature; to bring to perfection (*Donne*).

To ENRO'BE. *v. a.* (from *robe.*) To dress; to clothe; to habit; to invest (*Shakspeare*).

To ENRO'L. *v. a.* (*enroller*, French.) 1. To insert in a roll or register (*Sprat*). 2. To record; to leave in writing (*Milton*). 3. To involve; to inwrap (*Spenser*).

ENRO'LLER. *s.* He that enrols; he that registers.

ENRO'LMENT. *s.* Register; writing in which any thing is recorded; record (*Davies*).

EN RONDEAU, a musical term, signifying in the manner of a rondeau.

To ENRO'OT. *v. a.* To fix by the root; to implant deep (*Shakspeare*).

To ENRO'UND. *v. a.* To environ; to surround; to encircle; to enclose (*Shakspeare*).

ENS, among metaphysicians, denotes entity, being, or existence: this the schools call *ens reale*, and *ens positivum*; to distinguish it from their *ens rationis*, which is only an imaginary thing, or exists in the imagination.

Ens, among chemists, imports the power, virtue, and efficacy, which certain substances exert upon our bodies.

ENSA′MPLE. *s.* (*essempio*, Ital.) Example; pattern; subject of imitation (*Sanderson*).

To Ensa′mple. *v. a.* (from the noun.) To exemplify; to shew by example (*Spenser*).

To ENSA′NGUINE. *v. a.* (*sanguis*, Lat.) To smear with gore; to suffuse with blood (*Milton*).

ENSA′TÆ. (*ensis*, a sword.) In botany, the fifth order in Linnéus's Fragments, and the sixth in the natural orders at the end of Gen. Pl. Containing some of the liliaceous plants, which have sword-shaped leaves.

To ENSCHE′DULE. *v. a.* To insert in a schedule or writing (*Shakspeare*).

To ENSCO′NCE. *v. a.* To cover as with a fort; to secure (*Shakspeare*).

To ENSE′AM. *v. a.* To sew up; to enclose by a seam (*Camden*).

To ENSE′AR. *v. a.* To cauterize; to stanch or stop with fire (*Shakspeare*).

ENSEELED, in falconry, is said of a hawk that has a thread drawn through her upper eyelid, and made fast under her beak, to take away the sight.

ENSEMBLE, a French term, sometimes used in our language; literally signifying together, or one with another: being formed from the Latin *in* and *simul*. In architecture, we say the ensemble, or *tout ensemble*, of a building; meaning the whole work, or composition, considered together, and not in parts; and sometimes, also, the relative proportion of the parts to the whole. "All those pieces of building make a fine *ensemble*."

To ENSHI′ELD. *v. a.* To shield; to cover; to protect (*Shakspeare*).

To ENSHRI′NE. *v. a.* To enclose in a chest or cabinet; to preserve as a thing sacred (*Tate*).

ENSIFORM. (*ensiformis, cartilago*, from *ensis*, a sword, and *forma*, resemblance.) Sword-like. A term applied to a cartilage. See Cartilago ensiformis.

Ensiform leaf. (*folium ensiforme.*) In botany, sword-shaped, or sword-form: ancipital or two-edged, tapering from the base towards the point; as in some species of ixia, gladiolus, iris, &c.

E′NSIGN. *s.* (*enseigne*, French.) 1. The flag or standard of a regiment (*Shakspeare*). 2. Any signal to assemble (*Isaiah*). 3. Badge; mark of distinction (*Waller*). 4. The officer of foot who carries the flag.

E′NSIGNBEARER. *s.* He that carries the flag; the ensign (*Sidney*).

To ENSLA′VE. *v. a.* (from *slave.*) 1. To reduce to servitude; to deprive of liberty (*Milton*). 2. To make over to another as his slave or bondman (*Locke*).

ENSLA′VEMENT. *s.* The state of servitude; slavery (*South*).

ENSLA′VER. *s.* (from *enslave.*) He that reduces others to servitude (*Swift*).

To ENSU′E. *v. a.* (*ensuivre*, Fr.) To follow; to pursue (*Davies*).

To Ensu′e. *v. n.* 1. To follow as a consequence to premises (*Hooker*). 2. To succeed in a train of events, or course of time (*Shakspeare*).

ENSU′RANCE. *s.* (from *ensure.*) 1. Exemption from hazard, obtained by the payment of a certain sum. 2. The sum paid for security.

ENSU′RANCER. *s.* (from *ensurance.*) He who undertakes to exempt from hazard (*Dryden*).

To ENSU′RE. *v. a.* (from *sure.*) 1. To ascertain; to make certain; to secure (*Swift*). 2. To exempt any thing from hazard by paying a certain sum, on condition of being reimbursed for miscarriage. 3. To promise reimbursement of any miscarriage for a certain reward stipulated (*L'Estrange*).

ENSU′RER. *s.* (from *ensure.*) One who makes contracts of ensurance.

ENTABLATURE, in architecture, is that part of an order of column which is over the capital, comprehending the architrave, frieze, and corniche. This is sometimes called the trabeation. As the grand parts, or divisions above-mentioned, vary in the different orders, it is manifest that the entablature varies also.

ENTA′IL. *s.* (from the French *entaillé*, cut.) The estate entailed or settled, with regard to the rule of its descent. 2. The rule of descent settled for any estate. 3. Engraver's work; inlay: obsolete (*Spenser*).

To Enta′il. *v. a.* (*tailler*, to cut, French.) 1. To settle the descent of any estate, so that it cannot be by any subsequent possessor bequeathed at pleasure (*Dryden*). 2. To fix unalienably upon any person or thing (*Tillotson*). 3. To cut: obsolete (*Spenser*).

To ENTA′ME. *v. a.* To tame; to subjugate; to subdue (*Shakspeare*).

To ENTA′NGLE. *v. a.* To inwrap or insnare with something not easily extricable. 2. To lose in multiplied involutions. 3. To twist or confuse in such a manner as that a separation cannot easily be made. 4. To involve in difficulties; to embarrass; to perplex (*Clarendon*). 5. To puzzle; to bewilder. 6. To insnare by captious questions or artful talk (*Matthew*). 7. To distract with variety of cares (*Timothy*). 8. To multiply the intricacies or difficulties of a work.

ENTA′NGLEMENT. *s.* (from *entangle.*) 1. Involution of any thing intricate or adhesive. 2. Perplexity; puzzle (*More*).

ENTA′NGLER. *s.* One that entangles.

To E′NTER. *v. a.* (*entrer*, French.) 1. To go or come into any place (*Atterbury*). 2. To initiate in a business, method, or society (*Locke*). 3. To introduce or admit into any counsel (*Shakspeare*). 4. To set down in writing (*Graunt*).

To E′nter. *v. n.* 1. To come in; to go in (*Judges*). 2. To penetrate mentally; to make intellectual entrance (*Watts*). 3. To engage in (*Addison*). 4. To be initiated in (*Milton*).

ENTERDE'AL. *s.* (*entre* and *deal.*) Reciprocal transactions: obsolete (*Spenser*).

E'NTERING. *s.* (from *enter.*) Entrance; passage into a place (*Isaiah*).

ENTERITIS. (*enteritis*, εντεριτις, from εντερον, an intestine.) Inflammation of the intestines. It is a genus of diseases in the class pyrexiæ, and order phlegmasiæ of Cullen, and is known by the presence of pyrexia, fixed pain in the abdomen, costiveness, and vomiting.

To ENTERLA'CE. *v. a.* (*entrelasser*, Fr.) To intermix; to interweave (*Sidney*).

ENTEROCE'LE. (*enterocele*, εντεροκηλη, from εντερον, an intestine, and κηλη, a tumour.) Hernia intestinalis. Every hernia may be so called that is produced by the protrusion of an intestine, whether it be in the groin, navel, or elsewhere.

ENTERO-EPIPLOCE'LE. (*entero-epiplocele*, εντερο-επιπλοκηλη, from εντερον, an intestine, επιπλοον, the epiploon, and κηλη, a tumour.) A rupture formed by the protrusion of part of an intestine, with a portion of the epiploon.

ENTERO-HYDROCE'LE. (*entero-epiplocele*, εντερο-επιπλοκηλη, from εντερον, an intestine, ὑδωρ, water, and κηλη, a tumour.) An intestinal hernia with water in the scrotum.

ENTERO'MPHALUS. (*enteromphalus*, εντερομφαλος, from εντερον, an intestine, and ομφαλος, the navel.) An umbilical hernia produced by the protrusion of a portion of an intestine.

ENTERO'LOGY. *s.* (εντερον and λογος.) The anatomical account of the bowels and internal parts.

ENTERORA'PHIA. (*enteroraphia*, εντεροραφη, from εντερον, an intestine, and ραφη, a suture.) The sewing together the divided edges of an intestine.

ENTERPA'RLANCE. *s.* (*entre* and *parler*, Fr.) Parley; mutual talk; conference (*Hayward*).

ENTERPLE'ADER. *s.* (*entre* and *plead.*) The discussing of a point incidentally falling out, before the principal cause can take end (*Cowley*).

E'NTERPRISE. *s.* (*entreprise*, Fr.) An undertaking of hazard; an arduous attempt (*Dryden*).

To E'NTERPRISE. *v. a.* (from the noun.) 1. To undertake; to attempt; to essay (*Temple*). 2. To receive; to entertain: obsolete (*Spenser*).

E'NTERPRISER. *s.* A man of enterprise; one who undertakes great things (*Hayward*).

To ENTERTA'IN. *v. a.* (*entretenir*, Fr.) 1. To converse with; to talk with (*Locke*). 2. To treat at the table (*Addison*). 3. To receive hospitably (*Hebrews*). 4. To keep in one's service (*Shakspeare*). 5. To reserve in the mind (*Decay of Piety*). 6. To please; to amuse; to divert (*Addison*). 7. To admit with satisfaction (*Locke*).

ENTERTA'INER. *s.* (from *entertain.*) 1. He that keeps others in his service (*Bacon*). 2. He that treats others at his table (*Smalridge*). 3. He that pleases, diverts, or amuses.

ENTERTA'INMENT. *s.* 1. Conversation. 2. Treatment at the table; convivial provision (*Waller*). 3. Hospitable reception. 4. Reception; admission (*Tillotson*). 5. The state of being in pay as soldiers or servants (*Shakspeare*). 6. Payment of soldiers: obsolete (*Davies*). 7. Amusement; diversion (*Temple*). 8. Dramatic performance; the lower comedy.

ENTERTI'SSUED. *a.* (*entre* and *tissue.*) Interwoven or intermixed with various colours or substances (*Shakspeare*).

To ENTHRO'NE. *v. a.* (from *throne.*) 1. To place on a regal seat (*Shakspeare*). 2. To invest with sovereign authority (*Ayliffe.*)

ENTHU'SIASM. *s.* (ενθȣσιασμος.) 1. A vain belief of private revelation; a vain confidence of divine favour (*Locke*). 2. Heat of imagination; violence of passion. 3. Elevation of fancy; exaltation of ideas (*Dryden*).

ENTHUSIASM, an ecstasy of the mind, whereby it is led to think and imagine things in a sublime, surprising, yet probable manner. This is the enthusiasm felt in poetry, oratory, music, painting, sculpture, &c. In a religious sense, it implies a transport of the mind, whereby it fancies itself inspired with some revelation, impulse, &c. from heaven. Mr. Locke gives the following description of enthusiasm. "In all ages, men in whom melancholy has mixed with devotion, or whose conceit of themselves has raised them into an opinion of a great familiarity with God, and a nearer admittance to his favour than is afforded to others, have often flattered themselves with a persuasion of an immediate intercourse with the Deity, and frequent communications from the Divine Spirit. Their minds being thus prepared, whatever groundless opinion comes to settle itself strongly upon their fancies, is an illumination from the Spirit of God. And whatsoever odd action they find in themselves a strong inclination to do, that impulse is concluded to be a call or direction from heaven, and must be obeyed. It is a commission from above, and they cannot err in executing it. This I take to be properly enthusiasm, which, though arising from the conceit of a warm and overweening brain, works, when it once gets footing, more powerfully on the persuasions and actions of men than either reason or revelation, or both together; men being most forwardly obedient to the impulses they receive from themselves."

ENTHU'SIAST. *s.* (ενθȣσιαϛης.) 1. One who vainly imagines a private revelation; one who has a vain confidence of his intercourse with God (*Locke*). 2. One of a hot imagination, or violent passions (*Pope*). 3. One of elevated fancy, or exalted ideas (*Dryden*).

ENTHUSIA'STICAL. ENTHUSIA'STIC. *a.* (ενθȣσιαϛικος.) 1. Persuaded of some communication with the Deity (*Calamy*). 2. Vehemently hot in any cause. 3. Elevated in fancy; exalted in ideas (*Burnet*).

ENTHYMEME, in logic and rhetoric, an argument consisting only of two propositions, an antecedent, and a consequent deduced from it. The word is Greek ενθυμημα, formed of the verb ενθυμεισθαι, to think, conceive, a compound of εν and θυμος, mind. The enthymeme is the most simple and elegant of all argumentations; being what a man, in arguing closely, commonly makes, without attending at all to the form. Thus, that verse remaining of Ovid's tragedy, entitled Medea, contains an enthymeme; *Servare potui, perdere an possum rogas:* "I was able to save you; consequently to have destroyed you." All the beauty would have been lost, had all the propositions been expressed; the mind is displeased with a rehearsal of what is no ways necessary. Sometimes, also, the two propositions of an enthymeme are both included in a single proposition, which Aristotle calls an enthymematical sentence, and gives this instance thereof: Mortal, do not bear an immortal hatred. The whole enthymeme would be, Thou art mortal; let not, therefore, thy hatred be immortal.

To ENTI'CE. *v. a.* To allure; to attract; to draw by blandishments or hopes (*Ascham*).

ENTI'CEMENT. *s.* 1. The act or practice of alluring to ill (*Hooker*). 2. The means by which one is allured to ill; allurement; blandishment (*Taylor*).

ENTI'CER. *s.* One that allures to ill.

ENTI'CINGLY. *ad.* (from *entice*.) Charmingly; in a winning manner (*Addison*).

E'NTIERTY. *s.* (*entierté*, Fr.) The whole (*Bacon*).

ENTI'RE. *a.* (*entier*, French.) 1. Whole; undivided (*Bacon*). 2. Unbroken; complete in its parts (*Newton*). 3. Full; complete; comprising all requisites in itself (*Hooker*). 4. Sincere; hearty (*Bacon*). 5. Firm; sure; solid; fixed (*Prior*). 6. Unmingled; unallayed (*Milton*). 7. Honest; firmly adherent; faithful (*Clarendon*). 8. In full strength; with vigour unabated; with power unbroken (*Spenser*).

ENTIRE. (*integer.*) In botany, applied to the stem when quite single with scarce any branches. An entire leaf, integrum folium; undivided, without any sinus or opening in the edge. An entire perianth, integrum perianthium; opposed to fissum, cloven; as in genipa.

ENTI'RELY. *ad.* 1. In the whole; without division (*Raleigh*). 2. Completely; fully (*Milton*). 3. With firm adherence; faithfully (*Spenser*).

ENTI'RENESS. *s.* 1. Totality; completeness; fullness (*Boyle*). 2. Honesty; integrity.

To ENTI'TLE. *v. a.* (*entituler*, French.) 1. To grace or dignify with a title or honourable appellation. 2. To give a title or discriminative appellation (*Hooker*). 3. To superscribe, or prefix a title (*Locke*). 4. To give a claim to any thing (*Rogers*). 5. To grant any thing as claimed by a title (*Locke*).

E'NTITY. *s.* (*entietas*, low Latin.) 1. Something which really is; a real being (*Crashaw*). 2. A particular species of being (*Bacon*).

To ENTO'IL. *v. a.* (from *toil*.) To insnare; to entangle; to bring into toils or nets (*Bacon*).

To ENTO'MB. *v. a.* (from *tomb*.) To put into a tomb; to bury (*Denham*).

ENTOMO'LITHUS, in oryctology, a genus of class petrifactions, order animal; thus generically characterized; the body, or some part of an insect, changed into a fossile substance. Three species.

1. E. cancri. Petrified crab; in whole or in part, found in various parts of Great Britain, and very generally over the globe in slate, on foliated lime-stone, entire, or in fragments, as the shell, legs, claws, &c. and of various species.

2. E. monoculi. Monoculus polyphemus. Found near Solenhoffen, in foliated limestone.

3. E. paradoxus. Oniscus paradoxus. Found in various parts of Great Britain, and the continent, in various kinds of lime-stone, and indurated clay or slate; loose or affixed, solitary or in numbers, entire or in parts, straight, incurved, expanded, or contracted: the head covered with a very convex, roughish, often three-parted shell, semilunar in front, grooved through its whole length, with two hemispherical or cylindrical tubercles, above on the sides; trunk cylindrical, three-lobed, covered with a laminar shell, consisting of versatile, triarcuated rings; tail thin, three-parted by three tumours.

ENTOMOLOGY. (from εντομα, insects, and λογος, a treatise or discourse.) The doctrine of insects, constituting a distinct class of zoology or natural history. An investigation into the structures, functions, manners, modes of increase, and habitations, of the innumerable tribes of animals included under this name, so that they may be scientifically compared and arranged into distinct tribes or families. It is a science that conducts us into the most extensive and most populous province of the whole empire of nature. For while mammals are, for the most part, confined to land, and fishes to water; while birds, though equally capable of assuming earth and air as their natural range, know little more of water than its mere surface; insects, in innumerable multitudes, are traced through each of these elements, as their allotted residence, and are provided with an astonishing diversity of powers to fit them for such opposite habitations.

Entomology, therefore, of all the branches of natural history, presents the widest field for investigation. The labour of the botanist is considerable, who has to store his memory with the names of many thousands of plants before he can accurately discriminate them, but it bears no proportion to that of the entomologist, for, amidst all these plants, there is, perhaps, hardly any one that does not furnish nourishment and a habitation to several insects; while many, as the oak for example, afford a retreat for some hundreds of different species. Plants, however, are far from being the only abode of insects; vast numbers reside upon the larger animals, whose juices they continually suck; while many live upon and devour others of their own order. Infinite numbers spend a part of their lives in the water; others remain there entirely: the earth swarms, and the air teems with multitudes too small for the human eye to observe, and too numerous for the imagination to conceive!

While the individuals of this class of the animal kingdom thus exceed all our powers of calculation, its varieties are also multiplied to a degree that renders a complete discrimination of them equally impossible. The different species of insects are not only incalculable, but each has its own distinct history, and exhibits manners, appetites, and modes of propagation peculiar to itself. In the larger ranks of existence, two animals that nearly resemble one another in form, will generally evince a similar history; but insects, almost entirely alike, are often found very dissimilar in their habits, and in the different changes which they undergo during their brief existence.

But although a complete history of the operations of nature in this large and populous part of her empire cannot be expected; yet, such a general picture may be given, as shall demonstrate some few of the more prominent modifications of that great vivifying principle by which she is animated, and by which she is enabled continually to pour forth into existence such immeasurable numbers of organized beings. A history of such insects, as most frequently occur, and whose manners are best known, will present to us a pleasing view of that protection which Providence affords even to the minutest of its creatures; of the means it employs for perpetuating them; and of that mysterious arrangement of nature, by which one set of living beings find subsistence by devouring another set, and by which life is continued through every part of the creation without a pause.

1. *General Scope and Study of Entomology.*

Entomology, like every other branch of natural history, claims it as its prerogative to demonstrate the existence and perfections of that Almighty Power which produced, and governs the universe. It is one chapter in the history of creation, and naturally leads every intelligent mind to the Creator; for there are no proofs of his existence more level to the apprehension of all, than those which this chapter offers to the understanding.

The manner, however, in which entomology has too frequently been studied, and the extremes into which men, according to their different capacities and tastes, have fallen, have excited a derision against the science, which a proper degree of discernment would have directed against the foibles alone of those who have thus studied it. While the systems of some naturalists contain only a dry repetition of shades, colours, and shapes of different insects, without entering into the more interesting and animated description of their manners, those of others, as injudiciously, ascribe to them functions, and a degree of intelligence of which they are incapable. By the former, the imagination is fatigued and disgusted with a constant repetition of the same images. By the romantic air of the latter, the mind is led into distrust with regard to the truth of the whole narrative, and to doubt of those facts which are well established and certain. Hence the study of entomology has been deemed by many an occupation the most useless and frivolous in which the human mind can be engaged. Hence too, from a fear of prostituting their talents, many have been deterred from contemplating the wonders displayed by nature, in a kingdom of animals the most numerous, diversified, and splendidly adorned, of any on the face of the globe; and thus have deprived themselves of views of the power and munificence of the Author of Nature, in some respects the most striking and interesting that can be presented to the mind of man.

Yet even to those who derive but little pleasure from the pursuits and studies of a liberal mind, and who feel but little satisfaction in any employment unattended with immediate profit, the researches of the entomologist are not without their use. Had the operations of the silk-worm never been examined, how could men have availed themselves of the labours of an insect that administers so profusely to our splendour and our luxuries? It was not to the unobserving that it first occurred, that the toil of the silk-worm might be converted into a considerable article of commerce, and might give rise to many arts, and afford subsistence to thousands of manufacturers. In the same manner, wax and honey enter into the articles of commerce, and add to our enjoyments. It cannot, therefore, be denied, that those naturalists were profitably employed, who first observed the industry of the bee; who brought the insect from its native woods, introduced it into our gardens, and, by domesticating it, have rendered it subservient to our pleasures.

The Chinese, whose progress in many of the arts is superior to that of any other nation, avail themselves of the labours of certain insects in procuring a rich dye, and an elegant varnish, which is provided by a certain species of winged ant. The celebrated purple dye of the ancients was the produce of a small species of shell-fish; and we are told by Pliny, that the discovery of its virtue was occasioned by a dog, who, in eating the fish, had dyed his ears with that beautiful colour. It seems probable that the ancients were capable, from the shells of insects, of communicating to their stuffs many beautiful shades of scarlet with which we are unacquainted; and it is not unlikely that we have also some rich tints of that colour which they wanted. It is certain that our finest reds are furnished by insects of which they were ignorant. Cochineal, the extensive and profitable uses of which have been long estimated, is now known universally to be an insect which is propagated with care, and in vast numbers, in the kingdom of Mexico. The kermes or grain of scarlet, which was formerly imagined to be one of the galls or excrescences that are seen on shrubs, is now understood to be an insect, which attaches itself in that form to a species of the oak.

The medical uses of certain insects are far from being inconsiderable; and to these purposes they have long been applied, perhaps more frequently, and with better effect, than at present. The valuable purposes to which the lytta vesicatoria, or Spanish fly, has been made subservient, will alone vindicate the utility of those researches which have been made concerning this part of the animal kingdom. There are, however, other uses to which other insects have been applied, and that from the most remote antiquity, which appear of a still more singular nature. Before the times of Theophrastus and Pliny, certain kinds of them were employed in ripening the figs throughout the islands of the Archipelago; and it appears that the same practice still subsists among the present inhabitants of these islands. There are two kinds of figs cultivated around the Mediterranean; the wild, and the domestic. The former produces fruit several times in the year; and in it are deposited the eggs of insects which are soon converted into larves. It is by an artificial process of the same kind that the domestic fig is brought to maturity, which would otherwise drop from the tree in an unripe state. During the months of June and July, the peasants of these delightful climes are busily employed in collecting such of the wild figs as abound most with these insects, and in placing them near the cultivated fig, that they may deposit their eggs, and co-operate with the climate in bringing it to maturity. Similar purposes might probably be served by a judicious application of insects to fruit in more northerly climates, were we acquainted with the proper species. Those prunes, pears, and apples, which are first ripe, are commonly found penetrated by worms.

It is highly probable that the whole advantage resulting from this process of caprification, as it is called, consists in the putrescent disposition which is hereby produced, and which is always accompanied with an evolution or secretion of saccharine matter. See the article CAPRIFICATION.

But there are other inducements to the study of insects, of a nature totally different, yet not less personal: inducements, founded not on any hope of advantage to be derived from these animals, but of alleviating or preventing the numerous mischiefs they occasion. Infinite swarms of these animals annually desolate whole provinces; others attack our gardens and cultivated grounds, where they commit immeasurable devastations upon grain, vegetables, and fruit trees. Nor are their depredations confined to the fields; they enter the habitations of man, and by eating into the stoutest timber of which they are constructed, gradually reduce them to ruins. They destroy his furniture and clothing; some of them spare not even his person, tormenting it long before the period at which nature has destined it to become their legitimate prey.

There are four different species of the locust which are remarkably destructive. Almost every year, whole provinces, the most fertile in Asia and Africa, are laid waste by their depredation. In Tunis and Algiers, so numerous are the swarms of the species called grillus migratorius, that they darken the face of the sky like a thick cloud. These pernicious animals are wafted thither by the southerly winds in the month of April. In May they take their departure for the interior of the country, to propagate their young, which make their appearance in their larve state, during the month of June, when they commit vast depredations. The first columns, which pervade the country like an army, destroy every green shrub and pile of grass; and these are still succeeded by other swarms, that press upon their rear, devouring the tender branches and stalks of plants, which their forerunners may have left. This dreadful visitation, which the language of Scripture has justly described as a plague, does not terminate till the insects have passed into their winged state, when they fly off, leaving the whole surface of the earth naked and brown, as if scorched by fire.

Little inferior to the locust in its destructive powers is the phalæna graminis of Linnéus, which destroys the meadows in Sweden. There the peasants are employed in cutting deep ditches in the surface to stop the progress of the larves as they pass along. If the swarm be small, this device has the desired effect; but the numbers of these animals are often so great, that they fill up the trenches, and pass along over the dead bodies that are buried in them. The formica saccharivora is a native of the West Indies, where it pervades the plantations of the sugar-cane, entering the plants, and destroying them unmercifully while they are tender. In our own country, the turnip-fly, the butterfly, and the gooseberry worm, have long committed depredations in the fields and gardens, which no invention has hitherto been able to guard against. Watering the bushes, however, with an infusion of tobacco, has been found to possess some efficacy in the last case by killing the insect in its larva state.

Another object highly worthy the attention of the entomologist, is the means of preserving corn from the invasion of insects, after it is collected into granaries. This sort of sustenance, in almost every stage of its progress, is constantly exposed to the intrusions of these enemies of human industry. Flour, biscuit, and almost every kind of farinaceous food, even after it is barrelled up for exportation, is liable to be devoured, or rendered useless, by the depredations of the most hideous animals. The patriotism of statesmen, and their zeal for the good of mankind, could not receive a nobler or more useful direction than in holding out rewards to such as might discover the most effectual means of preventing the ravages of those animalcules which, by the most destructive activity, are continually converting large stores of provisions into so many masses of corruption.

May it not be hoped, that by a careful study of the nature of insects, some means may be discovered of preventing them from penetrating into the joists of buildings, and thereby reducing them into dust, and effecting the destruction of the most costly edifices? How often do we find wooden furniture destroyed by insects, which might otherwise have answered its purposes for ages? How many accidents are occasioned at sea by those formidable worms, whose heads are armed with hard shells, and who are hereby enabled to gnaw through the thickest planks, and make perforations under the water? The alarms they have frequently occasioned in Holland, by introducing themselves and multiplying among those wooden stakes which support their dikes, are universally known. The naturalist who should discover a mode of preventing such devastations would certainly deserve well of his country and of mankind, and could not be too highly rewarded.

The tar extracted from coal is an efficacious remedy in many cases. It not only penetrates so deeply into wood that it cannot be washed away, but is of so acrid a substance, as inevitably to destroy the grub: but the intolerable effluvia which it emits will, for ever, prevent its application in the case of household furniture.

The moth tribe makes still nearer approaches to man in the hostilities which it commits. No person is ignorant of the destructive quality of these insects to woollen cloths, and all kinds of fur and wearing apparel. The instinct of these animals, in providing a proper receptacle for their eggs, and food for their young, is astonishing, and it has been one of the chief objects of Reaumur, and other entomologists, to devise methods for preventing their depredations.

Of such vast extent are the mischiefs occasioned by the insect tribes upon the various objects of human industry, and the necessaries of life; all these, however, dwindle into nothing when we reflect on their dangerous effects upon the human body, and call to mind that thousands of them are continually entering into the lungs by breathing. During the whole of the summer months, the atmosphere teems with myriads of minute and viewless insects, and particularly in the months of July and August: and the excessive numbers that are conveyed into the stomach and lungs are probably one cause of those epidemic disorders for which this season of the year is so remarkable. In other cases these sources of evil are more obvious and apparent. What an uncomfortable life must be that of the poor Laplander at certain seasons of the year, in which the number of insects that surround him is so great, that a candle is no sooner lighted than the flame is extinguished by the multitudes that flock to it; where, after millions are destroyed, famished millions succeed, and renew the unceasing combat. Even in Britain, which is happily free from these unrelenting invaders, much inconvenience is often felt from the bug, the hornet, the wasp, the bee, and a great variety of other tribes.

Curiosity, however, is perhaps, after all, the leading stimulus of the entomologist: yet, are not objects of curiosity often nearly allied to those of utility? While we amuse ourselves with the former, we are frequently led to the discovery of the latter. Hence the origin of many of the most important discoveries in philosophy, as well as in natural history; and had mankind been deprived of this powerful incentive, the European world would have been as ignorant and barbarous at the present hour as the savages of Africa or America.

II. *History of Entomology.*

The class of insects, is by far the most numerous in the animal kingdom, the most remarkable for its effects on the objects of human industry, and perhaps the most important in the economy of nature. Very little attention, however, appears to have been bestowed on entomology by any of the writers of antiquity. Aristotle has allotted but a small portion of his works to the history of insects, and his authorities are not always to be depended upon. It is known, that his pupil Alexander furnished him with considerable sums to be employed in the various researches necessary for the compilation of his history of animals; and it is not improbable, that many persons were engaged in different parts to procure him the species he required, and to furnish him with such observations on their history as fell not within the reach of his own knowledge. But from several of the facts which he has related, we are led to suspect that these men were not altogether qualified for the task in which they were employed. The arrangement of Aristotle, moreover, is as defective as the authorities upon which his observations are founded. It consists of a long and tedious enumeration of animals, whose appearance and history correspond in certain particulars; followed by another enumeration of animals which differ from the former. Enumerations of this kind are seldom complete, and long before they can become so must prove a burden too great for the memory to retain. The histories of Pliny and Ælian are formed upon the same plan, and are possessed of similar defects. They consist of a number of observations ill arranged, and insufficiently authenticated.

During that long succession of subsequent ages, which was only distinguished by ignorance and barbarism, entomology shared the same fate as every other science: it was condemned to oblivion. After a taste for literature had begun to revive, the history of insects again attracted the notice of the curious; unhappily, however, for the growth of science, men were then devoted to the study of the ancients with a blind admiration. It was from their writings that they imagined the moderns were to derive a complete knowledge of all the secrets of nature; and Aristotle was principally consulted for the history of animals. Had Aldrovandi Gesner, and Mouffet, bestowed the same attention in studying the works of nature that they employed upon the writings of that naturalist, they would have made a much greater progress in real knowledge: but they observed nature only to observe there what they had read from Aristotle.

Yet the attempts of these early writers gave birth to the researches of others, who became more bold and successful in proportion as their reverence for antiquity was diminished. In 1668, about twelve years after Mouffet published his Theatrum Insectorum, the experiments and observations of the celebrated Redi made their appearance in Italy. His investigations were principally directed to the manner of the generation of insects, with a view to overthrow that absurd and erroneous doctrine established by the ancients, of their arising fortuitously from different bodies in a state of putrefaction. Nothing can more fully demonstrate the strength of prejudice than those elaborate treatises which Malphigi, Swammerdam, and Redi were obliged to compose, in order to combat the notion of the spontaneous generation of these animals. Notwithstanding all their efforts to prove that the smaller animals are produced in the same manner as the larger, and that the organization of the body of a mite requires the same apparatus of limbs, and the same delicate structure as that of an elephant, attempts were still made to revive the ancient error by Kirker, Bonarie, and others. And what is most mortifying to human reason, the same Redi, the declared enemy of prejudices and the man of all others who knew best how to combat them, has, upon this very subject, fallen into a similar error. In order to produce those insects which are found upon the small excrescences of plants and trees, he found himself obliged to confer a vivifying power, a kind of soul upon those vegetables where they were found, and has laid aside the ordinary mode of generation, which in other instances he had laboured to establish.

Swammerdam was the contemporary of Redi; and, like him, possessed the courage to examine nature, and to think for himself. This naturalist made many anatomical observations upon insects, which after his death were published at Leyden, under the title of Biblia Naturæ, in 1737, and laid a foundation for future improvements in entomology. About the same period, Madame Marianne, a Dutch lady, contributed largely to bring the history of insects into request, by the beauty of her paintings and drawings. After having executed elegant drawings of several of the insects of Europe, from a singular avidity for these studies, she was prompted to cross the Atlantic, and give paintings of those in America. Having resided for several years in Surinam, she returned to Europe with exquisite drawings of many of the splendid insects of that continent; which were afterwards engraved and published in Holland, about the end of the last century.

Goedart is another of the early authors who adorned the history of insects with the labours of the pencil. He paid great attention to the metamorphoses of these animals, and has painted many of them in the several forms which they assume, from their appearance till their death. His work was originally published in German, very badly arranged; a new edition in Latin was afterwards given by Dr. Lister, in which many errors were corrected, and a fresh arrangement made out by that able naturalist, who has himself written a valuable treatise upon the intricate genus of spiders.

Some of these authors, by the extent of their labours, and others by the boldness of their genius, had convinced mankind that the ancients were far from attaining that perfect knowledge of nature which had been hitherto imagined: and they were now so far emboldened by the progress they had already made, as to confide in their own judgment and observation in examining the works of nature; whence many productions far more judicious, accurate, and philosophical, were offered to the public than had ever hitherto appeared. Among the first of these may be ranked that of our celebrated countryman Mr. Ray, who had, for the greater part of his life, assiduously examined the economy of insects. His Methodus Insectorum, which was not published till after his death in 1710, may be regarded as the most accurate and concise performance on the subject of entomology. In the meanwhile, various other authors arose who treated of this class of the animal kingdom; Albin described the insects of England, while sir Hans Sloan, Petivert, Catesby, and Frisch, detailed the history of vast numbers of exotic insects.

In this state of the science, about the year 1754, appeared M. de Reaumur, by far the most laborious and indefatigable entomologist in Europe. In almost every part of France this naturalist had correspondents stationed, to transmit him by post descriptions and specimens of every curious and rare insect that might occur. And in order to examine their instincts, their metamorphoses, and mode of generation, he inclosed vast numbers of them in a large insect-menagery, constructed with a close net, and secured below with a pavement overlaid with green turf, and planted with shrubs and different kinds of plants. It was here that this unwearied observer of nature examined the manners and economy of those insects, which he has described in a work the most voluminous that has hitherto appeared on entomology. As a writer, he is extremely diffuse, but always entertaining and instructive. The principal defects in his work, are the want of a systematic arrangement, and of the synonyms of other authors. These defects, however, were soon remedied by that excellent arrangement which the immortal author of the Systema Naturæ has introduced into entomology, as well as into every other department of natural history. In the mean time Geoffrey, Scopoli, Wotton, Harvey, Valisnieri, and many others of inferior note, turned their attention to this interesting subject; and while they endeavoured to improve upon the arrangement of the Swedish naturalist, though generally without success, nevertheless added greatly to the number of known insects. The labours of De Geer, a Swedish nobleman, and councellor to his Swedish majesty, are particularly entitled to attention. He has not only described a great multitude of insects with accuracy, but has indulged in philosophical remarks upon their history, which possess very considerable merit. Other entomologists have given most elegant engravings of insects; among whom we may mention Roesel, Lewenhoeck, Baker, Barbut, Harris, and Drury. Some of these have improved the science by microscopical observation: the last has given excellent drawings of exotic insects, while Harris has applied himself successfully in delineating those of England.

To Fabricius we are deeply indebted for minute investigation, and accurate description; though his classification, as being chiefly derived from a variation in the mouth of insects, is too recondite for general use. Lamark, Latreille, Cuvier, and, as a very excellent monographist, Kirby, are all highly entitled to our thanks. Entomological physiology is considerably enriched by the labours of these eminent naturalists; and if the classification of the three former should not supersede that of Linnéus, it must at least be confessed to have great elegance and ingenuity.

III. *Instinctive Powers and Sensations of Insects.*

From the extraordinary instincts evinced by many insects, the whole class has been supposed by some entomologists to possess more intelligence than animals of any other kind; yet it is highly probable, that instead of more, they possess less than any animals, except the worm tribes. While various other animals are capable of some sort of education, these have but one invariable mode of operating, which no art can either alter or improve. The dog may be taught to carry; the bird to whistle a tune; fishes to obey a summons, and eat out of the hand; but those insects which may be considered as most perfectly domesticated, can by no invention be turned from their instinct. The silk-worm completes its labours, and the spider constructs its web, invariably in the same manner. An existence which continues but a single season, seems too short for the purposes of instruction. Hence insects are not only of a rank inferior to most other animals, but some of them seem more nearly allied to plants than to the classes above them. Many are attached to a single vegetable, some to a single leaf, where the period of their lives is completed in a few weeks, or perhaps a few days; and where the pleasures they enjoy, or the purposes for which they were produced, are in a great measure beyond the reach of our faculties to explore.

The external senses of insects, as far as we are enabled to judge of them, correspond with the low measure of sagacity which the Author of nature has assigned them. Of some senses they seem altogether destitute, while others they enjoy but in an imperfect manner. The organ of hearing is doubtful; spiders, and several other genera, give evident proofs of such an organ, though we know not where it resides, or in what it consists. In others, the existence of this sense is very equivocal, though it is probable they possess it. Many of them are endowed with the power of uttering sounds; as the bee, the fly, the gnat, and the beetle. The sphinx atropos squeaks when hurt, nearly as loud as a mouse; it has even the power, in certain circumstances, of uttering a plaintive note, which excites commiseration. In general, the power of uttering sounds agreeable to the feelings and necessities of animals is conferred on them for the purpose of communicating such feelings to the rest of their kind. In fishes we have been able to trace that the vocal tribes are also endowed with organs for the reception of sounds; and the same, perhaps, holds with regard to insects. For why should the individual be possessed of the power of expressing its pleasures or its pain, if all knowledge of sound be denied to its tribe? Were the sense of hearing withheld from the animals of the same class, it would crave assistance in vain; it would speak a language destined to be unintelligible to every being in nature. Experience daily convinces us of the truth of these remarks. If a bee or wasp be attacked near the hive, the usual consequence of this assault is, that the animal expresses its pain or indignation in a tone different from its ordinary hum; the complaint is immediately understood by the hive within, when the inhabitants hurry out to revenge the insult, in such numbers that the offending party seldom comes off with impunity. The same evidence of hearing is still more obviously afforded by the spider. Often his webs are of such an enormous length, that he cannot see from the one end of them to the other; often too, in watching for his prey he conceals himself in some adjoining crevice, where he cannot see the animal, that becomes ensnared in his toils. The fly, however, no sooner finds itself entangled than it makes a buzzing noise, in order to escape; this noise is instantly heard and understood by the spider, who sallies forth from his concealment, and riots in the spoil, with all the eagerness and ferocity which distinguish the most rapacious quadrupeds.

If the sense of hearing have with difficulty been allowed to insects, naturalists have had still more difficulty in ascertaining the place or organ where that sense is situated. Many physiologists have supposed it to be placed in the antennas: since these from their situation in the head, from their inward structure, and their capacity of motion, have been conceived most favourable for the seat of such organs. The antennas of all insects are composed of joints, varying in form, size, and number. Among those which are confined to live mostly under water, as the gyrinus, they are in general short; while such as roam at large through the air have them long and slender, as the phalenæ, ichneumons, and others. They are all hollow within, and rendered flexible by the joints, which are very visible in those of the crab; which are the best examples, because the largest belonging to this class of beings. This hollowness, it is supposed, is intended to receive the sound communicated to the extremities of the antennas, by the repercussion of the air; and to convey it, by means of the joints, from one piece to another, till it arrives at the brain, in that lessened degree of tone which is suited to the nature of the particular animal. Such is, or rather such till very lately was, the common opinion of physiologists. It seems fatal to it, however, that spiders have no antennas, and that in others which possess them the sense of hearing is not weakened by their removal.

But, besides the sense of hearing, it seems highly probable that insects possess also that of smell. Many of them live on bodies in a state of putrefaction, around which, when exposed, they are seen immediately to collect, as though attracted by the fetid aroma: while those which feed on herbs, flowers, or fruits, seem to require a similar sense to direct them. It has hence been supposed that the palpi, or feelers, are the organs of smell in the insect tribes. These instruments are four, sometimes six in number; two of them evidently destined to the purpose of handling their food, and conveying it to the mouth. The others, which are in continual motion, and constantly applied to objects on which they alight, seem employed, like the snout of a hog, in searching for food, and examining the quality of the different kinds of sustenance by which they are supported. All this, however, should equally prove that the palpi are organs of touch rather than of sense. Other physiologists, therefore, have regarded the stigmata of insects as their olfactory organ: but the whole is uncertain; perhaps the sense is limited to the anterior pair of palpi alone.

The organs of vision among most kinds of insects are large; a circumstance which has put their sense of seeing beyond a doubt. These large eyes are commonly two in number, each frequently consisting of a congeries or assemblage of lenses (supposed by some to be perfect eyes in themselves), covered with a crustaceous transparent substance, to protect them from injury. In other insects, and especially in the spider tribe, these large or aggregate eyes are numerous; and in others again, the sense of vision consists of mere stemmata of a simple structure, placed on the top of the head, the real nature of which, however, is not clearly understood.

IV. *External Organs, and Classical Characters.*

Insects have always been considered as a distinct class of the animal kingdom, though naturalists have not agreed in ascertaining its limits. The shades of nature are indeed intimately blended together; and the links by which she connects different portions of her animated offspring are often small and imperceptible. The insect tribe comprehends those small animals which are destitute of red blood, bones, and cartilages; which possess feet and antennas; are furnished either with a mouth or a trunk opening lengthwise; and which breathe by means of stigmata, or apertures upon the external parts of the body. They have obtained the name of insects from the frequent incisions by which they are apparently separated into several parts or segments: and they are generally divided by naturalists into the sections of head, thorax, abdomen, and limbs.

The Head.—This is for the most part distinct from the thorax, being attached to it only by a slender tendon, and is furnished with eyes, feelers, and antennas, which are doubtless the organs of the different senses. All insects are supposed by Linnéus to be destitute of brain: but by this he can only mean a brain similar to that of larger animals. Even in their larve state insects are found to possess two distinct ganglions contained in a horny cavity; and from this point the nervous chord, which, in red-blooded animals constitutes the medulla spinalis, proceeds along the abdomen, forming in its passage twelve simple ganglia, from which, and from the two ganglia forming the brain, the nerves derive their origin.

The *antennas* are organs peculiar to insects, and according to their various forms and proportions, afford a useful character for arranging the genera of these animals. In respect to their form they are either setaceous, filiform, moniliform, clavated, capitated, fissile, pectinated, or bearded; and in their proportions, they are either longer than the body, or shorter, or of equal length.

The *feelers*, or tentacula, seem, as we have already remarked, to constitute the organs both of touch and of smell; they have two, three, and sometimes four joints. Some insects are said to have no mouth; in general, however, that organ is situated under the head, and to it the feelers are attached: in some it is placed under the breast, and in others again constitutes a beak or snout (*rostrum*) of considerable length, having an upper lip, transverse jaws, teeth, and a tongue, not unfrequently rolled up in a spire. The stemmata, or small eyes, are usually three brilliant convex spots, situated upon the crown of the head. Of the external senses we have already spoken.

2. *The Thorax.*—This is placed between the head and the abdomen, and is the part to which the fulcra or limbs are attached: immediately behind it is situated the abdomen, containing the stomach and viscera. It is divided into five segments, each pierced on the sides with small foramina for the purpose of breathing. It was long imagined, that all animals destitute of red blood lived without respiration: it has, however, been found by experiment, that this is not the case; and that, among the insect tribes, breathing is carried on, though in a different manner from what takes place among the larger animals. Insects are for this purpose all furnished with minute organs, which, in the language of naturalists, are termed stigmata; and consist of a number of small tubercles, ranged along each side of the body, each having an aperture at the top, called the spiracle, which communicates with the external atmosphere. The stigmata are commonly situated on the sides both of the thorax and abdomen; and vary in their number from eight to twelve. When the uses of these organs at first began to attract the attention of naturalists, it was imagined, that by means of them the insect only inspired, and that the air was ejected by the pores in the common manner, by perspiration. This opinion was adopted by Reaumur; but subsequent experiments have proved, that the air is both introduced into the lungs, and emitted from them by the spiracles: if the stigmata be covered with oil, or any other viscid matter, respiration totally ceases, and the animal dies; if they be covered only on one side, the vital functions on that part are impeded, and the side becomes paralytic. Nor is it in their winged and active state alone that insects breathe. The crustaceous shell, by which the chrysalis is covered, is also provided with lateral stigmata, by which respiration is carried on during the period of their pupe state. In the breathing of insects there is still another peculiarity; they thrive in air tainted by putrefying substances, and are capable of subsisting in phlogisticated air, the inspiration of which is so fatal to other animals.

3. *The Abdomen.*—This part which contains the stomach, intestines, or other viscera, consists of several annular segments, and, as we have just observed, is perforated with spiracles. The alimentary canal is short, destitute of the mesentary possessed by red-blooded animals, and sometimes exhibits small blind appendices, which are perhaps biliary ducts. The stomach differs considerably: in the lobster and earwig it is furnished with teeth; in some species of the grasshopper it is triple, as in ruminating animals.

4. *The Limbs of Insects.*—These consist of the tail, the legs, and the wings; and from these are obtained the most permanent and striking generic characters. The tail terminates the abdomen; and sometimes has two horns, and sometimes none: it is either simple, or armed with a forceps, a bristle, with one or more claws, or a sting.

The legs of these animals are generally six; the crabs and spiders have eight, and the scolopendra has a much greater number. They are divided into the thighs, which are attached immediately to the body; the tibia or shanks immediately below the second joint; and the tarsi, which are composed of various articulations, and either terminate in or consist of nails, or hands and claws: the hind feet receive different appellations, according as they are formed, for executing the various movements of walking, leaping, or swimming, whence they are called pedes cursorii, saltorii, natatorii.

The wings are in some subjects two, and in others four in number, and are so various in their colour, shape, and consistency, that they afford many characters for the distribution of these animals. The elytra, or wing-cases are two, formed, in many, of a crustaceous substance, and for the most part moveable; they serve as a cover to the under wings, and furnish distinguishing marks to the naturalist. Under the wings of dipterous insects are placed the halters or poisers, which consist of a small stalk, terminating in a round knob or head; and are supposed to serve the purpose of balancing the animal; whence the French name as applied to them *les ballanciers*.

In the Linnean system the class of insect is divided into the following orders.

I. Coleoptera.	V. Hymenoptera.
II. Hemiptera.	VI. Diptera.
III. Lepidoptera.	VII. Aptera.
IV. Neuroptera.	

Order I. or coleopterous insects, consists, as indeed the ordinal term itself indicates, of insects with crustaceous elytra or upper wings, sheathing those underneath. The genera are formed from the different shapes of the antennas. The wing-sheaths are united by a suture.

In order II. or hemipterous, the wings are half covered with crustaceous elytra, and are less hard and robust than those of the coleopterous insects, but more strong than those of the membranaceous winged insects that compose the subsequent orders. The upper wings are semi-coriaceous: they do not meet together in a longitudinal suture, as in the first order; but have part of their interior margin crossed or lapped, the one over the other along the upper part of the abdomen. The mouth and proboscis of the insects of this order are bent inwards towards the breast.

Order III. comprehending the lepidopterous insects, embraces the various tribes of moths and butterflies, whose wings, as the term lepidopterous imports, are covered with imbricated scales. These wings are four in number and membranaceous; their body is rough, and the mouth furnished with a spiral tongue, which the insect can roll up or unfold at pleasure.

The neuropterous insects constituting order IV. comprehend all those genera which have four naked and membranaceous wings, reticulated with veins. The tail of these animals is unarmed, or has no sting, but is provided with appendices like pincers, by which the sexes are distinguished.

The insects of order V. (hymenopterous) have the tail armed with a sting in the females, but not in the males. They have four simple membranaceous wings.

Order VI. contains the dipterous insects, or such as have only two wings: they are farther distinguished, as we have already observed, by a poiser situated under each wing, the base of which is covered by a small scale, while the extremity terminates in a knob.

Order VII. comprehends the apterous insects, or such as are entirely destitute of wings in either sex. In some of these the head is distinct from the thorax, in others united to it.

Such is the classification of Linnéus. Other arrangements, however, have been made by other naturalists, which we will now glance at without dwelling upon.

The systems of Swammerdam and Ray are founded on the different changes which insects undergo, and distribute them into four great divisions, agreeably to the different forms under which they appear; Valisnieri has also distributed them into four orders, but according to their habitation; arranging together in one group, such as inhabit plants; placing in another, those that live in the water; and in a third, such as conceal themselves under the earth or sand; reserving for his last division, those that inhabit the bodies of other animals. All those systems are defective, in having too few divisions of a class of animals so extremely numerous; the last, however, is liable to an imperfection of another kind, because many insects change their habitation at the moment of their metamorphosis. Some are at first aquatic, but after their transformation, are seen inhabiting the trees and plants; many of the subterraneous insects in like manner rise into the air as soon as they arrive at their winged state.

The system of Fabricius is built upon the extraordinary variety which exists in the structure of the mouth in different tribes of insects. But the distinction is not sufficiently obvious for a general classification. Other naturalists have thrown out from the province of insects many of those introduced into the apterous order of Linnéus. This has been especially done by Cuvier and Latreille, who have formed a new and an eighth order of the cancer, monoculous, and oniscus tribes, under the name of CRUSTACEA, to which word the reader may turn for a particular account: while Lamarck is dissatisfied that the spider should be regarded as an insect and continued in the same class. The Linnéan arrangement is imperfect, but where shall we stop if we change it?

V. *Generation and Transformation of Insects.*

We have already noticed the erroneous opinion which the ancients entertained concerning the generation of insects, and mentioned the efforts made by Redi and others in order to combat it: after all their researches, however, this part of our subject is far from being free of difficulty.

We must still, for the present, suppose the existence of a neuter gender among many tribes of insects. The ingenious labours of M. Huber have, indeed, completely discarded this anomaly from the apis family (see the article BEE); but there are many other families of the hymenopterous class to which this anomaly seems still to attach, and especially the formica or ant genus.

There is another anomaly in the history of one or two tribes of insects of a nature altogether as extraordinary. The genus aphis or puceron exhibits hermaphrodites of the most perfect kind: a single animal of this tribe, though kept in the most careful manner from every other, will propagate its kind by itself; and if the offspring thus produced be preserved, it will also breed. M. Bonnet has well ascertained this fact by experiments, which he has repeated to the ninth generation.

This mode of generation, so different from that effected by the joint co-operation of the sexes, has been ascribed by naturalists to a power approximating that possessed by the vegetable tribes. The approximation, indeed, is obvious; and it is also visible in several other insect families, the females of which will continue to breed eight or nine successive generations from a single impregnation by the male.

Insects are in general oviparous, producing eggs which are gradually quickened into life, by the joint influence of the heat of the sun, and of those warm substances which constitute their nidus. Bonnet mentions some instances in the order diptera, in which the parent insect produces living young. The genus aphis exhibits a singular phænomenon also in this respect: during summer, being viviparous, but oviparous towards winter; the mode of birth being determined by the nature of the season.

The nide in which the eggs of insects are deposited is generally chosen with admirable skill; and adapted equally to the security, warmth, and subsistence of the larves that are to be reared in it. Some construct their nests in the earth with great labour: others deposite their eggs upon those plants, the leaves of which are to supply food for the nascent brood: a third kind, as various species of the musca, bury their eggs in the body of the chrysalids of other insects; upon the juices of which the young are nourished at the expence of the defenceless animal which they devour. Instinct is an unerring guide in directing each of these animals to a nide fitted for the preservation of its eggs.

The skin, the nostrils, the anus, and viscera of quadrupeds, furnish a receptacle for other insects; and here nature directs the parent animal to deposit its eggs. Instinct is the sole guide, and almost always an unerring one. The blow-fly, however, appears to be deceived by the putrid smell of the stapella hirsuta or carrion-flower: mistaking this smell for that of putrescent meat, she deposits her eggs on the corol; and the young are no sooner quickened into life than they die for want of proper food.

The different changes of form which many insects undergo, from their first appearance as eggs, till they arrive at their perfect and winged state, constitute an important article in their history: these have been termed their metamorphoses, or transformations; and, from the very language employed to express them, the false notions which were were long entertained, even by naturalists, are still discernible.

A fly, a spider, or an ant, insects of the most different kinds in outward appearance, do not differ more widely than the same insect does from itself, under the different forms of a worm, a chrysalis, and a butterfly. For what is at present a worm soon becomes a chrysalis, and this again is as suddenly changed into a winged animal. Changes apparently so instantaneously produced have been compared to the metamorphoses so renowned in ancient fable, and probably at first suggested the idea of such transformations. When an insect in so short a space appeared under a shape so different from that which it lately exhibited, mankind at first imagined that the change was real: they trusted to appearances, without giving themselves the trouble of reflecting on the improbability of the fact. This point, however, has been successfully laboured by Malphigi and Swammerdam, who, by dissecting insects a short time before the period of their transformation, observed that their first form is owing to an external covering alone, under which their different members are destined to acquire their proper size and firmness: that all the parts of a butterfly, for example, are perfectly distinct under the skin of the worm which invests them; and that under the crustaceous shell of the chrysalis they are still increasing in strength; and fast approaching to that state in which they are destined to appear, when the animal shall arrive at perfection, and be able to propagate its kind. All the parts of the insect in its perfect state are, hence, rather developed than formed by successive creations.

A silk worm, or the worm of a butterfly, which is about to enter into its chrysalis state, is observed for some time antecedently to grow languid, and to cease from gnawing those plants of which it was formerly so voracious: after having retired to a place fit for its purpose, and undergoing a few convulsive struggles, the skin which covered it, and gave it the form of a worm, bursts, and the animal within makes its appearance. At first it is soft and tender, and covered with a viscous fluid which ascends from the body: and which progressively hardens into that crustaceous shell in which all the members are again locked up, till they acquire greater firmness and stability. This viscous fluid, which is generally seen coloured and opaque in its crustaceous state, is at first transparent, and through it the wings, limbs, and antennas of the butterfly, are clearly perceptible. M. de Reaumur collected several hundreds of these worms before their transformation, and placed them together on a table where he had many opportunities of examining them as they passed from one shape to another: it was then that he distinctly perceived all the different members of the butterfly, before the chrysalis had assumed its hard and apparently inanimate state.

After having remained for some time in this torpid state of a nymph, chrysalis, or pupe, the limbs of the animal acquire sufficient strength to perform their functions; and it employs them in breaking open the second prison. On this event all the members are set at liberty, and instantly assume that posture and arrangement which is best suited to the new functions with which they are now to be charged.

Yet all insects do not undergo the same number of transformations before they arrive at the winged state.

Some, immediately on leaving the egg, assume a form pretty nearly resembling that which they possess after their growth is completed. The whole order of aptera, which comprehends all the different kinds of spiders, come under this denomination. The viviparous insects, in like manner, appear from the first, under their most perfect form. Some kinds, without undergoing all the changes of the silk worm, or that of the common butterfly, after having grown for a certain period, deposite a tunic in which their wings were inveloped, and ascend into the air. Previous to this change, however, such insects enjoy the power of locomotion by means of their limbs, and in this state are distinguished by voracity and activity: of this description are all the different species of locusts. Flies, wasps, and bees, constitute another class, which after leaving their vermicular form, and passing into their chrysalis state, display their limbs and wings without being capable of using them. The most complete example o transformation is displayed, as we have already observed, in the class of moths and butterflies.

One of the most wonderful circumstances in the economy of insects, is the different preparations which they make, and the expedients to which they have recourse, for their preservation, in their chrysalis or aurelia state. Many dig a hole in the earth, where they remain during the whole period of their inactivity. Such is the invention of all the coleopterous insects.

The gnats, on the other hand, dive into the water, where they remain till the period of their winged state arrives. Some eat their way into seeds and fruits, where they undergo the different changes previous to their entomized appearance. Many lodge themselves in animal bodies on the approach of their transformation, several of the aquatic tribes bury themselves among sand, encrusted with a glutinous substance; while the numerous race of phalenæ wrap themselves up in the leaves of trees, the bombyces, or larger kinds, constituting for themselves a silken web to protect them during that trying vicissitude of their lives.

In general, all insects provide for their security before their helpless state arrives, by retiring from their usual haunts into some sheltered retreat. It is thus that the worm of the butterfly provides for its safety, by betaking itself, while it has yet the power of motion, to the hole of a wall, or the eave of an incumbent roof. In this situation, some are suspended by a thread, which nature assists them in providing; some hang by the head, others by the opposite extremity, and many by the middle. The crustaceous covering with which they are then clothed, affords another instance of the attention paid by nature to the preservation of her offspring, during a period in which they are not able to avoid external injury by flight. Thus protected by the munificence of Providence, myriads of animals sink annually into a state of torpor so profound as appears to threaten the extinction of every vital power. At the return of spring, however, all nature seems again to quicken into life; her countless tribes awake from their torpid state, and enter upon new functions with enlarged powers.

VI. *Habitations, Foods, and Uses of Insects.*

It has been asserted by Aristotle that every kind of quadruped and bird is inhabited by its peculiar insect; and this assertion, which has never been contradicted, seems to admit of being much extended. Salmons, cods, and most other fishes are, at certain seasons, infested with insects parasitic to them: animals of other kinds afford food and residence to other insects; and the same is the case with plants. As the same quadruped is often seen to feed upon a great many different plants; so the same plant often supports a variety of insects. The oak in this country affords sustenance to twenty or thirty different genera; and there are varieties of this tree in warmer climates that serve for food to a far greater number.

Plants afford the most general and copious pabulum for this division of the animal kingdom. Wherever any insect is found indigenous in a country, there will always be found in it plants accommodated to its wants. There are many insects attached uniformly to one plant; the silk worm always gives a decided preference to the mulberry, but will live and propagate, though less vigorously, upon common lettuce. The cochineal insect is much attached to the opuntia; and by means of such attachments the animal is often known from the place where it is found to reside. Hence Linnéus has frequently given them names from the plants upon which they feed; a method often fallacious however, since perhaps the greater number reside indiscriminately upon several plants, and support themselves upon a variety of different vegetable foods. Some are asserted to be capable of residing in the human intestines, and of undergoing their transformations there; being ejected from the stomach in their winged state.

The most poisonous herbs afford food to insects equally with those that are salubrious: The water-hemlock, almost as poisonous a plant as any we know, is frequented by many tribes of these animals, and seems to constitute a favourite nourishment.

In the different stages of their lives, insects are distinguished by various degrees of voracity; many of them in the state of larves are most insatiable: the different species of the butterfly and silk worms are then endowed with teeth, with which they make great havoc among leaves, even though of a pretty strong consistency; their stomachs being capable of dissolving these harder substances. The same animal, when a chrysalis, not only loses all appetite for food, but the instruments that were employed in comminuting it. The teeth are deposited with its first covering; and the inner coats of the stomach are voided, it is said, along with the excrements, a short while before the first transformation. After being liberated from the last state of confinement, the butterflies are still inferior in voracity, and in the powers of digestion. Their food is now a thin liquid substance collected from the leaves of plants, and devoured only in small quantity.

The same is the case with the different species of locusts; some of which in their larve state are the most voracious of all animals, and desolate entire provinces. It is not till they arrive at their winged and more perfect form that their depredations cease, and mankind are relieved from one of the heaviest calamities which fall upon them in sultry climates. It is by insects in their larve state that the roots of corn are perforated and devoured in more northerly countries. If the season prove cold and wet, they continue long under ground in the same state; and the crop in the mean time, is so completely eaten away, that in some instances scarcely a tenth stalk survives the depredation. In a more genial spring, these animals are expedited into their more perfect form, and the damage done by them is proportionably less; their destructive operations below ceasing as soon as they are enabled by their wings to rise into the air, and go in quest of sustenance in another element.

All insects even when furnished with wings, take food in a greater or less quantity; though some, as the may-fly and gad-fly, are so short-lived, as in the opinion of one or two naturalists to require no sustenance, and to be destitute of mouths for eating. It is at least true, that the mouths of these insects have no mandibles. But to assert that they never eat, requires a more accurate examination than has hitherto taken place. The smaller and more delicate insects find, perhaps, various particles of matter floating in the air that serve for their support; the effluvia continually emitted by animal and vegetable substances in a state of putrefaction probably support many of them. We know, at least, that numerous tribes of fishes are capable of living upon earthy or other particles found floating in the purest water; and if animals of so superior a size be thus supported, there can hardly be any room to doubt that insects, many of whom are scarcely perceptible, may find abundant subsistence in the air, impregnated as it is with effluvia of various kinds.

The economical uses of insects, and their noxious effects upon the various objects of human industry, have already been considered; it only remains that we point out the purposes which they serve in the general system of nature. A class of beings by far the most numerous upon the face of the globe, and however small, taken individually, yet forming collectively a mass of organised matter, superiour in bulk to any other department of the animal kingdom, could not have been created, nor can continue to be propagated, without answering some important end.

The first and most obvious use of this part of the animal kingdom, seems to consist in that large supply of provision which it affords the superior ranks of life. It is for this same purpose that the whole surface of the earth is annually covered with plants and herbage. Many, perhaps the greater part, of the larger animals are hence supported: while not a few are also sustained by devouring the flesh of these larger animals themselves. Between these two species of nourishment, however, there is a wide difference; and insects afford an aliment which seems to partake somewhat of the nature of both, and which supplies the wants of an infinite number of creatures whose constitutions are not wholly adapted to either. Many kinds of birds live upon hardly any other food. What a blank in the feathered race would ensue, were this copious source of provision shut up from that department of the animal kingdom! Fishes seem still more dependant on the supplies afforded by those numerous tribes of insects that either float upon the water, or are seen hovering over its surface. The whale, the largest of nature's animated offspring, is supported entirely by crabs and medusa worms. Among this class, therefore, an inconceivable diminution of numbers would necessarily ensue, were the food of insects denied it. Farther, many of the larger insects prey upon the smaller; all of which, as well as the different animals they support in their turn, must be unavoidably struck out of the family of nature the moment this species of support is withheld.

But besides the supply of food which insects afford to the superior animals, they have justly been deemed serviceable in the general system, by preserving the salubrity of the air. Over the whole surface of the earth, those numberless productions that enjoy either animal or vegetable life are continually falling into decay, and making room for countless successions of the same kinds. The atmosphere would hence, perhaps, soon become unfit for the supply of life, did not millions of insects continually consume the carrion and other substances in a state of putrefaction, and purge the air of the noxious effluvia they emit. It is, perhaps, the office even of the very minute insects that escape our observation, to destroy those noxious particles with which that element is impregnated, and which, at certain seasons, render it pestilential. The operation of this class of animals upon putrid substances is much more considerable than a superficial examination might suggest. It has been asserted by the most judicious and discerning naturalists, that the produce of a dozen flies will consume a dead carcase in a shorter space than a hungry lion. If this be true, how inconceivable the benefits which may be produced by those prodigious numbers of insects, which in warm countries continually swarm through the air, their population regulated by infinite wisdom in proportion to their demand! For the rest, see Zoology.

E'NTRAILS. *s.* Without a singular. (*entrailles*, French.) 1. The intestines; the inward parts; the bowels; the guts (*Shakspeare*). 2. The internal parts (*Locke*).

To Entra'il. *v. a.* (*intralciare*, Ital.) To mingle; to interweave; to diversify (*Spenser*).

E'NTRANCE. *s.* (*entrans*, French.) 1. The power of entering into a place (*South*). 2. The act of entering (*Shakspeare*). 3. The passage by which a place is entered; avenue (*Wotton*). 4. Initiation; commencement (*Locke*). 5. Intellectual ingress; knowledge (*Bacon*). 6. the act of taking possession of an office or dignity (*Hayward*). 7. The beginning of any thing (*Hakewill*).

Entrance, in the sportsman's dialect, is applied to both horses and hounds.

Entrance of race-horses, the ceremony of entering them (at the place appointed) on a day previous to the races at any city, borough, or town, where the plates to be run for are advertised and given. Horses intended to run, are to be shewn and entered, paying two or three guineas entrance money (according to the custom of the place), and in general five shillings to the clerk of the course. For all plates given by his majesty, or the prince of Wales, no entrance money is paid or permitted, the clerk of the course only taking his accustomed fee.

Entrance of hounds, is the introduction of young hounds to the pack, into which at a proper age they are incorporated.

To Entra'nce. *v. a.* (from *trance.*) 1. To put into a trance. 2. To put into an ecstacy (*Milton*).

To ENTRA'P. *v. a.* (from *trap.*) 1. To insnare; to catch in a trap (*Spenser*). 2. To involve unexpectedly in difficulties; to entangle (*Shakspeare*). 3. To take advantage of (*Ecclus*).

To ENTRE'AT. *v. a.* (*traiter*, French.) 1. To petition; to solicit; to importune (*Genesis*). 2. To prevail upon by solicitation (*Rogers*). 3. To treat or use well or ill (*Prior*). 4. To entertain; to amuse: not used (*Shakspeare*). 5. To entertain; to receive: not used (*Spenser*).

To Entre'at. *v. n.* 1. To offer a treaty or compact: not used (*Mac.*). 2. To treat; to discourse: not used (*Hakew.*). 3. To make a petition (*Shakspeare*).

ENTRE'ATANCE. *s.* Petition; entreaty; solicitation: not used (*Fairfax*).

ENTRE'ATY. *s.* (from *entreat.*) Petition; prayer; solicitation; request (*Shakspeare*).

ENTRE-DOUERO-E-MINHO, a province of Portugal, forty-five miles in length, and thirty-five in breadth. Braga is the capital.

ENTREME'TS. *s.* (Fr.) Small plates set between the main dishes (*Mortimer*).

Entre-mets, in music, inferiour movements which are inserted, by way of relief, between the more important movements of a composition.

ENTREPAS, in the manage, a broken pace or going, and indeed properly a broken amble; that is, neither walk nor trot, but somewhat of an amble. This is the pace of such horses as have no reins or back, and go upon the shoulder, or of such as are hurt in their limbs.

ENTROCI, in oryctology. Zoophytic specimens of the isis entrocha. See Helmintholithus.

E'NTROCUS, in oryctology. See Helmintholithus.

ENTRO'PIUM. (*entropium*, εντροπιον, from εν, and τρεπω, to turn.) A disease of the eyelids, occasioned by the eyelashes and eyelid being inverted towards the bulb of the eye.

E'NTRY. *s.* (*entrée*, French.) 1. The passage by which any one enters a house (*Bacon*). 2. The act of entrance; ingress (*Addison*). 3. The act of taking possession of any estate. 4. The act of registering or setting down in writing (*Bacon*). 5. The act of entering publickly into any city (*Bacon*).

Entry, is sometimes also used to denote a duty or impost laid on commodities imported into a state, either by land or sea.

Entry, is also used for a writ which grants possession of lands or tenements to a person, on account of a legal right thereto.

To ENU'BILATE. *v. a.* (*e* and *nubilo*, Lat.) To clear from clouds.

To ENU'CLEATE. *v. a.* (*enucleo*, Latin.) To solve; to clear; to disentangle.

To ENVE'LOP. *v. a.* (*enveloper*, French.) 1. To inwrap; to cover. 2. To hide; to surround (*Philips*). 3. To line; to cover on the inside (*Spenser*).

ENVELO'PE. *s.* (French.) A wrapper; an outward case (*Swift*).

To ENVE'NOM. *v. a.* (from *venom.*) 1. To taint with poison; to poison (*Milton*). 2. To make odious (*Shakspeare*). 3. To enrage; to exasperate (*Dryden*).

E'NVIABLE. *a.* (from *envy.*) Deserving envy; such as may excite envy (*Carew*).

E'NVIER. *s.* (from *envy.*) One that envies another; a maligner (*Clarendon*).

E'NVIOUS. *a.* (from *envy.*) Infected with envy; pained by the excellence or happiness of another (*Sidney*).

E'NVIOUSLY. *ad.* With envy; with malignity; with ill-will (*Duppa*).

To ENVI'RON. *v. a.* (*environer*, French.) 1. To surround; to encompass (*Knolles*). 2. To involve; to envelop (*Donne*). 3. To surround in a hostile manner; to besiege; to hem in (*Shakspeare*). 4. To enclose; to invest (*Cleaveland*).

ENVI'RONS. *s.* (*environs*, French.) The neighbourhood or neighbouring places round about the country.

E′NULA CAMPANA. (*enula*, a corruption of *henula* or Helenium, from Helene, the island where it grew.) Helenium. Common inula, or elecampane. Inula helenium; foliis amplexicaulibus ovatis rugosis subtus tomentosis, calycum squamis ovatis, of Linnéus; of the class syngenesia, and order polygamia superflua. This plant, though a native of Britain, is seldom met with in its wild state, but mostly cultivated. The root, which is the part employed medicinally, in its recent state, has a weaker and less grateful smell than when thoroughly dried, and kept for a length of time, by which it is greatly improved, its odour then approaching to that of Florentine orris. It was formerly in high estimation in dyspepsia, pulmonary affections, and uterine obstructions, but is now fallen into disuse. See INULA.

To ENU′MERATE. *v. a.* (*enumero*, Lat.) To reckon up singly; to count over distinctly; to number (*Wake*).

ENU′MERATION. *s.* (*enumeratio*, Lat.) The act of numbering or counting over (*Sprat*).

At Rome, it was usual to have an enumeration made of all the families. The first of these was under Servius Tullus, when the men amounted to 80,000. Claudius made an enumeration in the year of Christ 48, when there were seven millions of people fit to bear arms. The last enumeration was that of Vespasian.

ENUMERATION, in rhetoric, a part of peroration; in which the orator, collecting the scattered heads of what has been delivered throughout the whole, makes a brief and artful relation or recapitulation thereof.

To ENU′NCIATE. *v. a.* (*enuncio*, Latin.) To declare; to proclaim; to relate; to express.

ENU′NCIATION. *s.* (*enunciatio*, Latin.) 1. Declaration; publick attestation (*Taylor*). 2. Intelligence; information (*Hale*). 3. Expression.

ENU′NCIATIVE. *a.* (from *enunciate*.) Declarative; expressive (*Ayliffe*).

ENU′NCIATIVELY. *ad.* Declaratively.

E′NVOY. *s.* (*envoye*, French.) 1. A publick minister sent from one power to another (*Denham*). 2. A publick messenger, in dignity below an ambassador. 3. A messenger (*Blackmore*).

ENURE′SIS. (*enuresis*; ενυρησις, from ενȣρεω, to make water.) An involuntary flow of urine. A genus of diseases in the class locales, and order apocenoses of Cullen, containing two species: 1. Enuresis atonica, the sphincter of the bladder having lost its tone from some previous disease. 2. Enuresis ab irratione, vel compressione vesicæ, from an irritation or compression of the bladder.

To E′NVY. *v. a.* (*envier*, French.) 1. To hate another for excellence, happiness, or success (*Collier*). 2. To grieve at any qualities of excellence in another (*Swift*). 3. To grudge; to impart unwillingly (*Dryden*).

To E′NVY. *v. n.* To feel envy; to feel pain at the sight of excellence or felicity (*Taylor*).

E′NVY. *s.* (from the verb.) 1. Pain felt and malignity conceived at the sight of excellence or happiness (*Pope*). 2. Rivalry; competition (*Dryden*). 3. Malice; malignity (*Shakspeare*). 4. Publick odium; ill repute (*Bacon*).

The word envy is commonly used in one or other of the four senses given above: but it may be proper to describe, a little more particularly, the nature of this passion. Envy is a painful sensation, excited by the view of something desirable in the state and situation of another, which self-love wishes to appropriate. To envy, is to repine at the good conferred upon another, or possessed by him. Thus it is a perfect contrast to the sympathy which rejoices at their welfare. Envy entertains a degree of sorrow that the good contemplated should escape ourselves, and of anger that it should fall to the share of another. The inordinate self-love which excites to envy, naturally induces the envious person to imagine that he is more deserving than the party who has been favoured. He contemplates his own supposed merit, in opposition to the supposed demerit of the more happy object, until he becomes fully convinced in his own prejudiced judgment of the injustice of the distribution; and feels a spirit of resentment arising against the possessor, and every cause of his enjoyment.

Thus is envy that species of malevolence, which is inspired by the conjoined influence of pride, sorrow, and anger.

Envy is denominated a passion, together with many other of the malevolent affections; partly because it may be very strongly excited by particular incidents, and partly in consequence of that singular law of usage, which assigns the word affections to the benevolent feelings, and passions to the powerful influence of vicious dispositions. (*Cogan*, p. 161.)

To ENWHE′EL. *v. a.* (from *wheel*.) To encompass; to encircle (*Shakspeare*).

To ENWO′MB. *v. a.* (from *womb*.) 1. To make pregnant (*Spenser*). 2. To bury; to hide as in a womb (*Donne*).

E. O. a game of chance, so denominated from the two letters of the alphabet employed to distinguish the two sets of niches that bound the circumference of the table.

The form of an E. O. table is circular, and its diameter commonly about four feet, though this last is not a point of essential consequence. The table is divided into three concentric circles. The outermost of these forms a counter, or depôt for the stakes, and is subdivided into forty niches or interstices, of which twenty are marked with the letter E, and the remaining twenty with the letter O; and on these letters, or subdivisions, each adventurer places money according to his inclination. The middle circle of the table consists of a gallery, or rolling place for the ball; and this and the exterior circle are stationary. The innermost circle moves upon an axis or pivot, and is turned about with handles, whilst the ball is set in motion round the gallery. The lodging of the ball in any of the niches, distinguished by the two letters employed, determines the wager.

The proprietors of these tables have two bar-holes, and are obliged to take all bets that are offered, either for E or O: and if the ball fall into either of the bar-holes, they win all the bets upon the opposite letter, and do not pay to that in which it falls; an advantage in the proportion of two to forty, or five per cent. in their favour.

EOLIAN, or ÆOLIAN, one of the five chief modes in the Greek music. See MODE.

EOLIPILE. See ÆOLIPILE.

EOLUS'S HARP. See ÆOLUS'S HARP.

EOSTRE, in mythology, a Saxon goddess, to whom they sacrificed in the month of April, called the month of Eostra; and thence the name Easter, which the Saxons retained after their conversion to Christianity, applying it to the festival celebrated in commemoration of our Saviour's resurrection.

EPACRIS, in botany, a genus of the class pentandria, order monogynia. Calyx five-parted; corol funnel-form, villous; nectariferous scales growing to the germ; capsule five-celled, five-valved; the partitions from the middle of the valves; seeds minute, numerous. Four species: natives of Australasia, herbaceous; shrubby; arboreous. See Botany, Plate LXXXIX.

Of this tribe, one of the most beautiful is e. grandiflora, crimson epacris, with shrubby woolly stem; ever-green alternate leaves, nearly heart-shaped; flowers axillary, solitary, pendulous, scentless. Peduncles short, recurved. Corol tubular. It may be propagated both by seeds and layers.

EPACTS, in chronology, the excesses of the solar month above the lunar synodical month, and of the solar year above the lunar year of twelve synodical months; or of several solar months above as many synodical months, and several solar years above as many dozen of synodical months. The epacts, then, are either annual or menstrual. Menstrual epacts are the excesses of the civil or calendar month above the lunar month. Suppose, *e. g.* it were new moon on the first day of January; since the lunar month is 29 days 12 h. 44′ 3″, and the month of January contains 31 days, the menstrual epact is 1 day 11 h. 15′ 57″. Annual epacts are the excesses of the solar year above lunar. Hence, as the Julian solar year is 365 days 6 h. and the Julian lunar year 354 days 8 h. 48′ 38″, the annual epact will be 10 days 21 h. 11′ 22″; that is, nearly 11 days. Consequently the epact of 2 years is 22 days; of 3 years, 33 days; or rather 3, since 30 days make an embolismic or intercalary month. Thus the epact of 4 years is 14 days, and so of the rest; and thus, every 19th year, the epact becomes 30 or 0; consequently the 20th year the epact is 11 again; and so the cycle of epacts expires with the golden number, or lunar cycle of 19 years begins with the same; these are Julian epacts: the Gregorian depend upon the same principles, amounting only for the difference of the respective years.

As the new moons are the same, that is, as they fall on the same day every 19 years, so the difference between the lunar and solar years is the same every 19 years. And because the said difference is always to be added to the lunar year, in order to adjust or make it equal to the solar year; hence the said difference respectively belonging to each year of the moon's cycle is called the epact of the said year, that is, the number to be added to the same year, to make it equal to the solar year; the word being formed from the Greek παγω, *induco, intercalo.*

Rule to find the Gregorian Epact.

The difference between the Julian and Gregorian years being equal to the difference between the solar and lunar year, or 11 days, therefore the Gregorian Epact for any year is the same with the Julian Epact for the preceding year; and hence the Gregorian Epact will be found, by subtracting 1 from the golden number, multiplying the remainder by 11, and rejecting the 30's. This rule will serve till the year 1900; but after that year, the Gregorian Epact will be found by this rule: Divide the centuries of the given year by 4; multiply the remainder by 17; then to this product add 43 times the quotient, and also the number 86, and divide the whole sum by 25, reserving the quotient: next multiply the golden number by 11, and from the product subtract the reserved quotient, so shall the remainder, after rejecting all the 30's contained in it, be the epact sought.

The following table contains the golden numbers, with their corresponding epacts, till the year 1900.

Table of Gregorian Epacts.

Golden Numb.	Epacts.	Golden Numb.	Epacts.	Golden Numb.	Epacts.
I	0	VIII	17	XV	4
II	11	IX	28	XVI	15
III	22	X	9	XVII	26
IV	3	XI	20	XVIII	7
V	14	XII	1	XIX	18
VI	25	XIII	12	I	0
VII	6	XIV	23		

EPAMINONDAS, a famous Theban, descended from the ancient kings of Bœotia. His father's name was Polymnus. He has been celebrated for his private virtues and military accomplishments. His love of truth was so great that he never disgraced himself by a lie. He formed a most sacred and inviolable friendship with Pelopidas, whose life he saved in a battle. By his advice Pelopidas delivered Thebes from the power of the Lacedæmon. This was the signal of war. Epaminondas was set at the head of the Theban armies, and defeated the Spartans at the celebrated battle of Leuctra, about 371 years B. C. Epaminondas made a proper use of this victorious campaign, and entered the territories of Lacedæmon with 50,000

men. Here he gained many partizans; but at his return to Thebes he was seized as a traitor for violating the laws of his country. In the midst of his success he neglected the law which forbade any citizen to retain the supreme power more than one month, and all his eminent services seemed unable to redeem him from death. He paid implicit obedience to the laws, and only begged of his judges that it might be inscribed on his tomb that he had suffered death for saving his country from ruin. This animated reproach was felt; he was pardoned, and invested again with the sovereign power. He was successful in a war in Thessaly, and assisted the Eleans against the Lacedæmonians. The hostile armies met near Mantinea, and while Epaminondas was bravely fighting, he received a fatal wound in the breast, and expired exclaiming, that he died unconquered, when he heard that the Bœotians obtained the victory, in the 48th year of his age, 363 years before Christ. The Thebans severely lamented his death; in him their power was extinguished, for only during his life they had enjoyed freedom and independence among the Grecian states.

EPANORTHOSUS, in rhetoric, a figure by which a person corrects, or ingeniously revokes, what he just before alleged, as being too weakly expressed, in order to add something stronger, and more conformable to the passion with which he is agitated.

EPARER, a word used in the manage to signify the flinging of a horse, or his striking or yerking out with his hind-legs. In caprioles a horse must yerk out behind with all his force, but in balotades he strikes but half out, and in croupades he does not strike out his hind-legs at all. All such yerking horses are deemed restive.

EPAULE, in fortification, denotes the shoulder of a bastion, or the place where its face and flank meet, and form the angle called the angle of the shoulder.

EPAULEMENT, in fortification, a work raised to coveri sdewise, is either of earth, gabions, or fascines, loaded with earth. The epaulements of the places of arms for the cavalry, at the entrance of the trenches, are generally of fascines mixed with earth.

Epaulement also denotes a mass of earth, called likewise a square orillon from its figure, raised to cover the cannon of a casement, and faced with a wall. It is likewise used for any work thrown up to defend the flank of a post, or other place.

EPAULETTES, shoulder knots. Among the French, all the degrees of rank, from a cadet to a general officer, were so minutely marked out by the epaulette, that a common centinel might instantly know what officer approached his station, and could pay the prescribed honours without hesitation or mistake.

This is not the case in our service. Some few alterations have lately been made in those ornaments; but they are so partial, and confined to the upper ranks only, that it is impossible to distinguish the youngest ensign from the oldest captain by his epaulette, or by an other part of his uniform. When Highland or fusileer regiments are mixed with the line, every sentinel is still more perplexed, as all the officers belonging to those corps indiscriminately wear two epaulettes made of fringe and bullion of the same quality.

Epaulettes have been introduced into the navy during the present war. The following are the gradations of rank as distinguished by epaulettes. Masters and commanders have one epaulette on the left shoulder. Post-captains under three years, one epaulette on the right shoulder. And after having been post three years, two epaulettes. Rear-admirals have one star on the strap of the epaulette, vice-admirals two stars, and admirals three stars.

EPENDYTES, among the Greeks, a garment worn under the pallium, but above the inner coat.

EPENTHESIS, in grammar, the interposition or insertion of a letter or syllable in the middle of a word; as alituum for alitum; relligio for religio; induperator for imperator.

EPERNAY, an ancient town of France, in the department of Marne. It is noted for exquisite wines. Lat. 49. 5 N. Lon. 4. 0 E.

EPHA, or Ephah, in Jewish antiquity, a measure for things dry, rather exceeding a Winchester bushel; being nearly 1·0961 in terms of the bushel.

EPHEBŒUM, the place where the Athenian Ephebi, or young men arrived at 18 years of age, exercised.

EPHEDRA. In botany, a genus of the class diœcia, order monadelphia. Male: calyx of the ament two-cleft; corolless; stamens seven; anthers four, inferior; three superior. Fem.: calyx two parted, fivefold: corolless; pistils two; seeds two, covered with the berried calyx. Two species.

1. E. distachia. Sea-grape. A native of the south of Europe, with opposite peduncles, and aments in pairs.

2. E. monostachya. Horse-tail. A native of Siberia; with many peduncles and solitary aments.

EPHELIS. (*ephelis*, εφηλις; from επι, and ηλιος, the sun.) A broad, solitary, or aggregated spot, attacking most commonly the face, back of the hand, and breast, from exposure to the sun.

EPHE'MERA. (*ephemera*, εφημερα; from επι, upon, and ημερα, a day.) A fever which begins, is perfectly formed, and runs through its course, in the space of twelve hours.

Ephemera. Day-fly. May-fly. In zoology, a genus of the class insecta, order neuroptera. Mouth without mandibles; feelers four, very short, filiform; antennas short, filiform: above the eyes are two or three large stemmata; wings erect, the lower ones much shorter; tail terminating in long bristles or hairs. These short-lived animals are found every where about waters in the summer, and in their perfect state seldom live above a day, some of them not an hour, during which time they perform all the functions of life and answer all the purposes of nature. The larve lives under water, and is eagerly sought after by trout and other fishes; is six-footed, active, and furnished with a tail and six lateral fins or gills: the pupe resembles the larve, except in having rudiments of future wings. Entomologists have reckoned up thirty-one distinct species: some of which have the tail with three hairs or bristles; and others with only two. In other respects their chief difference consists in the colour of their wings and body; the former being white, black spotted, reticulate, immaculate; the latter being brown, black, yellow, or yellowish. Of these about eight species are found in the atmosphere of our own country. It may be sufficient to instance the e. vulgata (common may-fly), with wings reticulate and spotted with brown; body yellowish spotted with black. These are extremely frequent over our own rivers during summer: but in some countries throng so considerably as to darken the atmosphere; and in Carniola appear in such prodigious swarms that the peasants collect them by cart-loads to manure their land with, so largely do they cover the banks of the rivers upon the cessation of their very transient existence. The females are extremely prolific; within the short term of its being each will generally lay seven or eight hundred eggs over the water, which are precipitated to the bottom, notwithstanding their apparent levity, by their own specific gravitation; yet the larves proceeding from them are devoured in immense quantities by fishes, who often watch their motions narrowly for this very purpose. See Nat. Hist. Pl. XC.

EPHE'MERAL. EPHE'MERIC. *a.* Diurnal; beginning and ending in a day.

EPHEMERIDES, in astronomy, tables calculated by astronomers, showing the present state of the heavens for every day at noon; that is, the places wherein all the planets are found at that time. It is from these tables that the eclipses, conjunctions, and aspects of the planets, are determined; horoscopes or celestial schemes constructed, &c. The astronomers of most nations publish ephemerides: of these the most celebrated are the Ephemerides of Bologna; the Nautical Almanac, published in England, under the superintendence of Dr. Maskelyne, the late worthy and excellent astronomer royal; and the Connoissance des Temps, published in France by M. J. Lalande, Delambre, and others.

EPHE'MERIST. *s.* (from *ephemeris.*) One who consults the planets; one who studies or practises astrology (*Howel*).

EPHE'MERON-WORM. *s.* A sort of worm that lives but a day. See EPHEMERA.

EPHESIA, in mythology, a feast instituted at Ephesus, in honour of Diana.

EPHE'SIANS (Epistle to), was written during St. Paul's imprisonment at Rome, about the spring of the year 61.

Ephesus was the chief city of the Proconsular Asia, which was a part of what was called the Lesser Asia. (See the next article.) It was particularly famous for the temple of Diana, and its inhabitants were remarkably addicted to idolatry and magic, and noted for their lasciviousness and luxury. Paul first preached the gospel among them in the year 54. He came again to Ephesus in the following year, and did not leave the Ephesians till the year 57. In his return to Achaia in 58, he sent for the elders of the Ephesian church to Miletus, and bade them his last farewell.

The former part of this epistle is doctrinal; the latter part practical. The general design of it was to establish the Ephesians in the faith, and to this end to give them more exalted views of the eternal love of God, and of the glorious excellence and dignity of Christ; to shew that they were saved by grace, and that howsoever wretched they were once, the Gentiles now have equal privileges with the Jews: to encourage them by declaring with what stedfastness he suffered for the truth, and with what earnestness he prayed for their establishment and perseverance in it: and finally, in consequence of their profession, to engage them to the practice of those duties, that became their character as Christians.

EPHESUS, a very ancient town of that part of Natolia, in Asiatic Turkey, which was formerly called Ionia. It is now called Ajasalouc, and many remains of its ancient magnificence and splendour are still to be seen. The fortress by which it is defended appears to have been the work of some of the Greek emperors. St. Paul's epistle to the Ephesians was written to the christian community of this city. Its situation is near a gulph of the same name, and it has a harbour. It is 40 miles S. of Smyrna. Lat. 37. 48 N. Lon. 27. 33 E.

Mr. Macgill, a recent traveller, informs us that this once famous city is now one of the most wretched villages even in the Turkish empire. The beautiful plains in which it stands are totally uncultivated; and the river, being allowed to choke itself up by the deposit of mud and sand, so frequently overflows its banks, that these plains are reduced to the state of perfect marshes. The ancient port was about a mile distant from the present bed of the river. The temple of Diana covers with its ruins a great space of the amphitheatre. Its huge pillars, broken and scattered, numberless arches, pedestals, architraves, pieces of sculpture, are all that remain of it; but they give mighty indications of its former grandeur.

EPHETÆ, magistrates at Athens first instituted by Demophoon, the son of Theseus. They were reduced to the number of 51 by Draco, who, according to some, first established them. They were superior to the Areopagites, and their privileges were great and numerous. Solon, however, lessened their power.

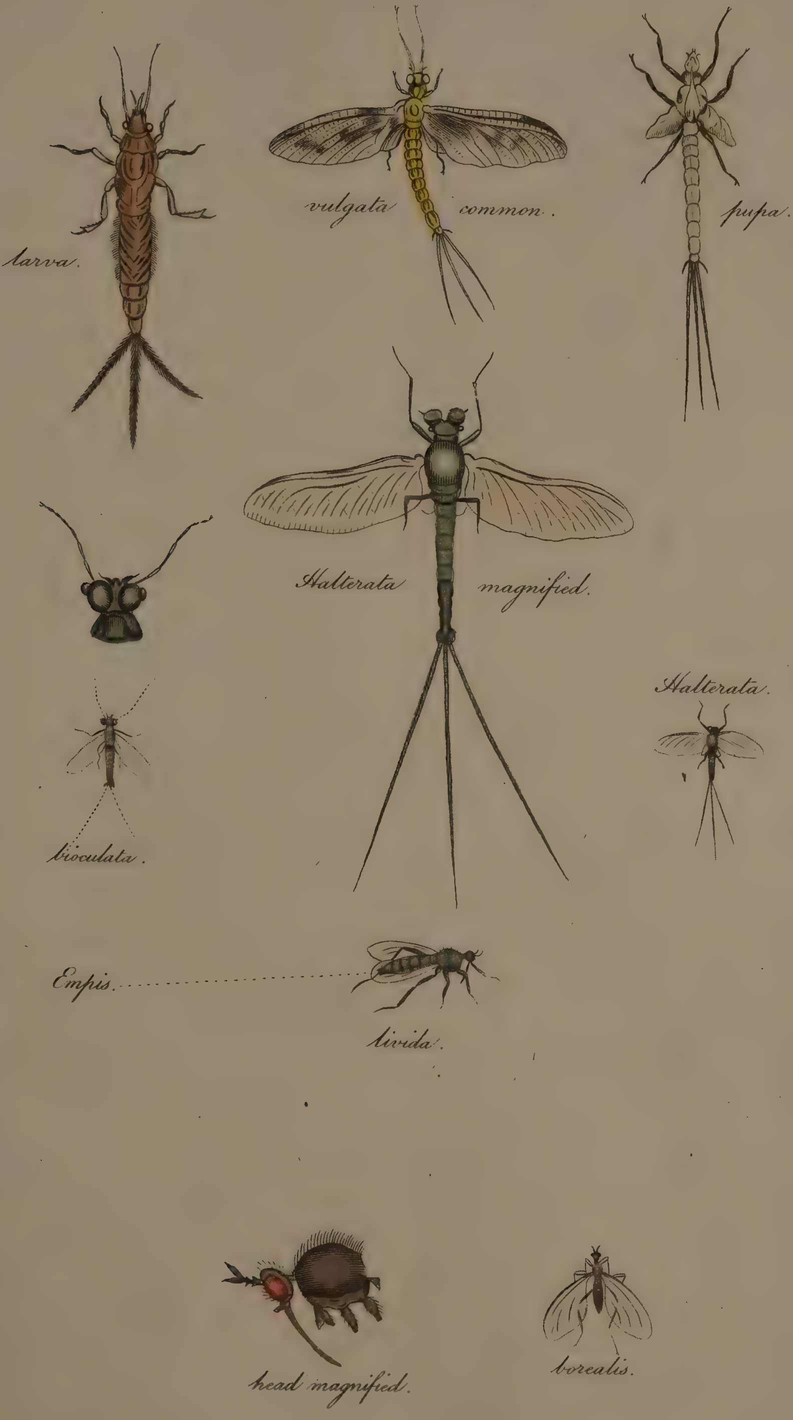
EPHIALTES. (εφιαλτης, from εφαλλομαι, to leap upon.) The incubus, or night-mare: so called because it used to be thought that a spectre or dæmon leaped upon the chest.

EPHIDRO'SIS. (*ephidrosis*, επιδρωσις; from εφιδρoω, to perspire.) Sudatio. Mador. A violent and morbid perspiration. A genus of

NATURAL HISTORY.

PL. XC.

Ephemera. Day-fly.



London Published for Geo. Kearsley, Fleet Street, June 1st, 1810.

disease in the class locales, and order apocenoses of Cullen.

EPHIELIS, in botany, a genus of the octandria, monogynia class and order. Essential character: calyx five-parted; petals five, with claws; nectary ten scales, two to each petal; capsule oblong, one-celled, two valved, two-seeded. There is but one species; viz. e. guianensis: this is a lofty tree, growing in the forests of Guiana, where it flowers in the month of October.

EPHIPPIUM. (*ephippium*, ἐφιππιον, a saddle, which it is thought to resemble.) See SELLA TURCICA.

EPHOD. (אפד, derived from אפד, *aphad*, to clothe.) A sacerdotal garment, in use among the ancient Jews, supposed to have been a kind of linen alb, or surplice, wore by persons of distinction, of various characters; the same with what the Latins call super-humerale.

It is very hard to say precisely what the ephod was; and there is room enough for the interpreters to be divided about it. The only point they are agreed upon is, that it was an upper garment worn over all the rest, immediately under the pectoral or breast-plate. Some hold it had sleeves, others deny it. The generality agree, that it was very short, though some maintain that it hung down to the feet behind.

EPHORI, powerful magistrates at Sparta, who were first created by Lycurgus; or, according to some, by Theopompus, B.C. 760. They were five in number. Like censors, they could check the authority of the kings, and even imprison them, if guilty of irregularities. They were much the same as the tribunes of the people at Rome.

EPHRATA, or DUNKERSTOWN, a town of Pensylvania, in the county of Lancaster, 60 miles W. of Philadelphia. It is the principal settlement of the sect called Dunkers in America. See DUNKERS.

EPHRELIS. In botany, a genus of the class octandria, order monogynia. Calyx five-parted; corol five-petalled; nectaries ten-scales, two inserted into each petal; capsule one-celled, two-valved, two-seeded. One species only; a Guiana tree about fifty feet high.

EPHYDOR, an officer in the Athenian courts of justice, who was to provide the plaintiff and defendant with equal water hour-glasses. When the glass was run out, they were not permitted to speak any farther; and, therefore, we find them very careful not to lose or mispend one drop of their water. Whilst the laws quoted by them were reciting, or if any other business happened to intervene, they gave orders that the glass should be stopped.

EPIBATŒ, marines aboard the Greek ships of war.

EPIBATERIUM. In botany, a genus of the class monœcia, order hexandria. Calyx double, the outer six-leaved; inner three-leaved and larger; petals six, three of them outer, and between the calycine leaflets; three inner; drupes three, nearly globular, mucimate with the three permanent styles, inclosing a kidney-form nut. One species; a native of the Polynesian isles.

EPIC, or HEROIC, POEM, a poem expressed in narration, formed upon a story partly real and partly feigned; representing, in a sublime style, some signal and fortunate action, distinguished by a variety of great events, to form the morals, and affect the mind with the love of heroic virtue. We may distinguish three parts of the definition, namely, the matter, the form, and the end. The matter includes the action of the fable, under which are ranged the incidents, episodes, characters, morals, and machinery. The form comprehends the way or manner of the narration, whether by the poet himself, or by any persons introduced, whose discourses are related: to this branch likewise belong the moving of the passions, the descriptions, discourses, sentiments, thoughts, style, and versification; and besides these, the similies, tropes, figures, and, in short, all the ornaments and decorations of the poem. The end is to improve our morals and increase our virtue.

An epic poem, according to Bossu, is a discourse invented with art, to form the manners, by instructions disguised under the allegory of an important action related in verse, in a probable, entertaining, and surprising manner.

The epic poem is distinguished from comedy, in that the action of the latter is not important, nor is related by the poet, but acted by the persons introduced for that purpose; which circumstance, likewise, distinguishes it from tragedy. It differs also from tragedy in the event, or conclusion; which, in the latter, is generally unfortunate, but never so in the former.

Nor is it a philosophical poem, as that of Lucretius, or the Creation of sir R. Blackmore; nor a treatise of agriculture, or the like, as the Georgics of Virgil; those poems not being intended to form the manners; beside, that the instructions they contain are naked, simple, and direct, without any disguise or allegory, which second circumstance likewise distinguishes it from a treatise of morality, written in verse; or a simple history in verse, as the Pharsalia of Lucan, the Punic War of Silius, or the Civil Wars of Sam. Daniel; add, that its being confined to one important action, distinguishes it from a poem which relates all the actions of a person's life, as the Theseid and Achilleid of Statius, which are what we properly call *heroic poems.*

The nature of the epic poem is finely drawn by the great critic abovementioned: the epic poets, says father Bossu, have done that with regard to morality which the ancient heathen divines did with regard to divinity. The too great diversity of divine actions and perfections, so very disproportionate to our comprehension, obliged the latter to divide a single idea of a simple essence, God, into several persons, to whom they attributed several names, Jupiter, Juno, Neptune, &c. And, on the contrary, the nature of moral philosophy, which never prescribes rules for particular things, led the poets to collect into one single idea, or into one and the same person, and one apparently singular action, whatever of that kind was found in different persons and different actions.

Thus Aristotle, *Ου στοχαζεται η ποιησις ονοματα*, &c. Poetry, says he, teaches moral philosophy, not by relating only, in the manner of an historian, what Alcibiades, for instance, did or suffered; but by proposing what some person, named as the poet thinks fit, would probably or necessarily have done on the like occasion: and thus it is that he shews either the unhappy consequences usually attending imprudent schemes or ill actions; or the reward of good actions, and the satisfaction resulting from a design laid in virtue, and conducted with prudence. So that in the epic poem, according to Aristotle's sentiment, the persons and actions, however named, are all to be feigned, allegorical, and universal, not historical and singular.

But the poets, thus taking on them the office of moral philosophers, did not cease to be divines. On the contrary, their morality itself frequently obliges them to introduce the deity in their works; as the knowledge, fear, and love of God, are the first and most solid foundations of all morality. The presence of the divinity, and the share so august a personage was supposed to have in the action, obliged the poet to make the action great and important, and to have it transacted by kings and princes. The same likewise obliged them to think and speak in a manner elevated above the common pitch of men, and equal, in some measure, to the dignity of the divine persons introduced. To which end serves the poetical and figurative language, with the majesty of heroic verse. Add, that as so much of the divine and miraculous might ruin the probability, they were hereby obliged to have recourse to several rules to maintain the same.

Thus much the poets were driven to by the substance of the things they had chosen for the matter of their poems and instructions. The manner of delivering them usefully and methodically obliged them to several other necessary rules.

The epic poem is intended more for the manners and habits, than for the passions. These latter rise all at once, and their violence is but of short duration; but the habits are more calm and impressed, or quitted more leisurely.

Consequently, the epic action could not be included in the space of a day, as that of the theatrical. A longer time was necessary than is required for tragedy, which is altogether for the passions.

"The epic poem (says Blair in his Lectures) is allowed to be, of all poetical works, the most dignified, and, at the same time, the most difficult in execution. To contrive a story which shall please and interest all readers, by being at once entertaining, important, and instructive; to fill it with suitable incidents; to enliven it with a variety of characters and of descriptions; and throughout a long work, to maintain that propriety of sentiment, and that elevation of style, which the epic character requires, is unquestionably the highest effort of poetical genius.

"The action or subject of the epic poem must be great and interesting. Without greatness it would not have sufficient importance either to fix our attention or to justify the magnificent apparatus which the poet bestows upon it. This is so evidently requisite as not to require illustration; and, indeed, hardly any who have attempted epic poetry have failed in choosing some subject sufficiently important, either by the nature of the action, or by the fame of the personages concerned in it. The fame of Homer's heroes, and the consequences of dissension between the greatest of them, is a subject important in itself, and must have appeared particularly so to his countrymen, who boasted their descent from those heroes. The subject of the Æneid is still greater than that of the Iliad, as it is the foundation of the most powerful empire that ever was established upon this globe; an event of much greater importance than the destruction of a city, or the anger of a semi-barbarous warrior. But the poems of Homer and Virgil fall in this respect infinitely short of that of Milton. Before the greatness displayed in Paradise Lost, Johnson has well observed that all other greatness shrinks away. The subject of the English poet is not the destruction of a city, the conduct of a colony, or the foundation of an empire: it is the fate of worlds, the revolutions of heaven and earth; rebellion against the Supreme King, raised by the highest order of created beings; the overthrow of their host, and the punishment of their crime; the creation of a new race of reasonable creatures; their original happiness and innocence, their forfeiture of immortality, and their restoration to hope and peace."

An epic poem, however, is defective, if its action be not interesting as well as great; for a narrative of mere valour may be so constructed as to prove cold and tiresome. "Much (says Blair) will depend on the happy choice of some subject, which shall by its nature interest the public: as when the poet selects for his hero one who is the founder, or the deliverer, or the favourite of his nation, or when he writes achievements that have been highly celebrated, or have been connected with important consequences to any public cause. Most of the great epic poems are abundantly fortunate in this respect, and must have been very interesting to those ages in which they were composed." The subject of the Paradise Lost, as it is infinitely greater, must likewise be considered as more universally interesting than that of any other poem. "We all feel the effects of Adam's transgression; we all sin like him, and like him must bewail our offences. We have restless enemies in the fallen angels, and in the blessed spirits we have guardians and friends; in the redemption of mankind we hope to be included; in the description of heaven and hell we are surely interested, as we are all to reside hereafter either in the regions of horror or bliss."

"The chief circumstance which renders an epic poem interesting, and which tends to interest not one age or country alone, but all readers, is the skilful conduct of the author in the management of his subject. His plan must comprehend many affecting incidents. He may sometimes be awful and august; he must often be tender and pathetic; he must give us gentle and pleasing scenes of love, friendship, and affection. The more that an epic poem abounds with situations which awaken the feelings of humanity, it is the more interesting. In this respect perhaps no epic poets have been so happy as Virgil and Tasso. The plan of the Paradise Lost comprises neither human actions nor human manners. The man and woman who act and suffer, are in a state which no man or woman can ever know. The reader finds no transaction in which he can be engaged; beholds no condition in which he can by any effort of imagination place himself; he has therefore little natural curiosity or sympathy."

A question has been moved, Whether the nature of the epic poem does not require that the hero should be ultimately successful? To this question Johnson replies, that "there is no reason why the hero should not be unfortunate, except established practice, since success and virtue do not necessarily go together." Most critics, however, are of a different opinion, and hold success to be, if not the necessary, at least the most proper, issue of an epic poem. An unhappy conclusion depresses the mind, and is opposite to the elevating emotions which belong to this species of poetry. Terror and compassion are the proper subjects of tragedy; but as the epic is of larger extent, it were too much, if, after the difficulties and troubles which commonly abound in the progress of the poem, the author should bring them all at last to an unfortunate conclusion. We know not that any author of name has held this course except Lucan; for in the Paradise Lost, as Adam's deceiver is at last crushed, and he himself restored to the favour of his Maker, Milton's hero must be considered as finally successful.

EPICEDIUM, or **Epicedion**, in the Greek and Latin poetry, a poem, on the death of a person; the word is formed of επι, upon, and κηδος, funeral. We have two beautiful epicedions in Virgil, that of Euryalus and that of Pallas.

EPICHARMUS, a poet and Pythagorean philosopher of Sicily, who introduced comedy at Syracuse, in the reign of Hiero. His compositions were imitated by Plautus. He wrote some treatises upon philosophy and medicine. According to Aristotle and Pliny, he added the two letters χ and ϑ to the Greek alphabet. He flourished about 440 years before Christ, and died in the 90th year of his age. (*Horat. Diog.* &c.)

EPICHYRUM, in botany, a genus of the class cryptogamia, order fungi. Fungus rounded, concave; seeds globular, tailless, attached to a branched filament creeping within. One species only.

EPICLEROS, among the Athenians, a daughter who had no brothers.

EPICŒNE, in grammar, a term applied to nouns, which, under the same gender and termination, mark indifferently the male and female species. Such in Latin is *aquila, vespertilio,* &c. which signify equally a male or female eagle or bat. Grammarians distinguish between *epicœne* and *common.* A noun is said to be common of two kinds, when it may be joined either with a masculine or a feminine article; and epicœne, when it is always joined to some one of the two articles, and yet signifies both genders.

EPICOLIC REGION. (*regio epicolica*; from επι, upon, and κολον, the colon.) In anatomy, that part of the abdomen which lies over the head of the cœcum and sygmoid flexure of the colon.

EPICRANIUM. (*epicranium,* επικρανιον; from επι, and κρανιον, the cranium.) The common integuments, aponeurosis, and muscular expansion which lie upon the cranium.

EPICRANIUS. See Occipito-frontalis.

EPICTETUS, an ancient Stoic philosopher of Hierapolis, in Phrygia. He was the slave of Epaphroditus, the freedman of Nero; but when, or by what means, he obtained his liberty does not appear. When Domitian banished the philosophers from Rome, he went to Nicopolis, but returned on the death of that tyrant, and was in great esteem with Adrian and Marcus Aurelius. He preferred poverty to riches, and resided in a cottage which had no furniture but an earthen lamp, which sold after his death for 3000 drachmas, near 100l. sterling. Here he wrote his Euchiridion, or Compendium of the Stoic Philosophy. It abounds in the purest maxims of morality, expressed with energy and plainness. The best edition of his works is that of Upton, in 2 vols. 4to. London, 1739. Mrs. Carter has given a good translation of Epictetus into English.

E'PICURE. *s.* (*epicureus,* Latin.) a man given wholly to luxury (*Locke*).

EPICURE'AN. *a.* Luxurious; contributing to luxury (*Shakspeare*).

Epicurean Philosophy, the doctrine or system of philosophy maintained by Epicurus and his followers. This consisted of three parts; canonical, physical, and ethical. The first respected the canons or rules of judging; in which soundness and simplicity of sense, assisted by some natural reflections, chiefly formed his art. His search after truth proceeded only by the senses; to the evidence of which he gave so great a certainty, that he considered them as an infallible rule of truth, and termed them the first natural light of mankind.

In the second part of his philosophy he laid down atoms, and space, as the first principles of all things. He asserted the existence of God, whom he accounted a blessed immortal being, but who did not concern himself with human affairs.

"In its mere physical contemplation," says Mr. Good, "the theory of Epicurus allows of nothing but matter and space, which are equally infinite and unbounded, which have equally existed from all eternity, and from different combinations of which every individual being is created. These existences have no property in common with each other; for, whatever matter is, that space is the reverse of; and whatever space is, matter is the contrary to. The actually solid parts of all bodies, therefore, are matter; their actual pores, space, and the parts which are not altogether solid, but an intermixture of solidity and pore, are space and matter combined. Anterior to the formation of the universe, space and matter existed uncombined, or in their pure and elementary state. Space, in its elementary state, is positive and unsolid void: matter, in its elementary state, consists of inconceivably minute seeds or atoms; so small that the corpuscles of vapour, light, and heat, are compounds of them; and so solid that they cannot possibly be broken, or made smaller, by any concussion or violence whatever. The express figure of these primary atoms is various: they are round, square, pointed, jagged, as well as many other shapes. These shapes, however, are not diversified to infinity; but the atoms themselves, of each existent shape, are infinite or innumerable. Every atom is possessed of certain intrinsic powers of motion. Under the old school of Democritus, the perpetual motions exhibited were of two kinds; a descending motion, from its own gravity; and a rebounding motion, from mutual concussion. Besides these two motions, and to explain certain phænomena which the following poem developes, and which were not accounted for under the old system, Epicurus supposed that some atoms were occasionally possessed of a third, by which, in some very small degrees, they descended in an oblique or curvilinear direction, deviating from the common and right line anomalously; and hence, in this respect, resembling the oscillations of the magnetic needle.

"These infinitudes of atoms, flying immemorially in such different directions, through all the immensity of space, have interchangeably tried and exhibited every possible mode of action; sometimes repelled from each other by concussion, and sometimes adhering to each other from their own jagged or pointed construction, or from the casual interstices which two or more connected atoms must produce, and which may just be adapted to those of other configurations, as globular, oval, or square. Hence the origin of compound bodies; hence the origin of immense masses of matter; hence, eventually, the origin of the world itself. When these primary atoms are closely compacted together, and but little vacuity or space intervenes, they produce those kinds of substances which we denominate solid, as stones, and metals: when they are loose and disjoined, and a large quantity of space or vacuity occurs between them, they produce the phænomena of wool, water, vapour. In one mode of combination, they form earth; in another, air; and in another, fire. Arranged in one way, they produce vegetation and irritability; in another way, animal life and perception. Man hence arises; families are formed; society multiplies, and governments are instituted.

"The world, thus generated, is perpetually sustained by the application of fresh elementary atoms, flying with inconceivable rapidity through all the infinitude of space, invisible from their minuteness, and occupying the posts of all those that are as perpetually flying off. Yet, nothing is eternal and immutable but these elementary seeds or atoms themselves: the compound forms of matter are continually decompounding, and dissolving into their original corpuscles: to this there is no exception: minerals, vegetables, and animals, in this respect all alike, when they lose their present configuration, perishing from existence for ever, and new combinations proceeding from the matter into which they dissolve. But the world itself is a compound, though not an organized being; sustained and nourished like organized beings from the material pabulum that floats through the void of infinity. The world itself must therefore, in the same manner, perish: it had a beginning, and it will eventually have an end. Its present crisis will be decompounded; it will return to its original, its elementary atoms; and new worlds will arise from its destruction.

"Space is infinite, material atoms are infinite, but the world is not infinite. This, then, is not the only world, or the only material system that exists. The cause whence this visible system originated is competent to produce others; it has been acting perpetually from all eternity; and there are other worlds and other systems of worlds existing around us. In the vast immensity of space, there are also other beings than man, possessed of powers of intellect and enjoyment far superior to our own: beings who existed before the formation of the world, and will exist when the world shall perish for ever; whose happiness flows unlimited, and unallayed; and whom the tumults and passions of gross matter can never agitate. These the founder of the system denominated gods; not that they created the universe, or are possessed of a power of upholding it; for they are finite and created beings themselves, and endowed alone with finite capacities and powers; but from the uninterrupted beatitude and tranquillity they enjoy, their everlasting freedom from all anxiety and care." (*Good's Lucretius*. I. cviii—cxi.)

As to the ethics of Epicurus, he made the supreme good of man to consist in pleasure, and consequently supreme evil in pain. Nature itself, says he, teaches us this truth; and prompts us from our birth to procure whatever gives us pleasure, and avoid what gives us pain. To this end he proposes a remedy against the sharpness of pain, which was to divert the mind from it by turning our whole attention upon the pleasures we have formerly enjoyed. He held that the wise man must be happy, as long as he is wise: that pain, not depriving him of his wisdom, cannot deprive him of his happiness. It is an essential defect in his scheme of morals, that it had no regard to the Deity; or to a divine authority and law. His morality is also defective with regard to the duties we owe to mankind. He taught that business and cares do not consist with happiness; and that a wise man ought not to marry, or to concern himself with public affairs. He gives excellent precepts of moderation, temperance, and the government of the passions; represents the inconvenience of indulging venereal pleasures; and declares that the pleasures he recommends are not those of luxury and excess, but such as are under the conduct of prudence. The virtues he prescribed are resolved wholly into a man's private advantage, without regard to the excellence of virtue, or to a divine command: he forbids injustice and other crimes, not because of any evil there is in them considered in themselves, but for fear of human punishments. He taught that happiness consists in indolence of the body and tranquillity of mind. And what he chiefly insisted upon as necessary to make men happy, was the delivering them from the fear of the gods, and the fear of death. His remedy against the first was to deny a Providence that concerneth itself with human affairs; what was urged against the latter was very feeble. It was a fundamental article of this system that man is to worship the Deity, induced by no hope, by no reward, but on account of his excellent majesty and supreme nature alone.

EPICUREANS, the sect of philosophers holding or following the principles and doctrine of Epicurus.

E'PICURISM. *s.* (from *epicure.*) Luxury; sensual enjoyment; gross pleasure (*Calamy*).

EPICURUS, a celebrated philosopher, born at Gargetium, in Attica. He gave an early proof of the brilliancy of his genius at the age of 12, when his preceptor repeated him this verse from Hesiod,

Ητοι μεν ϖρωτιστα χαος γενετ', &c.

"In the beginning of things the Chaos was created."

Epicurus earnestly asked him who created it? To this the teacher answered, that he knew not, but only philosophers. "Then," says the youth, "philosophers henceforth shall instruct me." After having improved himself, he visited Athens, which was then crowded by the followers of Plato, the Cynics, the Peripatetics, and the Stoics. Here he established himself, and soon attracted a number of followers by the sweetness and gravity of his manners, and by his social virtues. The Stoics particularly attacked his doctrine, but he refuted all the accusations of his adversaries by the purity of his morals. His health was at last impaired by continual labour, and he died of a retention of urine 270 years before Christ, in the 72d year of his age. The followers of Epicurus were numerous in every age and country, but they soon degenerated from the comparatively pure sentiments of their master, and placed their happiness in gross sensual pleasures.

EPICYCLE, in the ancient astronomy, a little circle whose centre is in the circumference of a greater circle: or it is a small orb or sphere, which being fixed in the deferent of a planet, is carried along with it; and yet, by its own peculiar motion, carries the planet, fastened to it, round its proper centre. It was by means of epicycles that Ptolemy and his followers solved the various phenomena of the planets, but more especially their stations and retrogradations.

EPICYCLOID, in geometry, a curve generated by the revolution of the periphery of a circle, along the convex or concave side of the periphery of another circle.

The length of any part of the curve, which any given point in the revolving circle has described, from the time it touched the circle whereon it revolved, is to double the versed sine of half the arch which during that time touched the quiescent circle, as the sum of the diameters of the circles to the semidiameter of the quiescent circle; provided the revolving circle moves upon the convex side of the quiescent circle; but if upon the concave side, as the difference of the diameters to the semidiameter.

Dr. Halley gives us a general proposition for the measuring of all cycloids and epicycloids: thus, the area of a cycloid, or epicycloid, either primary, or contracted, or prolate, is to the area of the generating circle; and also the areas of the parts, generated in those curves, to the areas of analogous segments of the circle; as the sum of double the velocity of the centre, and velocity of the circular motion, to the velocity of the circular motion. The demonstration hereof, see in Phil. Trans. Nº 218. See, farther, our article CYCLOID.

EPICYCLOID (Spherical). Let there be a right cone the summit of which remains immoveable; if the base of that cone be made to revolve at pleasure with regard to its summit, and if we imagine a style or trace fixed in any point of the periphery of the cone's base, this style will describe during the motion of the cone a curve which is called a spherical epicycloid, being epicycloidal in its nature, yet always found in the surface of a given sphere.

This kind of curve is useful in forming the teeth of wheels. See Camus, Cours de Mathematique, part 3; or Gregory's Mechanics, vol. ii.

EPICYEMA, among physicians, a superfœtation.

EPIDAURIA, in antiquity, a festival at Athens in honour of Æsculapius.

EPIDEMIA, in antiquity, feasts of Apollo at Delphos and Miletus, and of Diana at Argos.

EPIDEMIC. (*epidemicus*, επιδημικος; from επι, and δημος, the people.) A contagious disease is so termed that attacks many people at the same season, and in the same place; thus putrid fever, plague, dysentery, &c. are often epidemic.

EPIDENDRUM, in botany, a genus of the class gynandria, order dyandria. Nectary turbinate, oblique, reflected; coral spreading without spur. A hundred and twenty-two species; natives of the East and West Indies. Of these the following are the chief. See botany, Plate XCI.

1. E. vanillo. A West Indian plant, leaves ovate, oblong, nerved, sessile, cauline; tendrils spiral. The dried pods are sold under the name of vanilloes or vanelloes; and generally in the form of chocolate, of which they constitute the basis. It is a parasitic plant, and its leaves considerably resemble those of the vine; with flowers of a white ground, but intermixed with stripes of red and yellow. The pods are usually gathered between September and December; they are gradually dried in the shade, and in the process of drying occasionally rubbed over with a little oil of cocoa or calba to preserve them the better, and prevent them from becoming unnecessarily dry. It is from these pods that the chocolate derives its elegant perfume. To be propagated in our own country, this plant requires a stove, and in America must be reared in the immediate vicinity of some tree, that it may have an opportunity of shooting up its branches.

2. E. flos aëris: a native of Java and India; stem columnar, somewhat branched, climbing; leaves lanceolate; petals linear, obtuse. We have many instances among the parasitic plants that they do not require for their existence or growth that their roots or radical filaments should be in the earth: but the present species is able to support itself from the air alone, according to the account of Loureiro, who repeats the common assertion of its being suspended from the ceilings in the halls of large houses or palaces on the banks of the Ganges, and still continuing to blossom annually; and adds, that he himself was a witness to its vegetating in such situation for years, renewing its elegant corols in their season, and perfuming the circumambient atmosphere with its exquisite aroma.

3. E. sinense, Chinese epidendrum; with ensiform leaves; nervous striate radicles, nodding flowers; subequal petals; revolute, concave nectary, dotted within; bracte a little shorter than the germ. It has been hitherto treated as a stove-plant, but does not require so much heat as the West Indian species, thriving luxuriantly in the conservatory.

EPIDERMIS. (*epidermis*, επιδερμις; from επι, upon, and δερμα, the true skin.) In anatomy, the scarf skin. See CUTICLE.

EPIDERMIS, in botany, the outer, dry, and very thin coat or covering of a plant; corresponding with the scarf skin in animals. Tunica exterior-plantæ sicca tenuissima.

EPIDIDYMIS. (*epididymis*, επιδῖδυμος; from επι, upon, and διδυμος, a testicle.) A hard vascular oblong substance, that lies upon the testicle, formed of a convolution of the vas deferens. It has a thick end, which is convex, and situated posteriorly; and a thin end, which is rather flat, and situated inferiorly. The epididymis adheres to the testicle by its two extremities only, for its middle part is free, forming a bag, to which the tunica vaginalis of the testicle is attached.

EPIDROMUS. (of επι and δρομος, course.) In the ancient shipping, a sail near the stern, which was the largest but one in the ship.

EPIGÆA, in botany, a genus of the class decandria, order monogynia. Calyx double; the outer three-leaved, inner five-parted: corol salver-shaped; capsule five-celled. Two species; Virginia and Guadaloupe.

EPIGASTRIC REGION. (*epigrasticus*, επιγαστρικος; from επι, upon or above, and γαστηρ, the stomach.) That part of the abdomen that lies over the stomach.

EPIGLOTTIS. (*epiglottis*, επιγλωττις; from επι, upon, and γλοττις, the tongue.) The cartilage at the root of the tongue that falls upon the glottis or superior opening of the larynx. Its figure is nearly oval; it is concave posteriorly, and convex anteriorly. Its apex or superior extremity is loose, and is always elevated upwards by its own elasticity. While the back of the tongue is drawn backwards in swallowing, the epiglottis is put over the aperture of the larynx, hence it shuts up the passage from the mouth into the larynx. The base of the epiglottis is fixed to the thyroid cartilage, the os hyoides, and the base of the tongue, by a strong ligament.

EPIGONI, the sons and descendants of the Grecian heroes who were killed in the first Theban war. The war of the Epigoni is famous in ancient history. They resolved to avenge the death of their fathers, and marched against Thebes, under the command of Thersander. The Argives were assisted by the Corinthians, the people of Messenia, Arcadia, and Megara. The Thebans had engaged all their neighbours in their quarrel, as in one common cause. The two armies met and engaged on the banks of the Glissas. The fight was obstinate and bloody, but victory declared for the Epigoni, and some of the Thebans fled to Illyricum with Leodamas their general, while others retired into Thebes, where they were soon besieged, and forced to surrender. (*Paus.* &c.)

EPIGONIUM, a musical instrument, so named from its inventor Epigonius. It had forty strings; but whether they formed a scale of forty different sounds or not, is uncertain.

EPIGRAM, in poetry, a short poem, or composition in verse, treating only of one thing, and ending with some point, or lively ingenious thought. The word is formed of επιγραμμα, inscription, of επιγραφειν, to inscribe, or write upon. Epigrams then, originally, signify inscriptions, and they derive their origin from those incriptions placed by the ancients on their tombs, statues, temples, triumphal arches, &c. See INSCRIPTION.

M. le Brun, in the preface to his Epigrams, defines an epigram a little poem, susceptible of all kinds of subjects, and ending with a lively, just, and unexpected thought; which are three qualifications essential to the epigram; particularly the first and last of them, viz. brevity, and the point or close of the epigram.

The Greek epigrams have scarce any thing of the point, or briskness, of the Latin ones: those collected in the Anthology have most of them a remarkable air of ease and simplicity, attended with something just and witty; such as we find in a sensible peasant, or a child that has wit. They have nothing that bites, but something that tickles. Though they want the salt of Martial, yet to a good taste they are not insipid; except a few of them, which are quite flat and spiritless. However, the general faintness, and delicacy of the pleasantry in them, has given occasion for a Greek epigram, or epigram à la Greque, to denote, among the French, an epigram void of salt or sharpness.

We shall here put down a few epigrams, as they occur to our recollection.

1. By Dr. Young.

As in smooth oil the razor best is whet,
So wit is by politeness sharpest set:
Their want of edge from their offence is seen,
Both pain us least when exquisitely keen.

2. By Grierson.

Jack, eating rotten cheese, did say,
Like Samson, I my thousands slay:
I vow, quoth Roger, so you do,
And with the selfsame weapon too.

3. By Prior.

On his death-bed poor Simon lies,
  His spouse is in despair;
With frequent sobs, and mutual cries,
  They both express their care.
A different cause, says parson Sly,
  The same effect may give;
Poor Simon fears that he shall die,
  His wife—that he may live.

4. By Aaron Hill.

When Christ at Cana's feast, by pow'r divine,
Inspir'd cold water with the warmth of wine,
See! cried they, while in redd'ning tide it gush'd,
The bashful stream hath seen its God, and blush'd!

5. By Aaron Hill.

Tender-handed stroke a nettle,
  And it stings you for your pains;
Grasp it like a man of mettle,
  And it soft as silk remains.
'Tis the same with common natures:
  Use 'em kindly, they rebel;
But, be rough as nutmeg-graters,
  And the rogues obey you well.

6. From Martial.

Curmudgeon the rich widow courts,
Nor lovely she, nor made for sports;
'Tis to Curmudgeon charm enough,
That she has got a church-yard-cough.

7. From Martial.

When Arria from her wounded side
  To Pætus gave the reeking steel,
I feel not what I've done—she cried;—
  What Pætus is to do, I feel.

8. From Martial.

Her father dead—*alone* no grief she knows;
The obedient tear at every *visit* flows:
No mourner he, who must by praise be fee'd,
But he, who mourns in *secret*, mourns indeed!

9. From Anacreon.

To love is painful, it is true;
And not to love, is painful too:
But, ah! it gives the greatest pain,
To love and not be lov'd again!

10. By Dr. Doddridge, on the motto to his family arms "Dum vivimus vivamus."

"Live while you live," the epicure would say,
"And seize the pleasures of the present day."
"Live while you live," the sacred preacher cries,
"And give to God each moment as it flies."
Lord, in my views let both united be;
I live in pleasure when I live to Thee.

EPIGRAMMA'TICAL. EPIGRAMMA'TIC. *a.* (*epigrammaticus*, Latin.) 1. Dealing in epigrams; writing epigrams (*Camden*). 2. Suitable or belonging to epigrams (*Addison*).

EPIGRA'MMATIST. *s.* (from *epigram.*) One who writes or deals in epigrams (*Pope*).

EPIGRAPHE, among antiquarians, denotes the inscription of a building, pointing out the time when, the persons by whom, and the uses for which it was erected.

EPILEPSY. (*epilepsia*, επιληψιά; from επιλαμϐανω, to seize upon: so called, from the suddenness of its attack.) Convulsions with sleep, and usually froth issuing from the mouth. It is a genus of disease in the class neuroses, and order spasmi of Cullen, and contains nine species: 1. Epilepsia traumatica, arising from an injury of the head: 2. Epilepsia a dolore, from pain: 3. Epilepsia verminosa, from the irritation of worms: 4. Epilepsia a veneno, from poisons: 5. Epilepsia exanthematica, from the repulsion of cutaneous eruptions: 6. Epilepsia a cruditate ventriculi, from crudities of the stomach: 7. Epilepsia ab inanitione, from debility: 8. Epilepsia uterina, from hysterical affections: 9. Epilepsia ex onanismo, from onanism.

EPILE'PTIC. *a.* (from *epilepsy.*) Convulsed; diseased with an epilepsy (*Arbuthnot*).

EPILOBIUM. Willow-herb. In botany, a genus of the class octandria, order monogynia. Calyx four-cleft, tubular; petals four; capsule oblong, inferior; seeds feathered. Thirteen species; some with declined stamens, others with stamens erect, and regular, and cloven petals. Not less than eight species are common to the meadows, woods, or ditches of our own country; the blossom is usually red, and often beautiful. Some of the species have an intoxicating quality, especially e. angustifolium, which is used by the Kamscadales for this purpose. The down of the seed has lately been introduced into our hat and cotton manufactories.

EPILOGUE, in oratory, the conclusion of a discourse, ordinarily containing a recapitulation of the principal matters delivered.

Epilogue, in dramatic poetry, a speech addressed to the audience after the conclusion of the play, by one of the principal actors therein, usually containing some reflections on certain incidents in the play, especially those in the part of the person that speaks it.

In the modern tragedy the epilogue has usually somewhat of pleasantry, intended, in all probability, to compose the passions raised in the course of the representation. This is ridiculed by the Spectator, and compared to a merry jig upon the organ, after a good sermon, to wipe away any impressions that might have been made thereby, and send the people away just as they came.

EPIMEDIUM. Barren-wort. In botany, a genus of the class tetrandria, order monogynia. Corol four-petalled; nectaries four pouches lying on the petals; calyx caducous; silique? One species only; a low herbaceous plant, found in the woods of our own country.

EPIMENIDES, a Cretan poet and philosopher, who is said to have lived 289 years, and by others 157. He wrote a poem, from which St. Paul quotes this remarkable passage: "The Cretans are always liars, evil beasts, slow bellies."

EPIMETHEUS, in fabulous history, son of Japetus, and brother to Prometheus, married Pandora, and though warned of the danger, opened the fatal box presented her by Jupiter, by which means vice, folly, and diseases, overspread the earth. He had by Pandora a daughter, named Pyrrha, who married Deucalion; but Jupiter metamorphosed him into an ape, and banished him.

EPIMETRON, an allowance given the tax-gatherers in the Roman provinces, over and above their lawful demand of wine, grain, &c.

EPINAL, a town of France, in the department of the Vosges, famous for its paper-mills. Lat. 48. 4. N. Lon. 6. 0 E.

EPINICION. (Επινικιον; from επι, on, and νικη, victory.) In the Greek and Latin poetry, denotes, both a feast on occasion of a victory, and the poem which celebrates it.

EPINYCTIS. (Επινυκτις; from επι, on, and νυξ, night.) A pustule, which rises in the night, forming an angry tumor on the skin of the arms, hands, and thighs, of the size of a lupine, of a dusky red, and sometimes of a livid and pale colour, with great inflammation and pain. In a few days it breaks and sloughs away.

EPIPHANIUS (St.) an ancient father of the church, born at Besanducan, a village in Palestine, about the year 332. He founded a monastery near the place of his birth, and presided over it. He was afterwards elected bishop of Salamis; when he sided with Paulinus against Meletius, and ordained in Palestine, Paulinian, the brother of St. Jerom; on which a contest arose between him and John bishop of Jerusalem. He afterwards called a council in the island of Cyprus, in which he procured a prohibition of the reading of Origen's writings; and made use of all his endeavours to prevail on Theophilus bishop of Alexandria to engage St. Chrysostom to declare in favour of that decree: but not meeting with success, he went himself to Constantinople, where he would not have any conversation with St. Chrysostom; and formed the design of entering the church of the apostles, to publish his condemnation of Origen: but being informed of the danger to which he would be exposed, he resolved to return to Cyprus; but died at sea, in the year 403. His works were printed in Greek, at Basil, 1544, in folio; and were afterwards translated into Latin, in which language they have been often reprinted. Petavius revised and corrected the Greek text by two manuscripts, and published it together with a new translation at Paris in 1622. This edition was reprinted at Cologne in 1682.

Epiphanius, an heresiarch, and the son of Carpocrates. He maintained that a community of women was the re-establishment of primitive order, and that our natural desires are natural rights, which cannot be restrained without injustice. He opposed his system to that of the Gospel, and after his death he was worshipped by his followers as a deity.

EPIPHANY, a Christian festival, otherwise called the Manifestation of Christ to the Gentiles, observed on the sixth of January, in honour of the appearance of our Saviour to the three magi or wise men, who came to adore him and bring him presents.

EPIPHONE'MA. *s.* (επιφωνημα.) An exclamation; a conclusive sentence not closely connected with the words foregoing (*Swift*).

EPIPHORA. (επιφορα; from επιφερω, to carry forcibly.) The watery eye. An involuntary flow of tears. A superabundant flowing of a serous or aqueous humour from the eyes. A genus of disease in the class locales, and order apocenoses, of Cullen. The humour which flows very copiously from the eye in epiphora, appears to be furnished not only by the lachrymal gland, but from the whole surface of the conjunctive membrane, Meibomius's glands, and the caruncula lachrymalis; which increased and morbid secretion may be induced from any stimulus seated between the globe of the eye and lid, as sand, acrid fumes, and the like; or it may arise from the stimulus of active inflammation; or from the acrimony of scrophula, measles, small-pox; or from general relaxation. The disease may also be brought on by causes obstructing the absorption of the tears.

EPIPHYLLOSPERMOUS PLANTS. (of επι, φυλλον, leaf, and σπερμα, seed.) The same as the capillaries, herbs which bear their seed on the back part of their leaves.

EPIPHYSIS. (*epiphysis*, επιφυσις; from επι, upon, and φυω, to grow.) Any portion of bone growing upon another, but separated from it by a cartilage.

EPIPLOCE. *s.* (επιπλοκη.) A figure of rhetoric, by which one aggravation, or striking circumstance, is added in the due gradation to another.

EPIPLOCELE. (*epiplocele*, επιπλοκηλη; from επιπλοον, the omentum, and κηλη, a tumour.) An omental hernia. A rupture produced by the protrusion of a portion of the omentum. See HERNIA.

EPIPLOIC APPENDAGES. See APPENDICULÆ EPIPLOICÆ.

EPIPLOITIS. (*epiploitis*, επιπλοιτις; from επιπλοον, the omentum.) An inflammation of the process of the peritoneum, that forms the epiploon or omentum. See PERITONITIS.

EPIPLOOMPHALON, in medicine, an hernia umbilicalis, proceeding from the omentum falling into the region of the umbilicus or navel.

EPIPLOON. (*epiploon*, επιπλοον; from επιπλοω, to sail over, because it is mostly found floating, as it were, upon the intestines.) See OMENTUM.

EPIRUS, a country situate between Macedonia, Achaia, and the Ionian sea. It was formerly governed by kings, of whom Neoptolemus, son of Achilles, was one of the first. It was afterwards joined to the empire of Macedonia, and at last became a part of the Roman dominions. It is now called Larta.

This country, according to Josephus, was first peopled by Donanim, the son of Javan and grandson of Japhet. The people were very warlike; but they continued in their savage state long after their neighbours were civilized; whence the islanders used to threaten their offenders with transportation to Epirus. Their horses were in great request among the ancients, as well as the dogs produced in one of the divisions called Molossus; and hence these dogs were called by the Romans Molossi.

EPISCHESIS. (*epischesis*, επισχεσις; from επισχεω, to restrain.) A suppression of excretions. It is an order in the class locales of Cullen's nosology.

EPISCIRA. (Επισκιρα.) In antiquity, a festival celebrated at Scira in Attica, in honour of Ceres and Proserpine.

EPISCOPACY, that form of church government, in which diocesan bishops are established, as distinct from and superior to priests or presbyters. It has been much controverted whether the distinction be of divine or human right; whether it was settled in the apostolic age or afterwards. (See BISHOP.) This controversy commenced soon after the reformation; and has been agitated with great warmth between the Episcopalians on the one side, and the Presbyterians, Baptists, and Independents on the other. Among the Protestant churches abroad, those which were reformed by Luther and his associates are in general episcopal; whilst such as follow the doctrines of Calvin have for the most part thrown off the order of bishops as one of the corruptions of popery. In England, however, the controversy has been considered as of greater importance than on the continent: for it has been strenuously maintained by one party, that the episcopal order is essential to the constitution of the church; and by others, that it is a pernicious encroachment on the rights of men, for which there is no authority in Scripture.

EPISCOPAL, something that belongs to a bishop. The word is formed of the Greek επισκοπος, overseer, derived from επισκοπεω, *inspicio*, I inspect, or overlook. Episcopal government is the government of a diocese, wherein one single person, legally consecrated, presides over the clergy of a whole district, in quality of head, or superintendent thereof; conferring orders, and exercising a sort of jurisdiction.

EPISCOPALIANS, in church history, an appellation given to those who prefer the episcopal government and discipline to all others.

The episcopalians, in the modern acceptation of the term, belong more especially to the church of England, and derive this title from *episcopus*, the Latin word for bishop; or if it be referred to its Greek origin from Σκοπεω, to look, επι, over, implying the care and diligence with which bishops are expected to preside over those committed to their guidance and direction. They insist on the divine origin of their bishops, and other church officers, and on the alliance between church and state. Respecting these subjects, however, Warburton and Hoadley, together with others of the learned amongst them, have different opinions, as they also have on their thirty-nine articles; which were established in the reign of queen Elizabeth. These are to be found in most Common Prayer-Books; and the episcopal church in America has reduced their number to twenty. By some the articles are made to speak the language of Calvinism; and by others they have been interpreted in favour of Arminianism.

The church of England is governed by the king, who is the supreme head; by two archbishops, and by twenty-four bishops. The benefices of the bishops were converted by William the Conqueror into temporal baronies; so that every prelate has a seat and vote in the house of peers. Dr. Benjamin Hoadley, however, in a sermon preached from this text, "My kingdom is not of this world," insisted that the clergy had no pretensions to temporal jurisdiction, which gave rise to various publications, termed by way of eminence the Bangorian controversy, Hoadley being the bishop of Bangor.

Since the death of the intolerant archbishop Laud, men of moderate principles have been raised to the see of Canterbury, and this hath tended not a little to the tranquillity of church and state. The established church of Ireland is the same as the church of England, and is governed by four archbishops, and eighteen bishops.

The episcopalians of the English established church have had, and still have, amongst their clergy a great number of very learned and eminent men; to speak of whom in terms consistent with their appropriate merits would fill a volume. It must suffice if we barely mention the names of a few of the most distinguished, such as, Atterbury, Barrow, Bentley, Blackwall, Buchanan, Bull, Burnet, Butler, Chillingworth, Clarke, Cunningham, Daubeny, Delany, Fry, Gastrel, Gilpin, Hall, Hammond, Hervey, Hoadley, Hooker, Horsley, Hurd, Law, Lowth, Marsh, Milner, Middleton, Newton, Overton, Owen of Fulham, Paley, Parr, Patrick, Pearson, Porteus, Prideaux, Raine, Rennell, T. Robinson, Secker, Stillingfleet, Stock, South, Jer. Taylor, Tillotson, Tomline, Toplady, Vincent, Wallis, Waterland, Warburton, Watson, Wells, Whitby, Wilkins, Wrangham, and Young.

EPI′SCOPATE. *s.* (*episcopatus*, Lat.) A bishoprick; the office and dignity of a bishop.

EPISCOPIUS (Simon), a learned divine, born at Amsterdam in 1583. When the disputes broke out between the Calvinists and Arminians, he joined the latter, and on the death of Arminius became their leader. In 1612 he was chosen divinity professor at Leyden, but he met with considerable trouble on account of his opinions. In 1615 he was at Paris, which gave his enemies an opportunity of reporting that he had been concerting there the ruin of the protestant church and the United Provinces. He was at the synod of Dort as the principal of the remonstrant party, where he behaved with great spirit. This arbitrary assembly deposed Episcopius and the other deputies from their ministerial functions, and banished them from the republic. He then went to Antwerp with several others of his party, and employed himself there in writing against popery. In 1626 he returned to Holland, and was made minister of the church of the remonstrants at Rotterdam. In 1634 he removed to Amsterdam, where he was chosen rector of the Remonstrants' college. He died in 1643. His works were printed in 2 vols. folio; the first in his life-time, and the second posthumous (*Watkins*).

EPISODE. (Επεισοδιον; from επι, upon, and εισοδος, entry.) Is commonly conceived to be a separate incident, story, or action, which an historian, or poet, inserts, and connects with his principal action; to furnish out the work with a greater diversity of events; though, in strictness, all the particular incidents, whereof the action or narration is composed, are called episodes.

The episode, in its original, was only something rehearsed between the parts of the chorus, or ancient tragedy, for the diversion of the audience. Episodes serve to promote the action, to illustrate, embellish, and adorn it, and carry it to its proper period. Episodes are either absolutely necessary, or very requisite. All episodes are incidents, though all incidents are not episodes; because some incidents are not adventitious to the action, but make up the very form and series of it. Examples will clear up this distinction: the storm in the first Æneid of Virgil, driving the fleet on the coast of Carthage, is an incident, not an episode, because the hero himself, and the whole body of his forces, are concerned in it; and so it is a direct and not a collateral part of the main action. The adventures of Nisus and Euryalus, in the ninth Æneid, are episodes, not incidents, i. e. not direct parts of the main action. See Poetry.

EPISO′DICAL. Episo′dic. *a.* (from *episode.*) Contained in an episode (*Dryden*).

EPISPA′STIC. *a* (επι and σπαω.) 1. Drawing. 2. Blistering (*Arbuthnot*).

EPISPASTICS. (*epispastica medicamenta*, επισπαστικα; from επισπαω, to draw together.) Substances which increase the action of the vessels in those parts of the surface of the body to which they are applied, in such a manner as to produce an efflux of fluids there; as cantharides, squills, boiling water, &c. They are mostly employed, 1. To diminish violent pain. 2. To take off the effects of uncommon sensibility. 3. To remove torpor. 4. To diminish the impetus of the blood against any part morbidly affected. 5. To diminish the morbid increase of action in vessels in the neighbourhood of those to which they are applied. 6. To diminish the quantity of circulating fluids. 7. To evacuate morbid accumulations of serum.

EPISTAPHILI′NUS. (from επι and σταφυλινος, a parsnip.) The uvula, from its resemblance to this root. See Uvula.

EPISTA′XIS. (*epistaxis*, επισταξις; from επισταζω, to distil from.) Bleeding at the nose, with pain, or fulness of the head. A genus of disease arranged by Cullen in the class pyrexiæ and order hæmorrhagiæ.

EPISTHO′TONOS. (*episthotonos*, ετισθοτονος; from επισθω, forwards, and τεινω, to extend.) A spasmodic affection of muscles drawing the body forwards. See Tetanus.

EPISTLE, a letter missive. The word is formed of εϖίστελλω, I send. The term epistle is now scarce used, but for letters written in verse, and letters dedicatory.

In speaking of letters written by moderns, or rather in the modern languages, we never use the word epistle. Thus we say the letters, not epistles, of the cardinal D'Ossat, of Voiture, of Balzac, of Howel, of Pope, &c. but those wrote by the ancients, or rather in the ancient languages, we call epistles: as the epistles, not letters, of Cicero, Pliny, Seneca. The epistles of St. Paul, St. Peter, St. John, &c. to the Romans, Corinthians, &c.

A Table of St. Paul's Epistles in the order of time, with the places where, and the times when they were written.

Epistles.	*Places.*		*A.D.*
1 Thessalonians 2 Thessalonians	Corinth		52
Galatians	Corinth, or Ephesus	Near the end of or the beginning of	52 53
1 Corinthians	Ephesus	The beginning of	56
1 Timothy	Macedonia		56
Titus	Macedonia, or near it	Before the end of	56
2 Corinthians	Macedonia	About October	57
Romans	Corinth	About February	58
Ephesians	Rome	About April	61
2 Timothy	Rome	About May	61
Philippians	Rome	Before the end of	62
Colossians	Rome	Before the end of	62
Philemon	Rome	Before the end of	62
Hebrews	Rome, or Italy	In the spring of	63

A Table of the Seven Catholic Epistles, so called, because they were written to Christians in general, and the Revelation, with the places where, and the times when they were writ.

Epistles.	*Places.*		*A.D.*
The Epistle of St. James	Judæa	61 or beginning of	62
The 2 Epistles of St. Peter	Rome		64
St. John's 1st Epistle	Ephesus	About	80
His 2d and 3d Epistles	Ephesus	Between 80 and	90
The Epistle of St. Jude	Unknown		64 or 65
The Revelation of St. John	Patmos, or Ephesus		95 or 96

See Lardner's Credibility of the Gospel History, vol. xvi. and vol. xvii.

Learned writers are not absolutely agreed as to the dates of these several epistles, nor the places whence they were written. It would lead us too far to examine and produce the various authorities and arguments that have been used for settling these particulars: we shall only mention that Dr. Doddridge dates the 1st Epistle to the Corinthians about the year 57; and the 2d Epistle in 58; those to the Ephesians, Philippians, Colossians, and Philemon, in 63; the 1st to Timothy, in 58 or 65; the 2d to Timothy in 66 or 67; the Epistle to Titus, between St. Paul's first and second imprisonment at Rome; the Epistle of St. James, in 60 or 61; the 1st of Peter in 61; the 2d, in 67; that of St. Jude, some time after the 2d of Peter, according to Dr. Mills, in the year 90.

EPISTLES AND GOSPELS, in the liturgy of the church of England, are select portions of Scripture, taken out of the writings of the evangelists and apostles, and appointed to be read, in the communion-service, on Sundays and holidays. They are thought to have been selected by St. Jerom, and by him put into the lectionary.

EPI'STOLARY. *a.* (from *epistle.*) 1. Relating to letters; suitable to letters. 2. Transacted by letters (*Addison*).

EPI'STLER. *s.* (from *epistle.*) A scribbler of letters.

EPISTROPHE. (Επιστροφη.) In rhetoric, a figure wherein that which is supposed of one thing is strongly affirmed of another, and the repetition of the same word occurs at the end of each member or sentence. "Since concord was lost, friendship was lost, fidelity was lost, liberty was lost, all was lost." Auct. ad Herenn. lib. iv. cap. 13. See also 2 Cor. xi. 22.

EPISTROPHÆUS. (επιστροφαιος; from επιστροφαω, to turn round, because the head is turned upon it.) Epistrophæus. The second cervical vertebra. See DENTATUS.

EPISTYLE, the Greek term for architrave.

EPITAPH. (Επιταφιον; from επι, upon, and ταφος, sepulchre.) A monumental inscription, in honour or memory of a person defunct; or an inscription engraven or cut on a tomb, to mark the time of a person's decease, his name, family, and usually some eloge of his virtues or good qualities.

At Sparta, epitaphs were only allowed to people who died in battle. Boxhornius has made a collection of epitaphs not very ample, but exceedingly well chosen. Fa. Labbe has likewise given a collection of the like kind in French, intitled Tresor des Epitaphes. Camden, Weaver, and Toldervy, have done something in the same way with our English epitaphs.

In epitaphs, the dead person is sometimes introduced by way of prosopopœia, speaking to the living; of which we have a fine instance, worthy the Augustan age, the dead wife thus bespeaking her surviving husband:

Immatura perî: sed tu, felicior, annos
Vive tuos, conjux optime, vive meos.

The French have a proverb, "Menteur comme une epitaphe;" He lies like an epitaph;

in allusion to the elogies ordinarily contained therein, which are not always rigidly just.

Dr. Johnson and others have criticised some of our finest epitaphs: but we have no room for their remarks. Our readers will find a beautiful specimen by Thomson under the word AIKMAN: we here add one by Cowley.

> Here lies the great:—False marble, tell me where:
> Nothing but poor and sordid dust lies here.

That of Alexander:

Sufficit huic tumulus, cui non sufficeret orbis.

That of Newton:

> Isaacum Newton
> Quem immortalem
> Testantur Tempus, Natura, Cœlum;
> Mortalem hoc marmor
> Fatetur.

EPITASIS, in ancient poetry, the second part or division of a dramatic poem, in which the plot entered upon in the first part, or protasis, was carried on.

EPITHALAMIUM. (Επιθαλαμιον; formed of επι and ϑαλαμος, bride-chamber.) In poetry, a nuptial song, or a composition, usually in verse, on occasion of a marriage between two persons of eminence.

The topics it chiefly insists on are the praises of matrimony, and of the married couple, with pomp and order of the marriage solemnity: it concludes with prayers to the gods for their prosperity, their happy offspring, &c.

EPITHELIUM. (*epithelium.*) The cuticle on the red part of the lips; the cuticle reflected upon the internal parts, as the mouth, rectum, &c.

EPITHEMA. (*epithema*, επιθημα; from επι, upon, and τιθημι, to apply.) A lotion, fomentation, or other external application of the same kind.

E'PITHET. *s.* (επιθητον.) An adjective denoting any quality good or bad (*Swift*).

EPITHYMUM. (*epithymum*, επιθυμον; from επι, upon, and θυμος, the herb thyme.) Cuscuta. Dodder of thyme. A parasitic plant, possessing a strong disagreeable smell, and a pungent taste very durable in the mouth. Two kinds are recommended in melancholia, as cathartics, &c. Cuscuta epithymum; foliis sessilibus, quinquifidis, bracteis obvallatis: and cuscuta europæa; floribus sessilibus of Linnéus. See CUSCUTA.

EPI'TOME. *s.* (ἐπιτομη.) Abridgement; abbreviature; compendious abstract (*Wotton.*)

To EPI'TOMISE. *v. a.* (from *epitome.*) 1. To abstract; to contract into a narrow space (*Donne*). 2. To diminish; to curtail (*Addison*).

EPI'TOMISER. EPI'TOMIST. *s.* (from *epitomise.*) An abridger; an abstracter.

EPITRITES, the musical ratio of 3 to 4.

EPITROPUS, a kind of judge or arbitrator, among the Greek Christians under the dominion of the Turks.

EPOBOLIA, in antiquity, a fine laid upon those that could not prove the indictment they had brought against their adversaries.

EPOCH, or EPOCHA, in chronology, a term or fixed point of time, from whence the succeeding years are numbered or reckoned. Different nations make use of different epochs. The Christians chiefly use the epoch of the nativity or incarnation of Jesus Christ; the Mahometans, that of the Hegira; the Jews that of the creation of the world, or that of the deluge; the ancient Greeks, that of the Olympiads; the Romans, that of the building of their city; the ancient Persians and Assyrians, that of Nabonassar, &c. The doctrine and use of epochs is of very great extent in chronology. To reduce the years of one epoch to those of another, i. e. to find what year of one corresponds to a given year of another, a period of years has been invented, which, commencing before all the known epochs, is, as it were, a common receptacle of them all, called the Julian period. To this period all the epochs are reduced; i. e. the year of this period when each epoch commences is determined. So that, adding the given year of one epoch to the year of the period corresponding with its rise, and from the sum subtracting the year of the same period corresponding to the other epoch, the remainder is the year of that other epoch.

EPOCH OF CHRIST, is the common epoch throughout Europe, commencing at the supposed time of our Saviour's nativity, December 25; or rather, according to the usual account, from his circumcision, or the 1st of January. The author of this epoch was an abbot of Rome, one Dionysius Exiguus, a Scythian, about the year 507 or 527. Dionysius began his account from the conception or incarnation, usually called the Annunciation, or Lady Day; which method obtained in the dominions of Great Britain till the year 1752, before which time the Dionysian was the same as the English epoch: but in that year the Gregorian calendar having been admitted by act of parliament, they now reckon from the first of January, as in the other parts of Europe, except in the court of Rome, where the epoch of the incarnation still obtains for the date of their bulls.

A Table of the Years of the most remarkable Epochs or Eras and Events.

N. B. The years before Christ are those before the reputed year of his birth, and not reckoned back from the first year of his age, as is generally done in such tables.	Julian Period.	Year of the World.	Years before Christ.
The Creation of the World	706	0	4007
The Deluge, or Noah's flood	2362	1656	2351
Assyrian monarchy founded by Nimrod	2537	1831	2176
The birth of Abraham	2714	2008	1999
Kingdom of Athens founded by Cecrops	3157	2451	1556
Entrance of the Israelites into Canaan	3262	2556	1451
The destruction of Troy	3529	2823	1184
Solomon's temple founded	3701	2995	1012
The Argonautic expedition	3776	3070	937
Lycurgus formed his laws	3829	3103	884
Arbaces, first king of the Medes	3838	3132	875
Olympiads of the Greeks began	3938	3232	775
Rome built, or Roman Era	3961	3255	752
Era of Nabonassar	3967	3261	746
First Babylonish captivity, by Nebuchadnezzar	4107	3401	606
The 2d ditto, and birth of Cyrus	4114	3408	599
Solomon's temple destroyed	4125	3419	588
Cyrus began to reign in Babylon	4177	3471	536
Peloponnesian war began	4282	3576	431
Alexander the Great died	4390	3684	323
Captivity of 100,000 Jews by Ptolemy	4393	3687	320
Archimedes killed at Syracuse	4506	3800	207
Julius Cæsar invaded Britain	4659	3953	54
He corrected the calendar	4667	3961	46
The true year of Christ's birth	4709	4003	4
The Christian Era begins here.			Years since Christ.
Dionysian or vulgar era of Christ's birth	4713	4007	0
Christ crucified, Friday April 3d	4746	4040	33
Jerusalem destroyed	4783	4077	70
Adrian's wall built in Britain	4833	4127	120
Dioclesian Epoch, or that of Martyrs	4997	4291	384
The council of Nice	5038	4332	325
Constantine the Great died	5050	4344	337
The Saxons invited into Britain	5158	4452	445
Hegira, or flight of Mohammed	5335	4629	622
Death of Mohammed	5343	4637	630
The Persian Yesdegird	5344	4638	631
Sun, Moon, and Planets, ♄, ♃, ♂, ♀, ☿, in ♎, seen from the earth	5899	5193	1186
Art of printing discovered	6153	5447	1440
The reformation begun by Martin Luther	6230	5524	1517
The Calendar corrected by pope Gregory	6295	5589	1582
Oliver Cromwell died	6371	5665	1658
Sir Isaac Newton born, Dec. 25	6355	5649	1642
Made president of the Royal Society	6416	5710	1703
Died, March 20th	6440	5734	1727
New Planet discovered by Herschel	6494	5788	1781

EPO'DE. *s.* (επωδος.) The stanza following the strophe and antistrophe.

EPODYNE (from επι, and οδυνη, pain.) Producing or suffering much pain. The opposite to anodyne.

EPOPOEIA, in poetry, the history, action, or fable, which makes the subject of an epic poem. The word is derived from the Greek επος, *carmen*, verse; and ποιεω, *facio*, I make. In the common use of the word, however, *epopœia* is the same with *epos*, or epic poem, itself. See the article EPIC POEM.

EPPING, a town in Essex, with a market on Fridays. The butter made in this neighbourhood, and called Epping butter, is highly esteemed in London. Epping is seated at the N. end of a forest of the same name. Lat. 51. 46 N. Lon. 0. 9 E.

EPROUVETTE. See POWDER-PROVER, and Hutton's Tracts, vol. iii.

EPSOM, a town in Surrey, with a daily market. It is celebrated for its mineral waters and salts. Lat. 51. 25 N. Lon. 0. 15 W.

EPSOM SALTS. See MURIA, and MURABILE, for its mineral arrangement, and MAGNESIA VITRIOLATA for its medical properties.

EPSOM WATER. *Aqua Epsomensis.* This water evaporated to dryness leaves a residuum, the quantity of which has been estimated from an ounce and a half in the gallon to five drachms and one scruple. Of the total residuum, by far the greater part, about four or five sixths, is sulphat of magnesia mixed with a very few muriats, such as that of lime, and probably of magnesia, which render it very deliquescent, and increase the bitterness of taste, till purified by repeated crystallizations. There is nothing sulphureous or metallic ever found in this spring. The diseases in which it is employed are similar to those referred to Sedlitz water. There are many other simple saline springs which agree with that of Epsom, in containing a notable portion of some purging salt. This for the most part is either Epsom or Glauber's salt, or often a mixture of both, as at Acton, Kilburne, Bagnigge wells, Dog and Duck, St. George's Fields, &c.

EPULARES, in antiquity, an epithet given to those who were admitted to the sacred epulæ or entertainments, it being unlawful for any to be present at them who were not pure and chaste.

EPULA'TION. *s.* (*epulatio*, Latin.) Banquet; feast (*Brown*).

EPU'LIS. (*epulis*, επουλις, from επι and ουλα, the gums.) An excrescence growing from the gums.

EPULO, in antiquity, the name of a minister of sacrifice among the Romans.

EPULOTICS. (*epulotica medicamenta*, επουλοτικα; from επουλοω, to cicatrize.) A term given by surgeons to those applications which promote the formation of skin.

EPULUM, in antiquity, a holy banquet prepared for the gods, in times of public danger. The word is also used to denote any solemn feast, as *epulum ferale*, a funeral entertainment.

EQUABI'LITY. *s.* (from *equable.*) Equality to itself; evenness; uniformity (*Ray*).

E'QUABLE. *a.* (*æquabilis*, Latin.) Equal to itself; even; uniform (*Bentley*).

E'QUABLY. *ad.* (from *equable.*) Uniformly; evenly; equally to itself (*Cheyne*).

E'QUAL. *a.* (*æqualis*, Latin.) 1. Like another in bulk, or any quality that admits comparison (*Hale*). 2. Adequate to any purpose (*Clarendon*). 3. Even; uniform (*Smith*). 4. In just proportion (*Dryden*). 5. Impartial; neutral (*Dryden*). 6. Indifferent (*Cheyne*). 7. Equitable; advantageous alike to both parties (*Maccabees*). 8. Being upon the same terms (*Maccabees*).

E'QUAL. *s.* (from the adjective.) 1. One not inferior or superior to another. 2. One of the same age (*Galatians*).

To E'QUAL, *v. a.* (from the noun.) 1. To make one thing or person equal to another. 2. To rise to the same state with another person. 3. To be equal to (*Shakspeare*). 4. To recompense fully (*Dryden*).

To E'QUALISE. *v. a.* (from *equal.*) 1. To make even (*Brown*). 2. To be equal to: not used (*Digby*).

EQUA'LITY. *s.* (from *equal.*) 1. Likeness with regard to any quantities compared (*Shakspeare*I. 2. The same degree of dignity (*Milton*I. 3. Evenness; uniformity; equability (*Brown*).

EQUALITY, in a political sense, is a term much used, though not generally understood. All men are upon an equality with regard to their rights. Their right to have their persons and their property (whether it be less or more) protected by the government under which they live, cannot be disputed. Neither can the right to do any thing that is not injurious to another, which is the only true definition of liberty, be called in question, let the party exercising it be ever so poor. But it is a dangerous error to suppose, that an equality of property is meant by the term; for that is to suppose, what is not the fact, that all men are equal in merit and in talents.

EQUALITY, in algebra, the relation or comparison between two quantities, that are really or effectually equal. This equality is generally denoted by the sign =, which was introduced by Robert Recorde, who assigns this reason: "And to avoide the tediouse repetition of these woordes: is equalle to: I will sette, as I doe often in woorke use, a paire of paralleles, or gemowe lines of one lengthe, thus: =, bicause noe 2 thynges can be moare equalle."

E'QUALLY. *ad.* (from *equal.*) 1. In the same degree with another (*Rogers*). 2. Evenly; equably; uniformly (*Locke*). 3. Impartially (*Shakspeare*).

E'QUALNESS. *s.* Equality (*Shakspeare*).

EQUA'NGULAR. *a.* (from *æquus* and *angulus*, Latin.) Consisting of right angles.

EQUANIMITY, in ethics, denotes an even, uniform temper of mind, amidst all the varieties and revolutions of time and chance. This virtue, together with prudence, forms the character which Horace gives of Aristippus:

Omnis Aristippum decuit color et status et res.

All parts and fortunes he alike became.

Equanimity is the immediate result of magnanimity, and no other than a proof and evidence of it. "The truly great man (says Andronicus Rhodius) in the change of his circumstances, will always act worthy of himself, not rejoicing over much in prosperity, nor dejected in adversity. His opinion of honour is not extravagant, in which he knows how to behave himself with moderation; and much more in riches and power, to both which honour is preferable." It is truly excellent to maintain an equal temper in every part of life: Philip of Macedon, with regard to the greatness of his victories and renown, was exceeded by his son Alexander, but superior to him in the mild evenness and humanity of his temper: he, therefore, was always great, whereas Alexander often acted very basely.

EQUA'NIMOUS. *a.* (*æquanimis*, Latin.) Even; not dejected; not elated.

EQUANT, in astronomy, a circle formerly imagined by astronomers, in the plane of the deferent; for regulating and adjusting certain motions of the planets.

EQUATION, in algebra, a proposition asserting the equality of two quantities, whether simple or compound; it is expressed by placing the sign = between them: thus $2+5=7$, $x^2+ab=c$. When the quantities compared are simple and similar, the equation is identical; as $4=4$, and $a=a$. Sometimes the quantities are brought all on one side, (by transposition), and made equal to 0, or nothing, on the other, as $4+3-7=0$, $x^3+2ax^2-7x=0$. &c.

Terms of an equation, are the several parts or quantities of which it is composed.

Equations are either simple or affected. A simple equation is that which has only one power of the unknown quantity, whether high or low, as $a+x=3b$, $4x^3=16c$. &c. An affected or adfected equation contains two or more different powers of the unknown quantity: as $x^2+2ax=b^2$, $x^3-4x^2+61x=12$. &c.

Equations, containing only one unknown quantity and its powers, are divided into orders, according to the highest power of the unknown quantity to be found in any of its terms.

If the highest power of the unknown quantity in any term be the

$$\left.\begin{array}{l}\text{1st,}\\ \text{2d,}\\ \text{3d,}\\ \text{4th, \&c.}\end{array}\right\}\begin{array}{c}\text{The}\\ \text{Equation}\\ \text{is called}\end{array}\left\{\begin{array}{l}\textit{Simple,}\\ \textit{Quadratic,}\\ \textit{Cubic,}\\ \textit{Biquadratic, \&c.}\end{array}\right.$$

The Root of an Equation, is the value of the unknown letter or quantity contained in it. And this value being substituted in the terms of the equation instead of that letter or quantity, will cause both sides to vanish, or will make the one side exactly equal to the other. According to the principles adopted by nearly all algebraists since the time of Harriot, every equation is said to have as many roots as it has dimensions, or as it contains units in the index of the highest power, when the powers are all reduced to integral exponents. So the simple equation of the 1st power, has only one root; but the quadratic has 2, the cubic 3, the biquadratic 4, &c.

The Relation between the Roots of Equations, and the Coefficients of their Terms. Every equation, when the terms are ranged in order according to the order of the powers, the greater before the less; the first term or highest power freed from its coefficient, by dividing all the terms by it, and all brought to one side, and made equal to nothing on the other side, will appear in this form.

$$x^{n}+ax^{n-1}+bx^{n-2}+cx^{n-3}\ldots\ldots=0;$$

then the relations between the roots and coefficients, are as follow:

1st. The coefficient a of the 2d term, is equal to the sum of all the roots.

2d. The coefficient b of the 3d term, is equal to the sum of all the products of the roots that can be made by multiplying every two of them together. In like manner,

3d. The coefficients c, d, e, &c. of the following terms, are respectively equal to the sum of the products of the roots made by multiplying every three together, or every four together, or every five together, &c. the signs of all the roots being changed. All which will appear in the generation of equations.

4th. The roots of equations are positive or negative, and real or imaginary. Thus, the two roots of the equation $x^2-4x=-3$, are 1 and 3, real and both positive; but the roots of the equation $x^3-4x^2-11x=-30$, are 2, 5, & -3, which are real, two positive and one negative; and the roots of the equation $x^3+9x=10$, are 1 and $-\frac{1}{2}\pm\frac{1}{2}\sqrt{-39}$, one real and two imaginary. These imaginary roots always enter equations by pairs.

5th. Every equation has as many roots of the form $a\pm\sqrt{\pm b^2}$, as it has dimensions. The first satisfactory proof of this proposition with which we are acquainted is given by Mr. Wood, of St. John's College, Cambridge, in the Phil. Trans. for 1798: or New Abrigement, vol. xviii. p. 341.

Reduction of Equations, is the transforming or changing them to their simplest and most commodious form, to prepare them for finding or extracting their roots. The most convenient form is, that the terms be ranged according to the powers of the unknown letter, the highest power foremost next the left hand, and that term to have only $+1$ for its coefficient: also all the terms containing the unknown letter to be on one side of the equation, and the absolute known term only on the other side.

EQUATION (Recurring). See ALGEBRA, sect. VII.

To find the Roots of Equations, various rules are given, according to the nature of the equation. Thus for a simple equation, having reduced it, by bringing the unknown terms to one side, and the known ones to the other, freeing the former from radicals and fractions, by their counter operations, and lastly, dividing by the coefficients of the unknown quantity, the value of it is then found.

For the roots of quadratics, and equations of higher dimensions, see ALGEBRA, sect. VII. BIQUADRATIC, CUBIC, QUADRATIC: consult likewise the articles APPROXIMATION, CONSTRUCTION, DEPRESSION, DIVISORS, EXPEDIENT, EXTERMINATION, IRREDUCIBLE CASE, LIMITS, TRANSFORMATION, &c.

EQUATION (Exponential). See EXPONENTIAL.

EQUATION (Transcendental). See TRANSCENDENTAL.

EQUATION OF PAYMENTS, in arithmetic, is the method of finding a time on which to pay at once several debts due at different times, so that no loss shall be sustained by either party. The rule commonly given is, to multiply each payment by the time at which it is due; and divide the sum of the products by the sum of the payments, for the time required. But this rule is not accurate, as was first shewn, we believe, by Mr. Malcolm, who gave a true rule for *two* payments at simple interest. When three or more payments are to be equated for, it would not be easy, if possible, to give general rules or theorems, on account of the variation of the debts and times, and the difficulty of finding between which of the payments the equated time would fall. Malcolm's rule for two payments is well stated at p. 140 of Mr. Bonnycastle's Arithmetic.

EQUATION, in astronomy, is generally equivalent to correction: an equation is that which is applied to the mean position, or time, of a body, to obtain its true position, or time. In this sense astronomers speak of the annual equation of the sun and moon, and the equation of the moon's mean motion.

EQUATION TO CORRESPONDING ALTITUDES, is a correction which must be applied to the apparent time of noon, (found by means of the interval of time elapsed between the instants when the sun had equal altitudes, both before and after noon,) in order to ascertain the true time. Tables of equations to corresponding altitudes, by the late Mr. Wales, are given in the Nautical Almanac for 1773; also, in his Tract on finding the Longitude by Timekeepers. For Dr. Rittenhouse's ingenious method of finding the equation independent of tables, see the article ALTITUDE INSTRUMENT.

EQUATION OF THE CENTRE, called also *Prosthapheresis* and *Total Prosthapheresis,* is the difference between the true and mean place of a planet, or the angle made by the lines of the true and mean place; or, which amounts to the same, between the mean and equated anomaly.

The greatest equation of the sun's centre may be obtained by finding the sun's longitude at the times when he is near his mean distances, for then the difference will give the true motion for that interval of time: next find the sun's mean motion for the same interval of time; then half the difference between the true and mean motions will shew the greatest equation of the centre.

When the mean anomaly and excentricity of an orbit are given, the equation of the centre may be readily obtained by the following admirable rule given by Mr. T. Simpson. As radius, to the cosine of the given anomaly, so is $\frac{5}{4}$ of the excentricity of the orbit, to a fourth number; which number add to half the greater axis, if the anomaly be less than 90° or more than 270°, otherwise subtract from the same: Say, as the sum or remainder, is to double the excentricity, so is the logarithmic sine of the given anomaly, to the sine of a first arch, from three times which sine deduct the double radius, the remainder will be the sine of a second arch, whose $\frac{1}{3}$ part, taken from the former, leaves the equation sought. See Essays, p. 47.

Mr. Euler has particularly considered this subject in Mem. de l'Acad. de Berlin, tom. ii. p. 225. seq. where he solves the following problems:

1. To find the true and mean anomaly corresponding to the planet's mean distance from the sun; that is, when the planet is in the extremity of the conjugate axis of its orbit.

2. The excentricity of a planet being given, to find the excentric anomaly corresponding to the greatest equation.

3. The excentricity being given, to find the mean anomaly corresponding to the greatest equation.

4. From the same data to find the true anomaly corresponding to this equation.

5. From the same data to find the greatest equation.

6. The greatest equation being given to find the excentricity. Mr. Euler observes, that this problem is very difficult, and that it can only be solved by approximation and tentatively in the manner he mentions; but, if the excentricity be not great, it may be then found directly from the greatest equation. Thus if the greatest equation $=m$, and the excentricity $=n$, then,

$$m = 2n + \frac{11}{2^4 3} n^3 + \frac{599}{2^6 3.5.7} n^5 + \&c.$$

Whence, by reversion,

$$n = \tfrac{1}{2}m - \frac{11}{2^8 3} m^3 - \frac{587}{2^{10} 3.5} m^5 - \&c.$$

Where the greatest equation m, must be expressed in parts of the radius, which may be done by converting the angle m into seconds, and adding 4,6855749 to the logarithm of the resulting number, this will be the logarithm of the number m.

The mean anomaly to which this greatest equation corresponds will be

$$x = 90^\circ + \frac{5}{8} m - \frac{5}{2^9.3} m^3 - \frac{1}{2^9.5} m^5 -, \&c.$$

Whence, if to 90° we add $\frac{5}{8}$ of the greatest equation, we shall sufficiently approximate to this mean anomaly.

Mr. Euler gives us a table, in which may be found the greatest equations, the excentric and mean anomalies corresponding to these greatest equations for every hundredth part of unity, which he supposes equal to the greatest excentricity, or when the distance of the foci and the transverse axis become infinite. The last column of his table also gives us the logarithm of that distance of the planet from the sun where its equation is greatest. By the help of this table, any excentricity being given, we may find the greatest corresponding equation by interpolation. But the principal use of the table is to determine the excentricity when the greatest equation is known: and without this help, Mr. Euler thinks the problem cannot be resolved.

Equation of time, in astronomy, denotes the difference between mean and apparent time, or the reduction of the apparent unequal time, or motion of the sun or a planet, to equable and mean time, or motion.

If the earth had only a diurnal motion, without an annual, any given meridian would revolve from the sun to the sun again, in the same quantity of time as from any star to the same star again; because the sun would never change his place with respect to the stars. But, as the earth advances almost a degree eastward in its orbit in the time that it turns eastward round its axis, whatever star passes over the meridian on any day with the sun, will pass over the same meridian on the next day when the sun is almost a degree short of it; that is, 3 minutes 56 seconds sooner. If the year contained only 360 days, as the ecliptic does 360 degrees, the sun's apparent place, so far as his motion is equable, would change a degree every day; and then the sidereal days would be 4 minutes shorter than the solar.

The equation of time is calculated by tracing out the effects of three combined causes; the obliquity of the ecliptic, the sun's unequal apparent motion therein, and the precession of the equinoctial points: in consequence of the first of these, in the first and third quadrants of the ecliptic from aries, that is, between aries and cancer, and between libra and capricorn, the right ascension being less than the mean longitude, the point of right ascension is to the west, and therefore the apparent noon precedes the mean noon; but in the second and fourth quadrants, namely, between cancer and libra, or capricorn and aries, the right ascension being greater than the longitude, or the mean motion taken in the equator, the mean noon is westward, and therefore precedes the apparent noon. But, even if the plane of the ecliptic coincided with that of the equator, there would be a correction necessary; for the apparent annual motion of the sun being not quite uniform, a longer arc would be described in some days than others; that is, since the right ascension and longitude would in this case be the same, the daily increments of right ascension would be unequal. And besides these, the third cause ought to be attended to, though it is too frequently disregarded. The equation of time is, in fact, equal to the difference of the sun's true right ascension and his mean longitude, corrected by the equation of the equinoxes in right ascension. This was, we believe, first shewn by Dr. Maskelyne.

The mean and apparent solar days are never equal, except when the sun's daily motion in right ascension is 59′ 8″; this is nearly the case about April 15th, June 15th, September 1st, and December 24th: on these days the equation is nothing, or nearly so; it is at the greatest about November 1st, when it is 16′ 14″.

Tables of the equation of time, as computed by Dr. Maskelyne's rule for the noon of each day, are given in the Nautical and other Almanacs. Sometimes they are computed for every degree of the sun's place in the ecliptic: as in O. Gregory's and Ewing's Astron. But tables of this latter kind will not answer accurately for many years, because of the precession, the motion of the sun's apogee, &c. which render a frequent revision of the calculations necessary: we, therefore, give no such table in this work.

Timekeepers used by astronomers and mariners are, very properly, regulated by the equation of time: but we conceive there is an impropriety in regulating clocks by this equation, which are intended to shew the time of the day to persons engaged in the common concerns of life. Two instances only will, we think, shew the justice of this remark. 1. During the greater part of November, the equation of time is more than 15′ subtractive; or, the clock after the sun more than a quarter of an hour, if this equation be attended to: in consequence of this, the sun, according to the time shewn by the clock, sets $\frac{1}{4}$ of an hour sooner than it does in reality; thus the day is made to appear shorter than it is in fact, and gives rise to the common complaint of the dark days before Christmas. Again, 2dly, in February the clocks regulated by the equation of time, are nearly $\frac{1}{4}$ of an hour before the sun; and thus occasions the delusion of the mornings being unusually short, while the afternoons are comparatively long. If, instead of this, the clocks were always made to correspond with a good dial, such kind of mistaken inferences would be done away; as the real time of the sun's rising and setting would always be truly shewn by the clock.

EQUATION OF A CURVE, is an equation shewing the nature of a curve by expressing the relation between any absciss and its corresponding ordinate, or the relation of their fluxions, &c. Equations are not true definitions of a curve, but only artificial or analytical expressions, by the help of which we may proceed with much ease in the investigation of the various properties of curves. See ABSCISS, CURVE, CONICS, CARDIOID, &c.

Suppose we wished to deduce a general equation to a circle, that, for example, described from the centre A, (fig. 8. Pl. 57.) and with a radius equal to the line AD. The points in the circumference of this circle are distinguished from all other points in the same plane, by being at a distance from the centre A equal to AD; and consequently, wherever we assume the point M on that curve, the right lines AP, and PM, will be sides of a right-angled triangle, whose hypothenuse AM is equal to AD. Making, therefore, AP$=x$, PM$=y$, AD$=r$, we have $x^2+y^2=r^2$; whence we find $y-\sqrt{r^2-x^2}$, an equation which shews that when x or AP is known we can find by computation, and without its being necessary to construct the figure, y or PM, or, at least, the relation of that line with the radius. Taking, for instance, $x=\frac{1}{3}r$, it will be $y=\sqrt{r^2-\frac{1}{9}r^2}=\sqrt{\frac{8}{9}r^2}=\frac{2}{3}r\sqrt{2}$.

It is easy to conceive that we may deduce from the same original expression the lines PM corresponding to all assumed points of the line AB, comprised between A and D. The equation $y=\sqrt{r^2-x^2}$, proves also, as well as the geometrical description of the circle, that this curve cannot extend beyond the point D: for, that the point P may be beyond D it is requisite that x be greater than AD, or than r; in which case y would become imaginary.

Though we have only considéred the quadrant DE, the three others which together with this complete the circumference are comprehended in the equation $x^2+y^2=r^2$: for the ordinate y having for the same value of x, two values, namely $+\sqrt{r^2-x^2}$ and $-\sqrt{r^2-x^2}$, the second must be transferred to the side opposite the former; and will of consequence supply all the points of the quadrant DE′. But we may likewise assign negative values to x, which will direct it from A to D′, since the positive values were estimated from A towards D; to each of these values will answer two values of y: the positive value will give the points of the quadrant D′E, and the negative value the points of the quadrant D′E′.

Right lines, as well as curves, may be represented by algebraic equations. Suppose, for example, that the equation $ay-bx-cd=0$, was given, and that the locus was required. Since $y=\frac{bx+cd}{a}$, it follows that APM (fig. 9. Pl. 57.) being a right angle, if we draw AN making the angle NAP such that its cosine be to its sine as a to b; and drawing AD parallel to the ordinates PM, and equal to $\frac{cd}{a}$, through D we draw the right line DF parallel to AN, DF will be the locus required. Where we are to take AD on the same side of the line AE with PN, if bx and cd have the same sign; but on the contrary side of AE, if they have contrary signs.

EQUATOR, in geography, a great circle of the earth, perpendicular to its axis, and equidistant from its two poles. It divides the earth into two hemispheres, one north, the other south. It passes through the east and west points of the horizon, and at the meridian is raised as much above the horizon as is equal to the complement of the latitude of the place. From this circle, the latitudes of places, whether north or south, begin to be reckoned, in degrees of the meridian. The longitudes of places are reckoned in degrees of this circle; and, as the natural day is measured by one revolution of the equator, it follows that one hour answers to $\frac{360}{24}=15$ degrees. Hence, one degree of the equator is equivalent to 4 minutes of time; 15 minutes of a degree to 1 minute of time, and 1 minute of a degree to 4 seconds of time. All people living on this circle, called by mariners the line, have their days and nights constantly equal. The circle formed by extending the plane of the equator to the imaginary concave surface of the heavens is sometimes called the celestial equator, but more properly the equinoctial.

EQUATORIAL, UNIVERSAL, or PORTABLE OBSERVATORY, is an instrument intended to answer a number of useful purposes in practical astronomy, independent of any particular observatory. It may be employed in any steady room or place, and it performs most of the useful problems in the science.

The principal parts of this instrument are, 1st, The azimuth or horizontal circle, which represents the horizon of the place, and moves on a long axis, called the vertical axis. 2d, The equatorial or hour-circle, representing the equator, placed at right angles to the polar axis, or the axis of the earth, upon which it moves. 3d, The semicircle of declination, on which the telescope is placed, and moving on the axis of declination, or the axis of motion of the line of collimation. Which circles are measured and divided as in the following table:

Measures of the several circles and divisions on them.	Radius inches	Limb divided to	Non. of 30 gives seconds	Divid. on limb into pts. of Inc.	Divid. by Non. into pts. of Inc.
Azimuth or horizontal circle.	5·1	15′	30″	45th	1350th
Equatorial or hour circle	5·1	15′ or 1 m. in time.	30″ 2″	45th	350th
Vertical semicircle for declination or latitude.	5·	15′	30″	42d	1260th

The peculiar uses of this equatorial are, 1. To find the meridian by one observation only. For this purpose, elevate the equatorial circle to the co-latitude of the place, and set the declination-semicircle to the sun's declination for the day and hour of the day required; then move the azimuth and hour circles both at the same time, either in the same or a contrary direction, till you bring the centre of the cross hairs in the telescope exactly to cover the centre of the sun; when that is done, the index of the hour-circle will give the apparent or solar time at the instant of observation; and thus the time is gained, though the sun be at a distance from the meridian; then turn the hour-circle till the index points precisely at 12 o'clock, and lower the telescope to the horizon, in order to observe some point there in the centre of the glass, and that point is the meridian mark found by one observation only; the best time for this operation is three hours before or three hours after 12 at noon.

2. To point the telescope on a star, though not on the meridian, in full day-light. Having elevated the equatorial circle to the co-latitude of the place, and set the declination-semicircle to the star's declination, move the index of the hour-circle till it shall point to the precise time at which the star is then distant from the meridian, found in tables of the right ascension of the stars, and the star will then appear in the glass. Besides these uses peculiar to this instrument, it is also applicable to all the purposes to which the principal astronomical instruments, viz. a transit, a quadrant, and an equal altitude instrument, are applied.

For a full description of an equatorial invented by Mr. Short, see Phil. Trans. vol. 46; and for one invented by Mr. Nairne, vol. 61. See also Hutton's Math. Dict. English Encyclopædia, and Vince's Practical Astron.

EQUATO'RIAL. *a.* (from *equator.*) Pertaining to the equator (*Cheyne*).

EQUERY, or ECURY, a grand stable or lodge for horses, furnished with all the conveniences thereof; as stalls, manger, rack, &c.

EQUERRY, an officer in the king's household, under the sole direction of the master of the horse. There are five equerries, one of whom by way of pre-eminence is called the first: of the other four, two are always in waiting to attend the king in every equestrian excursion, whether on the road, to the field, or in the chase. The prince of Wales, the dukes of York, Clarence, and other branches of the royal family, have attendants of the same description.

The term equerry applies equally to those in a subordinate situation, who personally officiate in the stables of the crown, and to whom are entrusted the breaking, managing, and preparing saddle-horses of every description for the king's use. Some of the out-riders who attend upon the royal family pass also under the same denomination.

EQUES AURATUS, in antiquity, a knight bachelor.

EQUESTRIA, a place in the Roman theatre where the equites or knights sat.

EQUE'STRIAN. *a.* (*equestris*, Latin.) 1. Being on horseback (*Spectator*). 2. Skilled in horsemanship. 3. Belonging to the second rank in Rome.

EQUESTRIAN GAMES, among the Romans, horse-races, of which there were five kinds; the prodromus, or plain horse-race, the chariot-race, the decursory-race about funeral piles, the ludi sevirales, and the ludi neptunales.

EQUIANGULAR, in geometry, an epithet given to figures, whose angles are all equal: such are a square, an equilateral triangle, &c.

EQUICRURAL. (from *æquus* and *crus.*) In geometry, having legs of an equal length: isosceles.

EQUIDIFFERENT. *a.* Is applied in mathematics to such things as have equal differences, or form an arithmetical progression.

EQUICULUS, in astronomy. See EQUULEUS.

EQUICURVE CIRCLE. See CIRCLE OF CURVATURE.

EQUIDI'STANT. *a.* (*æquus* and *distans*, Lat). Being at the same distance (*Ray*).

EQUIDI'STANTLY. *ad.* (from *equidistant.*) At the same distance (*Brown*).

EQUIFO'RMITY. *s.* (*æquus* and *forma*, Lat.) Uniform equality (*Brown*).

EQUILATERAL FIGURE, is one that has all its sides equal to each other. Such as the square, and all the regular figures or polygons.

Equilateral hyperbola, is that which has the two axes equal to each other, and every pair of conjugate diameters also equal to each other. The asymptotes also are at right angles to each other, and make each half a right angle with either axis. Also, such an hyperbola is equal to its opposite hyperbola, and likewise to its conjugate hyperbola; so that all the four conjugate hyperbolas are mutually equal to each other.

To EQUILI′BRATE. *v. a.* (from *equilibrium.*) To balance equally (*Boyle*).

EQUILIBRA′TION. *s.* (from *equilibrate.*) Equipoise (*Derham*).

Equilibration (Arch of). See Arch.

EQUILI′BRIUM. (Latin.) *s.* 1. Equipoise; equality of weight. 2. Equality of evidence, motives, or powers, of any kind.

Equilibrium, in mechanics, is an equality of weights, powers, or forces of any sort. Bodies at rest are in a state of equilibrium, when they are solicited by various forces in different directions, in such a manner as to be completely balanced, and have no tendency to move in any direction. Bodies in motion are in a state of equilibrium, when the resistance to motion, and the power producing it, are so adjusted, that the result shall be uniform motion. The former of these has been called statical, the latter dynamical, equilibrium: an accurate knowledge of both kinds is indispensably necessary in the theory and practice of mechanics.

EQUIMULTIPLES, in arithmetic and geometry, numbers or quantities produced by multiplying others equally. Thus 3A and 3B, are equimultiples of the quantities A and B: $x\sqrt{m}$, $y\sqrt{m}$, are equimultiples of x and y. Equimultiples of any quantities have the same ratio as the quantities themselves.

EQUINE′CESSARY. *a.* (*æquus* and *necessarius*, Lat.) Needful in the same degree (*Hudibras*).

EQUINOCTIAL, a great circle in the heavens, under which the equator moves in its diurnal motion. The poles of this circle are the poles of the world. It divides the sphere into two equal parts, the northern and southern. The equinoctial has various properties; as,

1. Whenever the sun comes to this circle, he makes equal days and nights all round the globe; because he then rises due east, and sets due west. Hence it has the name equinoctial. All stars which are under this circle, or have no declination, do also rise due east, and set due west.

2. All people living under this circle, or upon the equator, or line, have their days and nights at all times equal to each other.

3. From this circle on the globe, is counted, upon the meridian, the declination in the heavens, and the latitude on the earth.

4. Upon the equinoctial, or equator, is counted the longitude, making in all 360° quite round, or else 180° east, and 180° west.

5. The shadows of those people who live under this circle are cast to the southward of them for one half of the year, and to the northward of them during the other half; and twice in a year, viz. at the time of the equinoxes, the sun at noon casts no shadow, being exactly in their zenith.

Equinoctial colure, is the great circle passing through the poles of the world and the equinoctial points, or first points of Aries and Libra.

Equinoctial dial, is one whose plane is parallel to the equinoctial. The properties or principles of this dial are,

1. The hour lines are all equally distant from one another, quite round the circumference of a circle; and the style is a straight pin, or wire, set up in the centre of the circle, perpendicular to the plane of the dial.

2. The sun shines upon the upper part of this dial-plane from the 21st of March to the 23d of September, and upon the under part of the plane the other half of the year.

Equino′ctial. *a.* (from *equinox.*) 1. Pertaining to the equinox (*Milton*). 2. Happening about the time of the equinoxes. 3. Being near the equinoctial line (*Philips*).

Equino′ctial flowers, in botany, opening at a regular stated hour. See Vigiliæ.

Equinoctial points, are the two points wherein the equator and ecliptic intersect each other: the one being in the first point of Aries, is called the vernal point; and the other in the first point of Libra, the autumnal point.

EQUINO′CTIALLY. *ad.* In the direction of the equinoctial (*Brown*).

EQUINOX, in astronomy, the time when the sun enters one of the equinoctial points. The equinoxes happen when the sun is in the equinoctial circle; when of consequence the days are equal to the nights throughout the world, which is the case twice a year, viz. about the 21st of March and the 23d of September, the first of which is the vernal, and the second the autumnal equinox. It is found by observation, that the equinoctial points, and all the other points of the ecliptic, are continually moving backward, or *in antecedentia*, that is, westward. This retrograde motion of the equinoctial points, is that famous and difficult phenomenon called the *precession of the equinoxes*.

EQUINU′MERANT. *a.* (*æquus* and *numerus*, Lat.) Having the same number (*Arbuthnot*).

To EQUI′P. *v. a.* (*equipper*, French.) 1. To furnish for a horseman or cavalier. 2. To furnish; to accoutre; to dress out.

E′QUIPAGE. *s.* (*equipage*, French.) 1. Furniture for a horseman. 2. Carriage of state; vehicle (*Milton*). 3. Attendance; retinue (*Pope*). 4. Accoutrements; furniture.

E′QUIPAGED. *a.* Accoutred; attended (*Spenser*).

EQUIPE′NDENCY. *s.* (*æquus* and *pendeo*, Lat.) The act of hanging in equipoise (*South*).

EQUI'PMENT. *s.* (from *equip.*) 1. The act of equipping or accoutring. 2. Accoutrement; equipage.

E'QUIPOISE. *s.* (*æquus*, Lat. and *poids*, Fr.) Equality of weight; equilibration (*Glanville*).

EQUIPO'LLENCE. *s.* (*æquus* and *pollentia*, Lat.) Equality of force or power.

EQUIPO'LLENT. *a.* (*æquipollens*, Lat.) Having equal power or force (*Bacon*).

EQUIPO'NDERANCE. Equipo'nderancy. *s.* (*æquus* and *pondus*, Lat.) Equality of weight; equipoise.

EQUIPO'NDERANT. *a.* (*æquus* and *ponderans*, Lat.) Being of the same weight (*Ray*).

To EQUIPO'NDERATE. *v. n.* (*æquus* and *pondero*, Latin.) To weigh equal to another thing (*Wilkins*).

EQUIPO'NDIOUS. *a.* (*æquus* and *pondus*, Latin.) Equilibrated; equal on either part: not in use (*Glanville*).

EQUISE'TUM, in medicine. (*equisetum*, from *equus*, a horse, and *seta*, a bristle, so named from its resemblance to a horse's tail.) Cauda equina. The plant directed for medicinal purposes under this name is the hippuris vulgaris of Linnéus. It possesses adstringent qualities, and is frequently used by the common people as tea in diarrhœas and hæmorrhages. The same virtues are also attributed to the equisetum arvense, fluviatile limosum, and other species, which are directed indiscriminately by the term equisetum. See Hippuris.

Equise'tum. Horse-tail. In botany, a genus of the class cryptogamia, order musci. Ament composed of peltate scales, flowering on the inside; involucels two-valved; seeds numerous, naked, enfolded by four pollen-bearing filaments. Eight species; six of them common to our own country, and found in our woods, corn-fields, moist places, or banks of stagnant waters. E. hyemale, shave-grass, or Dutch rushes, contains in its leaves a considerable portion of flinty or siliceous matter, and is hence employed by whitesmiths and cabinet-makers for polishing their metals and wood. Most of the species contain something of the same property; and are employed by the dairy-maids of the north to scour their milk-pails with.

EQUISONANT, in music. See Æquisonant.

E'QUITABLE. *a.* (*equitable*, French.) 1. Just; due to justice (*Boyle*). 2. Loving justice; candid; impartial.

E'QUITABLY. *ad.* Justly; impartially.

EQUITANGENTIAL CURVE, a curve first constructed by Mr. J. Perks, the tangent of which is always equal to a constant line. It is the involute of the catenaria. For the various properties of this curve, its mechanical construction, its use in dividing the meridian in Mercator's projection, and its relation to the catenaria, we refer to Phil. Trans. No. 345. See also Mr. Brougham's Paper on Porisms, in the Phil. Trans. vol. lxxxviii. or New Abridgement, vol. xviii. p. 354, for other curious properties of this curve. It is the curve of traction to a straight line.

EQUITANT LEAVES, in botany, riding as it were over each other. Quum folii latera parallele connivent, ut interiora ab exterioribus includantur; quod non in conduplicatis obtinet. Philos. Bot. When the sides of a leaf converge in parallel lines, so that the inner leaves are inclosed by the outer ones; which is not the case in conduplicate leaves. When two opposite leaves so converge to each other with their edges, as that one incloses the other; as in iris, hemerocallis, acorus, carex, gramina.

EQUITATION. See Horsemanship.

EQUITES, persons of the second degree of Roman nobility, immediately succeeding the senators in point of rank.

E'QUITY. *s.* (*equité*, French.) 1. Justice; right; honesty (*Tillotson*). 2. Impartiality (*Hooker*). 3. (In law.) The rules of decision observed by the court of chancery.

Equity of redemption, on mortgages, is that right which a mortgager has of redeeming his estate upon payment of the money borrowed. If where money is due on a mortgage, the mortgagee is desirous to bar the equity of redemption, he may oblige the mortgager either to pay the money or be foreclosed of his equity, which is done by proceedings in the court of chancery. But the chancery cannot shorten the time of payment of the mortgage money, where it is limited by express covenant, though it may lengthen it; and then upon non-payment, the practice is to foreclose the equity of redemption of the mortgager. 2 Vent. 364.

Equity, in mythology, sometimes confounded with Justice, a goddess among the Greeks and Romans, represented with a sword in one hand and a balance in the other.

EQUI'VALENCE. Equi'valency. *s.* (*æquus* and *valeo*, Lat.) Equality of power or worth (*Smalridge*).

To Equi'valence. *v. a.* (from the noun.) To equiponderate; to be equal to (*Brown*).

EQUI'VALENT. *a.* (*æquus* and *valens*, Lat.) 1. Equal in value (*Prior*). 2. Equal in any excellence (*Milton*). 3. Equal in force or power (*Milton*). 4. Of the same cogency or weight (*Hooker*). 5. Of the same import or meaning (*South*).

Equi'valent. *s.* A thing of the same weight, dignity, or value (*Rogers*).

EQUI'VOCAL. *a.* (*æquivocus*, Latin.) 1. Of doubtful signification; meaning different things (*Stil.*). 2. Uncertain; doubtful (*Ray*).

Equivocal chords, in music, those whose fundamental bass is not indicated by the intervals which form it.

Equivocal generation, a method whereby animals and plants are supposed to be produced, not by the usual way of coition between male and female, but by some supposed plastic power or virtue in the sun, or what are called *formative atoms*.

Thus insects, maggots, flies, spiders, frogs, &c. have usually been supposed to be produced by the heat of the sun warming, agitating, and impregnating the dust, earth, mud, and putrified parts of animals.

This method of generation, which we also call spontaneous, was commonly asserted and believed among the ancient philosophers; but the moderns, from more and better observations, unanimously reject it, and hold that all animals, nay, and vegetables too, are univocally produced; that is, from parent animals, and vegetables of the same species and denomination.

Equi'vocal. *s.* Ambiguity (*Dennis*).

EQUI'VOCALLY. *ad.* (from *equivocal.*) 1. Ambiguously; in a doubtful or double sense (*South*). 2. By uncertain or irregular birth; by generation out of the stated order (*Bentley*).

EQUI'VOCALNESS. *s.* (from *equivocal.*) Ambiguity; double meaning (*Norris*).

To EQUI'VOCATE. *v. n.* (*æquivocatio*, Lat.) To use words of double meaning; to use ambiguous expressions (*Smith*).

EQUIVOCA'TION. *s.* (*æquivocatio*, Lat.) Ambiguity of speech; double meaning (*Hooker*).

EQUIVOCA'TOR. *s.* (from *equivocate.*) One who uses ambiguous language (*Shakspeare*).

EQUULEUS, or Ecculeus, in antiquity, a kind of rack used for extorting confession: at first chiefly practised on slaves, but afterwards on Christians. It was originally constructed in the form of a horse; the sufferer was laid on his back, and his arms were turned under the breast of the equuleus, his hands were bound, and his feet stretched out towards his tail. A rope fastened to the feet, was made to pass over a smaller pulley between the hind-legs of the equuleus, and made to coil over another larger pulley fixed under the belly by means of a handle, which the executioner turned round till all the bones, &c. were dislocated.

Equuleus, Equus minor, the Horse's Head, in astronomy, an old northern constellation, consisting of twelve stars of the first six magnitudes, i. e. 0. 0. 0. 4. 1. 7.

Equuleus pictorius, the Painter's Easile, in astronomy, a new southern constellation. It contains seventeen stars of the first six magnitudes, i, e. 0. 0. 0. 2. 6. 9.

EQUUS, in zoology, a genus of the class mammalia, order belluæ. Fore-teeth, upper six, erect parallel; lower, six more prominent; tusks solitary, included, remote; teats two, inguinal. The most noble, most interesting, and most useful of all quadrupeds, possessing with the greatest grandeur of stature, the greatest elegance and proportion of parts. The animals of this invaluable tribe are used for draught, burden, and the saddle; fight by biting and kicking with the hind-feet: in the male the teats are situated on the glans penis; and they have the singular property of breathing only through the nostrils, and not through the mouth. Six species, as follow:

1. E. caballus. Horse. Hoofs solid; mane and tail with long flowing hair. The horse is composed of two varieties, the wild and the domestic.

It is cultivated with care in most parts of the earth; but is found in its natural state in the deserts of Great Tartary; sometimes in Africa: timid, swift, vigilant; moves in flocks, having a leader before with his ears thrown forwards, and a centinel behind, with his ears bent back, to guard against surprize both ways. It varies much in size and colour; feeds on grain and herbage; generous, proud, spirited; drives away flies and insects with its tail; carefully guards its hind parts; calls after its companion by neighing; and scratches its shoulder with its teeth; rolls itself when hot; is without gall-bladder, but has large gall ducts to answer the purpose; does not vomit or eructate; its dung heats and smokes; changes its fore-teeth in the second, third, and fourth years; acquires tusks in the fifth; gravid two hundred and ninety days.

Upon the several varieties or breeds of equus caballus, or horse, see the articles Cart-horse, Race-horse, Hunter, &c.

In the present article we can only be general, and shall, therefore, observe in the language of Dr. Shaw, for we cannot possibly employ better, that "of the several breeds of horses in common or general use in Europe, it is remarkable that none can come in competition with those of our own island, either for the strength required in laborious services, or for the swiftness and elegance of such as are bred for the course. The annals of Newmarket record instances of horses that have literally outstripped the wind, as is proved from accurate calculations. The celebrated Childers is commemorated in particular as the swiftest of his tribe, and the instances of his speed may be found in various publications. He was known to have run near a mile in a minute; and to have cleared the course at Newmarket, which is only four hundred yards short of four miles, in six minutes and forty seconds; running at the rate of eighty-two feet and a half in the space of a second. Of nearly equal fame is the character of Eclipse, whose strength was said to be greater, and whose swiftness scarcely inferior. This latter animal forms the subject of M. Sainbel's calculations, who in his work on the veterinary art has given an elaborate and curious description of his several proportions. It is remarkable that this horse was never esteemed handsome, though the mechanism of his frame, so far as regarded his powers of swiftness, was almost perfect." M. Sainbel has given an accurate table of the relative proportions of a horse perfect in every respect; and whoever compares the proportions of Eclipse as they are commonly exhibited in drawings and descriptions of him will discover the following differences.

1. In that table the horse should measure three heads in height, counting from the foretop to the ground. Eclipse measured upwards of three heads and a half.

2. The neck should measure but one head

in length; that of Eclipse measured a head and a half.

3. The height of the body should be equal to its length; the height of Eclipse exceeded his length by about an inch.

4. A perpendicular line falling from the stifle should touch the toe; this line in Eclipse touched the ground at the distance of half a head before the toe.

5. The distance from the elbow to the bend of the knee should be the same as from the bend of the knee to the ground; these two distances were unequal in Eclipse, the former being two parts of a head longer than the latter.

This summary comparison shows that the beauty of a horse cannot be absolutely determined by general rules, but must ever be in relation to a particular species.

2. E. hemionus. Wild mule. Jicta. Hoofs solid; colour uniform; without cross on the back; tail hairy at the tip only: head large, narrowing towards the nose; neck slender; hair soft; face tawny; nose white towards the end; body above brownish; beneath and towards the buttocks white; along the back a blackish list; tuft on the tail black; teeth thirty-four.

Inhabits the deserts of Arabia and China, in grassy, saline plains, but avoids woods and snowy mountains; timid, swift, not tameable; hearing and smell acute; neighing more sonorous than that of the horse; in size and habits resembles a mule; in ears and tail a zebra; hoofs and body an ass; limbs a horse: five feet in length. This species is supposed by Pallas to have been intended by Aristotle under the name hemionus; whence he has applied this term to its specific distinction. In the days of Aristotle it was supposed to inhabit Syria; and is mentioned by Pliny from Theophrastus as found also in Cappadocia. Its native name among the Mongalians is Dshikketaei; among the Chinese Yo-to-tse.

3. E. asinus. Ass. Hoofs solid; tail bristly at the extremity; a black cross on the shoulder of the male. Four varieties:

- α. Mane woolly, dusky; ears long, erect; forehead much arched: constituting the Wild ass.
- ϐ. Mane short; ears long, slouching; forehead flattish. Domestic ass.
- γ. Hybrid; produce of a male ass and a horse. Mule.
- δ. Hybrid; produce of a horse and a female ass. Hinny.

As a general character we may observe that the ears are large, flaccid; mane short; body cinereous. The domestic ass is swifter than in its wild state, as well as more active; hunts wild animals; acute in hearing and sight; loves salt and bitter herbs: its flesh is eaten by the Kergisees; the skin growing on the rump is made into shagrin; lives thirty years; and like the horse is gravid two hundred and ninety days.

The mule is much cultivated in Spain; where its size is nearly that of a horse. The hinny is much less, of a redder colour, with the ears of a horse; mane and tail of an ass.

Inhabits the mountainous desarts of Tartary; whence it annually migrates to India and Persia. It is found also, in its natural state, in various parts of Syria, Arabia, and Africa: is domesticated almost every where; loves warmth; is patient of hunger and stripes, feeds on thorns and thistles; is slothful, slow, stupid, and lascivious.

Yet such does not appear to have been the character of the wild ass in earlier times; in which this tribe was in far more repute than at present; and was accounted the chief part of the patriarchal store, as well as made companions of some of the principal deities of the Gentile world. The Hebrew פרא, (ονος αγριος, or οναγρος, onager as it is translated by the Septuagint) is always spoken of with respect in the Hebrew scriptures; and Priapus, though debased by the Romans, was esteemed the same as Pan, and styled πρωτογονος, as being the first of deified mortals. Near his statue was often described the figure of an ass. Asses are continually introduced in the histories of Bacchus and Silenus; these deities are peculiarly represented as being carried upon them: asses were placed in the celestial sphere, and were supposed, as asterisms, to have had a propitious influence. At Athens they were particularly employed in the mysteries of Ceres to bear the sacred vessels, and whatever belonged to those solemn rites at the festival. See Nat. Hist. Pl. XCII. XCIII.

4. E. zebra. Zebra. Hoofs solid; body pale buff, with perpendicular brown bands; the limbs with cross stripes. Inhabits in troops the plains of Southern Africa; is extremely beautiful but malignant; swift; wild; size of a mule; mane short, erect, striate; ears erect; tail like that of an ass.

5. E. quagga. Hoofs solid; body above chesnut, with perpendicular brown stripes; belly, legs, and thighs white without stripes; sides spotted. Inhabits South America in separate tribes; thicker, stouter, and more tameable than the zebra.

6. E. bisulcus. Chinese horse. Cloven-foot horse. Hoofs cloven. Inhabits the rocky mountains of the Corderellas in South America; wild, swift, vicious; neighs like a horse; resembles in size and colour the ass, but wants the shoulder-cross; ears small, erect.

ERA, in chronology. See ÆRA.

ERADIA'TION. *s.* (*e* and *radius*, Latin.) Emission of radiance (*K. Charles*).

To ERA'DICATE. *v. a.* (*eradico*, Latin.) 1. To pull up by the root (*Brown*). 2. To completely destroy; to end (*Swift*).

ERADICA'TION. *s.* (from *eradicate.*) 1. The act of tearing up by the root; destruction; excision. 2. The state of being torn up by the roots.

ERA'DICATIVE. *a.* (from *eradicate.*) That cures radically; that drives quite away.

ERANARCHA, in Grecian antiquity, an

NATURAL HISTORY.

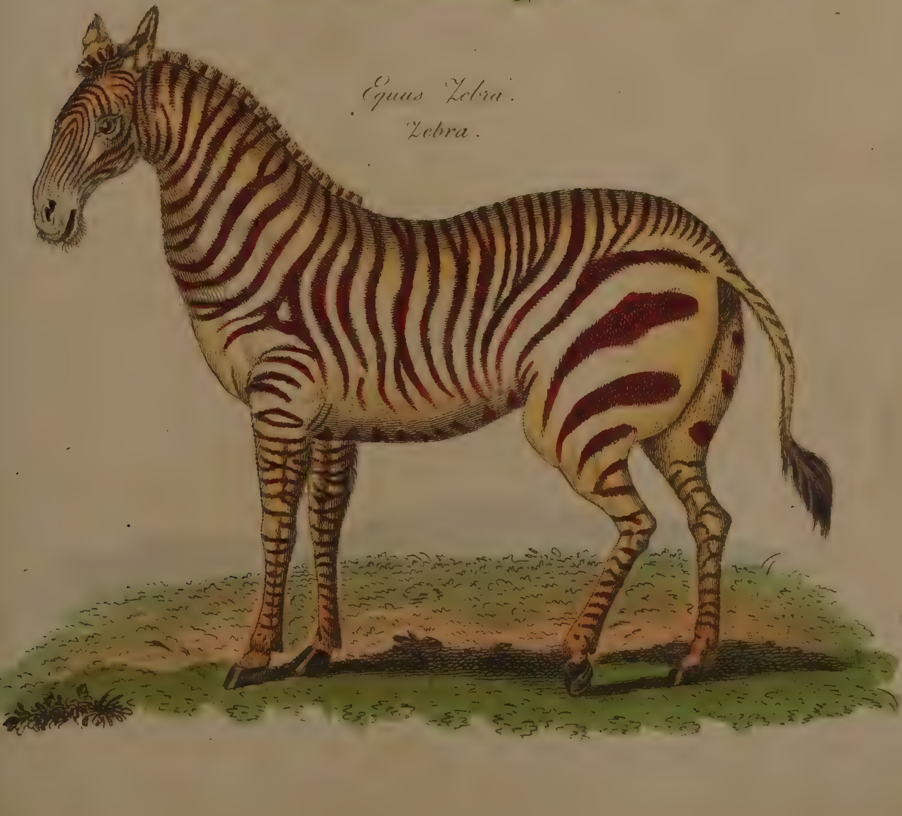
Quagga.



Equus Zebra.
Zebra.

officer who directed the alms and provisions made for the poor.

ERANES, certain societies among the ancient Athenians. Each member had to deposit a fixed sum, monthly, in the common treasury; and this was destined for the relief of associates who laboured under particular misfortunes, towards their support, or the maintenance of their credit in a critical moment. As soon as circumstances would admit of an arrangement, they were obliged to refund the principal sums, but without interest. The Athenians looked upon these societies as very useful among a commercial people, where disappointments and shipwrecks often produced such distresses as could only be relieved by these associations. Many of the ancients, however, condemned them; and indeed they were not long before they were much abused. See De Pauw on the Greeks, vol. i. p. 205—207.

ERANTHEMUM, in botany, a genus of the class diandria, order monogynia. Corol five-cleft with a filiform tube; anthers beyond the tube; stigma simple. Five species; natives of the Cape or some part of Africa; herbaceous or shrubby.

To ERA'SE. *v. a.* (*raser*, French.) 1. To destroy; to exscind (*Peacham*). 2. To expunge; to rub out.

ERA'SEMENT. *s.* (from *erase.*) 1. Destruction; devastation. 2. Expunction; abolition.

ERASMUS (Desiderius), born at Rotterdam in 1467. He lost his father and mother at 14 years of age; and was committed to the care of certain guardians, who would force him to be an ecclesiastic, which he refused for a long time. However, he was obliged to assume the religious habit among the canons regular in the monastery of Stein near Tergou; but afterwards obtained a dispensation from his vows. He was the most learned man of the age in which he lived; and contributed, by his example and his writings, to the restoration of learning in the several countries in which he occasionally resided, viz. Italy, Switzerland. Holland, France, and England: with the last he was most satisfied; and found the greatest encouragement from Henry VIII. sir Thomas More, and all the learned Englishmen of those days. He published a great many books; and died at Basil in 1536. He was buried honourably, and his memory is still held in veneration. He had, however, many enemies; and as he did not embrace the reformation, and yet censured many things on popery, he hath been treated injuriously both by Catholics and Protestants. The works of Erasmus in 10 vols. folio, were published at Leyden in 1706, in a very handsome manner, under the care of M. Le Clerc. Dr. Jortin published his life in one vol. 4to. 1758.

ERASTIANS, a religious sect or faction which arose in England during the time of the civil wars in 1647, thus called from their leader Thomas Erastus, whose distinguishing doctrine it was, that the church had no right to discipline, that is, no regular power to excommunicate, exclude, censure, absolve, decree, and the like.

ERATO. (from ερaω, I love.) In mythology, the name of one of the nine muses who presided over love-poetry. To this muse some have ascribed the invention of the lyre and lute; and she is represented with a garland of myrtles and roses, holding a lyre in one hand and a bow in the other, and at her side a Cupid with his torch. There is also a Nereid of the same name.

ERATOSTHENES, a Greek of Cyrene, who was a librarian of Alexandria, under king Euergetes, son of Ptolemy Philadelphus. He died 194 B. C. He was called the cosmographer, because he was the first who discovered the method of measuring the bulk and circumference of the earth. What remains to us of his writings appeared from the Oxford press, in 1672, 8vo.

The measurement of the earth by Eratosthenes, so much admired in its time, as a prodigy of human sagacity, has been transmitted to us by Cleomedes: Cycl. Theor. book I. chap. 10. Eratosthenes was informed, that at the time of the summer solstice the sun at noon was vertical to the city of Syene, situate on the borders of Ethiopia, under the tropic of cancer. A well is particularly mentioned to have been sunk in this city, which was illuminated throughout its whole depth by the sun at noon on the day of the solstice. He knew likewise, or at least he imagined, and he was not far from the truth, that Alexandria and Syene were both under the same meridian. On these data he constructed a concave hemisphere at Alexandria, from the bottom of which arose a vertical style, terminating at the centre of curvature of the hemisphere. Then, supposing the city of Syene to be in the vertical direction of the style, he observed, that the arc, included between the foot of the style and the extremity of its shadow projected on the concavity of the hemisphere by the meridian sun at the solstice, was equal to a fiftieth part of the whole circumference. Hence he inferred, that the arc of the heavens comprised between Alexandria and Syene must be the same; and that the distance of the two cities must likewise be a similar arc, or a fiftieth part of the whole circumference of a great circle of the earth. Now on measuring this distance, or the length of this arc, it was found to be 5000 stadia, which gave 250,000 stadia for the length of the entire circumference of the earth, and $694\frac{4}{9}$ stadia to a degree. Some later astronomers, desirous of avoiding the fraction, and supposing that it was impossible to answer for the accuracy of the measure to five or six stadia in a degree, extended this length to 700 stadia, which give 252,000 stadia for the measure of the whole circumference. See EARTH.

ERATOSTHENES'S SIEVE. (κοσκινον.) The name given to a contrivance by which that philosopher discovered prime numbers. The method was indirect: the numbers which were not prime were excluded one by one, as though they dropped through a sieve. We shall not give a detailed account of the progress, since it appears inferior to several of the modern methods of ascertaining prime numbers. Those, however, who are curious in these matters, may turn to Dr. Horsley's paper in the Philosophical Transactions for 1772, or to Montucula Histoire des Mathematiques, i. 281.

ERE, *ad.* (æɲ, Saxon.) Before; sooner than (*Shakspeare*).

ERELO'NG. *ad.* (from *ere* and *long*.) Before a long time had elapsed (*Spenser*).

ERENO'W. *ad.* Before this time (*Dryden*).

EREWHI'LE. Erewhi'les. *ad.* Some time ago; before a little while (*Shakspeare*).

ERBACH, a town of Franconia, capital of a county of the same name. It is 20 miles N.E. of Manheim.

EREBUS. (Ερεϐο, from ערב, night.) In mythology, a term denoting darkness. According to Hesiod, Erebus was the son of Chaos and the night, and the father of the day. This was also the name of part of the inferi among the ancients: they had a peculiar expiation for those who were detained in Erebus. Erebus was properly the gloomy region, and distinguished both from Tartarus the place of torment, and Elysium the region of bliss: according to the account given of it by Virgil, it forms the third grand division of the invisible world beyond the Styx, and comprehends several particular districts, as the limbus infantum, or receptacle for infants: the limbus for those who have been put to death without cause; that for those who have destroyed themselves; the fields of mourning, full of dark groves and woods, inhabited by those who died for love; and beyond these an open champaign country for departed warriors.

To ERE'CT. *v. a.* (*erectus*, Latin.) 1. To place perpendicularly to the horizon. 2. To raise; to build (*Addison*). 3. To establish anew; to settle (*Raleigh*). 4. To elevate; to exalt (*Dryden*). 5. To raise consequences from premises (*Locke*). 6. To animate; to encourage (*Denham*).

To Ere'ct. *v. n.* To raise upright (*Bacon*).

Ere'ct. *a.* (*erectus*, Latin.) 1. Upright; not leaning; not prone (*Brown*). 2. Directed upward (*Philips*). 3. Bold; confident; unshaken (*Glanville*). 4. Vigorous; not depressed (*Hooker*).

Erect, or Upright, in botany, applied to a stem capable of supporting itself; and is opposed to twining. Hence it does not strictly imply perpendicular or vertical, which is usually expressed by *straight, strictus*.

A leaf is said to be erect, when it makes so very acute an angle with the stem as to be close to it. When it makes an acute angle with the stem, it is also said to be patent or spreading.

An erect flower has its aperture directed upwards: as in trillium sessile. Opposed to nutans, nodding.

An erect anther, fixed by one end to the top of the filament; contrasted with versatile and incumbent, which are fixed by the side.

This term is applied also to the petiole, peduncle, and stipule.

ERE'CTION. *s.* (from *erect.*) 1. The act of raising, or state of being raised upward (*Brerewood*). 2. The act of building or raising edifices (*Raleigh*). 3. Establishment; settlement (*South*). 4. Elevation; exaltation of sentiments (*Sidney*). 5. Act of rousing; excitement to attention.

ERE'CTNESS. *s.* Uprightness of posture (*Brown*).

ERECTOR, in anatomy, a term applied to a variety of muscles, whose intention is to upraise or elevate.

Erector clitoridis. First muscle of the clitoris of Douglas. A muscle of the clitoris that draws it downwards and backwards, and serves to make the body of the clitoris more tense, by squeezing the blood into it from its crus. It arises from the tuberosity of the ischium, and is inserted into the clitoris.

Erector penis. A muscle of the penis that drives the urine or semen forwards, and, by grasping the bulb of the urethra, pushes the blood towards the corpus cavernosum and the glands, and thus distends them. It arises from the tuberosity of the ischium, and is inserted into the sides of the cavernous substance of the penis.

E'REMITE. *s.* (*eremita*, Lat. ερημος.) One who lives in a wilderness; a hermit (*Raleigh*).

EREMI'TICAL. *a.* (from *eremite.*) Religiously solitary (*Stillingfleet*).

ERIPTA'TION. *s.* (*eripto*, Lat.) A creeping forth (*Bailey*).

ERE'PTION. *s.* (*ereptio*, Lat.) A snatching or taking away by force.

ERETHI'SMUS. (*erethismus*, ερεθισμος, from ερεθιζω, to excite or irritate.) Increased sensibility and irritability. It is variously applied by modern writers; but, in general, rather to such eruptions as are plain and efflorescent, than to such as are prominent, and exanthematous.

EREUGMUS. (from ερευγω, to eructate.) Eructation.

EREUXIS. (from ερευγω.) Eructation.

ERFURT, the capital of Thuringia, in Germany. It is the seat of an university, has several libraries, and belongs to the elector of Mentz. About 180 houses were destroyed by fire in 1736. It is 35 miles N. by E. of Coburg. Lat. 51. 0 N. Lon. 11. 23 E.

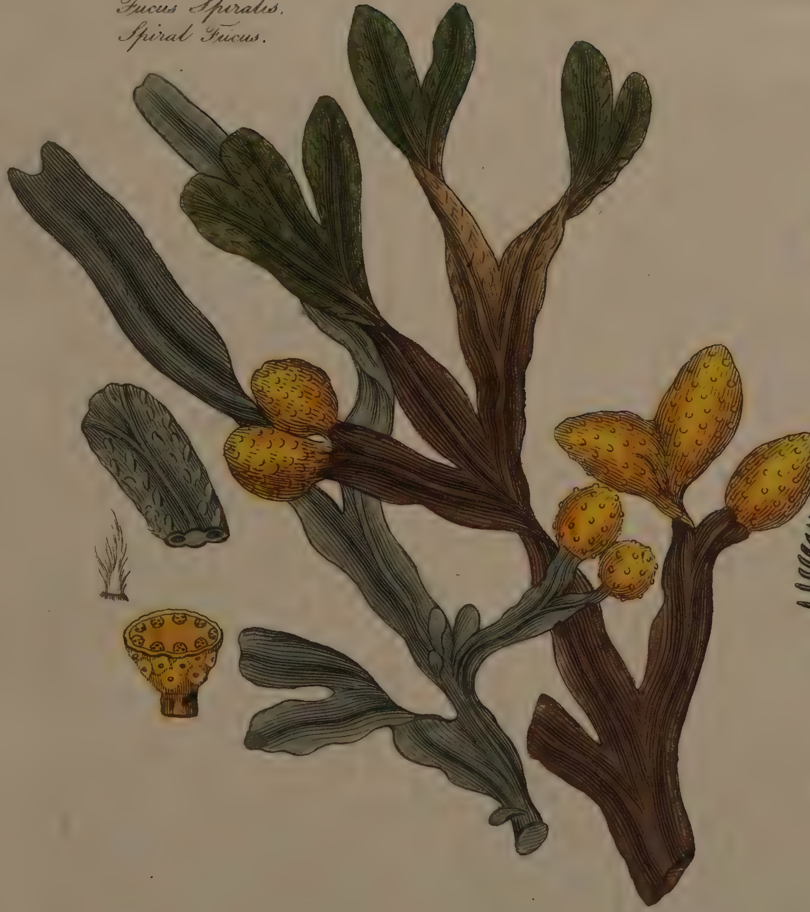
ERGASTULUM, among the Romans, a house of correction.

ERGOT, in veterinary language, a name given to a stub, like a piece of soft horn, about the bigness of a chesnut, which appears behind and below the pastern joint of a horse, and commonly hid under the tuft of the fetlock. It is to be taken out to the quick with an incision knife, in order to get at a bladder of fluid that lies covered with the ergot. This operation, in Holland, is frequently performed upon all four legs.

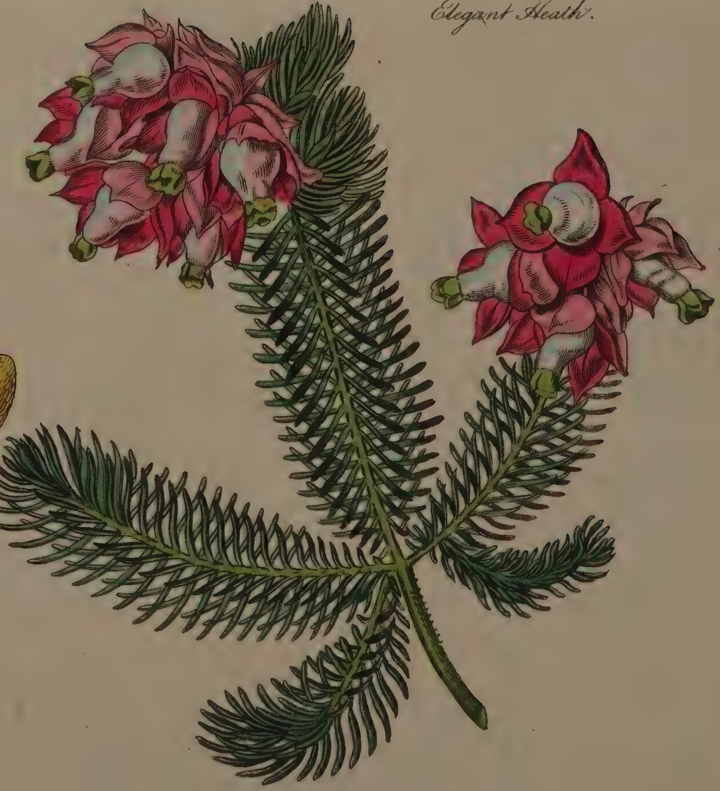
ERICA. Heath. Ling. In botany, a genus of the class octandria, order monogynia. Calyx four-leaved; corol four-cleft; stamens inserted on the receptacle; anthers with two pores; capsule superior, four-celled, many-seeded. A hundred and thirty-seven species; chiefly of

BOTANY.

PL. CI.



Fucus Spiralis,
Spiral Fucus.



Erica Elegans,
Elegant Heath.

the Cape and south of Europe, and four of them indigenous to the heaths or moors of our own country. They may be thus sectioned:

A. Anthers awned; leaves opposite.

B. Anthers awned; leaves in threes.

C. Anthers awned; leaves in fours.

D. Anthers awned; leaves six in a whorl.

E. Anthers awned; leaves eight in a whorl.

F. Anthers awned; leaves scattered.

G. Anthers bearded; leaves opposite.

H. Anthers bearded; leaves in threes.

I. Anthers bearded; leaves four in a whorl.

K. Anthers simple; leaves alternate or opposite.

L. Anthers simple; leaves in threes.

M. Anthers beardless; leaves in fours or more.

The two last sections the most numerous. The common heaths, e. vulgaris and e. vagaro, are of considerable use, and resorted to for a variety of purposes in many parts of this country. They are very generally employed in making brooms and brushes; serve frequently, and especially in Scotland, for thatching cottages, and often for land-draining, and the construction of the walls of hovels, out-houses, and, when plastered over with mortar, of decent cottages themselves. There is a considerable portion of saccharine matter in the juice of the young shoots, but combined with a peculiar aroma; which last inflames the bladder of cattle not accustomed to it, and induces them to discharge bloody urine; from which, however, they are soon relieved by drinking plentifully of water. The young plant, on account of its saccharine qualities, has been often employed with malt in the brewing of beer: but there are many other wild herbs indigenous to our own soils that might be selected with greater advantage. The sugar and aroma of the flower is very enticing to the bee, who makes a very free use of it, often so free a use as to give a red tinge to the honey she secretes. A great variety of the exotics are found in our green-houses, and largely contribute to their beauty. See Botany, Pl. CIX.

One of the most beautiful species of this captivating tribe is *erica elegans*, elegant erica, a low shrub with short branches growing in every direction. Leaves ternate, but by those of one whorl being placed directly between those of the next, the whole is neatly arranged in six distinct rows, glaucous, fleshy, acerose, channelled underneath. Flowers terminal, in a compact umbel. Involucre of six ovate, acuminate leaves. Peduncles scarcely as long as the involucre, with three or four large bractes similar to the involucre, deciduous. Calyx four-leaved. Nectary a glandular, beaded circle, within the stamens. Stamens included; filaments dilated at both ends, incurved. Anthers oblong, acute, cristate. Germ globosely four-lobed; style erect; stigma capitate, included.

ERIDANUS, one of the largest rivers of Italy, rising in the Alps and falling into the Adriatic by several mouths; now called the Po. Virgil calls it the king of all rivers.

ERIDANUS, in astronomy, an old southern constellation representing a river. It contains 82 stars of the first six magnitudes, viz. 1. 0. 10. 24. 19. 28.

ERIE LAKE, in North America, lies between 41° and 43° N. lat. and 79° and 84° W. lon. It is 290 miles long, and 40 in its broadest part. Its banks are much infested with rattle-snakes, and other reptiles. This lake, at its N.E. end, communicates with Lake Ontaria by the river Niagara.

ERIGENA (John Scotus), a learned man of the 9th century, born, according to the general account, in Scotland. His thirst for knowledge was so great, that he travelled into many countries to improve himself, and according to some he went to Athens, where he acquired the Greek and Oriental languages. Charles the Bald, king of France, invited him to his court, where he lived several years on terms of the greatest familiarity with that munificent prince. He here composed a great number of books, which procured him both friends and enemies. Some of the clergy pretended to have discovered in them the heresy of Pelagius. It is certain that he opposed the doctrine of absolute predestination, and the real presence in the eucharist. At the request of his patron he translated the works of Dionysius into Latin, which drew upon him the resentment of the pope, to avoid the fury of which he left France, and crossed over to England. His greatest work was that on the Division of Nature, or the Nature of Things, of which an edition was printed at Oxford, in 1681, by Dr. Thomas Gale. Some writers say, that Erigena was employed by king Alfred in restoring learning at the university of Oxford, and that he afterwards taught in the abbey of Malmsbury, where he was murdered by his pupils on account of his severity. Others say that he died a natural death in France about 874. (*Watkins.*)

ERIGERON. Flea-bane. In botany, a genus of the class syngenesia, order polygamia superflua. Receptacle naked; down simple: florets of the margin very numerous and narrow as well as linear; calyx imbricate. Thirty-two species; scattered over the globe, of which three are common to the pastures and mountains of our own country.

ERIGERUM. (*erigerum*, εριγερων; from ηρ, the spring, and γερων, old, so called, because in the spring it has a white blossom like the hair of an old man.) A term for groundsel. This very common plant, senecio vulgaris of Linnéus, is frequently under this name directed to be applied bruised to inflammations and ulcers, as a refrigerant and antiscorbutic.

ERIGONE, in fabulous history, a daughter of Icarius, who hanged herself when she heard that her father had been killed by some shepherds whom he had intoxicated. She was made a constellation, now known under the name of Virgo. Bacchus deceived her by changing himself into a beautiful grape. (*Ovid. Virg.* &c.) A daughter of Ægisthus and Clytemnestra, who had by her brother Orestes, Penthilus, who shared the regal power with Timasenus, the legitimate son of Orestes and Hermione. (*Paus.*)

ERINACEUS. Hedge-hog. In zoology, a genus of the class mammalia, order feræ. Foreteeth, upper two, distant; lower two, approximate; tusks upper, five on each side, lower three; grinders four on each side, on each jaw; back and sides covered with spines Six species, as follow; see Nat. Hist. Pl. XCV.

1. E. europæus. Common hedgehog. Ears rounded; nostrils with a loose flap; length about ten inches; snout acute; upper lip cleft; eyes small, black; spines at each end yellowish grey; middle blackish; legs short, naked, five-toed; claws weak. Inhabits all Europe, except the utmost north, the southern parts of Siberia, and Madagascar: lives in thickets and hedges; build its nest of moss, grass, leaves; winters in bushes rolled up; wanders by night; feeds on toads, worms, beetles, cock-roaches, crabs, shell-fishes, fruits, small-birds, and carcasses; digs in mossy places; swims easily; when frightened or angry, rolls itself up and presents its spines on every side; screams if the feet be pressed; is tamed by the Calmucs like the cat; female five teats; three pectoral, two abdominal; brings from three to five young; does not, as is vulgarly supposed, suck cattle; flesh not eatable.

2. E. inauris. Earless hedgehog. Without ears; head thick, short; claws long, crooked. Inhabits South America; about eight inches long.

3. E. malaccensis. Malacca hedgehog. Ears pendulous. Inhabits Asia: from it is procured the precious bezoard called piedra del porco.

4. E. auristus. Siberian hedgehog. Ears long, oval, nostrils with a flap. Inhabits the lower parts of the Volga and Ural, as far as lake Baikal; resembles e. Europæus, but is less; eyes larger, whiskers four rows, feet longer, slenderer, tail shorter, conic, annulate, nearly bald; female brings from four to seven young, sometimes twice a year; spines brown, a white ring at each end.

5. E. setosus. Asiatic hedgehog. Ears shorter; spines on the head, neck, tail and withers only. Inhabits India and Madagascar; hardly six inches long; wallows in the mire; grunts like a hog; burrows and is torpid six months, during which time the hair falls off.

6. E. excandata. Madagascar hedgehog. Tailless; snout very long, acute. Inhabits India and Madagascar; eight inches long; in its habits exactly resembles the last.

ERINGO, in botany. See Eryngium.

ERINUS, in botany, a genus of the class didynamia, angiospermia. Calyx five-leaved; corol with a five-cleft border, equal; the lobes emarginate; upper lip very short, and reflected; capsule two-celled. Seven species; chiefly natives of the Cape, with purple or yellow flowers; the stem from two inches to three feet in height.

ERIOCANLOR, in botany, a genus of the class triandria, order trigynia. General calyx an imbricate head; petals three, equal; stamens seated above the germ. Nine species; natives of India or South America.

ERIOCEPHALUS, in botany, a genus of the class syngenesia, order polygamia necessaria. Receptacle naked or villous; downless; calyx ten-leaved, equal; florets of the ray five. Three species; all Cape plants, and herbaceous.

ERIOPHORUM. Cotton-grass In botany, a genus of the class triandria, order monogynia. Glumes chaffy, imbricate every way; corolless; seed one inverted with very long hairs. Six species; four of which are common to the bogs of our own country.

ERIOSPERMUM, in botany, a genus of the class hexandria, order monogynia. Corol six-petalled; campanulate, permanent; filaments dilated at the base, capsule three-celled; seeds inverted with wool. Three species; all Cape-plants.

ERIOSTEMUM, in botany, a genus of the class decandria, order monogynia. Calyx five-parted; petals five, sessile; stamens flat, ciliate; anthers pedicelled, terminal; style from the base of the germ; capsules five united, seated on a nectary covered with protuberances; seeds coated. One species; an Australasian shrub with alternate leaves and solitary flowers.

ERIS, the goddess of discord among the Greeks. She is the same as the Discordia of the Latins.

ERI'STICAL. *a.* (εϱις.) Controversial; relating to dispute; containing controversies.

ERITHALIS, in botany, a genus of the class pentandria, order monogynia. Corol five-parted, the segments recurved; calyx cup-shaped; berry ten-celled, inferior. Two species; trees of Jamaica or the Polynesian islands. The last has two varieties from a difference in the breadth of its leaf.

ERIVAN, a large town of Asia, capital of Persian Armenia, with an Armenian patriarch. Lat. 40. 20 N. Lon. 44. 10 E.

ERKE. *a.* (eaꞃᵹ, Sax.) Idle; lazy; slothful (*Chaucer*).

E'RMELINE. *s.* (diminutive of *ermine*; *armelin*, French.) An ermine (*Sidney*)

ER'MINE, in mastiology. See Mustela.

Ermine, in heraldry, is always argent and sable, that is, a white field, or fur, with black spots. These spots are not of any determinate number, but may be more or less, at the pleasure of the painter, as the skins are thought not to be naturally so spotted; but serving for lining the garments of great persons, the furriers were wont, in order to add to their beauty, to sew bits of the black tails of the creatures that produced them upon the white of their skin, to render them the more conspicuous, which alteration was introduced into armoury.

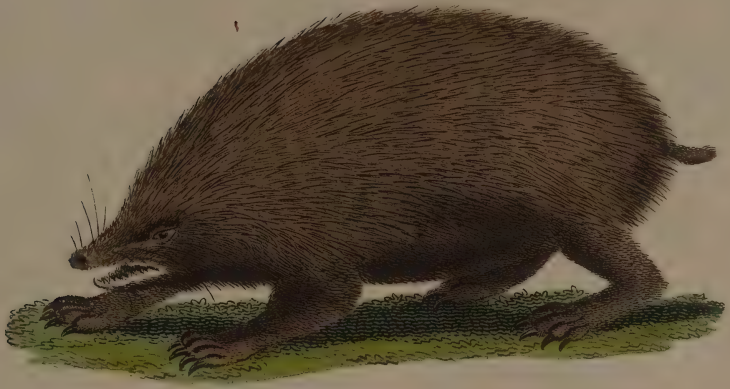
Ermine, or Cross ermine, is one composed of four ermine spots. It is to be observed, that the colours in these arms are not to be expressed, because neither this cross nor these arms can be of any other colour than white and black.

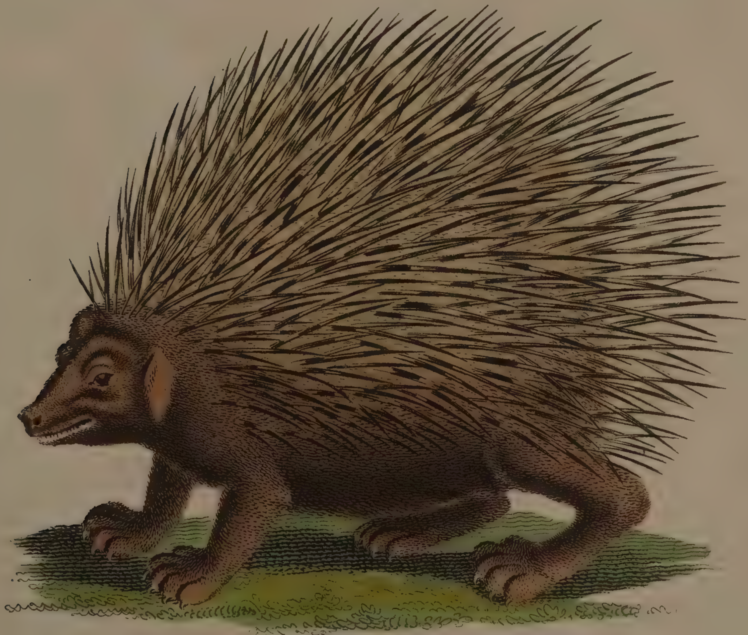
NATURAL HISTORY.

PL. XCVI.

Erinaceus Europæus.

COMMON HEDGEHOG.





Erinaceus Malaccensis.

MALACCA HEDGEHOG.

Taylor ſculp.

1810. Octr. 1 London, Publiſh'd by G. Kearsley, Fleet Street.

ERMINED. *a.* Clothed with ermine, that is, with the skin or fur of ermine.

ERMINITES, in heraldry, should signify little ermines; but it is otherwise, for it expresses a white field powdered with black, only that every such spot has a little red hair on it.

E'RNE. E'RON. Do immediately flow from the Saxon eꞃn, eaꞃn, a cottage (*Gibson*).

ERNODEA, in botany, a genus of the class tetrandria, order monogynia. Corol one-petalled, salver-shaped; calyx four-parted; berry two-celled, seeds solitary. One species only; a creeping plant of Jamaica with axillary flowers.

To ERO'DE. *v. a.* (*erodo*, Lat.) To canker; to eat away; to corrode (*Bacon*).

ERODIUM. Crane's-bill, a genus of the class monadelphia, order pentandria. Calyx five-leaved; petals five; nectariferous glands five, alternating with the filaments; stamens ten, five of them barren; fruit beaked, separating into five capsules, each tipped with a long spiral awn bearded on the inside. Thirty-four species; chiefly inhabitants of the warmer parts of Europe, and three common to our own wastes or sea-coasts. They have all a general resemblance in their external appearance to the geranium, with which they have often been confounded by those who have not attended to their ordinal character. They may be thus sectioned:

A. Leaves compound, pinnate and pinnatifid.

B. Leaves ternate, and three-parted.

C. Leaves lobed and undivided.

ERODIUS, in zoology, a genus of the class insecta, order coleoptera. Antennas moniliform; feelers four, filiform; body roundish, gibbous; emarginate; thorax transverse; shells closely united, longer than the abdomen; jaw horny, bifid; lip horny, emarginate. Four species: inhabit India or the Cape.

EROGA'TION. *s.* (*erogatio*, Latin.) The act of giving or bestowing; distribution.

EROSE LEAF, in botany, a gnawed leaf. When a sinuate leaf has other very small obtuse sinuses on its edge. Cum folium sinuatum margine sinus alios minimos obtusos acquirit. It has the appearance of being gnawed or eaten by insects.

ERO'SION. *s.* (*erosio*, Latin.) 1. The act of eating away. 2. The state of being eaten away (*Arbuthnot*).

EROTESIS, in rhetoric, interrogation.

EROTIA, a festival in honour of Eros the god of love. It was celebrated by the Thespians every fifth year with sports and games, when musicians and others contended. If any quarrels or seditions had arisen among the people, it was then usual to offer sacrifices and prayers to the god, that he would totally remove them.

EROTIC (derived from εϱως, love, whence ερωτικος), is applied to any thing which has relation to the passion of love. In medicine we find the phrase delirium eroticum used for a kind of melancholy contracted through excess of love.

EROTOMANIA. (from ερως, love, and μανια, madness.) Desperate love: sentimentalism producing morbid feelings.

EROTYLUS, in zoology, a tribe of coleopterous insects belonging to the genus cryptocephalus, thus named in the Fabrician system.

ERPACH, a town of Franconia, in Germany, 30 miles S.E. of Frankfort. Lat. 49. 32 N. Lon. 9. 10 E.

ERPACH, a town and castle of Suabia, in Germany, 8 miles S.E. of Ulm. Lat. 48. 20 N. Lon. 10. 19 E.

ERPETOLOGY, a term formerly employed by the Swedish naturalist Klein; to include the order serpentes as well as that of reptilia; thus comprehending the whole class of amphibia. In the Encyclopedie Methodique, and the Encyclopædia Britannica, the term is restricted to the order of reptilia, according to the plan of M. Bonnaterre.

ERQUICO, a seaport town on the coast of Abex, in Africa. Lat. 17. 30 N. Lon. 39. 5 E.

To ERR. *v. n.* (*erro*, Latin.) 1. To wander; to ramble (*Dryden*). 2. To miss the right way; to stray (*Common Prayer*). 3. To deviate from any purpose (*Pope*). 4. To commit errours; to mistake (*Taylor*).

E'RRABLE. *a.* (from *err.*) Liable to err.

E'RRABLENESS. *s.* Liableness to errour; liableness to mistake (*Decay of Piety*).

E'RRAND. *s.* (æꞃenꝺ, Sax.) A message; something to be told or done by a messenger; a mandate; a commission (*Hooker*).

E'RRANT. *a.* (*errans*, Latin.) 1. Wandering; roving; rambling (*Brown*). 2. Vile; abandoned; completely bad (*Jonson*).

E'RRANTRY. *s.* (from *errant.*) 1. An errant state; the condition of a wanderer (*Addison*). 2. The employment of a knight-errant.

ERRATA. *s.* (Latin.) The faults or mistakes of the printer, usually inserted in a list, at the beginning or end of a book.

ERRA'TIC. *a.* (*erraticus*, Latin.) 1. Wandering; uncertain; keeping no certain order; holding no established course (*Pope*). 2. Irregular; changeable (*Harvey*).

ERRA'TICALLY. *ad.* (from *erratical* or *erratic.*) Without rule; without method (*Brown*).

E'RRHINE. *a.* (εϱϱινα.) Snuffed up the nose, occasioning sneezing (*Bacon*).

ERRHINES. (*errhina, medicamenta*, εϱϱινα; from εν, in, and ϱιν, the nose.) Medicines which, when topically applied to the internal membrane of the nose, excite sneezing, and increase the secretion, independent of any mechanical irritation. The articles belonging to this class may be referred to two orders: 1. Sternutatory errhines, as nicotiana, helleborus, euphorbium, which are selected for the torpid, the vigorous, but not plethoric; and those to whom any degree of evacuation would not be hurtful. 2. Evacuating errhines, as asarum, &c. which is calculated for the phlegmatic and infirm.

ERRO'NEOUS. *a.* (from *erro*, Latin.) 1. Wandering; unsettled (*Newton*). 2. Irregular; wandering from the right road (*Arbuthnot*). 3. Mistaking; misled by errour (*South*). 4. Mistaken; not conformable to truth; physically false (*Newton*).

ERRO'NEOUSLY. *ad.* By mistake; not rightly (*Hooker*).

ERRO'NEOUSNESS. *s.* Physical falsehood; inconformity to truth (*Boyle*).

E'RROUR. *s.* (*error*, Latin.) 1. Mistake; involuntary deviation from truth (*Shakspeare*). 2. A blunder; a mistake committed (*Dryden*). 3. Roving excursion; irregular course (*Dryden*). 4. (In theology.) Sin (*Hebrews*). 5. (In law.) A mistake in pleading, or in the process (*Cowell*).

Errour, a mistake of the mind, in giving assent to a thing, or proposition, which is not true. See Fallacy.

Some philosophers define errour an act of the mind, whereby things that should be joined are separated; or, things that should be separated are joined; or a wrong judgement, disagreeing with the things whereon it is passed.

Errour stands in opposition to truth, which consists in an agreement between the proposition, and the thing whereof it is affirmed, or denied.

Mr. Locke reduces the causes of errour to these four; first, want of proofs; secondly, want of ability to use them; thirdly, want of will to use them; and, fourthly, wrong measures of probability.

He observes upon the first of these causes that the greatest part of mankind want conveniences and opportunities of making experiments and observations themselves, or of collecting the testimony of others, being prevented by the necessity of their condition. Upon the second of these causes he observes, that there are many, who, from the state of their condition, might bestow time in collecting proofs, but yet are not able to carry a train of consequences in their heads, nor weigh exactly the preponderancy of contrary proofs and testimonies, merely from the difference in men's understandings, apprehensions, and reasonings. Thirdly, he remarks, that though some have opportunities and leisure enough, and want neither parts, learning, nor other helps, that they never come to the knowledge of several truths within their reach, either upon account of their attachment to pleasure or business; or otherwise because of their laziness or aversion to study. The fourth cause of errour, viz. wrong measures of probability, he imputes, 1. To the practice of taking for principles, propositions that are not in themselves certain and evident, but, on the contrary, doubtful and false. 2. To received hypotheses. 3. To predominant passions or inclinations. And, 4. To authority, or the giving up our assent to the common received opinions either of our friends or party, neighbours or country.

The causes of errour in philosophy, or the reasons why all former philosophers have through so many ages erred, according to lord Bacon, are these following. 1. Want of time suited to learning. 2. The little labour bestowed upon natural philosophy. 3. Few entirely addicted to natural philosophy. 4. The end of the sciences wrong fixed. 5. A wrong way chosen. 6. The neglect of experiments. 7. Regard to antiquity and authority. 8. Admiration of the works in use. 9. The artifice of teachers and writers in the sciences. 10. Ostentatious promises of the moderns. 11. Want of proposing worthy tasks. 12. Superstition and zeal being opposite to natural philosophy, as thinking philosophy dangerous, on account of the school-theology; from the opinion that deep natural inquiries might subvert religion. 13. Schools and academies proving unfavourable to philosophy. 14. Want of rewards. And 15. Despair, and the supposition of impossibility.

ERROR LOCI. Boerhaave is said to have introduced this term, from an opinion that the vessels are of different sizes, for the circulation of red blood, lymph, and serum; and that when the larger-sized globules were forced into the lesser vessels by an error of place, they were obstructed.

ERST. *ad.* (*erst*, German.) 1. First (*Spenser*). 2. At first; in the beginning (*Milton*). 3. Once; when time was (*Milton*). 4. Formerly; long ago (*Prior*). 5. Before; till then; till now (*Knolles*).

ERUBE'SCENCE. Erube'scency. *s.* (*erubescentia*, Latin.) The act of growing red; redness.

ERUBE'SCENT. *a.* (*erubescens*, Latin.) Reddish; somewhat red; inclining to redness.

ERUCA. (*eruca*; from *erugo*, to make smooth, so named from the smoothness of its leaves; or from *uro*, to burn, because of its biting quality.) Garden rocket. Roman rocket. Rocket gentle. The seeds of this plant, brassica eruca; foliis lyratis, caule hirsuto siliquis glabris, of Linnéus, and of the wild rocket, have an acrid taste, and are eaten by the Italians in their pickles, &c. They are said to be good aperients and antiscorbutics, but are esteemed by the above-mentioned people for their supposed aphrodisiac qualities. See Brassica.

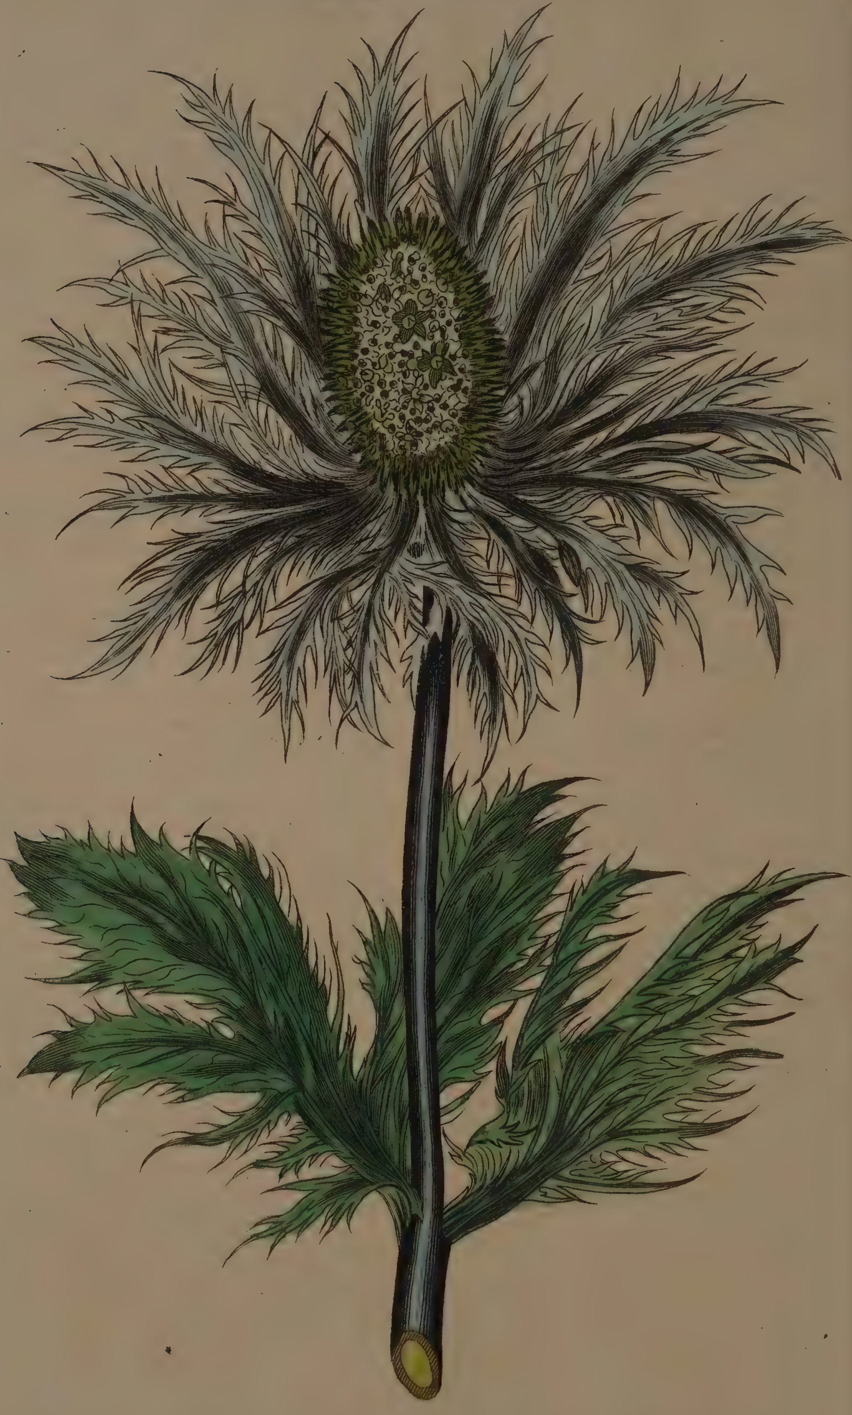
Eruca is also a term formerly used by naturalists to denote the caterpillar state of insects; but of late discarded for that of caterpillar, larve or larva. For the process by which this change is produced, see the articles Entomology, and Papilio.

To ERU'CT. *v. a.* (*eructo*, Latin.) To belch; to break wind from the stomach.

ERUCTA'TION. *s.* (from *eruct.*) 1. The act of belching. 2. Belch; the matter vented from the stomach (*Arbuthnot*). 3. A sudden burst of wind or matter (*Woodward*).

ERUDI'TION (from the Latin), denotes learning or knowledge; and chiefly that of history and antiquity, of languages and of books, which is the result of hard study and extensive reading. The Scaligers were men of deep erudition; the writings of M. Launoy, a priest of the Oratory, are full of erudition. Mr. Locke says, it is of more use to fill the head

Eryngium Alpinum



S. Edwards Del

London Published by G. Kearsley 46 Fleet Street Decr. 1809

with reflections than with points of erudition. If the mind be not just and right, ignorance is better than erudition, which only produces confusion and obscurity. M. Balzac calls a heap of ill chosen erudition the luggage of antiquity.

ERU'GINOUS. *a.* (*æruginosus*, Latin.) Partaking of the nature of copper (*Harvey*).

ERU'PTION. *s.* (*eruptio*, Latin.) 1. The act of bursting forth (*Bacon*). 2. Burst; emission (*Addison*). 3. Sudden excursion of a hostile kind (*Milton*). 4. Violent exclamation (*South*). 5. Efflorescence; pustules (*Arbuthnot*).

ERU'PTIVE. *a.* (*eruptus*, Latin.) Bursting forth (*Thomson*).

ERVUM. Tare. In botany, a genus of the class diadelphia, order decandria. Calyx four-cleft; stigma capitate; hairy all over. Three species, as follow:

1. E. tetraspermum: with two-flowered peduncles; glabrous, four-seeded, legumes; and oblong leaflets. Found in the corn-fields of our own country.

2. E. hirsutum: with many-flowered peduncles; hairy, two-seeded legumes; leaflets linear, truncate with a point; common also to our corn-fields.

3. E. vicioides. Peduncles about four-flowered; legumes silky, two-seeded; leaflets ovate. A native of Barbary.

For a further account of indigenous tares, see HUSBANDRY.

ERY'NGIUM. (*eryngium*, εϱυγγιον; from εϱυγγανω, to eructate, because it causes eructation.) Eryngo, a genus of the class pentandria, order digynia. Involucre many-leaved; flowers in heads; common receptacle conic, chaffy; seeds bristly. Eleven species; chiefly natives of the south of Europe. Of these the chief are:

1. E. aquaticum. Rattle-snake weed, with leaves sword-shaped, serrate-spinous; flowers undivided; stem simple. This is a native of Virginia.

2. E. campestre. Leaves clasping the stem, divided into lanceolate fragments; chaff undivided. Found in our own salt-marshes.

3. E. maritimum. Sea-eryngo, or sea-holly: root-leaves roundish, plaited, spinous; heads peduncled; chaff tricuspidate. It is found on the sandy shores of our own country. The root of this plant is directed for medicinal use. It has no particular smell, but to the taste it manifests a grateful sweetness; and, on being chewed for some time, discovers a light aromatic warmth or pungency. It was formerly celebrated for its supposed aphrodisiac powers, but it is now very rarely employed.

4. E. alpinum: alpine eryngo, with radical, petiolated, cordate leaves; and pinnated, ciliate involucre. It is a hardy perennial, well worthy of a place in every curious garden, where its uncommon form and beautiful colour cannot fail to attract the notice of every beholder. Its beauty and peculiarity are dependent on its floral leaves rather perhaps than on its blossom, admired for their feathery appearance and delicate blue tint. See Botany, Pl. XCIV.

ERYNGO. See ERYNGIUM.

ERYSIMUM. (*erysimum*, ερυσιμον; from εϱυω, to draw, so called from its power of drawing and producing blisters; others derive it απο του εϱειϰειν, because the leaves are much cut; others from εϱιτιμον, precious.) Hedge mustard. A genus of the class tetradynamia, order siliquosa. Silique columnar, exactly square; calyx closed; stigma capitate. Fourteen species: all European plants, and many of them indigenous to our own country. Of these the chief are:

1. E. alliaria. Jack in the hedge. Leaves heart-shaped, acute toothed. Found in our hedges.

2. E. Barbarea. The barbarea of the dispensatories. Lower leaves lyrate, with the terminal lobe rounded; upper ones obovate, toothed.

3. E. officinalis. Medicinal eryngo. Siliques pressed close to the spike-stalk: leaves runcinate. In medical practice formerly much used for its expectorant and diuretic qualities, which are now forgotten. The seeds are warm and pungent, and very similar to those of mustard in their effects.

ERYSI'PELAS. (*erysipelas*, ερυσιπελας; from ερυω, to draw, and ϖελας, adjoining; named from the neighbouring parts being affected by the eruption.) Ignis sacer. St. Anthony's fire. A genus of disease in the class pyrexiæ and order exanthemata of Cullen. It is known by synocha of two or three days continuance, with drowsiness, and sometimes with delirium; pulse commonly full and hard; then erythema of the face, with continuance of synocha, tending to either apoplexy or to abscess. There are two species of this disease, according to Cullen: 1. Erysipelas vessiculosum, with large blisters: 2. Erysipelas phlyctænodes, the shingles, or an erysipelas with phlyctenæ, or small blisters.

ERYTHEMA. (*erythema*, ερυθημα; from ερυθϱος, red.) A morbid redness of the skin, as is observed upon the cheeks of hectic patients after eating, and on the skin covering bubo, phlegmon, &c.

ERYTHRÆA, a town of Crete, situated in the south-east of the island at the promontory Erythræum.

ERYTHRÆUM MARE, erroneously called Rubrum by the Romans. Thus the ocean that washes Arabia and Persia, and extends a great way further, is denominated. Hence it is, Herodotus says, that the Euphrates and Tigris fall into the Mare Erythræum. He also calls it the South sea, on which the Persians dwell. It takes its name, not from its colour, the error of the Romans, who translated Erythræum, Rubrum; but from Erythras, son of Perseus and Andromeda, whose kingdom lay on the confines of that sea; whence its name Erythræum.

ERYTHRINA. Corol-tree. In botany, a genus of the class diadelphia, order decandria. Calyx two-lipped; corol with a very long, lanceolate banner; legume swelling at the seeds. Twelve species; natives of India or South America, under-shrubs and tall trees; generally with saffron or scarlet flowers.

ERYTHRINUS, in ichthyology. See Sparus.

ERYTHROIDES, in anatomy, the first of the proper tunics or coats which cover the testicles.

ERYTHRONIUM. Dogs-tooth violet. In botany, a genus of the class hexandria, order monogynia. Corol six-petalled, campanulate; nectaries two tubercles growing to the base of every other petal. One species only; a native of the south of Europe. There are, however, many varieties of this species; some with pale red, others with deep red, and others again with yellow, crimson, or white flowers. It is often propagated in our greenhouses, and is naturalised without difficulty.

ERYTHROXYLON, in botany, a genus of the class decandria, order trigynia. Calyx turbinate; petals five, with a small nectariferous emarginate scale at the base of each; stamens united at the base; drupe one-celled. Twelve species; natives of Africa or South America: shrubs chiefly.

ERYTRODANUM. (*erythrodanum*, ερυθροδανον; from ερυθρος, red, so called from the colour of its juice.) See Rubia, or Madder.

ERYX, a son of Butes and Venus, who, relying upon his strength, challenged all strangers to fight with him in the combat of the cestus. Hercules accepted his challenge after many had yielded to his superior dexterity; and Eryx was killed in the combat, and buried on the mountain, where he had built a temple to Venus. Virg. Æn. 5. ver. 402. A mountain of Sicily near Drepanum, also received its name from Eryx, who was buried there.

ERZERUM, the capital of Turcomania, in Asiatic Turkey. It is the see of an Armenian and of a Greek bishop, and the seat of a beglerberg. It is a great thoroughfare, and a resting-place for the caravans in their way to the East Indies. The inhabitants trade in furs, gall-nuts, Persian silks, cottons, calicoes, and drugs. Lat. 39. 57 N. Lon. 40. 41 E.

ESCALA'DE. *s.* (French.) The act of scaling the walls of a fortification (*Addison*).

ESCALLO'NIA, in botany, a genus of the class pentandria, order monogynia. Petals five; stigma capitate; berry covered with the calyx, two-celled, many-seeded. Two species; natives of South America.

E'SCALOP. *s.* 1. A shellfish, whose shell is regularly indented (*Woodward*). 2. An inequality of margin; indenture (*Ray*).

To ESCA'PE. *v. a.* (*escaper*, French.) 1. To obtain exemption from; to obtain security from; to fly; to avoid (*Wake*). 2. To pass unobserved by one (*Denham*).

To Esca'pe. *v. n.* To fly; to get out of danger; to avoid punishment (*Chronicles*).

Esca'pe. *s.* (from the verb.) 1. Flight; the act of shunning danger (*Psalms*). 2. Excursion; sally (*Denham*). 3. (In law.) Violent or privy evasion out of some lawful restraint (*Cowell.*) 4. Excuse; subterfuge; evasion (*Raleigh*). 5. Sally; flight; irregularity (*Milton*). 6. Oversight; mistake (*Brerewood*).

ESCA'RGATOIRE. *s.* (French.) A nursery of snails (*Addison*).

ESCHALO'T. *s.* (French.) Pronounced *shallot*. A plant. See Allium.

ESCHAR. (*eschara*, εσχαρα; from εσχαραω, to scab over.) The portion of flesh that is destroyed by the application of a caustic.

ECHA'ROTIC. *a.* (from *eschar.*) Caustic; having the power to sear or burn the flesh.

ESCHAROTICS. (*escharotica, medicamenta*, εσχαρωτικα; from εσχαραω, to scab over.) Caustics. Corrosives. A term given by surgeons to those substances which possess a power of destroying the texture of the various solid parts of the animal body to which they are directly applied. The articles of this class of substances may be arranged under two orders: 1. Eroding escharotics, as blue vitriol, alumen ustum, &c. 2. Caustic escharotics, as lapis infernalis, argentum nitratum, oleum vitrioli, acidum nitrosum, &c.

ESCHATON, a Greek musical term, denoting the difference between the diesis enharmonica and the hyperoche: its ratio is $\frac{393216}{390625}$.

ESCHEAT, in law, signifies any lands or tenements that casually fall to a lord within his manor. It is one of the consequences of tenure in chivalry: (See Feodal system, Knight-service, and Tenure.) It is the determination of the tenure or dissolution of the mutual bond between the lord and tenant, from the extinction of the blood of the latter by either natural or civil means: if he died without heirs of his blood, or if his blood was corrupted and stained by commission of treason or felony; whereby every inheritable quality was entirely blotted out and abolished. In such cases the land escheated or fell back to the lord of the fee; that is, the tenure was determined by breach of the original condition, expressed or implied in the feodal donation.

To Esche'at. *v. a.* (from the noun.) To fall to the lord of the manor (*Clarendon*).

ESCHE'ATOR. *s.* (from *escheat.*) An officer that observes the escheats of the king in the county whereof he is escheator (*Camden*).

ESCHEVIN, or Echevin (*Scabinus*), in the French and Dutch polity, a magistrate elected by the inhabitants of the city, to take care of their common concerns, the good order, conveniency, and decoration of the city, &c.

To ESCHE'W. *v. a.* (*escheoir*, old French.) To fly; to avoid; to shun (*Sandys*).

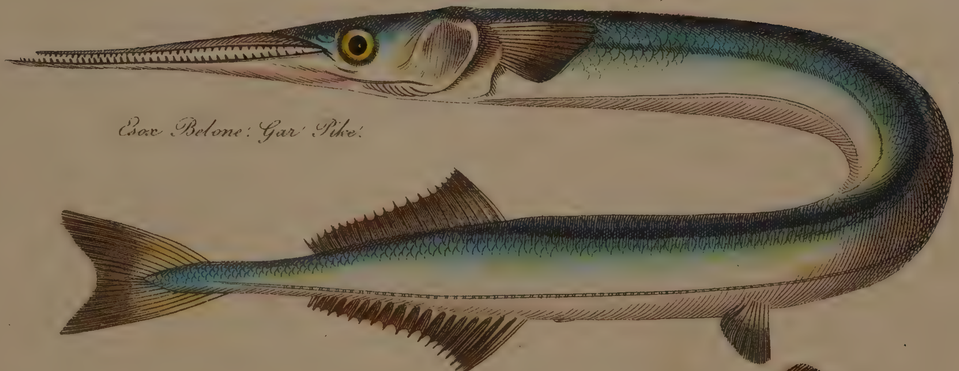
ESCO'RT. *s.* (*escort*, French.) Convoy; guard from place to place.

To Esco'rt. *v. a.* (*escorter*, French.) To convoy; to guard from place to place.

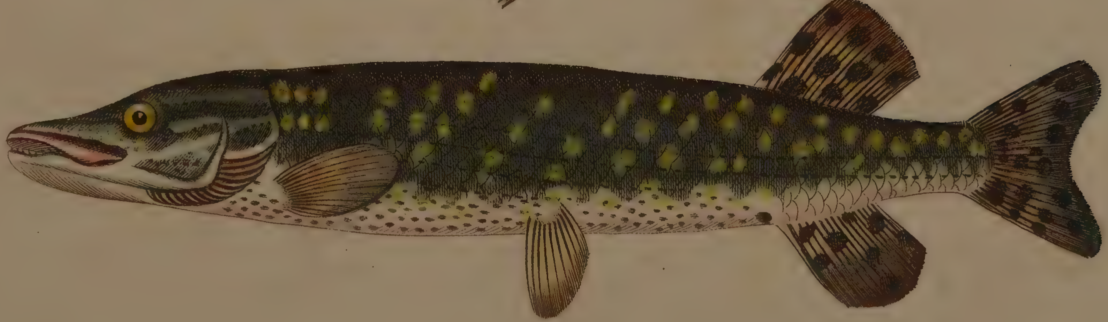
ESCO'T. *s.* (French.) A tax paid in boroughs and corporations towards the support of the community, which is called *scot* and *lot*.

NATURAL HISTORY.

PL. XCVII.



Esox Belone: Gar Pike.



Esox Lucius: Common Pike.

London, Published by Sherwood & Co. Paternoster Row, Novr. 10, 1813.

To Esco'τ. *v. a.* (from the noun.) To pay a man's reckoning; to support (*Shakspeare*).

ESCO'UT. *s.* (*escouter*, Fr.) Listeners or spies; persons sent for intelligence (*Hayward*).

ESCRITOI'R. *s.* (Fr.) A box with all the implements necessary for writing.

ESCU'AGE. *s.* (from *escu*, Fr. a shield.) *Escuage*, that is, service of the shield, is either uncertain or certain. *Escuage* uncertain is, where the tenant by his tenure is bound to follow his lord. Another kind of this *escuage* uncertain is called castleward, where the tenant by his land is bound to defend a castle. *Escuage* certain is, where the tenant is set at a certain sum of money, to be paid in lieu of such uncertain services (*Cowell*).

E'SCULENT. *a.* (*esculentus*, Latin.) Good for food; eatable (*Bacon*).

E'sculent. *s.* Something fit for food (*Brown*).

ESCURIAL, a village and palace of the king of Spain, twenty-one miles north-west of Madrid. The palace is one of the largest and most beautiful in the world. It has eleven thousand windows, fourteen thousand doors, one thousand eight hundred pillars, seventeen cloisters or piazzas, and twenty-two courts; with every convenience and ornament that can render a place agreeable in so hot a climate, as an extensive park, groves, fountains, cascades, grottos, &c. It is whimsically constructed in the form of a gridiron, being dedicated to St. Lawrence in commemoration of a victory, gained on the anniversary of that saint (who is said to have been broiled to death on a gridiron) in 1557. The apartment which the royal family inhabit is the handle of the instrument. The rest of the building contains offices, a church, a convent (in which are 200 monks), and a library containing 30,000 volumes.

ESCUTCHEON, or Scutcheon, in heraldry, is derived from the French *escusson*, and that from the Latin *scutum*, and signifies the shield whereon coats of arms are represented. Most nations of the remotest antiquity were wont to have their shields distinguished by certain marks painted on them; and to have such on their shields was a token of honour, none being permitted to have them till they had performed some honourable action.

The escutcheon, as used at present, is square, only rounded off at the bottom.

As to the bearings on shields, they might at first be arbitrary, according to the fancy of the bearer; but in process of time they came to be the gift of kings and generals, as the reward of honourable actions.

Escutcheon of pretence, that on which a man carries his wife's coat of arms, being an heiress, and having issue by her. It is placed over the coat of the husband, who thereby shows forth his pretensions to her lands.

ESDRAS, a Jewish priest, and doctor of the law. Artaxerxes Longimanus sent him with rich presents for the use and ornament of the temple of Jerusalem, rebuilt under Zerubbabel: the king also ordered the neighbouring governors to provide him with what conduced to the pomp of the Jewish religion, and to exempt the priests from paying taxes. He is supposed to be the collector of the Canon of Scripture; and that, by divine inspiration, he added some things which happened after the deaths of the authors. It is guessed he wrote the Chronicles, besides those books which bear his name, the two last of which are exploded even by the church of Rome.

ESENS, a town of Westphalia, in Germany, 20 miles N. of Embden. Lat. 53. 14 N. Lon. 7. 14 E.

ESK, the name of several rivers both in England and Scotland, particularly of one which forms part of the boundary between the two kingdoms. It runs from north-east to south-west, and gives name to the county of Eskdale.

ESKIMAUX, a people of N. America, inhabiting all that vast tract of country called Labrador, or New Britain. They have no fixed abode, but rove from place to place; for they sometimes come as far S. as Newfoundland, and sometimes are met with on the coasts of the straits and bays that the English have been in when they went in search of the N.W. passage. They are of a different race from the other native Americans; for, as they have no beards, these have them so thick and large, that it is difficult to discover any features of their faces. They have small eyes, large dirty teeth, and black rugged hair. They are always well clothed, for there is nothing to be seen but part of their faces and their hands. They have a sort of shirts, made of the guts of fish, with a coat of bear or bird skins, and a cap on their heads. They have likewise breeches, made of skins, with the hair within, and covered with furs without. They have also two pair of boots, one over another, of the same sort of skins. In summer they have nothing to cover them in the night; but, in winter, they lodge together promiscuously in caves. The dress of the women is nearly the same as that of the men. They are very superstitious, and have some sort of sacrifices. Their chief employment is hunting and fishing.

ESNE, Asne, or Essenay, a town of Egypt, on the Nile, supposed by some to be the ancient Syena, but Norden and Denon think it was Latopolis. Here are many curious remains of antiquity. Lat. 24. 46 N. Lon. 31. 40 E.

ESOX. Pike. In zoology, a genus of the class pisces, order abdominales. Head flattish above; mouth and throat large; jaws toothed, unequal, the upper flat, the lower punctate; tongue broad, loose; palate smooth; eyes round, moderate, lateral; nostrils double, near the eyes; gill-covers large; the aperture ample; the membrane from seven to twelve-rayed; body elongated, coated with hard scales, above convex, and compressed at the sides; lateral line straight, near the back, hardly visible; dorsal and anal fins very short, and mostly opposite. Fifteen species; found in various seas and rivers of Europe, Asia, and America: four of them in our own seas or rivers. The following are the chief. See Nat. Hist. Pl. LXXXVI. and Pl. XCVI.

1. E. osseus. Great gar-fish. Upper jaw longer than the lower; scales bony; tail quadrangular; iris yellow. Inhabits North America and Asia, and is occasionally found on the Sussex coast; scales imbricate; rhombic, those on the back rounded and retuse. Two feet long.

2. E. belone. Sea-pike. Gar-pike. Each jaw long, subulate; head small, eyes large, round, iris silvery. The bones have a shining green splendour by night. Inhabits the deeps of the ocean, and migrates annually towards the coasts, always preceding the mackerel; is seldom eaten. From one and a half to four feet long; body narrow, long, slender, above black, the sides greenish blue, coated with oblong thin scales, beneath silvery.

3. E. lucius. Common pike. Snout depressed; jaws nearly equal. A second variety with the upper jaw a little shorter than the lower: head broad, flat, pupil blueish, iris golden. Inhabits most lakes of Europe, Lapland, and northern Persia; (the second variety North America) and is found even in the Caspian sea: swims swift; grows very rapidly; from one to eight feet long; is extremely voracious, and feeds on almost any thing that comes in its way, even on its own tribe. It spawns from February to April: body above black; the sides cinereous, spotted with yellow, beneath white, dotted with black; rarely orange, spotted with black or green; scales small, oblong, hard.

The pike, like the carp, is possessed of great longevity; various instances have occurred of its being ninety years old; and Gesner relates an anecdote of a pike taken in 1497, near Hailburn in Suabia, with a ring affixed to its body, on which was an inscription asserting it to have been put into the lake by the governor of the universe Frederic II. October 5th, 1230. The inscription was in Greek characters.

The voracity of the pike induces it at times to attempt to swallow more than it can accomplish. In lord Gower's canal at Trentham, a pike once tried to swallow a swan, and actually got the head into its gorge; but could get no more down, and died in the effort, as did also the swan itself. The largest which has ever been found in our own country, according to Mr. Pennant, weighed thirty-five pounds.

4. E. saurus. Saury pike. Above and beneath six spurious fins near the tail. Inhabits the Northern seas, and sometimes descends to our own coasts; eleven inches long: body eel-shaped, growing suddenly slender near the tail; back dusky; belly bright-silvery; tail deeply forked.

ESPALIERS, in gardening, rows of trees planted about a whole garden or plantation, or in hedges, so as to inclose quarters or separate parts of a garden. They are trained up regularly to a lattice of wood-work in a close hedge, for the defence of tender plants against the injuries of wind and weather. See GARDENING.

ESPE'CIAL. *a.* (*specialis*, Latin.) Principal; chief (*Daniel*).

ESPE'CIALLY. *ad.* Principally; chiefly; particularly (*Hooker*).

ESPE'RANCE. *s.* (French.) Hope (*Shakspeare*).

ESPERNON, a town of France, in the department of Eure and Loire, seated on the Guesle. Lat. 48. 36 N. Lon. 1. 44 E.

ESPI'AL. (French.) A spy (*Spenser*).

ESPIONA'GE. (French.) The system of spying and informing.

ESPLANADE, in fortification, the sloping of the parapet of the covered way towards the campaign. It is the same with glacis, and is more properly the empty space betwixt a citadel and the houses of a town, commonly called a place of arms. See FORTIFICATION.

ESPLEES, in law, the general products which lands yield, or the profit or commodity that is to be taken or made of a thing; as of a common, the taking of grass by the mouths of the beasts that common there; of an advowson, taking of tythes by the parson; of wood, the selling of wood; of an orchard, selling the fruit growing there; of a mill, the taking of toll, &c.

These and such like issues are termed esplees. In a writ of right of land, advowson, &c. the demandant must allege in his court, that he or his ancestors took the esplees of the thing demanded, otherwise the pleading is not good.

ESPO'USAL. *a.* Used in the act of espousing or betrothing (*Bacon*).

ESPO'USALS. *s.* without a singular. (*espous*, French.) The act of contracting or affiancing a man and woman to each other.

To ESPO'USE. *v. a.* (*espouser*, French.) 1. To contract or betroth to another (*Bacon*). 2. To marry; to wed (*Milton*). 3. To adopt; to take to himself (*Bacon*). 4. To maintain; to defend (*Dryden*).

To ESPY'. *v. a.* (*espier*, French.) 1. To see things at a distance (*Hooker*). 2. To discover a thing intended to be hid (*Sidney*). 3. To see unexpectedly (*Genesis*). 4. To discover as a spy (*Joshua*).

To ESPY'. *v. n.* To watch; to look about (*Jeremiah*).

ESQUILIÆ, one of the hills of Rome, called by some of the ancients Suburranus, by the poets Esquilius. On the E. side it reached the city walls; on the S. the Via Lavicana; on the W. the valley between Mount Cœlius and the Palatinate; on the N. the Mons Viminalis.

ESQUIMAUX. See ESKIMAUX.

ESQUIRE, (from the French *escu*, and the Latin *scutum*, or in Greek σκυτος, which signifies a hide, of which shields were anciently made, and afterwards covered; for, in the time of the Anglo-Saxons, the shields had a covering of leather), was originally he, who, attending a knight in time of war, did carry his shield; whence he was called *escuier* in French, and *scutifer* or *armiger*, i. e. armour-bearer, in Latin. Hotoman says, that those whom the French called esquires, were a military kind of vassals, having *jus scuti*, viz. liberty to bear a shield, and in it the ensigns of their family, in token of their gentility or dignity. But this addition hath not of long time had any relation to the office or employment of the person to whom it hath been attributed, as to carrying of arms, &c. but hath been merely a title of dignity, and next in degree to a knight. Officers of the king's courts, and of the king's household, counsellors at law, justices of the peace, are only esquires in reputation; and he who is justice of peace has this title only during the time he is in commission, and no longer, if he is not otherwise qualified to bear it. A sheriff of a county being a superior officer, bears the title of esquire during his life; in respect of the great trust he has in the commonwealth. The chief of some ancient families are esquires by prescription; and in some acts of parliament, many wealthy persons commonly reputed to be such, were ranked among the esquires of this kingdom. The fellows of the Royal Society assume this title officially in the Philosophical Transactions: probably in consequence of the king being their patron. There is a general opinion, that every gentleman of landed property who has 300*l.* a year, is an esquire; which is a vulgar error. By custom, however, and by way of compliment, this title is indiscriminately given to every gentleman who lives on his private fortune, to rich merchants also, and even opulent tradesmen or manufacturers.

Esquires of the king, are such as have that title by creation, wherein there is some formality used, as their putting about their necks a collar of SS, and bestowing on them a pair of silver spurs, &c.

To ESSA'Y. *v. a.* (*essayer*, French.) 1. To attempt; to try; to endeavour (*Pope*). 2. To make experiment of. 3. To try the value and purity of metals (*Locke*).

E'ssay. *s.* (from the verb.) 1. Attempt; endeavour (*Smith*). 2. A loose sally of the mind; an irregular indigested piece (*Bacon*). 3. A trial; an experiment (*Locke*). 4. First taste of any thing (*Dryden*).

Essay, in literature, a particular kind of composition, the character of which is to be free, easy, and natural; not tied to strict order or method, nor worked up and finished like a formal system. The father of English essay-writing was lord chancellor Bacon.

ESSAYING, in chemistry. See Assaying.

ESSECK, a trading town of Sclavonia, with a strong castle. It has a bridge over the marshes, 8865 geometrical paces in length, and 15 in breadth, with towers at a quarter of a mile distance from each other. This town is seated on the river Drave. Lat. 45. 40 N. Lon. 19. 58 E.

E'SSENCE. *s.* (*essentia*, Latin.) 1. Essence is the very nature of any being, whether it be actually existing or no (*Watts*). 2. Formal existence; that which makes any thing what it is (*Hooker*). 3. Existence; the quality of being (*Sidney*). 4. Being; existent person (*Milton*). 5. Species of existent being (*Bac.*). 6. Constituent substance (*Milt.*). 7. The cause of existence: not proper (*Shakspeare*). 8. (In medicine.) The chief properties or virtues of any simple, or composition collected in a narrow compass. 9. Perfume; odour; scent (*Pope*).

Essence, in metaphysics, that which constitutes the peculiar nature of any thing, and makes it to be what it is. In philosophy, the essence of a thing is that which is the primary conception which one has of it, and is distinguished from its act, which is called its existence. Thus the essence of a rectilinear triangle, consists in its being bounded by three straight lines; of a circle, in that its radii or semi-diameters are all equal; and the essence of a square is, that it hath four right-angles and four equal right-lined sides.

Essences, or Essential oils, in pharmacy and chemistry; the volatile parts impregnated with specific aromas, which ascend from odoriferous substances by means of heat. The process by which these are obtained is usually that of distillation; and generally distillation in water. On account of the facility with which they ascend, they are also denominated volatile oils; and as plants are the substances from which they are obtained, they are again called vegetable oils. Their general nature and properties, together with the process by which they are separated from the vegetable matter that secretes and involves them, will be given under the article Oil, to which we refer the reader; as also to Pharmacy.

To E'ssence. *v. a.* (from *essence.*) To perfume; to scent.

ESSENES, or Essenians, in Jewish antiquity, one of the three ancient sects among that people. They allowed a future state, but denied a resurrection from the dead. Their way of life was very singular: they did not marry; but adopted the children of others, whom they bred up in the institutions of their sect: they despised riches, and had all things in common, and never changed their clothes till they were entirely worn out. When initiated, they were strictly bound not to communicate the mysteries of their sect to others; and if any of their members were found guilty of enormous crimes, they were expelled. Pliny tells us, that they dwelt on the west side of the lake of Asphaltites; and that they were a solitary kind of men, living without women or money, and feeding upon the fruit of the palm-tree: he adds, that they were constantly recruited by new comers, whom the surges of ill fortune had made weary of the world; in which manner the sect was kept up for several thousands of years, without any being born among them. The reason why we find no mention made of them in the New Testament may be, their recluse and retired way of life, not less than their great simplicity and honesty, whereby they lay open to no censure or reproof.

ESSE'NTIAL. *a.* (*essentialis*, Latin.) 1. Necessary to the constitution or existence of any thing (*Sprat*). 2. Important in the highest degree; principal (*Denham*). 3. Pure; highly rectified; subtilely elaborated (*Arbuthnot*).

Essential character. In natural history. *Character essentialis.* A single or peculiar natural mark, distinguishing one genus from all others in the same natural order.

Essential oils. See Oil.

Essential salt. This term seems to be generally applied to express any kind of salt procured from organised bodies, particularly vegetables, by simple extraction without any chemical decomposition. It is, therefore, synonymous with native salt. Thus we have the essential salt of sorrel, which is the native super-oxalat of potash contained in the plant, and procured by expression, clarification, and evaporation, all of them mechanical rather than simple processes. The super-tartrit of potash is an essential salt in tamarinds, the citric acid in lemons, the malic acid in apples, and the like.

The medicinal virtue of plants was thought formerly to reside peculiarly in the essential salt, so that a small dose of the latter would be equivalent to a proportionally large dose of the plant itself: and hence the extraction of the essential salts was an object of more importance to pharmaceutical chemistry than it is at present esteemed.

Esse'ntial. *s.* 1. Existence; being (*Milton*). 2. Nature; first or constituent principle (*South*). 3. The chief point.

ESSE'NTIALLY. *ad.* (*essentialiter*, Lat.) By the constitution of nature; really (*South*).

ESSERA. (*essera*, Arab.) A species of cutaneous eruption, distinguished by broad shining, smooth, red spots, mostly without fever, and differing from the nettle rash in not being elevated. It generally attacks the face and hands.

ESSEX, a county of England, bounded on the N. by part of Cambridgeshire, and by the river Stour, which separates it from Suffolk; on the E. by the German Ocean; on the S. by the Thames, which divides it from Kent; and on the W. by Herts and Middlesex, being divided from the former, in one part by the Stort, and then by the Lea, which separates it likewise from Middlesex. It is 54 miles long from E. to W. and 48 broad from N. to S. It is in the diocese of London; contains 18 hundreds, 24 market-towns, and 415 parishes; and sends eight members to parliament. The number of houses is 39,398; of inhabitants 260,900; and of militia-men 1244. There are about 800,000 acres of land, 30,000 of which are uncultivated, including woodlands. The N.W. part of this county is famous for the growth of saffron. The parts bordering on the Thames and the sea, called the Hundreds of Essex, consist chiefly of marshy grounds, which afford excellent pasturage, but are deemed unwholesome and agueish to a proverb. The rivers of Essex, besides the boundary ones, are the Chilmer, Blackwater, Coln, Crouch, and Roding. Chelmsford is the county town.

ESSOI'NE. *s.* (of the French *essonié*.) 1. He that has his presence forborn or excused upon any just cause; as sickness. 2. Allegement of an excuse for him that is summoned, or sought for, to appear (*Cowell*). 3. Excuse; exemption (*Spenser*).

ESSOIN, in law, an excuse for a person summoned to apear and answer to an action, on account of sickness or other just cause of his absence.

It is a kind of imparlance or craving of longer time, and obtains in real, personal, and mixed actions.

There are divers essoins: as de ultra mare, when the defendant is beyond sea, whereby he is allowed forty days; in an expedition to the Holy Land, a year and a day; infirmity, called common essoin when he is sick in bed; and lastly, in the king's service.

Essoin-day, is regularly the first day of every term, though the fourth day after is also allowed by way of indulgence.

Essoin de malo villæ, is where the defendant appears in court, but before pleading, falls sick in a certain village: this is also allowed, if found true.

To ESTA'BLISH. *v. a.* (*etablir*, French.) 1. To settle firmly; to fix unalterably (*Hale*). 2. To settle in any privilege or possession; to confirm (*Swift*). 3. To make firm; to ratify (*Numbers*). 4. To fix or settle in an opinion (*Acts*). 5. To form or model (*Clarendon*). 6. To found; to build firmly; to fix immoveably: not in use (*Psalms*). 7. To make a settlement of any inheritance: not in use (*Shak.*)

ESTA'BLISHER. *s.* (from *establish.*) He who establishes (*Digby*).

ESTA'BLISHMENT. *s.* (*etablissement*, French.) 1. Settlement; fixed state (*Spenser*). 2. Confirmation of something already done; ratification (*Bacon*). 3. Settled regulation; form; model of a government or family (*Spenser*). 4. Foundation; fundamental principle (*Att.*). 5. Allowance; income; salary (*Sw.*).

Establishment, among ecclesiastical writers, is used to signify the hierarchy, or church established in a nation by law. Thus, the religion of the English establishment is the episcopal; that of the Scotch establishment is the presbyterian. Episcopalians being dissenters there, and presbyterians dissenters here.

ESTATE, in law, signifies such inheritance, freehold, term for years, tenantcy by statute-merchant, staple, elegit, or the like, as any man has in lands and tenements. Estates are real, of lands, tenements, &c. or personal, of goods or chattels; otherwise distinguished into freeholds that descend to the heir, and chattels which go to the executors. Co. Lit. 315.

Of estate in fee-simple. An estate in fee-simple, is an estate, lands, tenements, lordships, advowsons, commons, estovers, and all hereditaments, to a man and his heirs for ever: also, where a corporation sole or aggregate are capable of holding in succession, and lands are given to them and their successors, they are said to have a fee-simple. 2. Bac. Abr. 249.

Of estate in tail. An estate is said to be intailed, when it is ascertained what issue shall inherit it.

What things may be intailed, by the statute of intails.—The statute makes use of the word tenementum, and therefore the estate to be intailed may be as well incorporeal as corporeal inheritances, because the word tenementum comprehends the one as well as the other, and consequently, not only lands may be intailed, but all rents, commons, estovers, or other profits arising from lands. Co. Lit. 19, b. 20, a.

What words create an estate tail.—When the notion of succession prevailed, it was necessary in feudal donations to use the word heirs, to distinguish such descendible feud from that which was granted only for life; but as to the word body, it was necessary to make use of that in the donation, but it might be expressed by any equivalent words, and therefore a gift to a man and hæredibus de se, or de carne quo sibi contigerit habere, or procreavit, is a good estate tail; for these sufficiently circumscribe the word heirs, to the descendants of the feudatory: and the reason of the difference is, because inheritances are only derived from the law, and the law requires the word heirs, that comprehends the whole notion of such legal representation; but the limiting the inheritance to the descendants of this or the other body, is only the particular intention of the person that forms the gift, and therefore the law leaves every man to express himself in such manner as may manifest that intention. 2. Bac. Abr. 259.

ESTAVAYER, a town and bailiwic of Swisserland, in the canton of Friburg, on the borders of the lake of Neuchatel, with a fine castle. Lat. 46. 55 N. Lon. 6. 56 E.

To ESTE'EM. *v. a.* (*estimer*, French.) 1. To set a value whether high or low upon any thing (*Wisdom*). 2. To compare; to estimate by proportion (*Davies*). 3. To prize; to rate high; to regard with reverence (*Dryden*). 4. To hold in opinion; to think (*Romans*).

ESTE'EM. *s.* (from the verb.) High value; reverential regard (*Pope*).

Esteem is the value we place upon some degree of worth. It is higher than simple approbation, which is a decision of the judgment. Esteem is the commencement of affection. It is a degree of love entertained for others on account of their pleasing qualities, though they should not immediately interest ourselves; by which it is distinguished from gratitude. The term is peculiarly applicable to virtuous and amiable dispositions of the heart, such as honesty, integrity, patience, kindness, gentleness, &c. which have no necessary connection with the understanding. It is also applicable to those of whom we have some knowledge, but who are at a remote distance from our intimacy. Thus we esteem the character of a person merely from the report of his good qualities. (*Cogan*, p. 151.)

If our esteem be raised by an object which has any thing in it either grand and sublime, or solemn and sacred, it is called reverence or veneration. So we reverence the persons and the counsels of our parents and superiors: we have a veneration for the Holy Bible, for the memory of the prophets and apostles, and for the names of St. Austin and sir Isaac Newton. And when this veneration or high esteem has God for its object, we think with Dr. Watts, that it may be termed adoration or inward worship. (*Watts on the Passions*, § 6.)

ESTE'EMER. *s.* (from *esteem.*) One that highly values; one that sets a high rate upon any thing (*Locke*).

ESTHER, a canonical book of the Old Testament; containing the history of a Jewish virgin, dwelling with her uncle Mordecai at Shushan, in the reign of Ahasuerus, one of the kings of Persia. The great beauty of this maid raised her to the throne of Persia; whereby she had an opportunity to save her countrymen, whose destruction was plotted by Haman, a favourite of that prince. The learned are not agreed who this Ahasuerus was; though the most prevailing opinion is that he was Artaxerxes Longomanus.

ESTHONIA, or REVEL, one of the 41 governments into which the Russian empire has been lately divided. It lies on the E. of the Baltic, and is bounded on the N. by the gulf of Finland, on the E. by Ingria, and on the S. by Livonia.

E'STIMABLE. *a.* (French.) 1. Valuable; worth a large price (*Shakspeare*). 2. Worthy of esteem; worthy of honour and respect (*Temple*).

E'STIMABLENESS. *s.* (from *estimable.*) The quality of deserving regard.

To E'STIMATE. *v. a.* (*æstimo*, Latin.) 1. To rate; to adjust the value of; to judge of any thing by its proportion to something else (*Locke*). 2. To calculate; to compute.

E'STIMATE. *s.* (from the verb.) Computation; calculation (*Woodward*). 2. Value (*Shakspeare*). 3. Valuation; assignment of proportional value; comparative judgment (*L'Estrange*).

ESTIMA'TION. *s.* (from *estimate.*) 1. The act of adjusting proportional value. 2. Calculation; computation. 3. Opinion; judgment (*Bacon*). 4. Esteem; regard; honour (*Hooker*).

E'STIMATIVE. *a.* (from *estimate.*) Having the power of comparing and adjusting the preference (*Hale*).

ESTIMA'TOR. *s.* (from *estimate.*) A settler of rates; a computist.

E'STIVAL. *a.* (*æstivus*, Latin.) Pertaining to the summer. 2. Continuing for the summer.

ESTIVA'TION. *s.* (*æstivatio*, Latin.) The act of passing the summer (*Bacon*).

ESTOPPEL, (formed of the French *estouper*, *oppilare*, *obstipare*, to stop or block up,) in law, an impediment or bar of action, arising from a man's own act or deed; against which a man is forbidden, by law, to speak, though it be to say the truth.

ESTOVERS, in law, is used, by Bracton, for that sustenance which a man, committed for felony, is to have out of his lands or goods for himself and his family during imprisonment. In stat. 6 Edw. I. it is used for an allowance in meat or clothes. In some manors, the tenants have common of Estovers; that is, necessary botes or allowances out of the lord's wood: in which last sense, estovers comprehends house-bote, hay-bote, and plow-bote; so that if a man have in his grant these general words, *de rationabili estoverio in boscis*, &c. he may thereby claim all three. Estovers is also used for alimony.

ESTRAC, in the manage, a term applied to a horse that is light-bodied, lank-bellied, thin-flanked, and narrow-chested.

ESTRADE, a French term signifying a public road, or highway. Hence the military term *battre l'estrade*, signifying the sending out scouts to obtain intelligence.

Estrade, is also used for a little elevation on the floor of a room, on which a bed is placed.

To ESTRA'NGE. *v. a.* (*estranger*, Fr.) 1. To keep at a distance; to withdraw (*Dryden*). 2. To alienate; to divert from its original use or possessor (*Jeremiah*). 3. To alienate from affection (*Milton*). 4. To withdraw or withhold (*Glanville*).

ESTRA'NGEMENT. *s.* (from *estrange.*) Alienation; distance; removal (*South*).

ESTRAPADE. In the manage, the defect of a horse that will not obey; but which, to get rid of his rider, rises in front, and while his forehand is yet in the air, yerks out furiously with his hind legs, striking higher than his head was before, and during his counter-time going back, rather than advancing.

ESTRAY, or Stray, a term applied equally to horse, mare, bull, ox, cow, sheep, or any head of cattle, that having strayed from its own home, common, waste, or lair, into a strange manor, or lordship, is there found without an owner: in this case, it is an established custom, that such stray be proclaimed, and its marks described, by the common crier, in the three next nearest towns on the market-day; and if it be not claimed within a year and a day of the time on which it was publicly cried and described, it becomes the property of the lord of the manor in which it was found. If the owner make the claim within the time limited, it must be returned to him upon his paying reasonable charges for finding, keeping, proclaiming, &c. An estray must be kept without labour, uninjured, and properly fed, till reclaimed, or the time above mentioned be expired.

ESTREAT, in law, *extractum*, a true copy, or note, of some original writing or record, and especially of fines and amercements, and imposed in the rolls of a court, and extracted or drawn out from thence, and certified into the court of Exchequer, from whence process is awarded to the sheriff to levy them: in order, therefore, to be relieved from any fine or estreat, application is made to that court upon motion.

ESTREMADURA, a province of Spain, about 175 miles in length, and 100 in breadth, bounded on the N. by Leon and Old Castile, on the E. by New Castile, on the S. by Andalusia, and on the W. by Portugal. It abounds with corn, wine, and fruits; but the air is bad for foreigners, on account of the excessive heat. It now makes a part of New Castile.

The chief province of Portugal bears the same name. Its capital is Lisbon.

ESTREMOS, a town of Portugal, in the province of Alentejo. It is a large place, and is divided into the upper town and the lower. Lat. 38. 46 N. Lon. 7. 16 W.

ESTRE'PEMENT. *s.* (of the French, *estrepier.*) Spoil made by the tenant for term of life upon any lands or woods (*Cowell*).

E'STRICH. *s.* (commonly written *ostrich.*) The largest of birds (*Sandys*).

E'STUANCE. *s.* Heat; warmth (*Brown*).

E'STUARY. *s.* (*æstuarium*, Latin.) An arm of the sea; the mouth of a lake or river in which the tide reciprocates; a frith. See Æstuary.

To E'STUATE *v. a.* (*æstuo*, Latin.) To swell and fall reciprocally; to boil.

ESTUA'TION. *s.* (from *æstuo*, Lat.) The state of boiling; reciprocation of rise and fall; agitation; commotion (*Norris*).

E'STURE. *s.* (*æstus*, Latin.) Violence; commotion (*Chapman*).

E'SULA. (*Esula*, from *esus*, eating, because it is eaten by some as a medicine.) Spurge.

E'sula major. The officinal plant ordered by this name in some pharmacopœias is the euphorbia palustris; umbella multifida, bifida, incolucellis ovatis, foliis lanceolatis, ramis sterilibus, of Linnéus. The juice is exhibited in Russia as a common purge; and the plant is given in some places in the cure of intermittents.

E'sula minor. *Tithymalis cyparissus.* Cypress spurge. This, like most of the spurges, is very acrimonious, inflaming the eyes and œsophagus after touching them. It is now fallen into disuse, whatever were its virtues formerly, which, no doubt, amongst some others, was that of opening the bowels, for amongst rustics it was called poor-man's rhubarb.

ESU'RIENT. *a.* (*esuriens*, Latin.) Hungry; voracious.

E'SURINE. *a.* (*esurio*, Latin.) Corroding; eating (*Wiseman*).

ETC. A contraction of the two Latin words *et cætera*, which signifies, and so on.

To ETCH. *v. a.* (*etizen*, German.) A way used in making of prints, by drawing with a proper needle upon a copper-plate, covered over with a ground of wax, and well blacked with the smoke of a link, in order to take off the figure of the drawing; which having its back side tinctured with white lead, will, by running over the strucken outlines with a stift, impress the exact figure on the black or red ground; which figure is afterward with needles drawn deeper quite through the ground; and then there is poured on well tempered aqua fortis, which eats into the figure or drawing on the copper-plate. (*Harris.*)

ETCHING, a method of engraving on copper, in which the lines or strokes, instead of being cut with a tool or graver, are eaten in with aqua fortis. (See Engraving.) Etching, though not very modern, is a later invention than engraving with the tool; of which it was at first only an imitation, that was practised by painters and other artists, who could much sooner form their hands to, and attain a faculty of, working in this way, than with the graver. But being then, nevertheless, considered as a counterfeit kind of engraving, and therefore inferior to the other, it was cultivated in a very confined manner; the closeness of the resemblance of the work to that performed by the tool being made the test of its merit, and consequently the principal object or aim of those who pursued it. This servile confinement of the art of etching to the imitation of the original kind of engraving was a great cause of retarding its advancement towards perfection, as many of the most able masters cramped their talents with the observance of it: which may be seen in the instances of Sadelers, Swaneberg, Villamena, and particularly Le Bosse; who, in his treatise on engraving, has laid down as a principle, that the perfection of this kind consists in the close similitude of the work with that done by the tool. This absurd prepossession has been since worn out: and the method of working with aqua fortis has been so far improved, that instead of being now deemed a spurious kind of engraving, it evidently appears the foundation of an excellence in many modern works, that could never have been produced without it: since, though the neatness and uniformity of the hatches, which attend the use of the tool, is more advantageous with respect to portraits; yet the liberty and facility of the other manner give a much greater opportunity to exercise the force of genius and fancy in history-engraving; where the effect of the whole, and not the minute exactness in finishing all the parts, constitutes the principal value.

He that would excel in this branch of the arts must be thoroughly acquainted with drawing, otherwise his works will appear tasteless indeed. The ground used in etching is a combination of asphaltum, gum-mastick, and virgin wax, mixed in such proportions as will prevent the asphaltum from breaking the composition when under the aqua fortis, or the wax from making it so soft as to close the lines when cut through it by the needle. As every thing depends upon the stability of the ground, it should be purchased of those persons who are most celebrated for making it; or if the person wishing to use it prefers doing it himself, let him remember that he must keep every particle of grease or oil far from him and his materials, and that without the greatest care the inflammability of the asphaltum will ruin his operations in melting them. The proportions of the ingredients should be obtained by experiment.

After being prepared in the above manner, the ground is tied in a piece of lustring for use, and another piece of the same kind of silk must be made into a dabber by tying a quantity of cotton in it. The copper-plate, hammered to a considerable degree of hardness, polished as if intended for the graver, and perfectly cleansed with whiting, is then secured at one corner by a hand vice, heated over a charcoal fire, and the silk containing the ground rubbed over it till every part is covered by the melted composition; but before it cools the silk dabber must be applied in all directions, till the surface of the plate is thinly and equally varnished. After this part of the process is completed, several lengths of wax taper, twisted together, are to be lighted, the plate raised by the vice in the left hand, and the right holding the burning taper, is to be moved gently backwards and forwards under the ground, carefully avoiding touching it with the wick, yet causing the flame to spread over the surface, which will render it perfectly black, smooth, and shining, in a short time; this is to be ascertained by turning the plate: if the copper appears through the ground, the taper must be applied again immediately; but if it is held too long beneath the plate, the ground will become opaque, and break when the aqua fortis is used.

The next object is to transfer the design to the ground, which may be done by drawing it on thin white paper with a black lead pencil, and having it passed through the copper-plate printer's rolling press, who will accomplish it by laying the plate carefully on the board of his press, the pencilled paper slightly damped on it, and turning the press, the lead will be conveyed firmly to the ground, which will appear in perfect outlines on removing the paper. Another method is to draw the design reversed from the original; rub the back with powdered white chalk, and laying it on the ground, trace the lines through with a blunt point; this operation requires much precaution, or the point will cut the ground; besides, if the paper is not securely fastened with wax at the corners it may slip, and either interrupt the true continuation of lines, or scratch the ground.

In working with the etching needle nothing more is required than to keep it upright, that the lines made by it through the ground may not slope, and thus make the aqua fortis corrode improperly; but it should be particularly observed, that the point, though taper, must be so rounded as to be free from a possibility of its tearing the surface of the copper, which would prevent the progress of the point, and ruin the plate when bitten; the necessary polish of the point may be accomplished by rubbing it on the sole of a shoe. The young artist must now be left to his own exertions, as directions for etching beyond these already given are useless, and he will acquire more knowledge and freedom from copying good prints in one week than a quarto volume of observations would afford. It seems almost needless to add, that every line must be kept distinct, at all events, throughout the plate, and that the most distant should be closer and more regular than those in the fore ground, as the greater the depth of shade, the broader and deeper must the lines be made.

When the etching of the plate is completely finished, the edges of it must be surrounded by a high border of wax, so well secured that water will not penetrate between the plate and it. The best spirits of nitre fortis must then be diluted with water, in the proportion of one part of the former to four of the latter, which will be found to answer the first operations, if the weather is fine and the atmosphere free from moisture; but, if the contrary is the case, the spirits of nitre must be increased in proportion to the humidity of the air; this, when poured on the plate, cannot be too attentively observed in order to remove the bubbles of fixed air with a feather, and to ascertain the time for stopping out the lightest parts; for it must be remembered, the whole secret of biting or corroding any subject consists in the judicious manner in which the depth and breadth of the lines are varied, as by proper management they may be left scarcely perceptible, or increased very considerably. The composition used for the above purpose is, turpentine varnish mixed with lamp-black, and diluted so as to be used freely with a camel's hair pencil; this applied to the parts of the plate sufficiently corroded, will effectually prevent the aqua fortis from touching it again, and the remainder proceeds as if no such application had taken place: it will be necessary to strengthen the water as the work becomes nearer completion, but cautiously, lest the ground should be broken; and every time the aqua fortis is removed, the plate must be washed with clean water and gradually dried, otherwise the varnish cannot be used, and the lines would be clogged with the decomposed metal. For taking the ground from the plate, it is usual to cover the surface with olive oil, and heating it, wipe the plate with a soft piece of old linen and spirits of turpentine, will effectually remove all remaining dirt.

Re-biting, is the art of strengthening those lines of an etching in a plate, from which the original ground has been cleansed. This is done by applying the ground as at first directed, but with great care that the melted composition does not fill, or even partially fill the lines; to prevent which, the cotton wrapt in silk, called the dabber, should be used exclusively by taking a small quantity of melted ground on it, and gently touching the parts between the lines till they are equally and completely covered; if the plate is considerably heated, the ground will spread with more facility over the various interrupted surfaces. Carelessness or inattention will instantly ruin this process, and the whole of the plate: a border of wax must surround the parts to be rebitten, and a channel made to carry off the aqua fortis without injuring those already completed. Supposing the operations of etching and biting the plate entirely finished, nothing more remains than to examine it attentively, and improve it with the graver and dry point.

Stipling, or engraving in the dotted manner, was in a great measure introduced by Bartolozzi, whose works in this way are astonishingly numerous, exclusive of those to which his name is affixed, and not the products of himself. Some pastoral scenes, with figures, when printed in colours, have a pleasing effect; and small portraits, stipled, will bear examination; but historical subjects, which have great breadth of shade, appear to no advantage engraved in this manner. Stipling is performed by etching the plate with dots and biting it, laying the shades with a tool for the purpose, using the graver and the dry point, and scraping off the roughness thus occasioned.

Etching on glass.—Glass resists the action of all the acids, except the fluoric acid. By this, however, it is corroded in the same manner as copper is by aqua fortis; and plates of glass may be engraven in the same manner as copper.

There are several methods of performing this. We shall first describe the mode of etching by means of the fluoric acid in the state of gas. Having covered over the glass to be etched with a thin coat of virgin wax (which is only common bee's wax bleached white), draw the design upon it in the same manner as in etching on copper. Then take some fluor spar, commonly called Derbyshire spar, pound it fine, and put it into a leaden vessel, pouring some sulphuric acid over it. Place the glass with the etched side lowermost over this vessel, two or three inches above it. Apply a gentle heat to the leaden vessel; this will cause the acid to act upon the fluor spar, and disengage the gas, which will corrode the glass. When it is sufficiently corroded, remove the wax by oil of turpentine.

This etching may be also performed by raising a margin of bordering-wax all round the glass, in the same manner as on copper, and pouring on the liquid fluoric acid, which acts upon the glass.

A third method of etching on glass is as follows: Having put the wax on the glass, draw your design, and raise a margin all round it. Then put pounded fluor spar, with some sulphuric acid diluted with water, upon the glass The sulphuric acid will disengage the fluoric, which will be absorbed by the water, and corrode the glass.

ETEOCLES, in fabulous history, a son of Œdipus and Jocasta. After his father's death, it was agreed between him and his brother, Polynices, that they should both share the royalty, and reign alternately each a year. Eteocles by right of seniority first ascended the throne, but after the first year of his reign he refused to resign to his brother, according to their mutual agreement. Polynices, resolved to punish him, implored the assistance of Adrastus, king of Argos. He received that king's daughter in marriage, and was soon after assisted with a strong army, headed by seven famous generals. Eteocles, on his part, did not remain inactive. He chose seven chiefs to oppose the seven leaders of the Argives, and stationed them at the seven gates of the city. Much blood was shed in light and unavailing skirmishes, and it was at last agreed between the two brothers that the war should be decided by single combat. They both fell; and it is said that the ashes of these two brothers, who had been so inimical one to the other, separated themselves on the burning pile, as if sensible of resentment, and hostile to reconciliation. (*Stat.*)

ETEOCLUS, one of the seven chiefs of the army of Adrastus, in his expedition against Thebes. He was killed by Megareus, the son of Creon, under the walls of Thebes. (*Eurip.*)

ETE'RNAL. *a.* (*æternus*, Latin.) 1. Without beginning or end (*Deuteronomy*). 2. Without beginning (*Locke*). 3. Without end; endless (*Shakspeare*). 4. Perpetual; constant; unintermitting (*Dryden*). 5. Unchangeable (*Dryden*).

ETERNAL FLOWER, in botany. See XERANTHEMUM, GNAPHALIUM, and GOMPHRÆNA.

ETER'NAL. *s.* (*eternel*, French.) One of the appellations of the Godhead (*Hooker*).

ETE'RNALIST. *s.* (*æternus*, Latin.) One that holds the past existence of the world infinite (*Burnet*).

To ETE'RNALIZE. *v. a.* (from *eternal.*) To make eternal.

ETE'RNALLY. *ad.* (from *eternal.* 1. Without beginning or end. 2. Unchangeably; invariably (*South*). 3. Perpetually; without intermission (*Addison*).

ETE'RNE. *a.* (*æternus*, Latin.) Eternal; perpetual; endless (*Shakspeare*).

ETE'RNITY. *s.* (*æternitas*, Latin.) 1. Duration without beginning or end (*Locke*). 2. Duration without end (*Addison*).

To ETE'RNIZE. *v. a.* (*æterno*, Latin.) 1. To make endless; to perpetuate (*Milton*). 2. To make for ever famous; to immortalize (*Sidney*).

ETESIÆ, or ETESIAN WINDS (from ετος, year). Such as blow at stated times of the year: monsoons, trade-winds.

ETHELBERT, king of England, and second son of Ethelwolf, succeeded his brother in 860. He was a virtuous prince, and greatly beloved by his subjects.

ETHELBERT, king of Kent in 560. He married Bertha, daughter of Caribert king of France. That princess laboured to convert the king to Christianity, which however was not accomplished till Austin the monk came to England, being sent hither by pope Gregory. Ethelbert died in 616, aged 56.

ETHELRED, king of England, the son of Edgar, succeeded his brother Edward the Martyr in 978. His kingdom was greatly harassed by the Danes, to whom he meanly paid a tribute, which he levied on his subjects. The tax was called *Dane gelt*. However he was at last roused into revenge by the insolence of the invaders; but, instead of resisting them bravely in the field, he caused them to be treacherously massacred in one day. Swein, king of Denmark, afterwards entered his kingdom, and compelled him to fly to Normandy, but his death happened soon after. Ethelred returned and died in 1016. (*Watkins.*)

ETHELWOLF, king of England, came to the crown in 838. He was a mild and religious prince, and went to Rome with his youngest son Alfred, afterwards so renowned. He died in 857, and was buried at Winchester.

E'THER. *s.* (*Æther*, Latin; αιθηρ.) 1. An element more fine and subtile than air; air refined or sublimed (*Newton*). 2. The matter of the highest regions above. See ETHER.

ETHER, in chemistry (*naphte huntsliche*, Germ.) When alkohol is mixed with sulphuric or several other acids, and the action of the acid is assisted by heat, the alkohol is decomposed, and converted partly into a very light, volatile, fragrant, inflammable liquor called ether. The different acids employed in the production of this liquid are supposed to render it different in some of its properties: and hence the ether produced is denominated from the acid employed, sulphuric ether, nitric ether, fluoric ether, muriatic ether: upon each of which we shall offer a few observations.

Sulphuric Ether.

The preparation of this precedes all the rest in point of time. It is described in the Dispensatory of Valerius Cordus, published at Nuremburg about the year 1540; and, under various processes, has been continued to the present day.

It is usually prepared by the following process. A mixture of equal parts of alkohol and sulphuric acid is put into the retort, to which a large receiver is then luted. The receiver should be surrounded with ice, or at least with cold water. Heat is applied, and as soon as the mixture boils the ether comes over and is condensed, and runs in large striæ down the sides of the receiver. As soon as it amounts to one half of the alkohol employed, the process must be stopt. The ether thus obtained is not quite pure, almost always containing a little sulphurous acid. This acid may be separated by pouring the ether on a little potash, or black oxyd of manganese, and distilling over again by means of a moderate heat.

This last process is called *rectification* of the ether. Yet the ether is not quite pure even after all the acid has been removed; it consists of alkohol and ether intermixed, rather than of ether alone. To render it more perfect, the ether is usually mixed with water and then distilled with a moderate heat. But Mr. Lowick has shown that this method does not succeed. The following process yielded him an ether much purer than any that had been previously obtained. Into sixteen parts of ether of the specific gravity 0,775 in a temperature of 60° he threw dry powdered salt of tartar, till the last portions were no longer wetted by the liquor. The mixture being allowed to digest the ether was then drawn off: and its specific gravity was found to be only 0,746. By this mean it was deprived of its water. To remove the alkohol, dry, powdered muriat of lime was thrown into the liquid in the same manner as long as it would dissolve. On standing, the mixture separated into two portions; the alkohol holding the salt in solution, sunk to the bottom; the ether swam on the surface. When separated from the inferior liquor its specific gravity was now only 0,632 in a temperature of 60°. It was therefore much purer than any former ether described by chemists, since it had never before been procured lighter than 0,725. The ether thus prepared contains a little of the salt from which it may be freed by distillation. But in such case its specific gravity increases; the purest portion of the ether assuming the form of elastic fluid.

Ether thus obtained is a limpid and colourless liquor, of a hot pungent taste, highly fragrant, and so volatile that it can scarcely be poured from one vessel to another without sustaining considerable loss by evaporation.

When exposed to a cold of −46° ether freezes and crystallizes. In moderate temperatures it is not affected by oxygen gass or common air; but when kindled in a state of vapour, it burns rapidly with a fine white flame, and leaves behind it a trace of charcoal. In the state of vapour it also detonates with common air and oxygen gass; and when, in this state, made to pass through a red hot porcelain tube, it is decomposed completely, and a large quantity of carbureted hydrogen gass is obtained.

Of the simple combustibles ether seems to act only on phosphorus and sulphur. It has no action on metals, but revives those that have a weak affinity for oxygen when mixed with their solution in acids, as gold and silver. It dissolves the muriat of gold and the oxymuriat of mercury. It absorbs nitrous gass in considerable quantity; and sulphuric gass seems capable of converting it into a peculiar kind of oil known by the name of sweet oil of wine. It dissolves the fixed and volatile oils, fluid bitumens, and resins; but it does not act upon gum.

Nitric Ether.

This is first mentioned in an epistle written by Kunkel to Voight, and published in 1681, but no attention was paid to it by succeeding chemists till it was discovered a second time by Navier in 1742, and a third time by Sebastiani in 1746. Navier's method of obtaining it is hazardous: Dr. Black invented a better process. Dehne attempted to improve upon Dr. Black's; and various other methods have since been devised; but the process at present most approved is that of Chaptal as corrected by Proust. A large retort is luted to a glass globular vessel furnished with a safety-tube. From this globe a tube passes to a second globe, likewise furnished with a safety-tube; and to this last vessel is connected three Woulfe's bottles in the usual way, which must be half full of alkohol. A mixture of 38 parts of alkohol and 24 of acid, of the specific gravity of 1.3, is put into the retort. The heat of a chafing-dish is applied, and removed as soon as the effervescence begins. The greatest part of the ether is detained by the alkohol in the first Woulfe's bottle; which mixture is to be saturated with an alkali, and the ether separated by distillation. Nitrous ether, by whatever process it is procured, is never pure at first, holding always in solution a considerable portion of nitrous gass; and hence its extraordinary volatility. It contains also a certain portion of nitric acid, and a little oil, to which it owes its yellow colour. The nitrous gass separates spontaneously when the ether is mixed with a considerable portion of water. By distilling it repeatedly from potash or sugar the oil may be abstracted, and when kept for some time the nitric acid is decomposed, and a little water and oxalic acid formed, which sink to the bottom of the vessel.

As far as it is known, nitric ether agrees very nearly in its properties with sulphuric ether: it is equally fluid and combustible, but it is heavier, the specific gravity being often 0,9000. Its taste and odour are nearly the same as those of sulphuric ether, but not quite so pleasant, owing, most probably, to the foreign bodies, from which it cannot easily be completely freed.

Nitrous ether appears capable of uniting with nitrous gass in two proportions. When the ether is in excess it forms nitrous ether in the state in which it appears previous to rectification; when the nitrous gass exceeds the ether it composes a permanently elastic fluid that has obtained the name *etherised nitrous gass*. The preparation of this differs from that of nitrous ether only in the rapidity with which the acid and alkohol act on each other; when the combination takes place very slowly much ether and little etherised gass is the result, but when the contrary is the case these two products are formed in an inverse proportion. If equal parts of alkohol and strong nitrous acid be mixed together at the usual atmospheric temperature, or at a higher heat in proportion as the acid is diluted, a very rapid and copious effervescence takes place, a little ether is condensed in the receiver, and a large quantity of gass passes through the conducting tube, the first portions of which are etherised nitrous gass, and the latter part common nitrous gass. What remains in the retort is acetous acid, with a little oxalic acid.

Muriatic Ether.

After the discovery of the two preceding ethers, various attempts were made to obtain ether by the action of muriatic acid on alkohol. But by employing this acid alone no ether has been or perhaps can be obtained: for in its usual state it is too much diluted with water to act with much energy upon alkohol. To obtain muriatic ether, therefore, it is necessary to employ the acid in a different state. Renelle discovered that muriatic ether might be obtained by distilling together alkohol and the smoking liquor of Libavius, which is a concentrated muriat of tin in its highest state of oxydation, which Dr. Thomson denominates a peroxyd. The marquis of Courtanvaux having repeated the experiments of Renelle with much care, proposes the following as the best method of preparation.

Mix together in a retort three parts of fuming muriat of tin and one of alkohol, a considerable degree of heat is immediately excited, and a white suffocating vapour arises, which, however, soon disappears on agitating the mixture. As soon as an ethereous odour is perceived, let two balloon receivers be luted on and kept as cool as possible, then by the application of a gentle heat to the retort there comes over first a little dephlegmated alkohol, which is succeeded by the ether: by an increase of temperature a few drops of coloured oil are produced, and then arises partly in the form of soft butter, and partly in that of a dense brown liquid, a quantity of smoking muriat of tin, part of the metallic oxyd remaining in the retort as a grey powder. When the ether thus produced is mixed with a solution of pearl-ash, a copious effervescence and precipitation takes place, owing to the decomposition of some muriat of tin contained in the ether, after which by distillation at a gentle heat the muriatic ether arises in a state of great purity, amounting to half of the impure product of the first distillation.

Several other metallic muriats have been found to be equally efficacious with the liquor of Libavius: the corrosive muriats of antimony and arsenic, the muriats of bismuth and zinc, and the red muriat of iron, have in particular been used with success in the preparation of muriatic ether.

Another method of obtaining muriatic ether is as follows, which is the plan recommended by Mr. Basse. Keep a quantity of common salt for an hour in a state of fusion, in order to deprive it of its water of crystallization. Put twenty parts of this salt into a tubulated retort, to the beak of which is fitted a bent tube, plunging into a Woulfe's bottle, containing ten parts of alkohol as strong as possible. Introduce into the retort, in small quantities at a time, ten parts of the most concentrated sulphuric acid, allowing the common air to escape from the bottle containing the alkohol: then distil in a sand-bath till the muriatic acid comes over, keeping the alkohol bottle as cool as possible during the process. The alkohol, thus saturated with acid, is put into a retort, and one half of it distilled over. Agitate this portion with an alkaline ley, and then decant the ether which swims on the surface: it usually amounts to two and a half parts.

After the discovery of the oxymuriatic acid, Scheele shewed that ether might be obtained by distilling a mixture of alkohol, black oxyd of manganese, and muriatic acid; or by distilling sulphuric acid, common salt, black oxyd of manganese, and alkohol: but the quantity which can be obtained by this process is trifling; for the oxymuriatic acid acts upon the ether formed, and converts it into a kind of oil.

Muriatic ether is transparent, colourless, and volatile like sulphuric ether, from which it only differs in the two following particulars: when burnt it exhales an acrid odour like that of sulphurous acid; and its taste is astringent like that of alum. These peculiarities are probably owing to the introduction of some extraneous body. Its specific gravity is about 0,719.

Fluoric Ether.

All we know of this substance is derived from Scheele. He first impregnated rectified alkohol with fluoric gass by distilling pulverised fluor spar with sulphuric acid, and placing alkohol in the receiver; the smoking spirit thus obtained was distilled with a gentle heat, but no sign of ether made its appearance. Another portion of the acidulated spirit was then mixed with black oxyd of manganese, and by subsequent distillation an ethereous fluid came over; from which by rectification a little ether was obtained, of a very agreeable smell, resembling that of nitrous ether.

Acetic Ether.

This was first obtained by the Count de Lauraguais in 1750, who prepared it by distilling together equal parts of alkohol and acetic acid. Scheele, Bergman, and Porner, tried this method, but failed. Pelletier, however, has abundantly proved the accuracy of Lauraguais' experiments, and at the same time pointed out the cause of Scheele's failure. Yet though Scheele did not succeed by this mode, he pointed out and amply succeeded by another and a much simpler process. Nothing more upon Scheele's own method is necessary than to mix acetit of pot-ash or of lead (sugar of lead) or of copper (distilled verdigris) with alkohol, and then adding as much sulphuric acid as is requisite to decompose the acetous salt, distil the mixture at a low heat, and shake the produce with water; when the ether will rise to the surface, and may be poured off. From sixteen parts of sugar of lead, six parts of strong sulphuric acid, and nine parts of alkohol, Bucholz obtained six parts of pure rectified ether.

Acetic ether has the properties of the other ethers, excepting only that the odour of acetic acid is perceptible in it.

Various other acids have been distilled with alkohol for the purpose of procuring ether, but with little or no success: such as the phosphoric, boracic, benzoic, tartaric, citric, succinic, and arsenic. A liquid lighter than alkohol has been obtained from some of them, but still soluble in water, and therefore not an ether.

The different species of ether have not been examined with sufficient care: but it is now generally, though perhaps improperly, conceived that pure ether, however obtained, is one and the same, and that the differences manifested are only owing to foreign substances with which the ether is contaminated.

ETHE'REAL. *a.* (from *ether.*) 1. Formed of ether (*Dryden*). 2. Celestial; heavenly (*Milton*).

ETHE'REOUS. *a.* (from *ether.*) Formed of ether; heavenly (*Milton*).

ETHEREGE (George), an English dramatic writer, born about 1636, of an ancient family in Oxfordshire. In 1664 he produced a comedy, called, The Comical Revenge; or, Love in a Tub, which introduced him to the friendship of the greatest wits of the age. Encouraged by the favourable reception of this piece, he brought out another in 1668, entitled, She would if she could, which also met with considerable success. In 1676 appeared his Man of Mode, or Sir Fopling Flutter, which seems to be his best performance. He received the honour of knighthood about 1683, and married a rich old widow. He was a man of licentious habits, and broke his neck, it is said, by falling down stairs when intoxicated at Ratisbon. His songs are very sprightly.

ETHERIAL OIL. Any highly rectified essential oil.

ETHERIFICATION (Theory of). As chemists of different periods and different schools have entertained various opinions concerning the nature of ether, the theories by which they have endeavoured to account for its production have differed accordingly. The theories which have attracted most attention are those of Macquer, Lavoisier, and Vauquelin.

The first conceived ether to be alkohol in its utmost purity, deprived by the acid employed of the whole of its waters. Upon this hypothesis, the acid does not enter into the ether as a component part; which was, nevertheless, the common opinion at the time, and has since been confirmed by experiments; while it takes no notice of the copious deposition of charcoal, and the formation of acetous acid during the production of ether.

When the theory and general deductions of Lavoisier began to be received among chemists, oxygen was at once regarded as the active principle in the formation of ether, as well as of every other chemical substance: and hence, according to Lavoisier, ether is alkohol combined with oxygen. This theory, however, has proved just as unsatisfactory as the preceding; for were it true, ether might be obtained from any other substances possessing oxygen, and combined with alkohol, as well as from acids; and this indeed was expressly asserted by Lavoisier, who affirmed, that it might also be procured by repeated distillations of alkohol from the red oxyd of mercury; an assertion, however, which is now well known to be unfounded, unless the oxyd be prepared in a particular way, as for example by nitrous acid, and with the acid undecomposed, from having been insufficiently heated.

A new, and, upon the whole, a more satisfactory theory, has since been advanced by Fourcroy and Vauquelin, which leads to the conclusion that, during the etherial process, the alkohol is completely decomposed, and that ether is compounded of the same principles or ingredients, but in different proportions; that it contains a greater proportion of hydrogen and oxygen, and a smaller proportion of carbon than alkohol.

The theory upon which these conclusions are drawn, and which appeals to various phænomena uniformly taking place, upon a mixture of different proportions of alkohol with different proportions of sulphuric acid, is as follows;

1. A small quantity of ether is formed spontaneously, and without the assistance of heat, by the combination of two parts of concentrated sulphuric acid, and one part of alkohol.

2. As soon as ether is formed, there is a production of water at the same time, and while the first of these compositions takes place, the sulphuric acid undergoes no change in its intimate nature.

3. As soon as the sulphurous acid appears no more, or at least very little more, ether is formed; but the sweet oil of wine passes over, together with water and acetic acid.

4. The sweet oil of wine having ceased to come over, nothing further is obtained but the sulphurous and carbonic acids, and at last sulphur, if the distillation be carried to dryness.

The operation of ether is, therefore, naturally divided into three periods; the first in which a small quantity of ether and water are formed without the assistance of heat; the second in which the whole of the ether which can be obtained is disengaged without the accompaniment of sulphurous acid; and the third, in which the sweet oil of wine, the acetous acid, the sulphurous acid, and the carbonic acid are afforded. The three stages have no circumstance common to all but the continual formation of water, which takes place during the whole of the operation.

This theory has been opposed by Zaudet and Dabit; but the objections thus far advanced have been satisfactorily replied to by its inventors; though their explanation is not sufficiently precise to ascertain exactly the component parts of ether. The process for producing this compound we have given under the article Ether, which see.

E'THICAL. *a.* (ηθικος.) Moral; treating on morality.

E'THICALLY. *ad.* According to the doctrine of morality (*Government of the Tongue*).

E'THIC. *a.* (ηθικος.) Moral; delivering precepts of morality.

ETHICS, the doctrine of manners, or the science of moral philosophy. The word is formed from ηθος, ηθη, *mores*, manners, because the scope or object thereof is to form the manners.

By manners or morals is here meant a way or manner of living confirmed by custom or habit, or certain habitudes of doing, or actions which are often repeated, which, if they be according to right reason, the morals or manners are said to be good, otherwise, evil and vicious.

Hence the object of ethics is the exercise of right reason in all our affairs, actions, and relations; or it is man himself considered as dirigible, and to be conducted according to reason; and the end of ethics is to make him good and happy: so that if a man conducted himself according to right reason in all the circumstances of his actions, affairs, and relations, he would arrive at the highest pitch of moral perfection and beatitude.

Whence ethics may be defined a right manner of thinking in order to attain to human felicity, or a science whereby man is directed to conduct his will, and the actions thereof, so as to live well and happily.

The principal, nay, the only topics thereof, are happiness and manners, whence arise two parts or branches of ethics; the first, on moral happiness, considered as the end; and the second on moral virtues or good manners, as the means to arrive at that end.

It has not been unusual, of late, for persons to object to the science of ethics, or morality, as an abstruse and useless speculation, a mere amusement of the mind, presenting us only with ingenious hypotheses, and specious conjectures, more calculated to lead a man to endless doubts and perplexities, than to settle him in a state of solid and lasting satisfaction. On the contrary, however, we hesitate not to assert that it is of the utmost importance to mankind, that it lies level to the apprehensions of the weakest minds, provided they are sincere and well-disposed, and that it is attended with all the certainty that any impartial and considerate person can desire.

An admirable writer (Cumberland, De Leg. N. C. 4.) forms an ingenious comparison between algebra and morality, as to the method of finding out truth, and teaching it when found: he judiciously observes, that in external operations, where the question is often perplexed by the multiplicity of circumstances, our not being able always to arrive at precise determinations, no more affects the certainty of morality, than it does the truth and usefulness of the principles of geometry about the measuring of lines, surfaces, and solids; that neither by the senses nor the help of instruments is it possible to effect a line perfectly straight, or a surface perfectly plane or spherical, or a body perfectly regular. It is enough that we approach so near to the utmost exactness, that nothing of any moment to human practice is wanting. And so much may be attained by the principles of moral doctrine. The method, the rules of operations, and the way of deducing one thing from another, are the same (in morality as in mathematics), neither do the uses of life require a complete accuracy, any more than the same is necessary in measuring planes and solids.

The celebrated Puffendorf has also remarked, that moral qualities, as they are not capable of being adjusted in their mutual proportions with so much exactness as physical quantities are, so they do not need such a precision, but allow of a latitude. Thus in estimating the merit of persons, the value of things and actions, the proportion of the punishment to the crime, and in the exercise of the greater part of the virtues, except justice, as liberality, gratitude, equity, charity, &c. there is a certain latitude or extent. It cannot be denied that the nature of the subject matter is different in moral and mathematical sciences; and according to this difference in the subject, there is a like difference in the kind of evidence: but from this it will by no means follow, that because the evidence to be expected in morality is not the same as that of the mathematics, that therefore it is not satisfactory.

Ethics give satisfaction, where it is most of all desirable, in the enquiry after happiness. It has been already observed, that one great end of ethics is happiness; and will any one say that happiness is an impossible attainment? A most wise and good God hath made ample provision for other creatures, that they might reach the ends to which they incline, and for which by their several natures he hath fitted them; and it is hard to conceive that man only should be under a necessity of falling short of the happiness of which he is capable. It is possible for God to make man happy; the thing does not imply a contradiction; nor is there are any insurmountable incapacity in the subject to oppose it; for, being furnished both with understanding and will, man wants not the principles of fruition. And who can doubt but that infinite power can supply objects of enjoyment adequate to the faculty? Certain it is then that God can make man happy; and because he is infinitely good, we are justified in inferring that he will do it, with this only condition, that man be not wanting to himself. See the Introduction to Grove's Moral Philosophy, where many other arguments are urged to the same purpose, and the most prominent objections are answered.

ETHIOPIA, a celebrated, though very much unknown empire of Africa, whose boundaries have never been exactly defined either by ancient or modern geographers. By some writers of antiquity the title of Ethiopians was given to all nations whose complexion was black: hence we find the Arabians as well as many other Asiatics sometimes falling under this denomination; besides a number of Africans, whose country lay at a distance from Ethiopia, properly so called. Thus the Africans in general were by these writers divided into the Western or Hesperian Ethiopians, and those above Egypt situated to the east of the former; the latter being much more generally known than the former, by reason of the commerce they carried on with the Egyptians. But there was one country to which the title was thought most properly to belong, and which was therefore called Ethiopia Propria. This was bounded on the north by Egypt, extending all the way to the less cataract of the Nile, and an island named Elephantine; on the west it had Libya interior; on the east the Red Sea, and on the south unknown parts of Africa; though these boundaries cannot be fixed with any kind of precision. In this country the ancients distinguished a great variety of different nations, to whom they gave names either from some personal property, or from their manner of living.

ETHIOPS ANTIMONIAL. See SULPHURETUM HYDRARGYRI STIBIATUM NIGRUM.

ETHIOPS MINERAL. See HYDRARGYRUS CUM SULPHURE.

Ethiops per se. See Oxydum hydrargyri nigrum.

ETHMOID BONE. (*os ethmoideum*; from εθμος, a sieve, and ειδος, form; because it is perforated like a sieve.) Os ethmoides. Os æthmoides. Cribriform bone. A bone of the head. It is situated anteriorly in the basis of the cranium, at the upper part of the nose. The principal eminences and depressions of this bone are the crista galli, the perpendicular septum, the spongy laminæ, and the cribrose foramina.

ETHNARCHA, Ethnarch. (formed of εθνος, nation, and αρχη, command, a governor or ruler of a nation.) There are some medals of Herod I. surnamed the Great, on one side whereof is found 'Ηρωδου, and on the other Εθναρχου, q. d. Herod the ethnarch. Josephus gives Herod the appellation of tetrarch, in lieu of that of ethnarch.

ETHNIC. *a.* (εθνικος.) Heathen; pagan; not Jewish; not Christian (*Grew*).

ETHNICS. *s.* Heathens (*Raleigh*).

ETHNOPHRONES, a sect of heretics in the seventh century, who made a profession of Christianity, but joined thereto all the ceremonies and follies of paganism.

ETHOLO'GICAL, *a.* (ηθος, and λογος.) Treating of morality.

ETHU'LIA, in botany, a genus of the class syngenesia, order polygamia æqualis. Receptacle naked; seeds crowned with a membranaceous margin; calyx equal. Seven species; natives of the East or West Indies.

ETIENNE (St.) a city of France, in the department of Rhone and Loire, remarkable for its manufactures in iron and steel, and for its ribands. Lat. 45. 22 N. Lon. 4. 30 E.

ETIO'LOGY. *s.* (αιτιολογια.) An account of the causes of any thing, generally of a distemper (*Arbuthnot*).

ETIQUETTE, a French term, primarily denoting a ticket or title affixed to a bag or bundle of papers, expressing its contents. It is also used, when applied to the Spanish and some other courts, to signify a particular account of what is to be done daily in the king's household, and in the chief ceremonies relating to it. It likewise denotes those forms that regulate the decorum of conduct towards persons of various ranks and stations in life.

ETNA, or Ætna, a famous burning mountain of Sicily, and the largest in Europe. The form of mount Etna is that of a cone, very broad at the base, which is more than forty miles in circumference. From the bottom you ascend ten leagues before reaching its summit on the south side; and on any of the other sides, the way being not so straight, would be considerably longer. Etna is entirely composed of substances that have been discharged from the volcano in its various explosions.

It appears from the quantities of marine bodies deposited all over the under part of Etna, that it must have been once covered by the sea to at least one half of its present height. The whole island of Sicily, and the greatest part of mount Etna, have been, in M. Houel's opinion, formed under water. But the period when the eruptions from this volcano first commenced, the manner in which the sea subsided, and the precise time at which it fell so low as the present level on the shores of Sicily, are facts concerning which we have no certain knowledge. The general principle, however, that author thinks, may be regarded as undeniable.

When the sea subsided from mount Etna, the mountain must have been covered over with such matters as the sea usually deposits; consequently with calcareous substances. A part of those matters would be indurated by the action of the atmosphere, while the rest would be carried down by the rain-waters, and again conveyed into the ocean. The torrents of rain-water which pour down the sides of mount Etna, have furrowed its sides, by cutting out for themselves channels; and they have removed from its summit, and are still removing to a farther distance, all the extraneous bodies upon it. In many places, they flow at present over a channel of lava, having cut through all the matters which lay above it: still, however, there remain in many places, both calcareous matter and other marine productions, which show that this volcano has been once covered by the waters of the ocean. But these are daily wasting away; not only by the rains, but by men likewise, who carry them off as materials for lime and for building.

The lower parts of Etna present to the eye very extensive plains entirely covered with lava of different thickness, on which vegetation has not yet made any progress. The nearer the shore the more barren is the ground; while the fertility of the soil increases as we advance farther inwards. The mountain is every where full of vast excavations; which our author considers as a proof, that instead of increasing in bulk, it is actually in a state of decay and diminution. The vast torrents of lava, which overspread the sides of it from time to time, he considers as insufficient to repair the waste occasioned by rains, rivulets, and torrents flowing down from the summit. Unless the eruptions, therefore, become more frequent than they have been for some time past, M. Houel supposes that, by degrees, the height of the mountain must be reduced to that of the surrounding beds of lava. He had not an opportunity of measuring the altitude of Etna himself; but he observes that it had been done by the celebrated M. de Saussure, who found the elevation to be 10,036 feet. This was done on the 5th of June, 1773, at twenty minutes after seven in the morning. The height of the barometer on the most elevated part at the brink of the crater, was 18 inches $11\frac{1}{4}$ lines; which, by the necessary corrections, is reduced to eighteen inches $10\frac{15}{16}$ lines. At the same time the mercury at Catania, placed only one foot above the level of the sea, stood at 28 inches $2\frac{1}{16}$ lines; which must be reduced to 28 inches $1\frac{1}{8}$ lines, on account of the necessary corrections for the thermometer.

Four of the mouths of this mount appear to be composed of a reddish pozzolano, which has procured it the name of the Red Mountain: but when we ascend the pyramids, or rather funnels, which they form, we find them composed of different coloured layers of sand. Some of these are of a blueish grey colour, others of a fine yellow, and some of a kind of green, formed by a mixture of grey and yellow, while others are of a red colour. A great number of small crystals, black schoerls, and granites, are found among them, as well as pieces of scoria, which had been discharged from the volcano in the form of a thick and glutinous matter. All these mouths have internally the form of a funnel, and their shape is nearly that of a mutilated cone or round pyramid. This is the natural and unavoidable consequence of the perpendicular fall of the pulverised matter which the volcano discharges from the orifice at the bottom. The sides of the craters are not all of one height; the parts to the east and west being considerably higher than the intermediate summits, because the currents of the ashes passed alternately from east to west, and fell upon these sides in greater quantities than on the others; which circumstance has given to this volcano the appearance of having two summits.

The majestic forests which surround Etna afford a singular spectacle, and bear no resemblance to those of other countries. Their verdure is more lively, and the trees of which they consist are of a greater height. These advantages they owe to the soil whereon they grow; for the soil produced by volcanoes is particularly favourable to vegetation, and every species of plants grows here with great luxuriance. In several places where we can view their interior parts, the most enchanting prospects are displayed. The hawthorn trees are of an immense size. Our author saw several of them of a regular form, and which he was almost tempted to take for large orange-trees cut artificially into the figures they represented. The beeches appear like so many ramified pillars, and the tufted branches of the oak like close bushes impenetrable to the rays of the sun. The appearance of the woods in general is exceedingly picturesque, both because of the great number and variety of the trees, and the inequality of the ground, which makes them rise like the seats in an amphitheatre, one row above another; disposing them also in groups and glades, so that their appearance changes to the eye at every step: and this variety is augmented by accidental circumstances, as the situation of young trees among others venerable for their antiquity; the effects of storms, which have often overturned large trees, while stems shooting up from their roots, like the Lernæan hydra, show a number of heads newly sprung, to make up for that which was cut off.

Etna abounds very much with springs, fountains, and even rivers of considerable magnitude. M. Houel has computed, that if all the water flowing down the sides of this mountain were collected, it would fill the channel of a river thirty-six feet broad, and six in depth. Many of the springs afford fine salt; some are very pure, and others are impregnated with noxious substances; while others are remarkable for their use in dyeing particular colours.

It has been a question, whether the eruptions of Mount Etna were more frequent in ancient than in modern times? At first it seems impossible to give a precise answer to such a question; but when we consider, that the matter in the volcanic focus was then greater in quantity than at present, in proportion to the space which it occupied; that the cavities were then sooner filled with vapour; and that the centre of the focus was then less remote, we need not hesitate to pronounce, that in earlier times the eruptions were more frequent as well as more copious.

Mount Etna, as we have already remarked, has been a celebrated volcano from the remotest antiquity. Diodorus Siculus mentions eruptions of it as happening 500 years before the Trojan war, or 1693 years before the Christian æra. From Homer's silence with regard to the phenomenon of Etna, it is to be presumed that the volcano had been many ages in a state of inactivity, and that no tradition of its burning remained among the inhabitants at the time he composed his Odyssey; perhaps it never had emitted flames since the country was peopled. The first eruption taken notice of by ancient, but by no means contemporary, authors, happened before the Greeks landed on the island, and is supposed to have scared the Sicani from the east part of Sicily.

Pindar is the oldest writer extant who speaks of Etna as a volcano. The first recorded eruption was in the time of Pythagoras. Plato was invited by the younger Dionysius to examine the state of the mountain after the sixth. It threw up flames and lava near an hundred times between that period and the battle of Pharsalia: it was particularly furious while Sextus Pompeius was adding the horrors of war to its devastations. Charlemagne happened to be at Catania during one of the eruptions; and from his reign the chronicles mention fifteen down to that of the year 1669, the most terrible of them all. Since 1669 there have been several eruptions, but none of them comparable to it. In that which happened in 1766, the lava sprung up into the air to a considerable height, twelve miles below the summit; but formed a stream only six miles in length and one mile in breadth.

A considerable eruption happened in 1787. From the 1st to the 10th of July, there were signs of its approach. On the 11th, after a little calm, there was a subterraneous noise, like the sound of a drum in a close place, and it was followed by a copious burst of black smoke. It was then calm till the 15th, when the same prognostics recurred. On the 17th, the subterraneous noise was heard again; the smoke was more abundant, slight shocks of an earthquake followed, and the lava flowed from behind one of the two little mountains which form the double head of Etna. On the 18th, while the spectators were in anxious expectation of a more severe eruption, all was quiet, and continued so more than twelve hours: soon after, they perceived some new shocks, accompanied with much noise; and the mountain threw out a thick smoke, which, as the wind was westerly, soon darkened the eastern horizon; two hours afterwards a shower of fine black brilliant sand descended: on the east side it was a storm of stones; and, at the foot of the mountain, a deluge of flashes of fire, of scoria and lava.

These appearances continued the whole day; at the setting of the sun the scene changed. A number of conical flames rose from the volcano; one on the north, another on the south, were very conspicuous; and rose and fell alternately. At three in the morning, the mountain appeared cleft, and the summit seemed a burning mass. The cones of light which arose from the crater were of an immense extent, particularly the two just mentioned. The two heads seemed to be cut away; and at their separation was a cone of flame, seemingly composed of many lesser cones. The flame seemed of the height of the mountain placed on the mountain; so that it was probably two miles high, on a base of a mile and a half in diameter. This cone was still covered with a very thick smoke, in which there appeared very brilliant flashes of lightning, a phenomenon which Etna had not before afforded. At times, sounds like those from the explosion of a large cannon were heard, seemingly at a less distance than the mountain. From the cone, as from a mountain, a jet of many flaming volcanic matters was thrown, which were carried to the distance of six or seven miles: from the base of the cone a thick smoke arose, which, for a moment, obscured some parts of the flame, at the time when the rivers of lava broke out. This beautiful appearance continued three quarters of an hour. It began the next night with more force: but continued only half an hour. In the intervals, however, Etna continued to throw out flames, smoke, stones ignited, and showers of sand. From the 20th to the 22d, the appearances gradually ceased. The stream of lava was carried towards Bronte and the plain of Lago.

After the eruption, the top of the mountain on the western side was found covered with hardened lava, scoria, and stones. The travellers were annoyed by smoke, by showers of sand, mephitic vapours, and excessive heat. They saw that the lava which came from the western point divided into two branches, one of which was directed towards Libeccio; the other, as we have already said, towards the plain of Lago. The lava on the western head of the mountain had, from its various shapes, been evidently in a state of fusion; from one of the spiracula, the odour was strongly that of liver of sulphur. The thermometer, in descending, was at 40 degrees of Fahrenheit's scale; while near the lava, in the plain of Lago, it was 140 degrees. The lava extended two miles; its width was from 12 to $13\frac{3}{4}$ feet, and its depth $13\frac{5}{4}$ feet.

A variety of particulars respecting this celebrated mountain may be found in different volumes of the Philosophical Transactions. See also Ætna.

ETOLIA, a country of ancient Greece, comprehending all that tract now called the Despotat, or Little Greece. It was parted on the east by the river Evenus, now the Fidari, from the Locrenses Ozolæ: on the west, from Acarnania by the Achelous; on the north, it bordered on the country of the Dorians and part of Epirus; and, on the south, extended to the bay of Corinth.

ETON, a town of Buckinghamshire, opposite Windsor. It is seated on the Thames, over which there is a bridge. Lat. 50. 30 N. Lon. 0. 36 W. Here is a college, which was founded by Henry VI. for the support of a provost and seven fellows, one of whom is vice-provost, and for the education of seventy king's scholars, as those are called who are on the foundation. These, when properly qualified, are elected, on the first Tuesday in August, to King's college, Cambridge; but they are not removed till there are vacancies in the college, and then they are called according to seniority: and after they have been three years at Cambridge they claim a fellowship. Besides those on the foundation, there are seldom less than three hundred scholars, and often many more, who board at the masters' houses, or within the bounds of the college. The school is divided into upper and lower, and each of these into three classes. To each school there is a master and four assistants or ushers. The revenue of the college is about 5000*l.* a year. Here is a noble library, and in the great court is a fine statue of the founder erected at the expence of a late provost, Dr. Godolphin, dean of St. Paul's. The chapel is in a good style of Gothic architecture. The schools and other parts, which are in other styles of building, are nearly as good, and seem like the design of Inigo Jones.

At Eton there is a singular festival, celebrated triennially (formerly duennially) by the scholars of the school upon Whit Tuesday, for the benefit of the captain or head-boy of the school for the time being, and thence called Montem, i. e. *Mon-tem*, "my turn, or season." The following account of this festival, taken from the Monthly Magazine, will probably be acceptable to many of our readers.

It commences by a number of the senior boys taking post upon the bridges or other leading places of all the avenues around Windsor and Eton soon after the dawn of day. These youths so posted, are chiefly the best figures, and the most active of the students; they are all attired in fancy dresses of silks, satins, &c. and some richly embroidered, principally in the habits or fashion of running footmen, with poles in their hands; they are called salt-bearers, and demand salt, i. e. a contribution from every passenger, and will take no denial.

When the contribution is given, which is *ad libitum*, a printed paper is delivered with their motto and the date of the year, which passes the bearer free through all other salt-bearers for that day, and is as follows, viz.

"Pro more et monte,
1809, (or the year of the ceremony),
Vivant rex et regina."

These youths continue thus collecting their salt at all the entrances for near seven miles round Windsor and Eton, from the dawn of day until about the close of the procession, which is generally three o'clock in the afternoon.

The procession commences about twelve o'clock at noon, and consists of the queen's and other bands of music; several standards borne by different students; all the Etonian boys, two and two, dressed in officers' uniforms; those of the king's foundation wearing blue, the others scarlet uniforms, swords, &c.

The grand standard-bearer.

The captain, or head boy of Eton school.

The lieutenant, or second boy.

His majesty, attended by the prince of Wales, and other male branches of the royal family on horseback, with their suite.

The queen and princesses in coaches, attended by their suite.

Band of music, followed by a great concourse of the nobility and gentry in their carriages and on horseback.

The procession commences in the great square at Eton, and proceeds through Eton to Slough, and round to Salt Hill, where the boys all pass the king and queen in review, and ascend the Montem: here an oration is delivered, and the grand standard is displayed with much grace and activity by the standard-bearer, who is generally selected from among the senior boys.

There are two extraordinary salt-bearers appointed to attend the king and queen, who are always attired in fanciful habits, in manner of the other salt-bearers already described, but superbly embroidered. These salt-bearers carry each an embroidered bag, which not only receives the royal salt, but also whatever is collected by the out-stationed salt-bearers. The donation of the king and queen, or, as it is called upon this occasion, the royal salt, is always fifty guineas each; the prince of Wales thirty guineas; all the other princes and princesses twenty guineas each. As soon as this ceremony is performed, the royal family return to Windsor. The boys are all sumptuously entertained at the tavern at Salt Hill; and the beautiful gardens at that place are laid out for such ladies and gentlemen as choose to take any refreshments, the different bands of music performing all the time in the gardens.

About six o'clock in the evening, all the boys return in the same order of procession as in the morning (with the exception only of the royal family), and, marching round the great square in Eton school, are dismissed. The captain then pays his respects to the royal family at the queen's lodge, Windsor, previous to his departure for King's college, Cambridge; to defray which expence, the produce of the Montem is presented to him. Upon Whit Tuesday, in the year 1796, it amounted to more than 1000 guineas. The day concludes by a brillant display of beauty, rank, and fashion, a promenade on Windsor terrace, bands of music performing, &c. and the scene highly enlivened and enriched by the affable condescension of the royal family, who indiscriminately mix with the company, and parade the terrace till nearly dark.

ETRURIA, a village in Staffordshire, near Newcastle. It is the principal seat of the potteries in this county. Here was first made that excellent English ware, known by the name of Wedgewood's ware, from its inventor, the late Josiah Wedgewood, esq. Kuttner, the author of Travels through Germany, &c. speaking of the inns in Sweden, says, "Here the plates and dishes are of Staffordshire ware, or as it is called in Germany, English stoneware. It would be difficult to name the man who ever instituted for his country so prodigious an article of commerce as Wedgewood, in bringing the earthenware to such a pitch of perfection; and which is used from one extremity of Europe to the other, as the general table service, both by the rich, and by the poor. It is one of the greatest things that any one man ever yet performed."

ETTRICK, a river in Selkirkshire, which rises from the mountainous region in the S. W. and having formed a junction with the Yarrow, their united streams meet the Tweed, where that river enters Roxburghshire.

ETYMOLO'GICAL. *a.* (from *etymology.*) Relating to etymology (*Locke*).

ETYMO'LOGIST. *s.* (from *etymology.*) One who searches out the original of words.

ETYMOLO'GICON, is used for a book containing the etymologies of any language. See Etymology.

ETYMOLOGY. (ετυμολογια.) That part of grammar which considers, deduces, and explains the origin, reason, and derivation of words, in order to arrive at their first and primary signification. The word is formed of the Greek ετυμος, *verus*, true, and λεγω, *dico*, I speak; whence λογια, discourse, &c. and thence Cicero calls the etymology *notatio* and *veriloquium*, though Quintilian chooses rather to call it *originatio.*

In all ages there have been people curious in etymologies: Varro has written on the etymology of the Latin words; and we have a Greek etymologicon, under the name of Nicas.

The etymologies of our English words have been deduced from the Saxon, Welsh, Walloon, Danish, Latin, Greek, &c. by Somner, Camden, Verstegan, Spelman, Casaubon, Skinner, Henshaw, Junius, &c.

Those of the French and Italian words by Menage, Henry Stephens, Tripot, Borel, Caseneuve, Guichard, F. Thomassin, Postel, and Falconet.

We have a Latin etymologicon of Gerard Vossius, another of Martinius, &c. Octavio Ferrari has given a body of etymologies of the Italian tongue, and Bernard d'Aldretta another of the Spanish.

A strict and solicitous inquiry into etymologies is no frivolous and impertinent design, but has considerable uses. Nations, who value themselves on their antiquity, have always looked on the antiquity of their language as one of the best titles they could plead. The etymologists, by seeking the true and original reason of the notions and ideas annexed to each word and expression, may often furnish an argument of antiquity from the vestigia or traces remaining thereof, and from the indices still subsisting in the present use of the words compared with the ancient uses. Add, that etymologies are necessary to the thorough understanding of a language; for, to explain a term precisely, there seems a necessity of recurring to its first imposition, in order to speak justly and satisfactorily thereof. The force and extent of a word is generally better conceived and entered into when a person knows its origin and etymology. It is objected, however, that the art is arbitrary, and built altogether on conjectures and appearances; and the etymologists are charged with deriving their words from what originals they please; but the science is certainly real, and as regular as diverse others, having its proper principles and method. It must be owned, indeed, that it is not easy to return into the ancient British and Gaulish ages; to follow, as it were, by the track, the diverse imperceptible alterations a language has undergone from age to age. A sober etymologist has need of all the lights he can come at, to conduct and bring down words variously disguised in their passage, and remark all the changes that have befallen them; and as those alterations have sometimes been owing to caprice or hazard, it is easy to take a mere imagination or conjecture for a regular analogy; so that it is not strange the public should be prejudiced against a science which seems to stand on so precarious a footing.

As a specimen of the use of etymology, we may remark that the name of Hiddekel (given by Moses to one of the rivers he mentions in his description of Eden), that of Diglath, current in the Levant, and the Tigris of the Europeans, denote one and the same river. Taking away the aspiration of the word Hiddekel, the word Dekel remained, which the Syrians disguised by making Diklat out of it: Josephus, and the Chaldæan paraphrasts, the Arabians, and the Persians, turned it into Diglath; other modern orientals into Degil and Degola; Pliny, or those who informed him, into Diglito; and the Greeks, who gave to all strange words the turn and genius of their own tongue, instead of Diglis, called it Tigris; being induced probably to do so, by the information they had received of the swiftness of this river, which was aptly denoted by the name Tigris. See Plin. l. vi. c. 27. Strab. &c.

Etymology denotes also the part of grammar which delivers the inflections of nouns and verbs.

E'TYMON. *s.* (ετυμον.) Original; primitive word (*Peacham*).

EU, a seaport of France, in the department of Lower Seine, with a strong castle, and a handsome square. The principal trade is in serges and lace. Lat. 50. 3 N. Lon. 1. 30 E.

To EVA'CATE. *v. a.* (*vaco*, Latin.) To empty out; to throw out (*Harvey*).

EVA'CUANTS, in medicine, remedies proper to expel or carry off any ill, peccant, or redundant humours in the human body, by the proper outlets or emunctories.

To EVA'CUATE. *v. a.* (*evacuo*, Latin.) 1. To make empty; to clear (*Hooker*). 2. To throw out as noxious, or offensive. 3. To void by the excretory passages (*Arbuthnot*). 4. To make void; to nullify (*South*). 5. To quit; to withdraw from out of a place (*Swift*).

EVACUA'TION. *s.* (from *evacuate*.) 1. Such emissions as leave a vacancy; discharge (*Hale*). 2. Abolition; nullification (*Hooker*). 3. The practice of emptying the body by physic (*Temple*). 4. Discharge of the body by any vent natural or artificial.

To EVA'DE *v. a.* (*evado*, Latin.) 1. To elude; to escape by artifice or stratagem (*Brown*). 2. To avoid; to decline by subterfuge (*Dryden*). 3. To escape or elude by sophistry (*Stillingfleet*). 4. To escape as imperceptible or unconquerable (*South*).

To Eva'de. *v. n.* 1. To escape; to slip away (*Bacon*). 2. To practise sophistry or evasions (*South*).

EVAGA'TION. *s.* (*evagor*, Lat.) The act of wandering; excursion; ramble; deviation (*Ray*).

EVAGORAS. The most celebrated of this name is a king of Cyprus who retook Salamis, which had been taken from his father by the Persians. He made war against Artaxerxes, the king of Persia, with the assistance of the Egyptians, Arabians, and Tyrians, and obtained some advantage over the fleet of his enemy. The Persians, however, soon repaired their losses, and Evagoras saw himself defeated by sea and land, and obliged to be tributary to the power of Artaxerxes, and to be stripped of all his dominions except the town of Salamis. He was assassinated soon after this fatal change of fortune, by an eunuch, 374 B.C. He left two sons, Nicocles, who succeeded him, and Protagoras, who afterwards deprived his nephew Evagoras of his possessions, upon account of his oppression. (*C. Nep. Justin*, &c.)

EVANDER, a son of the prophetess Carmente, king of Arcadia. An accidental homicide obliged him to leave his country, and he came to Italy, drove the Aborigines from their ancient possessions, and reigned in that part of the country where Rome was afterwards founded. He gave Æneas assistance against the Rutuli, and distinguished himself by his hospitality. It is said he first brought the Greek alphabet into Italy, and introduced there the worship of the Greek deities. He was honoured as a god after death, and his subjects raised him an altar on mount Aventine. (*Paus. Liv.* &c.)—2. A philosopher of the second academy, who flourished B.C. 215.

EVANE'SCENT. *a.* (*evanescens*, Latin.)

Vanishing; imperceptible; lessening beyond the perception of the senses (*Wollaston*).

EVANESCENT OF VANISHING QUANTITIES, are by Newton considered as divisible, and not determinate, but continually diminishing. The term vanishing is, indeed, applied daily to objects during the time of their disappearing, before they are actually out of sight, absolutely signifying no more than going to vanish: and, as these quantities, being of a finite, i. e. a real magnitude, do not vanish instantaneously, with the utmost propriety they may be said to be vanishing all the time they are undergoing the diminution ascribed to them. Hence appears the mistake of Dr. Berkeley, when he asserts that, *Let these increments vanish*, is equivalent to, *Let the increments be nothing*.

EVANGE'LICAL, *a.* (*evangelicus*, Lat.) 1. Agreeable to Gospel: consonant to the Christian principles revealed in the Gospel (*Atterbury*). 2 Contained in the Gospel (*Hooker*).

EVA'NGELISM, *s.* (from *evangely.*) The promulgation of the blessed Gospel (*Bacon*).

EVANGELISTS, the inspired authors of the Gospels. The word is derived from the Greek ευαγγελιον, formed of ευ, *bene*, well, and αγγελος, angel, messenger.

The denomination evangelists was likewise given in the ancient church to such as preached the Gospel up and down, without being attached to any particular church, being either commissioned by the apostles to instruct the nations, or, of their own accord, abandoning every worldly attachment, consecrated themselves to the sacred office of preaching the Gospel. In which sense some interpreters think it is that St. Philip, who was one of the seven deacons, is called the evangelist, in the twenty-first chapter of the Acts of the Apostles, ver. 8. Again, St. Paul writing to Timothy, Ep. ii. chap. iv. ver. 5, bids him do the work of an evangelist. The same apostle, Eph. iv. 11, ranks the evangelists after the apostles and prophets.

To EVA'NGELIZE. *v. a.* (*evangelizo*, Lat. ευαγγελιζω.) To instruct in the Gospel, or doctrine of Jesus (*Milton*).

EVAN'GELY. *s.* (ευαγγελιον.) Good tidings: the message of pardon and salvation: the holy Gospel; the Gospel of Jesus (*Spenser*).

EVA'NIA, in zoology, a tribe of hymenopterous insects, belonging to the genus sphex; thus denominated by Fabricius in his entomological system.

EVA'NID. *a.* (*evanidus*, Latin.) Faint; weak; evanescent (*Brown*).

To EVA'NISH. *v. n.* (*evanesco*, Latin.) To vanish; to escape from notice or perception.

EVANTES, in antiquity, priestesses of Bacchus.

EVA'PORABLE. *a.* (from *evaporate.*)—Easily dissipated in fumes or vapours (*Grew*).

To EVA'PORATE. *v. n.* (*evaporo*, Lat.) To fly away in vapours or fumes; to waste insensibly as a volatile spirit (*Boyle*).

To EVA'PORATE. *v. a.* 1. To drive away in fumes (*Bentley*). 2. To give vent to; to let out in ebullition or sallies (*Wotton*).

EVAPORA'TION. *s.* (from *evaporate.*) 1. The act of flying away in fumes or vapours; vent; discharge (*Howel*). 2. The act of attenuating matter, so as to make it fume away (*Raleigh*).

EVAPORATION. (*evaporatio.*) The volatilization of a fluid by means of heat, with access of air, in order to diminish its fluidity, to obtain any fixed salts it may hold in solution, or to inspissate a residuum. In this manner sea water is evaporated, and its salt obtained, and decoctions are made into extracts.

As a part of technical chemistry, the process of evaporation is of extreme importance, as being essential to an infinite number of chemical processes, both for experiment and manufacture. As the consumption of fuel is an object of first importance in all large evaporations, numerous experiments have been made to ascertain the greatest possible effect of combustibles in evaporating the watry part of saline and other solutions. It seems to be now well ascertained, that more liquid is evaporated by a given portion of fuel when the liquor is kept at the boiling point, than at any inferior temperature; and hence this is the heat generally employed, except a lower temperature is required for particular purposes. Evaporation is greatly increased by the agitation of the air on the surface of the heated fluid; but again, as this has an equal effect in cooling the whole mass, it is a matter of great doubt, whether the additional strength of fire required to counteract this effect will not, in most cases, destroy any economical advantages which may be proposed from this circumstance.

Evaporating vessels are sometimes made of metal, but more generally of earthen-ware or glass. The glass vessels used in this country are segments of spheres, blown thin enough to bear a lamp-heat; and sold in assortments of different sizes, from the capacity of nearly a pint to that of about an ounce. A broken matrass or Florence flask, cut round, will answer the purpose extremely well. The globular shape of all these vessels, however, renders them difficult to heat; but it is not easy to get glass much flatter at bottom, while it retains that uniform thinness which is necessary to make it bear the application of heat.

Very convenient evaporating vessels, nearly flat-bottomed, are made by Messrs. Wedgewoods, and sold in nests, or assortments, the largest of which will hold eight or ten pints. They are sometimes plain, sometimes with a lip in the upper edge, that the contained liquor may be poured out the more easily. They are made either with or without glazing. Even when unglazed, they do not really imbibe the liquor introduced into them, as their texture is a very dense, hard, biscuit porcelain: though in great length of time saline solutions will make their way through and show themselves in efflorescences on the outside. These evaporating vessels will bear to be heated to boiling, over a clear hot fire, such as that of charcoal or cinders; but they are liable to crack when exposed to jets of flame, or unless heated with some caution at first. No liquor should be evaporated to dryness in these vessels, as they generally crack whilst the last portion of fluid is expelled, unless the heat be much lowered.

Evaporation, in natural philosophy, is the conversion of water into vapour, which in consequence of becoming lighter than the atmosphere, is raised considerably above the surface of the earth, and afterwards by a partial condensation forms clouds.

The phenomenon which consists in the passage of a body from the state of liquidity to that of vapour, takes the name of vaporization, when it is solely due to the action of caloric; and that of evaporation, when the air intervenes in its production, by the affinity (as is usually affirmed) which it exercises towards the particles of the vapour.

Though evaporation be generally considered as an effect of the heat and motion of the air, yet M. Gauteron, in the Memoires de l'Acad. des Scienc. an. 1705, shows, that a quite opposite cause may have the same effect, and that fluids lose more of their parts in the severest frost than when the air is moderately warm: thus, in the great frost of the year 1708, he found that the greater the cold, the more considerable the evaporation: and that ice itself lost full as much as the warmer liquors that did not freeze.

There are indeed few subjects of philosophical investigation that have occasioned a greater variety of opinion than the theory of evaporation, or of the ascent of water in such a fluid as air, between 8 and 9 hundred times lighter than itself, to different heights according to the different densities of the air; in which case it must be specifically lighter than the air through which it ascends. The Cartesians account for it by supposing, that by the action of the sun upon the water, small particles of the water are formed into hollow spheres, and filled with the *materia subtilis*, which renders them specifically lighter than the ambient air, so that they are buoyed up by it.

Dr. Nieuwentyt, in his Religious Philosopher, cont. 19, and several others, have alleged, that the sun emits particles of fire which adhere to those of water, and form moleculæ, or small bodies, lighter than an equal bulk of air, which consequently ascend till they come to a height where the air is of the same specific gravity with themselves; and that these particles being separated from the fire with which they are incorporated, coalesce and descend in dew or rain.

Dr. Halley has advanced another hypothesis, which has been more generally received: he imagined, that by the action of the sun on the surface of the water, the aqueous particles are formed into hollow spherules, that are filled with a finer air highly rarefied, so as to become specifically lighter than the external air. Philos. Transac. number 192.

Others have attempted to account for the phenomena of evaporation on another principle, viz. that of solution; and shown, from a variety of experiments, that what we call evaporation is nothing more than a gradual solution of water in air, produced and supported by the same means, or by attraction, heat, and motion, by which other solutions are effected. This was the opinion of F. Nollet, of Dr. Hamilton, and of M. Leroie.—(See Haüy's Natural Philosophy, vol. 1.) It is, however, liable to some very strong objections, as will be seen further on.

Dr. Halley furnishes us with some experiments of the quantity or measure of the evaporation of water. The result is contained in the following articles:

1. That water salted to about the same degree as salt-water, and exposed to a heat equal to that of a summer's day, did, from a circular surface of about eight inches diameter, evaporate at the rate of six ounces in twenty-four hours. Whence, by a calculus, he finds that the thickness of the pellicle or skin of water, evaporated in two hours, was the fifty-third part of an inch; but, for a round number, he supposes it only a sixtieth part; and argues thence, that if water as warm as the air in summer evaporates the thickness of one sixtieth part of an inch in two hours from its whole surface; in twelve hours it will evaporate the tenth of an inch: which quantity, he observes, will be found abundantly sufficient to furnish all the rains, springs, dews, &c. By this experiment, every ten square inches of surface of the water yield in vapour *per diem* a cubic inch of water: and each square foot, half a wine pint; every space of four square feet, a gallon; a mile square, 6914 tuns; and a square degree, of sixty-nine English miles, will evaporate thirty-three millions of tuns a-day; and the whole Mediterranean, computed to contain 160 square degrees, at least, 5280 millions of tuns each day. Philos. Trans. number 189, or Abridg. vol. 2, p. 108.—2. A surface of eight square inches, evaporated purely by the natural warmth of the weather, without either wind or sun, in the course of a whole year, 16292 grains of water, or sixty four cubic inches; consequently, the depth of water thus evaporated in one year amounts to eight inches. But this being too little to answer the experiments of the French, who found that it rained nineteen inches of water in one year at Paris; or those of Mr. Townley, who found the annual quantity of rain in Lancashire above forty inches; he concludes, that the sun and wind contribute more to evaporation than any internal heat or agitation of the water. In effect, Dr. Halley fixes the annual evaporation of London at 48 inches; and Dr. Dobson states the same for Liverpool at 36¾ inches. Philos. Trans. vol. 67, p 252.

3. The effect of the wind is very considerable, on a double account; for the same observations show a very odd quality in the vapours of water, viz. that of adhering and hanging to the surface that exhaled them, which they clothe as it were with a fleece of vapourous air; which once investing the vapour, it afterwards rises in much less quantity. Whence, the quantity of water lost in twenty-four hours, when the air is very still, was very small, in proportion to what went off when there was a strong gale of wind abroad to dissipate the fleece, and make room for the emission of vapour; and this, even though the experiment was made in a place as close from the wind as could be contrived. Add, that this fleece of water, hanging to the surface of waters in still weather, is the occasion of very strange appearances, by the refraction of the vapours differing from and exceeding that of common air: whence every thing appears raised, as houses like steeples, ships as on land above the water, the land raised, and as it were, lifted from the sea, &c.

4. The same experiments show that the evaporation in May, June, July, and August, which are nearly equal, are about three times as great as those in the months of November, December, January, and February. Philosophical Transactions, number 212.

Dr. Brownrigg, in his Art of making common salt, p. 189, fixes the evaporation of some parts of

England at 73.8 inches during the months of May, June, July, and August; and the evaporation of the whole year at more than 140 inches. But the evaporation of the four summer months at Liverpool, on a medium of four years, was found to be only 18.88 inches. Also Dr. Hales calculates the greatest annual evaporation from the surface of the earth in England at 6.66 inches; and therefore the annual evaporation from a surface of water, is to the annual evaporation from the surface of the earth at Liverpool, nearly as 6 to 1. Philos. Trans. vol. 67, ubi supra.

As a very considerable proportion of the earth's surface is covered with water, and as this water is constantly evaporating and mixing with the atmosphere in the state of vapour, a precise determination of the rate of evaporation must be of very great importance in meteorology. Accordingly, many experiments have been made to determine the point by different philosophers. No person has succeeded so completely as Mr. Dalton: but many curious particulars had been previously ascertained by the labours of Richman, Lambert, Watson, Saussure, De Luc, Kirwan, and others.—From these we learn that, 1. the evaporation is confined entirely to the surface of the water: hence it is in all cases proportional to the surface of the water exposed to the atmosphere. Much more vapour of course rises in maritime countries, or those interspersed with lakes, than in inland countries. 2. Much more vapour rises during hot weather than during cold: hence the quantity evaporated depends in some measure upon temperature. The precise law has been happily discovered by Mr. Dalton, who says, in general, the quantity evaporated from a given surface of water per minute at any temperature, is to the quantity evaporated from the same surface at 212°, as the force of vapour at the first temperature is to the force of vapour at 212°. Hence, in order to discover the quantity which will be lost by evaporation from water of a given temperature, we have only to ascertain the force of vapour at that temperature. Hence, we see that the presence of atmospheric air obstructs the evaporation of water; but this evaporation is overcome in proportion to the force of the vapour. Mr. Dalton ascribes this obstruction to the *vis inertiæ* of air. 3. The quantity of vapour which rises from water, even when the temperature is the same, varies according to circumstances. It is least of all in calm weather, greater when a breeze blows, and greatest of all with a strong wind. Mr. Dalton has a given a table that shows the quantity of vapour raised from a circular surface of six inches in diameter in atmospheric temperatures. The first column expresses the temperature; the second the corresponding force of vapour; the other three columns give the number of grains of water that would be evaporated from a surface of six inches in diameter in the respective temperatures, on the supposition of there being previously no aqueous vapour in the atmosphere. These columns present the extremes, and the mean of evaporation likely to be noticed, or nearly such: for the first is calculated upon the supposition of 35 grains loss per minute, from the vessel of 3½ inches in diameter; the second 45, and the third 55 grains per minute.

Temperature.	Force of vapour in inches.	Evaporating force in grains.

4. Such is the quantity of vapour which would rise in different circumstances, on the supposition that no vapour existed in the atmosphere. But this is a supposition which can never be admitted, as the atmosphere is in no case totally free from vapour. Now, when we wish to ascertain the rate at which evaporation is going on, we have only to find the force of the vapour already in the atmosphere, and subtract it from the force of vapour at the given temperature; the remainder gives us the actual force of evaporation; from which, by the table, we readily find the rate of evaporation.—Thus, suppose we wish to know the rate of evaporation at the temperature 59°. From the table, we see that the force of vapour at 59° is 0.5, or $\frac{1}{60}$ its force at 212°. Suppose we find by trials, that the force of the vapour already existing in the atmosphere is 0.25, or the half of $\frac{1}{60}$. To ascertain the rate of evaporation, we must subtract the 0.25 from 0.5; the remainder 0.25 gives us the force of evaporation required: which is precisely one half of what it would be if no vapour had previously existed in the atmosphere. 5. As the force of the vapour actually in the atmosphere is seldom equal to the force of vapour of the temperature of the atmosphere, evaporation, with a few exceptions, may be considered as constantly going on. Various attempts have been made to ascertain the quantity evaporated in the course of a year; but the difficulty of the problem is so great, that we can expect only an approximation towards a solution.

If we believe Col. Williams, the evaporation from the surface of land covered with trees and other vegetables is one-third greater than from the surface of water; but this has not been confirmed by other philosophers. From his experiments it appears, that in Bradford, in New England, the evaporation, during 1772, amounted to 42.65 inches. But, from the way that his experiments were conducted, the amount was probably too great.

From an experiment of Dr. Watson, made on the 2d of June, 1779, after a month's drought, it appears, that the evaporation from a square inch of a grass plot amounted to 1.2 grains in an hour, or 28.8 grains in 24 hours, which is 0.061 of an inch. In another experiment, after there had been no rain for a week, the heat of the earth being 110°, the evaporation was found almost twice as great, or=0.108 of an inch in the day.—The mean of these two experiments is 0.084 inches, amounting for the whole of June to 2.62 inches. If we suppose this to bear the same proportion to the whole year that the evaporation in Dr. Dobson's experiments for June do to the annual evaporation, we shall obtain an annual evaporation, amounting to about 22 inches. This is much smaller than that obtained by Col. Williams. But Dr. Watson's method was not susceptible of precision. He collected the vapour raised on the inside of a drinking-glass; but it was impossible that the glass could condense much more than one half of what did rise, or would have been raised in other circumstances. But then the experiments were made in the hottest part of the day, when much more vapour is raised than during any part of it.

The most exact set of experiments on the evaporation from the earth was made by Mr. Dalton and Mr. Hoyle, during 1796, and the two succeeding years. The method which they adopted was this: Having got a cylindrical vessel of tinned iron, ten inches in diameter, and three feet deep, there were inserted into it two pipes turned downwards for the water to run off into bottles: the one pipe was near the bottom of the vessel; the other was an inch from the top. The vessel was filled up for a few inches with gravel and sand, and all the rest with good fresh soil. It was then put into a hole in the ground, and the space around filled up with earth, except on one side, for the convenience of putting bottles to the two pipes; then some water was poured on to sadden the earth, and as much of it as would was suffered to run through without notice, by which the earth might be considered as saturated with water. For some weeks the soil was kept above the level of the upper pipe, but latterly it was constantly a little below it, which precluded any water running off through it. For the first year the soil at top was bare; but for the two last years it was covered with grass, the same as any green field.—Things being thus circumstanced, a regular register was kept of the quantity of rain water that ran off from the surface of the earth through the upper pipe (whilst that took place), and also of the quantity of that which sunk down through the three feet of earth, and ran out through the lower pipe. A rain-gauge of the same diameter was kept close by to find the quantity of rain for any corresponding time. The weight of the water which ran through the pipes being subtracted from the water in the rain-gauge, the remainder was considered as the weight of the water evaporated from the earth in the vessel.

From the experiments which were thus conducted, it appears that the quantity of vapour raised annually at Manchester is about 25 inches. If to this we add five inches for the dew with Mr. Dalton, it will make the annual evaporation 30 inches. Now, if we consider the situation of England, and the greater quantity of vapour raised from water, it will not surely be considered as too great an allowance, if we estimate the mean annual evaporation over the whole surface of the globe at 35 inches. Now, 35 inches from every square inch, on the superficies of the globe, make 94,450 cubic miles, equal to the water annually evaporated over the whole globe. Were this prodigious mass of water all to subsist in the atmosphere at once, it would increase its mass by about a twelfth, and raise the barometer nearly three inches: but this never happens; no day passes without rain in some part of the earth; so that part of the evaporated water is constantly precipitated again. Indeed it would be impossible for the whole of the evaporated water to subsist in the atmosphere at once, at least in the state of vapour. *Manchester Memoirs.*

But the grand question returns upon us, how is water taken up and retained in the atmosphere? It cannot be in the state of vapour, it is said, because the pressure is too great: there must, therefore, be a true chemical solution. But when we consider that the surface of water is subject to a pressure equal to 30 inches of mercury, and that besides this pressure, there is a sensible affinity between the particles of water themselves; how does the insensible affinity of the atmosphere for water overcome both these powers? How does vapour, which ascends with an elastic force of only half an inch of mercury, detach itself from water when it has the weight of 30 inches of mercury to oppose its ascent? This difficulty applies nearly the same to all theories of the solution of water in air; and it is therefore of consequence for every one, let him adopt what opinion he may, to remove it. Chemical solution but very ill explains it; for the affinity of air for vapour is always described as weak, and yet it must be sufficient to overcome a pressure so powerful as that of the atmosphere. Mr. Dalton is of opinion, that it is not till the depth of 10 or 12 strata of particles of any liquid, that the pressure upon each vertical column becomes uniform; and that several of the particles in the uppermost stratum are in reality subject to very little pressure. Chem. Philos. p. 193.

Hence it appears, that we have not, as yet, any theory of evaporation which is even plausible.

EVA'SION. *s.* (*evasum*, Latin.) Excuse; subterfuge; sophistry; artifice (*Milton*).

EVA'SIVE. *a.* (from *evade.*) 1. Practising evasion; elusive (*Pope*). 2. Containing an evasion; sophistical.

EVA'SIVELY. *ad.* By evasion; elusively; sophistically.

EVATES, and EUBAGES, orders among the Druids. The former took care of the sacrifices; the latter gave themselves up to contemplation.

EUBŒA, the largest island in the Ægean sea after Crete, now called Negropont. It is separated from the continent of Bœotia by the narrow straits of the Euripus. It is 150 miles long, and 37 broad in its most extensive parts. The principal town was Chalcis, and the whole island in process of time was subjected to the power of the Greeks. (*Plin. Strab.* &c.)—The only remarkable person of this name is one of the three daughters of the river Asterion, who was one of the nurses of Juno.

EUBULIDES. The most remarkable of this name is a philosopher of Miletus, pupil and successor to Euclid. Demosthenes was one of his pupils. He severely attacked the doctrines of Aristotle.

EUCALY'PTUS, in botany, a genus of the class icosandria, order monogynia. Calyx superior, permanent, truncate: covered, before flowering, with an entire deciduous lid or veil; capsule four-celled, opening at top, many-seeded. Fifteen species; some with the lid or veil conic; others hemispheric. All natives of New Holland. They are all trees or shrubs; and afford, on being tapped, a considerable portion of gummose or resinous fluid; not unfrequently employed with success in diarrhœas.

EUCHARIST, the sacrament of the Lord's supper properly signifies giving thanks. The word in its original Greek, ευχαριστια, literally imports thanksgiving; being formed of ευ, *bene*, well, and χαρις, *gratia*, thanks. This sacrament was instituted by Christ himself, and the participation of it is called communion. The scriptural accounts of the institution of the eucharist, prove clearly that it was a rite designed by God to keep up a continual remembrance of the doctrine of the atonement. See Dr. A. Clarke's learned Discourse on the Eucharist.

EUCHARI'STICAL. *a.* (from *eucharist.*) 1. Containing acts of thanksgiving (*Ray*). 2. Relating to the sacrament of the supper of the Lord.

EUCHITES, or EUCHITÆ, a sect who were first formed into a religious body towards the end of the fourth century, though their doctrine and discipline subsisted in Syria, Egypt, and other eastern countries before the birth of Christ; they were thus called because they prayed without ceasing, imagining that prayer alone was sufficient to save them. Their great foundation were those words of St. Paul, Epist. i. to the Thessalonians, chap. v. ver. 17, *pray without ceasing*. The word is formed of the Greek εὐχη, prayer, whence ευχιται, the same with the Latin *precatores*, prayers. They were also called Enthusiasts and Messalians, a term of Hebrew origin, denoting the same as Euchites. The Euchites were a sort of mystics who imagined, according to the oriental notion, that two souls resided in man, the one good, and the other evil; and who were zealous in expelling the evil soul or dæmon, and hastening the return of the good spirit of God, by contemplation, prayer, and singing of hymns. They also embraced the opinions nearly resembling the Manichean doctrine, and which they derived from the tenets of the oriental philosophy.

EUCHOLOGIUM. (ευχολογιον.) A Greek term, signifying literally, a discourse on prayer. The word is formed of ευχη, prayer, and λογος, discourse. The euchologium is properly the Greek ritual, wherein are prescribed the order and manner of every thing relating to the order and administration of their ceremonies, sacraments, ordinations, &c.

EUCLASE. See GEMMA.

EU'CLEA, in botany, a genus of the class diœcia, order dodecandria. Calyx four or five-toothed; corol four or five-parted. Male; stamens from twelve to fifteen. Female; germ superior; styles two; berry two-celled. One species only: a Cape tree, with branching spread; racemes axillary and nodding.

EUCLID, an eminent philosopher of Megara, and the disciple of Socrates. Although he was extremely partial to his master, he differed from him in the manner of teaching; for, instead of instructing his pupils in morals, he confined their attention wholly to the subtleties of logic. Hence his followers became noted wranglers, and were less desirous of discovering truth than of puzzling blockheads.

EUCLID, a famous mathematician of Alexandria, who flourished B.C. 300. He immortalized his name by his books on geometry, in which he digested all the propositions of the eminent geometricians who had preceded him, as Thales, Pythagoras, and others. King Ptolemy became one of his pupils, and his school became so famous, that Alexandria continued for ages the great university for mathematicians. The latest edition of his works is that of Gregory, Oxford, folio, 1703. There have been published many editions of his Elements in the course of the last two or three centuries, as by Billingsley, Commandine, De Chales, Barrow, Tacquet, Ozanam, Whiston, Martin, R. Simson, Bonnycastle, Playfair, and Ingram. The last four are generally esteemed the best; though Barrow's is particularly valuable, as it contains the whole fifteen books, and sir H.

Billingsley's (in 1570), is not merely valuable on the same account; but is curious for its great age, and for the elaborate preface of John Dee, dated from his "poore house at Mortlake."

EU'COMIS, in botany, a genus of the class hexandria, order monogynia. Corol inferior, six-parted, permanent, spreading; filaments united at the base into a nectary growing to the bottom of the corol. Five species; all Cape plants.

EU'CRASY, *s.* (ευκρασια.) An agreeable well-proportioned mixture of qualities, whereby the body is in health (*Quincy*).

EUDIOMETER. See EUDIOMETRY.

EUDIOMETRY. (ευδια, purity of air, and μετρον, a scale or measure.) The science of determining the purity of atmospheric air, by measuring the proportion of oxygen (on which its respirable property depends) in a given quantity of it: whence the tests or instruments employed in this science are denominated eudiometers.

When the composition of the atmosphere became first known to philosophers, it was taken for granted that the proportion of its oxygen varies at different times and in different places; and that upon this variation depends the purity or noxious qualities of air. Hence it became an object of great importance to get possession of a method to determine readily the quantity of oxygen in a given portion of air. Accordingly various methods were proposed, all of them depending upon the property which many bodies possess of absorbing the oxygen of the air without acting upon its azote.

These bodies were mixed with a certain known quantity of atmospheric air in graduated glass vessels, inverted over water, and the proportion of oxygen was determined by the diminution of bulk. The eudiometers thus proposed by different chemists, may be reduced to four; that of nitrous gas, of sulphurets, of hydrogen gas, and of phosphorus.

Eudiometer of Nitrous Gass.

1. The first eudiometer was devised in consequence of Dr. Priestley's discovery, that when nitrous gass is mixed with air over water, the bulk of the mixture diminishes rapidly, in consequence of the combination of the gass with the oxygen of the air, and the absorption of the nitric acid thus formed by the water. When nitrous gass is mixed with azotic gass, no diminution at all takes place. When it is mixed with oxygen gass in proper proportions, the absorption is complete. Hence it is evident, that in all cases of a mixture of these two gasses, the diminution will be proportional to the quantity of the oxygen. Of course it will indicate the proportion of oxygen in air; it will indicate the different quantities of oxygen which they contain, provided the component parts of air be susceptible of variation. Dr. Priestley's method was to mix together equal bulks of air and nitrous gass in a low jar, and then to transfer the mixture into a narrow graduated glass tube about three feet long, in order to measure the diminution of bulk. He expressed this diminution by the number of hundred parts remaining. Thus suppose he had mixed together equal parts of nitrous gass and air, the sum total of this mixture was 200 (or 2·00): suppose the residuum when measured in the graduated tube to amount to 104 (or 1·04), and of course that ninety-six parts of the whole had disappeared, he denoted the purity of the air thus tried by 104. A more convenient instrument was invented by Dr. Falconer of Bath; and Fontana greatly improved this method of measuring the purity of air. A description of his eudiometer was published by Ingenhousz in the first volume of his experiments; but it was Mr. Cavendish who first brought this eudiometer to such a state of precision, as to be enabled to ascertain correctly the constituents of air. His method was to put 125 measures of nitrous gass into a glass vessel, and to let up into it very slowly 100 measures of the air to be examined, agitating the vessel containing the nitrous gass during the whole time. The diminution of bulk when the process was conducted in this way was almost uniform. The greatest was 110, the least 106·8; the mean 108·2. The variation he found to depend, not upon the air examined, but upon the state of the water in which the experiment was made. If the experiment was reversed, by letting up the nitrous gass to common air, he used 100 measures of each, and the diminution in that case was only 90 measures.

This constancy in the diminution of the bulk of all the different specimens of common air examined, induced Mr. Cavendish to conclude, that the proportion between the oxygen and azot in common air does not vary. To find the absolute quantity of oxygen in air, he mixed together oxygen gass and azot in various proportions, and at last found that a mixture of 10 measures of the purest oxygen which he could procure with 38 measures of azot, was just as much diminished by nitrous gass as the same bulk of common air. Hence he concluded that air is composed of 10 parts by bulk of oxygen, and 38 of azot, which gives us for its composition per cent.

79·16 azot.
20·84 oxygen.

100·00

Or very nearly 21 per cent. of oxygen gass.

Other philosophers, who did not pay that rigid attention to precision which characterises all Mr. Cavendish's experiments, obtained variable results from the nitrous gass eudiometer. Most of the circumstances which occasion the variation, were pointed out by Cavendish; but they seem to have escaped the observation of succeeding chemists. Humboldt's attempt to render the eudiometer of Fontana accurate did not succeed. But Mr. Dalton has lately explained the anomalies in a very luminous manner. According to this philosopher, oxygen gass and nitrous gass are capable of uniting in two proportions: 21 measures of oxygen gass, or with twice 36-72 measures. Both of these compounds are soluble in water. If the tube be wide, a considerable portion of nitrous gass comes at once in contact with the oxygen. Hence the latter gass combines with a maximum of nitrous, especially if agitation be employed. In a narrow tube the oxygen combines with the minimum of nitrous gass, provided no agitation be employed, and the residue be poured soon into another vessel. When intermediate proportions are used, the absorption will be intermediate. Mr. Dalton recommends a narrow tube; the nitrous gass is to be only in the proportion requisite to form the minimum combination; no agitation is to be employed; and when the diminution is completed, the gass must be transferred to another tube. To 100 measures of air, add about 36 of nitrous gass; note the diminution of bulk, and multiply it by $\frac{7}{19}$; the product gives the bulk of oxygen in the air examined. In order to get rid of the anomalies which had perplexed former experimenters, Mr. Davy proposed to employ the nitrous gass in a different state. He caused sulphat or muriat of iron to absorb this gass to saturation, and employed the dark brown liquid thus obtained to deprive air of its oxygen. A small graduated glass tube, filled with the air to be examined, is plunged into the nitrous solution, and moved a little backwards and forwards. The whole of the oxygen is absorbed in a few minutes. The state of greatest absorption ought to be marked, as the mixture afterwards emits a little gass, which would alter the result. By means of this, Mr. Davy examined the air at Bristol, and found it always to contain 0·21 of oxygen. Air sent to Dr. Beddoes from the coast of Guinea gave exactly the same result.

Eudiometer of Sulphurets.

2. For the second kind of eudiometer we are indebted to Scheele. It is merely a graduated glass vessel, containing a given quantity of air, exposed to newly prepared liquid alkaline or earthy sulphurets, or to a mixture of iron filings and sulphur, formed into a paste with water. These substances absorb the whole of the oxygen of the air, which converts a portion of the sulphur into an acid. The oxygen contained in the air thus examined is judged by the diminution of bulk which the air has undergone. This method is not only exceedingly simple, but it requires very little address, and yet is susceptible of as great accuracy as any other whatever. The only objection to which it is liable is its slowness; for when the quantity of air operated on is considerable, several days elapse before the diminution has reached its maximum.

But this objection has been completely obviated by Mr. de Marti, who has brought Scheele's eudiometer to a state of perfection. He found that a mixture of iron filings and sulphur does not answer well, because it emits a small quantity of hydrogen gass, evolved by the action of the sulphuric acid formed upon the iron; but the hydrogureted sulphurets, formed by boiling together sulphur and liquid potash or lime water, answered the purpose perfectly. These substances, indeed, when newly prepared, have the property of absorbing a small portion of azotic gass; but they lose this property when saturated with that gass, which is easily effected by agitating them for a few minutes with a small portion of atmospheric air. His apparatus is merely a glass tube, ten inches long, and rather less than half an inch in diameter, open at one end, and hermetically sealed at the other. The close end is divided into 100 equal parts, having an interval of one line between each division. The use of this tube is to measure the portion of air to be employed in the experiment. The tube is filled with water; and by allowing the water to run out gradually while the tube is inverted, and the open end kept shut with the finger, the graduated part is exactly filled with air. These hundred parts of air are introduced into a glass bottle filled with liquid sulphuret of lime, previously saturated with azotic gass, and capable of holding from two to four times the bulk of the air introduced. The bottle is then to be corked with a ground glass stopper, and agitated for five minutes. After this the cork is to be withdrawn, while the mouth of the phial is under water; and for the greater security, it may be corked and agitated again. After this, the air is to be again transferred to the graduated glass tube, in order to ascertain the diminution of its bulk.

Air examined by this process suffers precisely the same diminution in whatever circumstances the experiments are made: no variation is observed whether the wind be high or low, or from what quarter soever it blows; whether the air tried be moist or dry, hot or cold; whether the barometer be high or low. Neither the season of the year, nor the situation of the place, its vicinity to the sea, to marshes, or to mountains, make any difference. Mr. De Marti found the diminution always between 0·21 and 0·23.

Eudiometer of Hydrogen Gass.

3. The third kind of eudiometer was proposed by Volta. The substance employed by that philosopher to separate the oxygen from the air was hydrogen gass. His method was to mix given proportions of the air to be examined and hydrogen gass in a graduated glass tube; to fire the mixture by an electric spark; and to judge of the purity of the air by the bulk of the residuum. This method has been lately examined by Gay Lussac and Humboldt. They have found it susceptible of great precision. It is one of the simplest and most elegant methods of estimating the proportion of oxygen in air. When 100 measures of hydrogen are mixed with 200, or any greater bulk of oxygen up to 900 measures, the diminution of bulk after detonation is always 146 measures. The same diminution is obtained if the hydrogen be increased up to a certain quantity. The result of their trials is, that 100 measures of oxygen gass require 200 of hydrogen for complete combustion, which coincides very

well with the trials previously made in this country. Hence the method of using this eudiometer is very simple: mix together equal bulks of the air to be examined, and of hydrogen gass, ascertain the diminution of bulk after combustion, divide it by three; the quotient represents the number of measures of oxygen in the air. A great number of trials, in different seasons of the year, of mixtures of 200 measures of air and as much hydrogen, gave almost uniformly a diminution of bulk amounting to 126 measures. Now the third of 126 is 42, the quantity of oxygen in 200 measures of air. Hence 100 parts of air, according to these trials, contain 21 of oxygen.

Eudiometer of Phosphorus.

4. In the fourth kind of eudiometer, the abstraction of the oxygen of air is accomplished by means of phosphorus. This eudiometer was first proposed by Achard. It was considerably improved by Reboul, and by Seguin and Lavoisier; but Berthollet has lately brought it to a state of perfection.

Instead of the rapid combustion of phosphorus, this last philosopher has substituted its spontaneous combustion, which absorbs the oxygen of air completely; and when the quantity of air operated on is small, the process is over in a short time. The whole apparatus consists in a narrow graduated tube of glass, containing the air to be examined, into which is introduced a cylinder of phosphorus fixed upon a glass rod, while the tube stands inverted over water. The phosphorus should be so long as to traverse nearly the whole of the air. Immediately white vapours rise from the phosphorus and fill the tube. These continue till the whole of the oxygen combines with phosphorus. They consist of phosphoric acid, which falls by its weight to the bottom of the vessel, and is absorbed by the water. The residuum is merely the azotic gass of the air, holding a portion of phosphorus in solution. Berthollet has ascertained, that by this foreign body its bulk is increased one-fortieth part. Consequently the bulk of the residuum, diminished by one-forty, gives us the bulk of the azotic gass of the air examined; which bulk subtracted from the original mass of air gives us the proportion of oxygen gass contained in it. All the different experiments which have been made by means of this eudiometer agree precisely in their result, and indicate that the proportions of the ingredients of air are always the same; namely, about 0·21 parts of oxygen gass, and 0·79 of azotic gass. Berthollet found these proportions in Egypt and France, and we have found them constantly in London, in all the different seasons of the year.

Thus it appears that whatever method is employed to abstract oxygen from air, the result is uniform, provided the experiment be precisely made. They all indicate that common air consists very nearly of 21 parts of oxygen, and 79 of azot. Scheele and Lavoisier found 27 per cent. of oxygen, but their methods were not susceptible of precision. Air, then, does not vary in its composition; the proportion between its constituents is constant in all places and in all heights. Gay Lussac examined air brought from the height of more than 21,000 feet above Paris, and found it precisely the same as the air at the earth's surface.

Eudiometers.

The instruments employed in eudiometrical observations, as we have already observed, are denominated eudiometers; and consist of jars graduated in some particular manner for the purpose of experiment. The jar employed for this purpose should be wider at the bottom than at the top, that it may stand securely: and in order to graduate it, weigh in the jar successive portions of distilled water, corresponding with the divisions of the cubic inch intended to be marked, and scratch the levels by the file or a diamond, and carry the lines of division nearly round the whole circumference of the jar; as otherwise some deception may easily arise in the use of it, unless the surfaces of the top and bottom of the jar should be exactly parallel to each other; for when graduated by successive quantities of water, it is obvious that the jar must stand on its closed end, and the contrary when graduated by portions of air.

But this may be regarded as merely a graduated, and not, strictly speaking, an eudiometrical jar. Eudiometrical vessels, however, have been contrived, in which the substance intended to analyze the contained air, by absorbing a portion, may be conveniently applied to it.

Of these, the first we shall notice is Dr. Hope's. It consists of two parts, the lower of which is a short thick bottle, with an upper and a side opening (the latter closed by a glass stopple); and the higher part is a graduated tube closed at top, and accurately fitting into the lower bottle by grinding. To use it, take off the tube, and fill it quite full with the gass to be examined; and fill also the bottle with the eudiometrical liquid (sulphuret of lime, for example), and without shaking it, sink it in water. Then immersing the open end of the tube in the same vessel, bring it over the bottle and thrust it in. The bottle and tube may then be taken out and well shaken, that the liquor may thoroughly come in contact with the contained gass; and the bottle from time to time re-immersed under water, and the side stopple a little loosened, that the water may rush in, to supply the partial vacuum produced by the absorption. This will, indeed, somewhat dilute the eudiometrical liquor, but not so as to prevent it from acting. When no more absorption takes place, the process is finished (which at longest only requires a few minutes), and the absorption is noted at once by the graduated scale; or if the tube be not graduated, the residual gass may be transferred to another that is.

Another eudiometer has been invented by Mr. Davy, but rather for the analysis of atmospheric air than of any other aërial compound. It consists simply of a portion of a glass barometer tube, bent into two legs of equal lengths, both of which are furnished with glass stopples, and one of them graduated. It is thus used: the tube is of course filled with the air of the place which it occupies; or for greater certainty, it may be first entirely filled with water, and then inverted; by which means the adjoining air will enter as the water falls out. Then holding it with the bend lowermost, and both the stopples out, drop down through the plain or ungraduated side a little water, till it reaches the beginning of the graduation, and close the graduated side with the stopple, so that the air may occupy exactly the whole of the graduated space. Then pour down the plain side upon the water the eudiometrical liquor (sulphat of iron holding nitrous gass in solution) till this side is quite full, and close the stopple also. The whole cavity will then contain a known portion of air in contact with the proper liquor, which, by agitation, will absorb all the oxygen of the air in a few seconds, and by loosening the stopple of the plain side under water, the residuary gass on the other side will shrink to its proper volume, and may be estimated immediately.

EUDOSIA, ATHENIA (before her conversion to Christianity), a celebrated lady, the daughter of Leontius, philosopher of Athens; who gave her such a learned education, that at his death he left her only a small legacy, saying she was capable of making her own fortune; but pleading at Athens without success against her two brothers, for a share in her father's estate, she carried her cause personally by appeal to Constantinople; recommended herself to Pulcheria, the sister of the emperor Theodosius the younger; embraced Christianity, was baptized by the name of Eudosia, and soon after married to the emperor. Their union lasted a considerable time: but a difference at last taking place, on account of the emperor's jealousy excited by Chrysapius the eunuch, she retired to Jerusalem, where she spent many years in building and adorning churches and relieving the poor. Dupin says, that she did not return thence till after the emperor's death; but Cave tells us, that she was reconciled to him, returned to Constantinople, and continued with him till his death; after which she went again to Palestine, where she spent the remainder of her life in pious works. She died in the year 460, according to Dupin; or 459, according to Cave: the latter observes, that on her deathbed she took a solemn oath, by which she declared herself entirely free from any stains of unchastity. She was the author of a paraphrase on the first eight books of the Old Testament in heroic verse; and of a great number of poems, which are lost.

EUDOXIA, a daughter of Theodosius the younger, who married the emperor Maximus, and invited Genseric the Vandal over into Italy.

EUDOXIANS, a party or sect in the fourth century, so denominated from their leader Eudoxius, patriarch of Antioch and Constantinople, a great defender of the Arian doctrine. The Eudoxians adhered to the errors of the Arians, &c. maintaining, that the son was created out of nothing, &c.

EUDOXUS, of Cnidus, a city of Caria, in Asia Minor, flourished about 370 years before Christ. He learned geometry from Archytas, and afterwards travelled into Egypt to learn astronomy and other sciences. There he and Plato studied together, as Laertius informs us, for the space of 13 years; and afterwards came to Athens, fraught with all sorts of knowledge, which they had imbibed from the mouths of the priests. Here Eudoxus opened a school; which he supported with so much glory and renown, that even Plato, though his friend, is said to have envied him. Eudoxus composed Elements of Geometry, from whence Euclid literally borrowed, as mentioned by Proclus. Cicero calls Eudoxus the greatest astronomer that had ever lived: and Petronius says, he spent the latter part of his life upon the top of a very high mountain, that he might contemplate the stars and the heavens with more convenience and less interruption: and we learn from Strabo, that there were some remains of his observatory at Cnidus, to be seen even in his time. He died in the 53d year of his age (*Hutton.*)

EVE, the mother of all mankind, who, being deluded by the serpent, occasioned the fall, and all its dismal consequences.

EVE. E'VEN. *s.* (æꝼen, Saxon.) 1. The close of the day (*May*). 2. The vigil or fast to be observed before a holiday (*Duppa*).

EVECTION, is used by some astronomers for the liberation of the moon; being an inequality in her motion, by which, at or near the quadratures, she is not in a line drawn through the centre of the earth to the sun, as she is at the sizygies, or conjunction and opposition, but makes a small angle with that line.

The term evection is used by some astronomers to denote that equation of the moon's motion, which is proportional to the sine of double the distance of the moon from the sun, diminished by the moon's anomaly.

The general and constant effect of the evection is to diminish the equation of the centre in the sizygies, and to augment it in the quadratures. If this diminution and augmentation were always the same, the evection would depend solely on the angular distance of the moon from the sun; but its absolute value varies likewise with the distance of the moon from the perigee of its orbit. The period of the evection differs very little from a periodical revolution of the moon, it is 27·178533 days.

Representing the moon by the sign ☾, and the sun by ☉, the evection may be expressed by

1·034018 sin. (2 dist. ☾ ☉ — mean anom. ☾). From this it will be easy to trace the successive variations of this inequality: for, it will only be requisite to consider the divers values which its argument may assume. If, for example, we would know the case where it attains its maximum, we have only to inquire when the angle 2 dist. ☾ ☉ — mean anom. ☾, becomes equal to 90° or to 270°; because then the sine of that angle being equal to unity taken positively or negatively, the evection will become ±1·°34018=1° 20′ 25″. The first value will obtain in the quadrature, for instance, when the mean anomaly will be equal to 90°; for we shall then have 2 dist. ☾ ☉ =180°, and 2 dist. ☾ ☉ — mean anom. ☾ =180°—90°. On the contrary, the evection will disappear, when the argument is either 0° or 180°, which happens, for example, in the sizygies, when the moon will be in its perige or apoge; because in that case the distance of the moon from the sun is either 0° or 180°, and it is the same with the mean anomaly. But by the various combinations and mutations of the two angles which form the argument of the evection, the greatest and the least values occur again, according to the values of that argument in several other points of the orbit. In general, in the conjunctions the evection will have a contrary sign to the equation of the centre; for its argument then becomes —mean anom. ☾, which will in that case give a *negative* sign if the anomaly is less than 180°, and a *positive* sign if it be greater; but in the former case the equation of the centre is additive, in the latter it is *subtractive*.

It will be the same at the oppositions, as we may easily assure ourselves; since we see that in general in the sizygies the evection is subtractive from the equation of the centre; while, on the contrary, it becomes additive in the quadratures. Thus the early observers, who only determined the elements of the lunar theory by means of eclipses, and solely with the view of predicting those phænomena, found the equation of the centre too small by all the quantities of the evection in the sizygies.

We may easily find the period of the evection from the variations of the angle on which it depends: it is merely necessary to compute the changes that angle undergoes in a given time, and thence to infer by a simple proportion the number of days required to produce a variation of 363°. This period we have stated near the commencement of the present article.

EVELYN (John), an ingenious writer of the last century. He was born at Wotton, in Surrey, in 1620, and educated at Baliol-college, Oxford. In 1644 he went on his travels, and improved himself greatly in the knowledge of antiquities and the arts. About 1650 he married a daughter of sir Robert Brown, the English ambassador at Paris, and thereby became possessed of Sayes Court, a seat in the county of Kent, whither he retired, and composed several books, political and philosophical. He was not, however, so absorbed in study as to neglect public affairs, for on the death of Richard Cromwell he laboured zealously in bringing about the restoration. On the king's return he was honoured with particular marks of his attention: and at the establishment of the royal society he became one of the first members. In 1662 appeared his Sculptura, or the History and Art of Chalcography and Engraving in Copper, with an ample enumeration of the most renowned masters and their works; to which is annexed, a new manner of engraving, or mezzotinto, communicated by his royal highness prince Rupert to the author of this treatise, 8vo. In 1664 Mr. Evelyn was appointed one of the commissioners to take care of the sick and wounded; and the same year came out his great work, entitled, Sylva, or a Discourse of Forest Trees, folio, which work has gone through several editions. At his entreaty it was that lord Henry Howard presented the university of Oxford with the Arundelian marbles, for which that learned body returned Mr. Evelyn their thanks. He was appointed one of the commissioners for re-building St. Paul's, and paid considerable attention to that great work. In 1669 he was honoured with the degree of LL.D. by the university of Oxford, and about the same time was appointed one of the commissioners of the new board of trade. At the accession of James II. he was made one of the commissioners for executing the office of lord privy seal, and after the revolution he was appointed treasurer of Greenwich hospital. In 1697 appeared his Numismata, or Discourse of Medals, in folio. This ingenious and indefatigable man died in the 86th year of his age, in 1706, and was buried with his ancestors at Wotton. He wrote a great number of books besides those above mentioned.

E'VEN. *a.* (eꝼen, Saxon.) 1. Level; not, rugged; not unequal (*Newton*). 2. Uniform; equal to itself (*Prior*). 3. Level with; parallel to (*Exodus*). 4. Not having inclination any way (*Shakspeare*). 5. Not having any part higher or lower than the other (*Davies*). 6. Equal on both sides; fair (*South*). 7. Without any thing owed, either good or ill; out of debt (*Shakspeare*). 8. Calm; not subject to elevation or depression; not uncertain (*Pope*). 9. Capable to be divided into equal parts; not odd (*Taylor*).

EVEN NUMBER, EVENLY EVEN NUMBER, and EVENLY ODD NUMBER. See NUMBER.

To E'VEN. *v. a.* (from the noun.) 1. To make even. 2. To make out of debt (*Shakspeare*). 3. To level; to make level (*Raleigh*).

To E'VEN. *v. n.* To be equal to (*Carew*).

E'VEN. *ad.* (often contracted to *ev'n.*) 1. Verily (*Spenser*). 2. Notwithstanding (*Dryden*). 3. Likewise; not only so, but also (*Atterbury*). 4. So much as (*Swift*).

EVENHA'NDED. *a.* (*even* and *handed.*) Impartial; equitable (*Shakspeare*).

E'VENING. *s.* (æꝼen, Saxon.) The close of the day; the beginning of night (*Watts*).

E'VENLY, (from *even.*) 1. Equally; uniformly (*Bentley*). 2. Levelly; without asperities (*Wotton*). 3. Without inclination to either side; horizontally (*Brerewood*). 4. Impartially; without favour or enmity (*Bac.*).

E'VENNESS. *s.* (from *even.*) 1. State of being even. 2. Uniformity; regularity (*Grew*). 3. Equality of surface; levelness. 4. Freedom from inclination to either side; horizontal position (*Hooker*). 5. Impartiality; equal respect. 6. Calmness; freedom from perturbation; equanimity (*Atterbury*).

E'VENSONG. *s.* (*even* and *song.*) 1. The form of worship used in the evening (*Taylor*). 2. The evening; the close of the day (*Dryden*).

E'VENTIDE. *s.* (*even* and *tide.*) The time of evening (*Spenser*).

EVE'NT. *s.* (*eventus*, Latin.) 1. An accident; any thing that happens, good or bad (*Ecclus*). 2. The consequence of an action; the conclusion; the upshot (*Dryden*).

To EVE'NTERATE, *v. a.* (*eventero*, Lat.) To rip up; to open the belly (*Brown*).

EVE'NTFUL. *a.* (*event* and *full.*) Full of incidents (*Shakspeare*).

To EVE'NTILATE. *v. n.* (*eventilo*, Lat.) 1. To winnow; to sift out. 2. To examine; to discuss.

EVE'NTUAL. *a.* (from *event.*) Happening in consequence of any thing; consequential.

EVE'NTUALLY. *ad.* In the event; in the last result; in the consequence (*Boyle*).

EVENUS, a river of Ætolia, flowing into the Ionian sea. It receives its name from Evenus, son of Mars and Sterope, who being unable to overcome Idas, who had promised him his daughter Marpessa in marriage, if he surpassed him in running, grew so desperate that he threw himself into the river, which afterwards bore his name. (*Ovid*).

E'VER. *ad.* (æꝼꝛe, Saxon.) 1. At any time (*Tillotson*). 2. At all times; always; without end (*Hooker*). 3. *For ever.* Eternally; to perpetuity (*Phil.*). 4. At one time (*Spenser*). 5. In any degree (*Hall*). 6. A word of enforcement, or aggravation. *As soon as* ever *he had done it* (*Shakspeare*). 7. Ever *a.* Any (*Shakspeare*). 8. It is often contracted into *e'er.* 9. It is much used in composition in the sense of *always*: as *evergreen*, green throughout the year; *everduring*, enduring without end.

EVERBU'BBLING. *a.* Boiling up with perpetual murmurs (*Crashaw*).

EVE'RBURNING. *a.* Unextinguished (*Milton*).

EVE'RDURING. *a.* Eternal; enduring without end (*Raleigh*).

EVERGETES, a surname, signifying *benefactor*, given to Philip of Macedonia, and commonly to the kings of Syria and Pontus.

EVERGRE'EN. *a.* Verdant throughout the year (*Milton*).

E'vergreen. *s.* A plant that retains its verdure through all the seasons (*Evelyn*).

Evergreen oak, in botany. See Quercus.

Evergreen thorn, in botany. See Mespilus.

EVERHO'NOURED. *a.* Always held in honour or esteem (*Pope*).

EVERLA'STING. *a.* Enduring without end; perpetual; immortal; eternal (*Hammond*).

Everlasting, in botany. See Gnaphalium.

Everlasting flower. See Gomphrœna.

Everlasting pea. See Lathyrus.

Everla'sting. *s.* Eternity (*Psalms*).

EVERLA'STINGLY. *ad.* Eternally; without end (*Shakspeare*).

EVERLA'STINGNESS. *s.* Eternity; perpetuity; an indefinite duration (*Donne*).

EVERLI'VING. *a.* Living without end; immortal; eternal; incessant (*Newton*).

EVERMO'RE. *ad.* Always; eternally (*Tillotson*).

EVERO'PEN. *a.* Never closed; not at any time shut (*Taylor*).

EVERPLE'ASING. *a.* Delighting at all times; never ceasing to give pleasure (*Sidney*).

To EVE'RSE. *v. a.* (*eversus*, Latin.) To overthrow; to subvert: not used (*Glanville*).

EVERSHOT, a town in Dorsetshire, with a market on Fridays. Lat. 50. 52 N. Lon. 2. 55 W.

To EVE'RT. *v. a.* (*everto*, Latin.) To destroy; to overthrow (*Ayliffe*).

EVERWA'TCHFUL. *a.* Always vigilant (*Pope*).

E'VERY. *a.* (æꝼeꝛ ealc, Saxon.) 1. Each one of all (*Hammond*). 2. Every-where. In all places (*Hooker*).

EVERYO'UNG. *a.* Not subject to old age; undecaying (*Pope*).

E'VESDROPPER. *s.* (*eaves* and *dropper.*) Some mean fellow that skulks about a house in the night to listen (*Dryden*).

EVESHAM, a borough in Worcestershire, with a market on Mondays. It is seated on a hill which rises with a gradual ascent from the Avon, over which is a stone bridge. It was formerly famous for an abbey: it now has 3 churches. Lat. 52. 4 N. Lon. 1. 45 W.

Evesham (The Vale of), in Worcestershire, on the banks of the Avon, which flows along the S. E. port of the county in its course to meet the Severn. It is celebrated for its fertility and beauty; and, beside the usual objects of agriculture, great quantities of garden-stuff are here grown, and sent to the towns around to a considerable distance. In this vale, Simon de Montfort, earl of Leicester, was defeated and slain, in 1265, the very year in which, by virtue of his usurped authority, that admirable part of our constitution, the house of commons, is said to have first received its existence.

To EVE'STIGATE. *v. a.* (*evestigo*, Lat.) To search out.

EUGENE (Francis), prince of Savoy, descended from Carignan, one of the three branches of the house of Savoy, and son of Eugene Maurice, general of the Swiss and Grisons, governor of Champagne, and earl of Soissons, was born in 1663. Louis XIV. to whom he became afterwards so formidable an enemy, thought him so unpromising a youth, that he refused him preferment both in the church and the state, thinking him too much addicted to pleasure to be useful in either. Prince Eugene, in disgust, quitted France; and, retiring to Vienna, devoted himself to the imperial service. The war between the emperor and the Turks afforded the first opportunity of exerting his military talents; and every campaign proved a new step in his advancement to the highest offices in the army. He gave the Turks a memorable defeat at Zenta; commanded the German forces in Italy, where he foiled marshal Villeroy in every engagement, and at length took him prisoner. Our limits do not allow a detail of his campaigns; but prince Eugene distinguished himself greatly, when the emperor and queen Anne united against the exorbitant power of Louis XIV. He died at Vienna in the year 1736; and was as remarkable for his modesty and liberality, as for his abilities in the field and the cabinet.

EUGENIA. Yamboo. Clove-tree. In botany, a genus of the class icosandria, order monogynia. Calyx four-cleft, superior; petals four; berry one-celled, many-seeded. Twenty-nine species; natives of the East or West Indies, or South America. Generally trees rising to between twenty and thirty feet; bearing a plum-shaped fruit, inclosing a single nut.

The two following species are particularly worth noticing:

1. E. jambos. Malabar plum. Leaves very entire, lanceolate; peduncles terminal, about four-flowered. The fruit is eaten both fresh, and preserved in sugar. A conserve is made of the flowers for medicinal purposes, and most commonly used as an astringent.

2. E. caryophyllata. Aromatic clove-tree. Leaves very entire, oblong, rather acute; panicles axillary and terminal; peduncles trichotomous; calyx repand; fruit elliptic. This has formerly been regarded as a distinct genus of the polyandrian, monogynian class and order, and described under the generic name caryophyllus. A minuter examination, however, has sufficiently proved that the present is its true situation. It is a native of the Moluccas, and especially of Amboyna, where it is principally cultivated. In its bark it resembles the olive, and is of the usual size of the laurel. No verdure grows beneath it. It bears a great number of branches, at the extremities of which are produced vast quantities of flowers that are at first white, then green, and at last pretty red and hard, in which state they constitute our officinal cloves. They contain a prodigious quantity of oil, and have an oily feeling to the pressure of the finger.

EUGH. *s.* A tree; the yew (*Dryden*).

To EVI'CT. *v. a.* (*evinco,*) Latin. 1. To dispossess of by a judicial course. 2. To take away by a sentence of law (*K. James*). 3. To prove; to evince (*Cheyne*).

EVI'CTION. *s.* (from *evict.*) 1. Dispossession or deprivation by a definitive sentence of a court of judicature (*Bacon*). 2 Proof; evidence (*L'Estrange*).

E'VIDENCE. *s.* (French.) 1. The state of being evident; clearness; notoriety; indubitable certainty. 2. Testimony; proof (*Tillotson*). 3. Witness; one that gives evidence (*Bentley*).

To E'VIDENCE. *v. a.* (from the noun.) 1. To prove; to evince (*Tillotson*). 2. To show; to make discovery of (*Milton*).

EVIDENCE, in law, is the testimony adduced before a court or magistrate of competent jurisdiction, by which such court or magistrate are enabled to ascertain any fact which may be litigated between the parties.

This may be of two kinds, viz. written or verbal: the former by deeds, bonds, or other written documents; the latter by witnesses examined viva voce.

Evidence may be further divided into absolute and presumptive; the former is direct, in positive or absolute affirmance or denial of any particular fact; the latter collateral, and from the conduct of the parties, affords an inference that such a particular fact did or did not occur.

The party making an affirmative allegation which is denied by his adversary, is in general required to prove it: unless, indeed, a man is charged with not doing an act, which by law he is required to do; for here a different rule must necessarily prevail. And the rule is, that the evidence must be applied to the particular fact in dispute; and therefore, no evidence not relating to the issue, or in some manner connected with it, can be received; nor can the character of either party, unless put in issue by the very proceeding itself, be called in question; for the cause is to be decided on its own circumstances, and not to be prejudiced by any matter foreign to it.

It is an established principle, that the best evidence the nature of the case will admit shall be produced; for if it appears that better evidence might have been brought forward, the very circumstance of its being withheld furnishes a suspicion that it would have prejudiced the party in whose power it is, had he produced it. Thus, if a written contract is in the custody of the party, no verbal testimony can be received of its contents.

The law never gives credit to the bare assertion of any one, however high his rank or pure his morals: but requires (except in particular cases with respect to Quakers) the sanction of an oath, and the personal attendance of the party in court that he may be examined and cross-examined by the different parties; and therefore, in cases depending on parole or verbal evidence, the testimony of persons who are themselves conversant with the facts they relate must be produced; the law paying no regard, except under special circumstances, to any hearsay evidence. Thus in some cases, the memorandum in writing made at the time, by a person since deceased, in the ordinary way of his business, and which is corroborated by other circumstances, will be admitted as evidence of the fact.

Witnesses are summoned by writ of subpœna, to attend on penalty of 100*l.* to the king, and 10*l.* to the party, by statute 5 Eliz. c. 9. besides damages sustained by their non-attendance. All witnesses of all religions, who believe in a future state of rewards and punishments, are received, but not persons infamous in law by their crimes, nor persons directly interested in the matter in issue; and no counsel or attorney shall be compelled to disclose the secrets intrusted to him by his client, but he may give evidence of facts which he knew by other means than for the purpose of the cause. One witness is sufficient to any fact, except in high treason, when by statutes 1 Edw. VI. c. 12, and 5 and 6 Edw. VI. c. 11, two are required, but that is only in treasons of conspiracy against the state, and not treasons relating to the coin, &c. The oath of the witness is to speak the truth; the whole truth, and nothing but the truth, and all evidence is to be given in open court.

The general rules of evidence are, 1. The best evidence must be given that the nature of the thing is capable of. 2. No person interested in the question can be a witness; but to this there are exceptions, as first, in criminal prosecutions; secondly, for general usage, for convenience of trade, as a servant to prove the delivery of goods, though it tends to clear himself of neglect. 3. Where the witness acquires the interest by his own act, after the party who calls him has a right to his evidence. The third rule is, that hearsay of a matter of fact is no evidence; but of matter of reputation, such as a custom, it is in some sort evidence. 4. Where a general character is the matter in issue, particular facts may be received in evidence, but not where it occurs incidentally. 5. In every issue the affirmative is to be proved. 6. No evidence need be given of what is agreed, or not denied upon the pleadings.

In criminal cases the same rules prevail, but evidence of the confessions of the party should be received with caution, and are rejected when obtained through promises or threats. Presumptive evidence should be admitted with caution, and two excellent rules are given by sir Matthew Hale, that no one should be convicted of stealing goods of a person actually unknown, unless there is a proof of a felony actually committed; and none tried for murder, until the murdered body be found.

As no one can be a witness for himself, it follows of course, that husband and wife, whose interest the law has united, are incompetent to give evidence on behalf of each other, or of any person whose interest is the same; and the law, considering the policy of marriage, also prevents them giving evidence against each other: for it would be hard that a wife, who could not be a witness for her husband, should be a witness against him; such a rule would occasion implacable divisions and quarrels between them. In like manner, as the law respects the private peace of men, it considers the confidential communications made for the purpose of defence in a court of justice. By permitting a party to intrust his cause in the hands of a third person, it establishes a confidence and trust between the client and person so employed.

Barristers and attorneys, to whom facts are related professionally during a cause, or in contemplation of it, are neither obliged nor permitted to disclose the facts so divulged during the pendency of that cause, nor at any future time; and if a foreigner, in communication with his attorney, has recourse to an interpreter, he is equally bound to secrecy.

Lord Ellenborough, upon the authority of lord chief justice Tully, has recently laid down a very important doctrine, viz. that no witness shall be bound to answer any question which tends to degrade himself, or to show him to be infamous.

E'VIDENT. *a*, (French.) Plain; apparent; notorious *(Brown)*.

E'VIDENTLY. *ad*. Apparently; certainly; undeniably *(Prior)*.

E'VIL. (ẏꝼel, Saxon.) 1. Having bad qualities of any kind; not good *(Psalms)*. 2. Wicked; bad; corrupt *(Matthew)*. 3. Unhappy; miserable; calamitous *(Proverbs)*. 4. Mischievous; destructive *(Genesis)*.

Evil. *s*. (generally contracted to *ill*.) 1. Wickedness; a crime *(Shakspeare)*. 2. Injury; mischief *(Proverbs)*. 3. Malignity; corruption *(Ecclesiasticus)*. 4. Misfortune; calamity *(Job)*. 5. Malady; disease *(Shakspeare)*.

Evil (Malum), in ethics, a privation or absence of some proper or necessary good, or of some measure or degree thereof.

Evil is either natural or moral; between which there is this relation, that moral evil produces natural.

Evil (Moral), is defined a deviation from right reason; a discernment of right from wrong, being given us as a guide to our actions; or it is the disagreement between the actions of a moral agent and the rule of those actions, whencesoever it is derived and howsoever made known; and no action can be morally evil unless the agent be properly such, intelligent and free, and capable of distinguishing, choosing, and acting for himself. This the philosophers call inhonestum, and turpe, as staining the image of God, and sullying our original beauty, likewise malum culpæ.

Evil (Natural), is a want of something necessary to the bene esse, or perfection of a thing, or to its answering all its purposes: such are defects of the body, blindness, lameness, hunger, diseases, death. This species is denominated triste, injucundum, noxium, and malum pœnæ.

Again, evil is either absolute, as envy, impiety, &c. or relative, as meat, which in itself being good, may be evil to a man on account of some disease; as wine to a feverish person, &c.

On the subject of this article there is a question which has perplexed mankind in all ages. If the world is conducted by a wise and benevolent Being, how came evil to be introduced into it? The ancient Persians resolved the question, by asserting the existence of two gods, Oromasdes the author of good, and Arimanius the author of evil. From them the Christian Heretics called Manichees borrowed their doctrine of two opposite coeternal principles. Both the Platonists and Stoics ascribed the origin of evil to the perverseness or imperfection of matter, which they thought the Deity could not alter; and Pythagoras imagined a state of pre-existence, in which the souls of men had committed offences, for which they are here suffering the punishment. But these hypotheses are some of them impious, and all unsatisfactory.

Taking the expression in its most extensive sense, the evils to which the human race are exposed may be reduced to pain, uneasiness, disappointment of appetites, and death; of which not one could have been wholly prevented without occasioning greater evils, inconsistent with the perfect goodness of the Creator. As long as we have solid bodies capable of motion, supported by food, subject to the influence of the atmosphere, and divisible, they must necessarily be liable to dissolution or death: but if a man could suffer death, or have his limbs broken, without feeling pain, the human race had been long ago extinct. A fever is a state of the body in which the fluids are in great disorder, we should have no inducement to pay the proper attention to our state, and should certainly die unawares, without suspecting ourselves to be in danger; whereas, under the present administration of divine Providence, the pain and sickness of the disease compel us to have recourse to the remedies proper for restoring us to soundness and to health. Of the uneasinesses to which we are liable, and which are not the effect of immediate pain, the greatest has been sometimes said to arise from the apprehension of death, which constantly stares us in the face, and frequently embitters all our pleasures even in the hour of perfect health. But this dread of death is implanted in our breasts for the very best of purposes. Had we no horror at the apprehension of death, we should be apt, whenever any misfortune befel us, to quit this world rashly, and rush unprepared into the presence of our judge: but the horror which attends our reflections on our own dissolution, arising not from any apprehensions of the pain of dying, but from our anxiety concerning our future state of existence, tends strongly to make us act, while we are here, in such a manner as to ensure our happiness hereafter. Add to this, that the fear of death is the greatest support of human laws. We every day see persons breaking through all the regulations of society and good life, notwithstanding they know death to be the certain consequence, and feel all the horrors of it that are natural to man; and, therefore, were death divested of these horrors, how insignificant would capital punishments be as guardians of the laws, and how insecure would individuals be in civil society?

With regard to the unavoidable misfortunes and anxieties of our present state, so far from being truly hurtful in themselves, they are proofs of divine beneficence. When we see men displeased with their situation, when we hear them complain of the difficulties, the miseries, and the cares of life, of the hardships which they have undergone, and the labours which still lie before them; instead of accounting them unfortunate, we ought to regard them as active beings, placed in the only situation that is fit for the improvement of their nature. That discontent, those restless wishes to improve their condition, are so many sure indications that their faculties will not languish.—They who are in the least degree accustomed to observe the human character know well the influence which pleasure and repose have in enfeebling every manly principle, and how capable they are of attaching us even to a sordid and dishonourable existence.

Happy indeed it is for the human race, that the number of those men is small whom Providence has placed in situations in which personal activity is unnecessary. By far the greater number are compelled to exert themselves, to mix and to contend with their equals, in the race of fortune and of honour. It is thus that our powers are called forth, and that our nature reaches its highest perfection. It is even perhaps a general truth, that they who have struggled with the greatest variety of hardships, as they always acquire the highest energy of character, so if they have retained their integrity, and have not sunk entirely in the contest, seldom fail to spend their remaining days respectable and happy, superior to passion, and secured from folly by the possession of a wisdom dearly earned.

But the benefits of physical evils have been set in a still stronger light by a great master of moral wisdom, who was himself subject to many of those evils. That man is a moral agent sent into this world to acquire habits of virtue and piety, to fit him for a better state, is a truth to which no consistent theist will for a moment refuse his assent. But almost all the moral good which is left among us is the apparent effect of physical evil, as Dr. Johnson thus shows:

"Goodness is divided by divines into soberness, righteousness, and godliness. Let it be examined how each of these duties would be practised if there were no physical evil to enforce it.

"Sobriety or temperance is nothing but the forbearance of pleasure; and if pleasure was not followed by pain, who would forbear it? We see every hour those in whom the desire of present indulgence overpowers all sense of past and all foresight of future misery. In a remission of the gout, the drunkard returns to his wine and the glutton to his feast; and if neither disease nor poverty were felt or dreaded, every one would sink down in idle sensuality, without any care of others, or of himself. To eat, and drink, and lie down to sleep, would be the whole business of mankind.

"Righteousness, or the system of social duty, may be subdivided into justice and charity. Of justice, one of the heathen sages has shown, with great acuteness, that it was impressed upon mankind only by the inconveniencies which injustice had produced. 'In the first ages (says he) men acted without any rule but the impulse of desire; they practised injustice upon others, and suffered it from others in their turn: but in time it was discovered, that the pain of suffering wrong was greater than the pleasure of doing it; and mankind, by a general compact, submitted to the restraint of laws, and resigned the pleasure to escape the pain.'

"Of charity it is superfluous to observe that it could have no place, if there were no want; for of a virtue which could not be practised, the omission could not be culpable. Evil is not only the occasional but the efficient cause of charity; we are incited to the relief of misery by the consciousness that we have the same nature with the sufferer; that we are in danger of the same distresses, and may sometime implore the same assistance.

"Godliness or piety is elevation of the mind towards the Supreme Being, and extension of the thoughts to another life. The other life is future, and the Supreme Being is invisible.—None would have recourse to an invisible power, but that all other subjects had eluded their hopes. None would fix their attention upon the future, but that they are discontented with the present. If the senses were feasted with perpetual pleasure, they would always keep the mind in subjection. Reason has no authority over us but by its power to warn us against evil.

"In childhood, while our minds are yet unoccupied, religion is impressed upon them; and the first years of almost all who have been well educated are passed in a regular discharge of the duties of piety: but as we advance forward into the crowds of life, innumerable delights solicit our inclinations, and innumerable cares distract our attention. The time of youth is passed in noisy frolics: manhood is led on from hope to hope, and from project to project; the dissoluteness of pleasure, the inebriation of success, the ardour of expectation, and the vehemence of competition, chain down the mind alike to the present scene: nor is it remembered how soon this mist of trifles must be scattered, and the bubbles that float upon the rivulet of life be lost for ever in the gulph of eternity. To this consideration scarce any man is awakened but by some pressing and resistless evil; the death of those from whom he derived his pleasure, or to whom he destined his possessions, some disease which shows him the vanity of all external acquisitions, or the gloom of age which intercepts his prospects of long enjoyment, forces him to fix his hopes upon another state; and when he has contended with the tempests of life till his strength fails him, he flies at last to the shelter of religion.

"That misery does not make all virtuous, experience too certainly informs us; but it is no less certain, that of what virtue there is, misery produces far the greater part. Physical evil may be therefore endured with patience, since it is the cause of moral good; and patience itself is one virtue by which we are prepared for that state in which evil shall be no more." (*Johnson's Idler*, No. 89.)

The calamities and the hardships of our present state, then, are so far from being real evils, of which providence ought to be accused, that in every point of view in which we can consider them, they afford the surest proofs of the wisdom of its administration, and of its goodness to man.

The most serious difficulty lies in accounting for the permission of moral evil or guilt, in a system governed by infinite benevolence and wisdom. Those who in a consistent manner hold the doctrine of the absolute necessity of human actions in its full extent, and acknowledge all its consequences, find it easy to elude this difficulty. They very fairly deny the existence of any such thing as moral evil in the abstract; and assert that what we call a crime, is nothing more than an action which we always regard with a painful sensation; that these apparent evils endure only for a time; and that all will at last terminate in the perfection and happiness of every intelligent being.

Upon the system of liberty, the shortest answer seems to be this: that some things are absolutely impossible, not from any weakness in the Deity, but because they infer absurdity or contradiction. Thus it is impossible for twice two to be any thing else than four; and thus it is impossible for Omnipotence itself to confer self-approbation upon an intelligent being who has never deserved it; that is to say, it is impossible for a man of sense to be pleased with himself for having done a certain action, while he himself is conscious that he never did that action. But self-approbation constitutes the highest, the most unmingled, and permanent felicity of which our nature is capable. It is not in the power of Omnipotence itself, then, to bestow the highest and most permanent felicity of our nature; it must be earned and deserved before it can be obtained. In the same manner good desert, virtue, or merit, cannot be conferred; they must be acquired. To enable us to acquire these, we must be exposed to difficulties, and must suffer in a certain degree. If these difficulties had no influence upon our conduct and feelings, if they exposed us to no real danger, no fabric of merit and of self-approbation could be reared upon them. All that the Supreme Being could do for us, was to confer such an original constitution and character as would enable us to do well if we should exert our utmost powers. The universe is not ruled by favour, but by justice. Complete felicity must be purchased. Guilt is an abuse of our freedom, a doing ill where we could have done well, and is entirely the work of man. Heaven could not avoid permitting its existence, and exposing us to danger; for temptation is necessary to virtue, and virtue is the perfection of our nature, our glory, and our happiness.

The permission of moral evil has been so ably accounted for by Simplicius, a Pagan writer, and therefore not biassed by any partiality to the Jewish or Christian Scriptures, that we cannot deny ourselves the pleasure of laying his reasoning before our readers. He asks, "Whether God may be called the author of sin, because he permits the soul to use her liberty?" and answers the question thus:

"He who says that God should not permit

the exercise of its freedom to the soul, must affirm one of these two things; either that the soul, though by nature capable of indifferently choosing good or evil, should yet be constantly prevented from choosing evil; or else that it should have been made of such a nature as to have no power of choosing evil.

" The former assertion (continues he) is irrational and absurd; for what kind of liberty would that be in which there should be no freedom of choice? and what choice could there be, if the mind were constantly restrained to one side of every alternative? With respect to the second assertion, it is to be observed (says he), that no evil is in itself desirable, or can be chosen as evil. But if this power of determining itself either way in any given case must be taken from the soul, it must either be as something not good, or as some great evil. But whoever saith so, does not consider how many things there are which, though accounted good and desirable, are yet never put in competition with this freedom of will: for without it we should be on a level with the brutes; and there is no person who would rather be a brute than a man. If God then shows his goodness in giving to inferior beings such perfections as are far below this, is it incongruous to the divine nature and goodness to give man a self-determining power over his actions, and to permit him the free exercise of that power? Had God, to prevent man's sin, taken away the liberty of his will, he would likewise have destroyed the foundation of all virtue, and the very nature of man; for there could be no virtue were there not a possibility of vice; and man's nature, had it continued rational, would have been divine, because impeccable. Therefore (continues he), though we attribute to God, as its author, this self-determining power, which is so necessary in the order of the universe; we have no reason to attribute to him that evil which comes by the abuse of liberty: for God doth not cause that aversion from good which is in the soul when it sins; he only gave to the soul such a power as might turn itself to evil, out of which he produces much good, which, without such a power, could not have been produced by Omnipotence itself." So consonant to the doctrine of our Scriptures is the reasoning of this opponent of the writings of Moses! *Fus est et ab hoste doceri.*

E'VIL. *ad.* (commonly contracted to *ill.*) 1. Not well in whatever respects (*Shakspeare*). 2. Not well; not virtuously (*John*). 3. Not well; not happily (*Deuteronomy*). 4. Injuriously; not kindly (*Deuteronomy*). 5. It is often used in composition to give a bad meaning to a word.

EVILAFFE'CTED. *a.* Not kind; not disposed to kindness (*Acts*).

EVILDO'ER. *s.* Malefactor; one that commits crimes (*Peter*).

EVILFA'VOURED. *a.* Ill countenanced; having no good aspect (*Bacon*).

EVILFA'VOUREDNESS. *s.* (from *evil-favoured.*) Deformity (*Deuteronomy*).

E'VILLY. *ad.* (from *evil.*) Not well (*Sh*).

EVILMI'NDED. *a.* Malicious; mischievous; malignant; wicked (*Dryden*).

E'VILNESS. *s.* (from *evil.*) Contrariety to goodness; badness of whatever kind (*Hale*).

EVILSPEA'KING. *s.* Slander; defamation; calumny; censoriousness (*Peter*).

EVILWI'SHING. *a.* Wishing bad to; having no good-will (*Sidney*).

EVILWO'RKER. *s.* One who does wickedness (*Philippians*).

To EVI'NCE. *v. a.* (*evinco*, Latin.) To prove; to show; to manifest (*Atterbury*).

EVI'NCIBLE. *a.* (from *evince.*) Capable of proof; demonstrable (*Hale*).

EVI'NCIBLY. *a.* (from *evincible.*) In such a manner as to force conviction.

To E'VIRATE. *v. a.* (*eviratus*, Latin.) To deprive of manhood: to emasculate.

To EVI'SCERATE. *v. a.* (*eviscero*, Latin.) To embowel; to draw; to deprive of the entrails; to search within the entrails.

E'VITABLE. *a.* (*evitabilis*, Latin.) Avoidable; that may be escaped or shunned (*Hook.*).

To E'VITATE. *v. a.* (*evito*, Latin.) To avoid; to shun; to escape (*Shakspeare*).

EVITA'TION. *s.* (from *evitate.*) The act of avoiding (*Bacon*).

EVITE'RNAL. *a.* (*æviturus*, Latin.)—Eternal in a limited sense; of duration not infinitely but indefinitely long.

EVITE'RNITY. *s.* (*æviturnitas*, low Lat.) Duration not infinitely but indefinitely long.

EULER (Leonard), was born at Basil, on the 14th of April, 1707; he was the son of Paul Euler and of Margaret Brucker (of an illustrious family in letters), and spent the first year of his life at the village of Richen, of which place his father was minister. Being intended for the church, his father, who had himself studied under James Bernoulli, taught him mathematics, with a view to their proving the ground-work of his other studies, and in hopes that they would turn out a noble and useful secondary occupation; but they were destined to become a principal one; and Euler, assisted by John Bernoulli, soon declared his intention of devoting his life to the pursuit: an intention which the wise father did not thwart, and which the sensible son did not so adhere to, as not to connect with it a more than common improvement in every other kind of useful learning, insomuch that in his latter days men were wont to wonder how, with such a superiority in one branch, he could have been so near eminence in all the rest. On the foundation of the Academy of Sciences at St. Petersburg, in 1723, by Catherine I. the two younger Bernoullis had gone thither, promising, when they set out, to endeavour to procure Euler a place in it: they accordingly wrote to him soon after, to apply his mathematics to physiology: he did so, and studied physic under the best physicians at Basil, but at the same time, i. e. 1727, published a dissertation on the nature and propagation of sound: and an answer to the question on the masting of ships, which the Academy of Sciences at Paris judged worthy of the accessit. Soon after this, he was called to St. Petersburg, and declared adjutant to the mathematical class in the academy, a class in which, from the circumstances of the times (Newton, Leibnitz, and so many other immortals having just ceased to live) no easy laurels were to be gathered. Euler now perfected the calculus integralis, which before was in its infancy: he was the inventor of a new kind of calculus, that of sines; he simplified analytical operations, and, aided by these powerful helpmates, and the astonishing facility with which he knew how to subdue expressions the most intractable, threw a new light on all the branches of the mathematics. But at Catherine's death the academy was threatened with extinction, by men who knew not the connection which arts and sciences have with the happiness of a people. Euler was offered and accepted a lieutenancy on board one of the empress's ships, with the promise of speedy advancement. Luckily things changed, and our doctor captain again found his own element, and was named Professor of Natural Philosophy in 1733, in the room of his friend John Bernoulli. The great number of memoirs which Euler produced prior to this period is astonishing; but what he did in 1735 is almost incredible. An important calculation was to be made, without loss of time; the other academicians had demanded some months to do it. Euler asked three days; in three days he did it; but the fatigue threw him into a fever, and the fever left him, but not without the loss of an eye; an admonition which would have made ordinary men more sparing of the other: he continued his exertions, however, with such ardour as, at length, produced total blindness. In 1736 he published an excellent treatise on the science of motion. In 1740 he shared the prize offered by the Paris Academy for the best theory of the Tides, with Maclaurin and D. Bernoulli, a very extraordinary triumvirate. In 1741, Euler received some very advantageous propositions from Frederic the second (who had just ascended the Prussian throne) to go and assist him in forming an academy of sciences out of the wrecks of the Royal Society founded by Leibnitz. With these offers the tottering state of the St. Petersburg academy under the regency made it necessary for our philosopher to comply. He accordingly illuminated the last volume of the Melanges de Berlin with five essays, which are perhaps, the best things in it, and contributed largely to the academical volumes, the first of which was published in 1744. No part of his multifarious labours is, perhaps, a more wonderful proof of the extensiveness and facility of his genius, than what he executed at Berlin, at a time when he contrived that the Petersburg acts should not suffer from the loss of him. In 1744, Euler published a complete treatise of isoperimetrical curves. In 1766 he returned to Petersburg, and soon after became completely blind. About this period he dictated to his servant his Elements of Algebra, which have excited wonder and applause. About the year 1770 he entered with great ardour into the consideration of the theory of the moon; in the course of which he performed the most immense calculations, and went through them with astonishing dexterity. Some time after this the famous oculist Wentzell, by couching the cataract, restored sight to our author; but the joy produced by this operation was of short duration. Some instances of negligence on the part of his surgeons, and his own impatience to use an organ, whose cure was not completely finished, deprived him a second time and for ever of his sight: a relapse which was also accompanied with tormenting pain. With the assistance of his sons, however, and of Messrs. Krafft and Lexell, he continued his labours: neither the infirmities of old age, nor the loss of his sight, could quench his genius. He had engaged to furnish the academy of Petersburg with as many memoirs as would be sufficient to complete its acts for 20 years after his death. In the space of seven years he transmitted to the academy above 70 memoirs, and above 200 more, left behind him, were revised and completed by a friend. Such of these memoirs as were of ancient date were separated from the rest, and form a collection that was published in the year 1783, under the title of Analytical Works. The general knowledge and taste of our author was more extensive than could well be expected in one who had pursued, with such unremitting ardour, mathematics and astronomy as his favourite studies. He had made a very considerable progress in medical, botanical, musical, and chemical science. What was still more extraordinary, he was an excellent scholar, and possessed in a high degree what is generally called erudition. He had attentively read the most eminent writers of ancient Rome; the civil and literary history of all ages and all nations was familiar to him; and foreigners, who were only acquainted with his works, were astonished to find in the conversation of a man, whose long life seemed solely occupied in mathematical and physical researches and discoveries, such an extensive acquaintance with the most interesting branches of literature. In this respect, no doubt he was much indebted to a very uncommon memory, which seemed to retain every idea that was conveyed to it, either from reading or from meditation. He could repeat the Æneid of Virgil, from the beginning to the end, without hesitation, and indicate the first and last line in every page of the edition he used. He invented the clavichord.

Several attacks of a vertigo, in the beginning of September 1783, which did not prevent his computing the motions of the aërostatic globes, were however the forerunners of his mild passage out of this life. While he was amusing himself at tea with one of his grandchildren, he was struck with an apoplexy, which terminated his illustrious career at 76 years of age.

Possessing a mind of such wonderful comprehension, and dispositions so admirably formed to virtue and happiness, Euler found no difficulty in being a Christian. The advocates for the truth of revealed religion, therefore, may add to the bright catalogue of believers, which already claims a Bacon, a Newton, a Boyle, a Locke, and a Hale, the illustrious name of Euler. For his learned and grateful pupil, M. Fuss, thus sums up his character: "His piety was rational and sincere: his devotion was fervent: he was fully persuaded of the truth of Christianity; felt its importance to the dignity and happiness of human nature; and looked upon its detractors and opposers as the most pernicious enemies of man."

The catalogue of Euler's works has been printed in 50 pages, 14 of which contain his MS. works. Of his numerous performances none have yet been translated into English, but the Theory of the Construction and Properties of Vessels, the Elements of Algebra, and the Letters to a German Princess. We hope our countrymen will soon import more of the rich productions of Euler's highly cultivated, comprehensive, and penetrating mind.

EULOGY. (from εὖ *bene*, well, and λεγω, *dico*, I say, or speak.) In church history, a name by which the Greeks call the panis benedictus, or bread over which a blessing is pronounced, and which is distributed to those who are unqualified to communicate. The name eulogiæ was anciently given to the consecrated pieces of bread, which the bishops and priests sent to each other, for the keeping up a friendly correspondence: those presents likewise which were made out of respect or obligation, were called eulogiæ. St. Paulinus, bishop of Nola, about the end of the sixth century, having sent five eulogiæ, at one time, to Romanian, says "I send you five pieces of bread, the ammunition of the warfare of Jesus Christ, under whose standard we fight."

Eulogy means likewise an encomium on any person, on account of some virtue or good quality. See Elogy.

EUMARIDES, an elegant kind of shoes, worn by both sexes, among the ancients.

EUMENES, a Greek officer in the army of Alexander, son of a charioteer. He was the most worthy of all the officers of Alexander to succeed after the death of his master. He conquered Paphlagonia, and Cappadocia, of which he obtained the government, till the power and jealousy of Antigonus obliged him to retire. He joined his forces to those of Perdiccas, and defeated Craterus and Neoptolemus. Neoptolemus perished by the hands of Eumenes. Eumenes fought against Antipater and conquered him, and after the death of Perdiccas, his ally, his arms were directed against Antigonus, by whom he was conquered, chiefly through the treacherous conduct of his officers, who betrayed him into the hands of Antigonus at Nora, a fortified place in Cappadocia, whither he had retired after the last fatal battle. He was put to death by order of Antigonus, B.C. 315. Antigonus, however, honoured his remains with a splendid funeral, and conveyed his ashes to his wife and family in Cappadocia. (*Plut. Diod.* &c.) This name was common also to two kings of Pergamus, in alliance with the Romans, both remarkable for their love of learning. The second of the name greatly enriched the famous library of Pergamus, which had been founded by his predecessors in imitation of the Alexandrian collection of the Ptolemies. (*Polyb.* &c.)

EUMENIDES, a name given to the Furies in the ancient mythology. They sprang from the drops of blood which flowed from the wound which Cœlus received from his son Saturn. According to others they were daughters of the earth, and conceived from the blood of Saturn. Some make them daughters of Acheron and Night, or Pluto and Proserpine. According to the more received opinions, they were three in number, Tisiphone, Megara, and Alecto, to which some add Nemesis. They were supposed to be the ministers of the vengeance of the gods, and were generally represented with a grim aspect, bloody garment, and serpents wreathing round their heads instead of hair. They held a burning torch in one hand, and a whip of scorpions in the other, and were always attended by terror, rage, paleness, and death.

EUMENIDIA, annual festivals in honour of the Eumenides, called by the Athenians σεμναι ϑεαι, venerable goddesses.

EUMOLPIDÆ, the priests of Ceres at the celebration of her festivals of Eleusis. They were descended from Eumolpus, a king of Thrace, who was made priest of Ceres by Erechtheus king of Athens. The priesthood which enjoined perpetual celibacy, remained in the family of Eumolpus for 1200 years.

EUNAPIUS, a writer and physician of the 4th century. He wrote a book of the Lives of the Philosophers and Sophists, in which he speaks rancorously of Christianity. He also composed the History of the Cæsars, which is lost, but the substance of it may be seen in Zosimus.

EUNOMIANS, in church history, Christians in the fourth century. They were a branch of Arians, and took their name from Eunomius, bishop of Cyzicus, who was instructed by Ætius in the points which were then controverted in the church, after having at first followed the profession of arms. Eunomius so well answered the designs of his master, and declaimed so vehemently against the divinity of the Word, that the people had recourse to the authority of the prince, and had him banished; but the Arians obtained his recal, and elected him bishop of Cyzicus. The manners and doctrines of the Eunomians were the same with those of the Arians.

EUNUCH. (Ευνουχος.) A term applied in the general to all who have not the faculty of generating, either through imbecility or frigidity; but more particularly to such as have been castrated, or have lost some of the parts necessary for that purpose. The word is formed of ευνην εχει, q. d. *lecti curam habet*, guardian, or keeper of the bed. In England, France, &c. eunuchs are never made but on occasion of some disease which renders such an operation necessary; but in Italy they make eunuchs for the sake of preserving the voice;

and in the east they make eunuchs to be guards or attendants on their women.

EU'NUCHATE. *v. a.* To make an eunuch.

EVOCATI, among the Romans, soldiers, who having served their time in the army, went afterwards volunteers at the request of some favourite general.

EVOCATION. (*Evocatio.*) Among the Romans, a religious ceremony always observed by them at undertaking the siege of a town, wherein they solemnly called upon the gods and goddesses of the place to forsake it and come over to them.

EVOCATORIÆ EPISTOLÆ, letters commanding or permitting the attendance of any person upon the Roman emperors.

EUODIA, in botany, a genus of the monogynian order, belonging to the tetrandrian class of plants. The calyx is a tetraphyllous perianth; the corol consists of four spathulated, sharp, and open petals; the stamens are four subulated filaments as long as the petals; the pericarp four roundish, bivalve, and monospermous capsules; the seeds solitary.

EVOLA'TION. *s.* (*evolo,* Lat.) The act of flying away.

EVOLI, an ancient town in Naples, in Italy. Lat. 40. 46 N. Lon. 15. 16 E.

To EVO'LVE. *v. a.* (*evolvo,* Latin.) To unfold; to disentangle (*Hale*).

To Evo'lve. *v. n.* To open itself; to disclose itself (*Prior*).

EVOLVENT, in the higher geometry, a term used by some writers for the involute, or curve resulting from the evolution of a curve.

EVOLUTE, in the higher geometry, a curve first proposed by M. Huygens, and since much studied by the late mathematicians. It is any curve supposed to be evolved or opened, by having a thread wrapped close upon it, fastened at one end, and beginning to evolve or unwind the thread from the other end, keeping the part evolved, or wound off, tight stretched; then this end of the thread will describe another curve called the involute. Or the same involute is described the contrary way, by wrapping the thread upon the evolute, keeping it always stretched.

Thus, if EFGH be any curve, and AE either a part of the curve, or a right line; then if a thread be wound close upon the curve from A to H, where it is fixed, and then be unwound from A; the curve AEFGH, from which it is evolved, is called the evolute; and the other curve ABCD described by the end of the thread, as it evolves or unwinds, is the involute. Or, if the thread HD, fixed at H, be wound or wrapped upon the evolute HGFEA, keeping it always tight, as at the several positions of it HD, GC, FB, EA, the extremity will describe the involute curve DCBA. Pl. 57. fig. 10.

From this description it appears, 1. That the parts of the thread at any positions, as EA, FB, GC, HD, &c. are radii of curvature, or osculatory radii, of the involute curve, at the points A, B, C, D.

2. The same parts of the thread are also equal to the corresponding lengths AE, AEF, AEFG, &c. of the evolute; that is,

AE=AE is the rad. of curvature to the point A,
BF=AF - - - - - B,
CG=AG - - - - - C,
DH=AH - - - - - D.

3. Any radius of curvature BF, is perpendicular to the involute at the point B, and is a tangent to the evolute curve at the point F.

4. The evolute is the locus of the centre of curvature of the involute curve.

The finding the radii of evolutes, is a matter of great importance in the higher speculations of geometry; and is often useful in practice; as is shewn by Huygens, the inventor of this theory, in applying it to the pendulum. Horol. Oscil. part 3.

The subject is well treated by some of the authors on fluxions, but we would particularly refer to Hayes, to Maclaurin's elegant work, art. 402, &c.; and Newton's as translated by Colson, p. 124. A very excellent article on the subject is given under the word Involution in the Supplement to the 3d edition of the Encyclopædia Britan. It will not admit of compression, and is much too long for the limits we are obliged to assign ourselves.

Evolute (Imperfect), a name given by M. Reaumur to a new kind of evolute. The mathematicians had hitherto only considered the perpendiculars let fall from the involute on the convex side of the evolute: but if other lines not perpendicular be drawn upon the same points, provided they be all drawn under the same angle, the effect will still be the same: that is, the oblique lines will all intersect in the curve, and by their intersections form the infinitely small sides of a new curve, to which they would be so many tangents. Such a curve is a kind of evolute, and has its radii; but it is an imperfect one, since the radii are not perpendicular to the first curve, or involute.

EVOLU'TION. *s.* (*evolutus,* Latin.) 1. The act of unrolling or unfolding (*Boyle*). 2. The series of things unrolled or unfolded (*More*).

Evolution, in geometry, the unfolding, or opening, of a curve, and making it describe an evolute.

The word *evolutio* is formed of the preposition, *e, out*; and *volvo,* I roll, or wind; q. d. an unwinding, or unrolling.

Evolution, in arithmetic and algebra, denotes the extraction of the roots out of powers.

Evolution, in the art of war, the motion made by a body of troops, when they are obliged to change their form and disposition, in order to preserve a post or occupy another, to attack an enemy with more advantage, or to be in a condition of defending themselves the better. It consists in doublings, counter-marches, conversions, &c.

EVOLVULUS, in botany, a genus of the class pentandria, order tetragynia. Calyx five-leaved; corol five-cleft, wheel-shaped; capsule four-celled; seeds solitary. Seven species; chiefly herbaceous annuals of the East or West Indies.

EVOMI'TION. *s.* (*evomo,* Latin.) The act of vomiting out.

EUONYMUS. Spindle tree. In botany, a genus of the class pentandria, order monogynia. Corol flat, five-petalled; capsule five-angled, five-celled, five-valved, coloured; seeds enveloped in a pulpy coat. Seven species: scattered over Europe, Asia, and America; of which one, e. Europæus, is common to the hedges of our own country, with an upright arboreous stem, rising ten or fifteen feet, and glabrous opposite leaves. E. Americanus, a native of Virginia, is frequently propagated among ourselves; and will bear the change of climate well. The wood cut while the plant is in blossom, is extremely tough, and used by watch-makers for cleaning watches; and by toy-makers for tooth-picks, and other small wares.

Euonymus (Bastard). See Celastrus.

Euonymus (Climbing). See Celastrus.

EVORA, a fortified city of Portugal, capital of Alentejo, with an archbishop's see, and a university. Some remains of the ancient Roman wall are visible, and the famous aqueduct built by Sertorius still conveys a noble stream of water to the city. Evora is seated in a country which, though a little unequal, is very pleasant, surrounded on all sides by mountains, and planted with large trees of divers sorts. It is 65 miles E. by S. of Lisbon. Lon. 7. 30 W. Lat. 38. 28 N.

EUPA'REA, in botany, a genus of the class pentandria, order monogynia. Calyx five-leaved; corol from five to twelve-petalled; berry superior, juiceless, many-seeded. One species only; a native of New Holland.

EU'PATHY. (from ευ, well, and παθια, affection.) In medicine, a good state of the body. Excellent health.

EUPATOR, a surname given to many of the Asiatic princes; as Mithridates, &c.

EUPATO'RIUM. Hemp-agrimony. In botany, a genus of the class syngenesia, order polygamia æqualis. Receptacle naked; down simple or rough; calyx imbricate or oblong; style longer than the flowers, cloven half its length. Seventy species; some with a calyx containing from three to five flowers; others with a calyx possessing six-florets; the greater number American plants, but one, e. cannabinum, found on the watery banks of our own country, with petioled leaves, in three or five lanceolate, serrate leaflets; the terminal ones longer. There is another variety with undivided leaves. Each is a very strong smelling and bitter plant; the juice of which proves violently emetic and purgative, and promotes the secretions. It is still used in Holland in jaundice, dropsies, and scurvies.

EUPATRIDÆ, in antiquity, a name given by Theseus to the nobility of Athens, to distinguish them from *geomori*, the husbandmen, and *demiurgi*, the artificers.

EUPEPSY. (from ευ, well, and πεπτω, to concoct.) In medicine, good digestion: the reverse of dyspepsy.

EUPEPTIC. (*eupeptica*, ευπεπτικα; from ευ, good, and πεπτω, to digest.) Substances are so called that are easy to digest, or that produce good digestion.

EUPHEMIA, a sea-port town of Naples, in Italy. Lat. 38. 44 N. Lon. 16. 32 E.

EUPHEMISM, in rhetoric, a figure which expresses things in themselves disagreeable and shocking, in terms implying the contrary quality: thus, the Pontus, or Black sea, having the epithet αξενος, *i. e.* inhospitable, given it, from the savage cruelty of those who inhabited the neighbouring countries, this name, by euphemism, was changed into that of Euxinus.

Thus Ovid, Trist. lib. iii. el. 13.

"Dum me terrarum pars penè novissima Ponti,
Euxinus falso nomine dictus, habet."

And again, in Trist. lib. v. el. 10.

"Quem tenet Euxini mendax cognomine litus."

In which significations, nobody will deny its being a species of irony: but every euphemism is not irony, for we sometimes use improper and soft terms in the same sense with the proper and harsh.

EUPHON, a musical instrument invented by Dr. Chladni, of Gottingen, in 1790, and to which this name is appropriated on account of its pleasant sound. In this instrument the sounds are drawn from glass tubes like those made for thermometers, which are of different colours: the whole tones being denoted by green tubes, the half tones by milk white ones: "The euphon has some resemblance to a small writing desk. When opened, the above-mentioned glass tubes, of the thickness of the barrel of a quill, and about sixteen inches long, are seen in a horizontal position. They are wetted with water, by means of a sponge, and stroked with the wet fingers in the direction of their length, so that the increase of the tone depends merely on the stronger or weaker pressure, and the slower or quicker movement of the fingers. The number of tubes at present is forty-two. In the back part there is a perpendicular sounding-board divided in the middle, through which the tubes pass. It appears therefore that the euphon ought not to be considered as an altered or improved Armonica, but as a totally new and different instrument. In regard to sweetness of sound, it approaches very near to the Armonica; but it has several advantages which no unprejudiced person, who examines both instruments, will deny.

"In the first place, it is simpler, both in regard to its construction and the movement necessary to produce the sound, as neither turning nor stamping is required, but merely the movement of the finger.

"2. It produces its sound speedier; so that as soon as it is touched you may have the tone as full as the instrument is capable of giving it; whereas, in the Armonica, the tones, particularly the lower ones, must be made to increase gradually.

"3. It has more distinctness in the quick passages, because the tones do not resound so long as in the Armonica, where the sound of one low tone is often heard when you wish only to hear the following tone.

"4. The unison is purer than is generally the case in the Armonica, where it is difficult to have perfect glasses, which in every part give like tones with mathematical exactness. It is however as difficult to be tuned as the Armonica.

"5. It does not affect the nerves of the performer; for a person scarcely feels a weak agitation in the fingers; whereas, in the Armonica, particularly in concords of the lower notes, the agitation extends to the arms and even through the whole body of the performer.

"6. The expense of this instrument will be much less than that of the Armonica.

"7. When one of the tubes breaks, or any other part is deranged, it can be soon repaired, and at very little expense; whereas, when one of the glasses of the Armonica breaks, it requires much time and is very difficult to procure another capable of giving the same tone as the former, and which will correspond sufficiently with the series of the rest." See ARMONICA.

From the history of the invention of this instrument, as related in vol. 2 of the Philosophical Magazine, it appears, that Dr. Chladni after various fruitless attempts for the space of a year and a half, at length in a state of slumber had presented to him an image of the instrument he wished for, very soon after which he completely accomplished his intended object.

EUPHO'NICAL. *a.* (from *euphony.*) Sounding agreeably.

EU'PHONY. *s.* (ευφωνια.) An agreeable sound; the contrary to harshness.

EU'PHORBIA. In botany. Spurge. A genus of the class and order dodecandria, trigynia. Calyx one-leafed, inflated, nectaries four or five standing on the calyx; capsule on a pedicel, three-lobed. A hundred and twenty species; natives of warm climates, and some few of our own country. They may be subdivided as follows:

A. Shrubby, prickly.
B. Shrubby, unarmed; stem not forked nor umbelliferous.
C. Forked; umbel bifid, or none.
D. Umbel three-rayed.
E. Umbel four-rayed.
F. Umbel five-rayed.
G. Umbel many-rayed.

They all produce a highly pungent and acrimonious fluid, discharged upon puncturing, in the semblance of milk; and by this appearance many of the species may be distinguished from the cactus, which they resemble in external character. The acrimony of the juices of several species is so great as to prove a fatal and almost instantaneous poison: and the Hottentots are in the common habit of arming their poisoned arrows from a preparation of this juice: as they also are of poisoning animals, on particular occasions, by infusing the leaves of these species in the waters they frequent. There is one species, however,

1. E. balsamifera, that exudes at the same time a pleasant and salutary balsam.

The rest that are chiefly worth noticing are,

2. E. canariensis; affording the gum euphorbium.

3. E. cyparissus. Cypress spurge, employed in the dispensatories under the name of ESULA MINOR, which see.

4. E. officinarum; the common spurge of the shops: of which there are two varieties, the one differing from the other in having the angles of the stem repand.

5. E. palustris; employed also in medicine under the name of ESULA MAJOR, which see.

6. E. paralias; used in the pharmacopœias under the officinal name of TITHYMALUS PARALIOS, which see.

7. E. petiolaris: long-stalked spurge, an elegant plant with slender woody stem, petioles in the whorls, solitary flowers. It is a native of the West Indies; and, like the other tropical euphorbias, should be kept in the dry stove. See Botany, Pl. CX.

EUPHORBIUM. (*euphorbium*; from *Euphorbus*, the physician of king Juba, in honour of whom it was named.) An inodorous gum-resin in yellow tears, which have the appearance of being worm-eaten; said to be obtained from several species of euphorbiæ, but principally from the euphorbia canariensis, and euphorbia officinarum; aculeata nuda multangularis, aculeis germinatis, of Linnéus; it is imported from Ethiopia, Libya, and Mauritania. It contains an active resin, and is very seldom employed but as an errhine.

EUPHORION. The most remarkable of this name is a Greek poet of Chalcis in Eubœa, in the age of Antiochus the Great. Tiberius took him for his model for correct writing. He died in his 56th year, B. C. 220.

EUPHRASIA. Eye-bright. In botany, a genus of the class didynamia, order angiosperma. Calyx cylindrical, four-cleft, equal; upper lip of the corol cloven; lower-lip three-lobed, with the lobes cloven; anthers awned with unequal spines; capsule ovate-oblong, two-celled; seeds striate. Eleven species; chiefly natives of the south of Europe: but one, e. officinalis, indigenous to our own pastures, with leaves ovate, obtusely toothed; lobes of the lower lip of the corol emarginate; flowers blue. It is esteemed by the vulgar as a remedy for all diseases of the eyes, and was formerly an article in the Materia Medica of many dispensatories. It is an ingredient in the English herb-tobacco. There are one or two other plants which have been mistaken by some naturalists for indigenous species of euphorbia: but e. officinalis is the only plant that is found native in our own country.

EUPHRATES, one of the most celebrated rivers in the world, and the principal of Turkey in Asia. It has its rise about a day's journey from Erzerum; and another source about two days journey from the same place. They both lie to the eastward, on high mountains covered with snow almost the year round. The plain of Erzerum is inclosed between two fine streams, which, when united, are called the Euphrates, or the Frat. After their junction, three days journey from Erzerum, it begins to be navigable for boats; but the channel is so rocky that the navigation is not safe. At first it runs S.S.W. then S. till it approaches nearest to Aleppo; when it runs S. E. till it reaches Rakka. It afterwards turns more to the S. till it comes to Meshed; and then passes S. E. again by Anna, Hit, Cubessa, and Felugia; and, not far thence, visits the spot where Babylon stood. It then fetches a compass like a bow, till it runs E. and unites with the Tigris; and, still retaining its name, it runs to Bussarah, and thence into the gulf of Persia, about 50 miles below it. It first divides Armenia from Natolia; then Syria from Diarbeck; after which it runs through Irac Arabia till it meets the Tigris. It is also the north-eastern boundary of the great desert of Arabia.

EUPOLIS, a comic poet of Athens, who flourished 435 years before the Christian æra. He severely lashed the vices and immoralities of his age. It is said that he had composed 17 dramatical pieces at the age of 17. Some suppose that Alcibiades put Eupolis to death, because he had ridiculed him in his verses; but Suidas maintains that he perished in a sea-fight between the Athenians and the Lacedæmonians in the Hellespont. (*Hor.*)

EURE, a department of France, which includes part of the late province of Normandy, and is so named from a river which rises in Perche, in the forest of Logny, and falls into the Seine, above Pont-d'Arche. Evreux is the capital.

EURE and **LOIRE**, a department of France, so called from the rivers of that name. It contains the late province of Beauce, and its capital is Chartres.

EVREMONT, ST. (Charles de St. Denis, lord of), a celebrated French writer. He was born in Normandy, in 1613, and being a younger son was designed for the law. After going through the necessary course of studies, he abandoned that profession, and adopted the military life. In 1640 he was at the siege of Arras, and not long after the Duke of Engiuen made him lieutenant of his guards on purpose to have him near his person. This post, however, he lost in 1648, on account of some satirical expression which he had made use of; for though the duke could give, he did not like to take a joke. When the civil war broke out he received the commission of a major-general, with a pension of 3000 livres a year. In 1657 he fought a duel with the marquis de Force, on which account he was obliged to keep himself concealed till his friends could obtain a pardon. In 1659 he served in Flanders, and soon afterwards attended cardinal Mazarine when he went to conclude a peace with the prime minister of Spain. While this negociation was going on, he wrote a confidential letter to the marquis of Crequi, in which he charged the cardinal with having sacrificed the welfare of France to his own private interests. This letter somehow or other got into the hands of some of Mazarine's friends after his death, and was made such use of by them, that the author was glad to escape from France. He was well known and esteemed in England, and thither he repaired. After staying here some time he went to Holland, with a view of settling there, but at the express invitation of Charles II. he returned to England, where he spent the remainder of his days very agreeably, and died in 1703. His remains were interred in Westminster abbey, where there is a monument to his memory. St. Evremont was a man of infinite wit, and considerable ingenuity. His works were printed in 1728, in 3 vols. 8vo. (*Watkins.*)

EVREUX, an ancient town of France, capital of the department of Eure, with a bishop's see. Here are manufactures of cloths and velvets. Lat. 49. 1. N. Lon. 1. 14. E.

EURIPIDES, a celebrated tragic poet born at Salamis. He studied eloquence under Prodicus, ethics under Socrates, and philosophy under Anaxagoras. He applied himself to dramatical composition, and his writings became so much the admiration of his countrymen, that the unfortunate Greeks, who had accompanied Nicias in his expedition against Syracuse, were freed from slavery, only by repeating some verses from the pieces of Euripides. Euripides and Sophocles viewed each other's talents with a most illiberal jealousy, which gave an opportunity to the comic muse of Aristophanes to ridicule them both on the stage with success and humour. The ridicule and envy to which he was continually exposed, obliged him at last to remove from Athens. He retired to the court of Archelaus, king of Macedonia, where he received the most conspicuous marks of royal munificence. His end was most deplorable. It is said that the dogs of Archelaus met him in his solitary walks, and tore his body to pieces, 407 years before the Christian æra, in the 78th year of his age.—Euripides wrote 75 tragedies, of which only 19 are extant. He is peculiarly happy in expressing the passions of love, especially the more tender and animated. To the pathos he has added sublimity, and the most common expressions have received a perfect polish from his pen. The best editions of the remaining tragedies are those of Commelin, in 1597; Stevens, in 1604; Barnes, in 1694; and Musgrave, in 1778. Euripides has been well translated into English by Woodhouse and Potter.

EURIPUS, now the NEGROPONT, a canal or strait which divides the island of Eubœa from the continent of Greece. In one place it is so narrow that a galley can scarce pass through it. The agitations of the Euripus were much spoken of by the ancients. Some say that the canal has a flux and reflux six times in 24 hours; others that it ebbs and flows seven times a day; but Livy does not allow this flux and reflux to be so regular. In this place, as the story commonly goes, Aristotle drowned himself out of chagrin, for not being able to account for so unusual a motion.

Euripus has since become a general name

for all straits, where the water is in great motion and agitation. The ancient circuses had their euripi, which were no other than pits or ditches on each side of the course, into which it was very dangerous falling with their horses and chariots as they ran races.

EUROCLYDON. (of Ευρος, east-wind, and κλυδων, wave.) Is a species of wind, of which we have an account only in Acts xvii. 14, and concerning the nature of which critics have been much divided. Bochart, Grotius, Bentley, and others, substitute another reading, supported by the Alexandrian MS. and the Vulgate, viz. Ευρακυλων, or *Euro-aquilo*; but Mr. Bryant defends the common reading, and considers the Euroclydon, i. e. Ευρος κλυζὼν, as an east-wind that causes a deep sea or vast inundation. He maintains, in opposition to Dr. Bentley's reasoning, who supposes that the mariners in the ship, the voyage of which is recited in this passage, were Romans, that they were Greeks of Alexandria, and that the ship was an Alexandrian ship employed in the traffic of carrying corn to Italy; and therefore, that the mariners had a name in their own language for the particular typhonic or stormy wind here mentioned.

EUROPA, in fabulous history, a daughter of Agenor, king of Phœnicia, so beautiful that Jupiter became enamoured of her, who, the better to seduce her, assumed the shape of a bull, and mingled with the herds of Agenor, while Europa, with her female attendants, were gathering flowers in the meadows. Europa caressed the animal, and at last had the courage to sit upon his back. The god took advantage of her situation, and with precipitate steps retired towards the shore, and crossed the sea with Europa on his back, and arrived safe in Crete. Here he assumed his original shape, and declared his love. The nymph consented, though she had before made vows of perpetual celibacy, and she became mother of Minos, Sarpedon, and Rhadamanthus. After this distinguished amour with Jupiter, she married Asterius, king of Crete. Minos succeeded to the throne of Asterius. Some suppose that Europa lived about 1552 years before the Christian æra. (*Ovid*, &c. &c.)

EUROPE, called by the people of Asia *Frankistan*, one of the four grand divisions of the world. We may state in general, that towards the E. it is bounded by Asia, without ascertaining the boundary lines more nearly than we have done under the article ASIA: elsewhere the limits are more accurately defined, as from the sea of Asoph to the Mediterranean on the south-east, through the Euxine or Black sea, the Bosphorus, the sea of Marmora, the Dardanelles, and the Archipelago; on the south it is bounded by the Mediterranean; on the west by the Atlantic; and on the north by the Frozen sea: Cabo di Rocca, or the Rock of Lisbon, on the coast of Portugal, being the most westerly point of land, 8. 40 W. of Greenwich; and probably the most easterly may be about the 57° or 58° of E. longitude. Its extent from south to north is supposed to be from about the 26th to the 72d degree of north latitude. It is much more populous, and better cultivated, than either Asia or Africa. It is fuller of villages, towns, and cities, and the buildings are stronger, more elegant and commodious, generally speaking, than in the two former. The inhabitants are all whites, and, for the most part, much better made than the Africans, or even the Asiatics. With regard to arts and sciences, there is no manner of comparison; nor yet in trade, navigation, and war. The number of inhabitants in Europe is calculated at 150 millions; but it is certainly capable of supporting a much greater number. These form different states, which are sometimes united and sometimes divided, as different political interests may weigh; each state speaks a different language, many of which are derived from the same original source, or are a mixture of others formed and sanctioned by time. Europe may be divided into sixteen parts, four to the north, viz. the British islands, Denmark with Norway, Sweden, and Russia; eight in the centre, viz. France, Netherlands, Swisserland, Germany, Bohemia, Hungary, Poland, and Prussia; and four to the south, viz. Portugal, Spain, Italy, and European Turkey. Its length from east to west is reckoned above 1100 leagues, and breadth from north to south about 900. Although Europe is the smallest quarter of the world in point of extent, yet it may be considered as the principal in every thing relating to man in society; mildness of air, fertility of soil; whence are produced all the necessaries, and most of the luxuries of life; for the beauty, strength, courage, and wisdom of its inhabitants; the excellence of its government, laws, and religion. The principal islands of Europe are Great Britain, Ireland, the Orcades, the Hebrides, Iceland; the isles of Ferro in the Atlantic; Sicily, Sardinia, Corsica, Candia, the Greek Isles, Majorca, Minorca, and others in the Mediterranean; and in the Baltic are Zealand, Funen, Rugen, Bornholm, Gottland, Oesel, &c. The most considerable rivers are the Po and the Tiber in Italy; the Rhine, the Danube, the Elbe, and the Oder, in Germany; the Loire, the Seine, the Rhone, and the Garonne, in France; the Tagus and the Duero in Spain; the Vistula in Poland; the Dnieper, the Volga, and the Don, in Russia; the Thames and the Severn in England; the Tay in Scotland; the Shannon in Ireland; the Scheldt and Meuse in the Netherlands, &c.—The chief mountains are the Alps, Apennines, and Pyrenees. The prevailing religion is the Christian, divided into the Greek, Romish, and Protestant churches. There are also Jews in every country, and Mahometanism is the established religion of the Turks. Europe is entirely within the temperate zone, except a small part of Norway and Russia; so that the inhabitants of this quarter of the world are so situated, as to be free from both the excessive heat and insupportable cold of other parts of the continent.

EURYALE, in mythology, one of the Gorgons, daughter of Phorcys, and sister of Medusa: she was subject neither to old age nor death.

EURYANDRA, in botany, a genus of the trigynia order, belonging to the polyandria class of plants. The calyx is a pentaphyllous perianth, with small, roundish, and concave leaves; the corol consists of three roundish hollow petals, longer than the calyx. The stamens are very many capillary filaments much dilated at the apex; the pericarp three egg-shaped follicles, containing several seeds.

EURYDICE, in fabulous history, the wife of Orpheus, who, flying from Aristæus that endeavoured to ravish her, was slain by a serpent. Her husband went down to the shades, and by the power of his music persuaded Pluto and Proserpine to give him leave to carry back his wife; which they granted, provided he did not look on her till he came to the light; but he breaking the condition, was forced to leave her behind him.

EURYTHMY, in architecture, painting, and sculpture, is a certain majesty, elegance, and easiness, appearing in the composition of divers members or parts of a body, painting, or sculpture, and resulting from the fine proportion of it.

EUSEBIUS (Pamphilus), an ecclesiastical historian, born in Palestine about 267. He received deacon's orders from Agapius, bishop of Cæsarea, where he had been educated. In the time of Dioclesian's persecution, he greatly assisted the suffering Christians by his pious exhortations, particularly his friend Pamphilus, whose name out of veneration he assumed. However he has been charged with having temporized in his own conduct at that time, but apparently on no just grounds. When peace was restored to the church, Eusebius was chosen bishop of Cæsarea, about 313. Shortly after this he was engaged in the dispute kindled by Arius, with whom he sided at first, but rather from a dislike of persecution, than from an approbation of that heresiarch's notions. He assisted at the council of Nice, and also at that of Antioch, where he was appointed bishop of that see, which he declined accepting. The emperor Constantine had a very particular esteem for him, and showed him several tokens of favour. He died about 338. He wrote an Ecclesiastical History, the Life of Constantine, and other works. The best edition of his Præparatio et Demonstratio Evangelica, is that of Vigerus, folio, 2 vols. 1628; and of his Ecclesiastical History, that of Cambridge, folio, 1720.

EU'SERA, in zoology, a tribe of the hymenopterous genus of insects apis, thus denominated in the Fabrician system of entomology. See APIS.

EUSTACHIAN TUBE. (*tuba Eustachiana.*) The tube so called was discovered by the great Eustachius. It begins, one in each ear, from the anterior extremity of the tympanum, and runs forwards and inwards in a bony canal, which terminates with the petrous portion of the temporal bone. It then goes on, partly cartilaginous and partly membranous, gradually becoming larger, and at length ends behind the soft palate. Through this tube the air passes to the tympanum.

EUSTACHIAN VALVE. See VALVULA EUSTACHII.

EUSTACHIUS (Bartholomew), physician and anatomist at Rome, flourished about the year 1550.

EUSTATHIANS, the same with the catholics of Antioch in the fourth century; so called from their refusing to acknowledge any other bishop beside St. Eustathius, who was deposed by the Arians.

EUSTATIA (St.), one of the least of the Leeward islands in the West Indies, which properly is nothing but a mountain in the form of a sugar-loaf, whose top is hollow. It is strong by situation, and has a good fort. It lies to the N.W. of St. Christopher's, and belongs to the Dutch, from whom it was taken by Admiral Rodney in 1781; but was soon after taken by the French, and restored to the Dutch by the peace of 1783. Lat. 17. 29 N. Lon. 63. 5 W.

EUSTE'PHIA, in botany, a genus of the class hexandria, order monogynia. Corol superior, tubular, cylindrical, bifid; nectary six cavities in the tube of the corol; filaments tricuspidate, distinct. One species only: a native of South America, with linear obtuse leaves; and four scarlet nodding flowers.

EUSTYLE. (formed of ευ, *bene*, well, and στυλος, column.) In architecture, a kind of edifice, where the columns are placed at a most convenient distance from one another, the intercolumniations being all just two diameters and a quarter of the column, except those in the middle of the fronts, before and behind, which are three diameters distant.

EURYA, in botany, a genus of the class dodecandria, order monogynia. Calyx double; the outer two-leaved, inner five-leaved; petals five; capsule five-celled, many-seeded. One species only: a native of Japan, with a shrubby stem, ever-green, alternate leaves, and axillary flowers.

EUTERPE, one of the Muses, daughter of Jupiter and Mnemosyne. She presided over music, and was looked upon as the inventress of the flute. She is represented as crowned with flowers, and holding a flute in her hands.

EUTHANASIA. (ευθανασιά.) An easy death.

EUTHYMIA, among the Greeks, signified such a disposition, or state of mind, as could not be ruffled.

EUTROPIUS, a Latin historian in the age of Julian, under whom he carried arms in the fatal expedition against the Persians. His origin as well as his dignity are unknown. He wrote an epitome of the history of Rome, from the age of Romulus to the reign of the emperor Valens, to whom the work was dedicated. Of all his works, the Roman history alone is extant. It is composed with conciseness and precision, but without elegance.

EUTYCHIANS, an ancient sect, which

denied the duplicity of natures in Christ; thus denominated from Eutyches, the archimandrite, or abbot of a monastery at Constantinople, who began to propagate his opinion A. D. 448. He did not, however, seem quite steady and consistent in his sentiments: for he appeared to allow of two natures, even before the union; which was apparently a consequence he drew from the principles of the Platonic philosophy, which supposes a pre-existence of souls: accordingly, he believed that the soul of Jesus Christ had been united to the divinity before the incarnation; but then he allowed no distinction of natures in Jesus Christ since his incarnation.

Eutychians was also the name of another sect, half Arian, half Eunomian; which arose at Constantinople in the fourth century. It being then a matter of mighty controversy among the Eunomians at Constantinople, whether or no the Son of God knew the last day and hour of the world, particularly with regard to that passage in the Gospel of St. Matthew, chap. xxiv. ver. 36. or rather that in St. Mark, xiii. 32. where it is expressed that the Son did not know it, but the Father only; Eutychius made no scruple to maintain, even in writing, that the Son did not know it; which sentiment displeasing the leaders of the Eunomian party, he separated from them, and made a journey to Eunomius, who acquiesced fully in Eutychius's doctrine, and admitted him to his communion.

EVU'LSION. *s.* (*evulsio,* Lat.) The act of plucking out (*Brown*).

EVULGA'TION. *s.* (*evulgo,* Latin.) The act of divulging; publication.

EUXINE, or **Black Sea**, forms part of the boundary betwixt Europe and Asia. It was anciently called the Axenus, from Ashkenaz, the son of Gomer, who is said to have settled near it. The original being forgot in length of time, the Greeks explained it by inhospitable, which the word Axenus literally signifies; and, therefore, when they came to consider the inhabitants of these coasts as more civilised and hospitable, they changed the name into Euxinus, which it still retains.

EWAGE, in old customs, toll paid for water passage.

EWE, *s.* (eope, Saxon.) The she sheep. See **Ovis**.

EWELL, a town in Surrey, with a market on Thursdays. It is seated on a rivulet which empties itself into the Thames at Kingston. Lat. 51. 26 N. Lon. 0. 15 W.

E'WER. *s.* (from *eau,* perhaps anciently *eu,* water.) A vessel in which water is brought for washing the hands (*Pope*).

E'WRY. *s.* (from *ewer.*) An office in the king's household, where they take care of the linen of the king's table, lay the cloth, and serve up water in silver ewers after dinner.

EX, a Latin preposition, often prefixed to compound words; sometimes meaning *out,* as *exhaust,* to draw *out,* and sometimes only enforcing the meaning.

Ex, a river which rises in the forest of Exmoor, in Somersetshire, and leaving that county below Dulverton, runs to Tiverton, Exeter, and Topsham, whence it forms an estuary, which terminates in the English channel at Exmouth.

Ex officio, among lawyers, signifies the power a person has, by virtue of his office, to do certain acts without being applied to. Thus a justice of peace may *ex officio,* at his discretion, take surety of the peace, without complaint made by any person whatsoever. There was formerly an oath *ex officio,* whereby a supposed offender was compelled in the ecclesiastical court to confess, accuse, or clear himself of a crime; but this law is repealed.

Ex post facto, in law, something done after another: thus an estate granted may be good by matter *ex post facto,* that was not so at first, as in case of election.

To EXACE'RBATE, *v. a.* (*exacerbo,* Lat.) To embitter; to exasperate.

EXACERBA'TION. *s.* (from *exacerbate.*) 1. Increase of malignity; augmented force or severity. 2. Height of a disease; paroxysm (*Bacon*).

EXACERVA'TION. *s.* (*ex* and *acervus,* Lat.) The act of heaping up.

EXA'CT. *a.* (*exactus,* Lat.) 1. Nice; not deviating from rule (*Pope*). 2. Methodical; not negligently performed. 3. Careful; not negligent (*Spectator*). 4. Honest; strict; punctual (*Ecclus*).

To **Exa'ct.** *v. n.* (*exigo, exactus,* Lat.) 1. To require authoritatively (*Taylor*). 2. To demand of right (*Smalridge*). 3. To summon; to enjoin (*Denham*).

To **Exa'ct.** *v. n.* To practise extortion (*Psalms*).

EXA'CTER. *s.* (from *exact.*) 1. Extortioner; one who claims more than his due (*Bacon*). 2. He that demands by authority (*Bacon*). 3. One who is severe in his injunctions or his demands (*Tillotson*).

EXA'CTION. *s.* (from *exact.*) 1. The act of making an authoritative demand, or levying by force (*Shakspeare*). 2. Extortion; unjust demand (*Davies*). 3. A tribute severely levied (*Addison*).

EXA'CTLY. *ad.* (from *exact.*) Accurately; nicely; thoroughly (*Atterbury*).

EXA'CTNESS. *s.* (from *exact.*) 1. Accuracy; nicety; strict conformity to rule or symmetry (*Woodward*). 2. Regularity of conduct; strictness of manners; care not to deviate (*Rogers*).

EXACUM, in botany, a genus of the class tetrandria, order monogynia. Calyx four-leaved, or four-cleft; corol four- or five-cleft, with an inflated tube; capsule two-grooved, two-celled, many-seeded, opening at top: stigma capitate. Eighteen species; chiefly natives of the East Indies, or South America. One indigenous to the marshes of our own country, e. filiforme, with sessile leaves; and flowers on long stalks.

To EXA'GGERATE. *v. a.* (*exaggero,* Lat. 1.) To heap upon; to accumulate (*Hale*). 2. To heighten by representation (*Clarendon*).

EXAGGERA'TION. *s.* (from *exaggerate.*)

1. The act of heaping; a heap (*Hale*). 2. Hyperbolical amplification (*Swift*).

To EXA'GITATE. *v. a.* (*exagito*, Latin.) 1. To shake; to put in motion (*Arbuthnot*). 2. To reproach; to pursue with invectives: not in use (*Hooker*).

EXAGITA'TION. *s.* (from *exagitate.*) The act of shaking or agitating.

To EXA'LT. *v. a.* (*exalter*, French.) 1. To raise on high (*Matthew*). 2. To elevate to wealth or dignity (*Ezekiel*). 3. To elevate to joy or confidence (*Clarendon*). 4. To praise; to extol; to magnify (*Psalms*). 5. To raise up in opposition (*Kings*). 6. To intend; to enforce (*Prior*). 7. To heighten; to refine by fire (*Arbuthnot.*) 8. To elevate in diction or sentiment (*Roscommon*).

EXALTA'TION. *s.* (from *exalt.*) 1. The act of raising on high. 2. Elevation to power or dignity (*Hooker*). 3. Elevated state; state of greatness or dignity (*Tillotson*). 4. (In pharmacy.) Raising a medicine to a higher degree of virtue (*Quincy*). 5. Dignity of a planet in which its powers are increased in astrology (*Dryden*).

Exaltation of the cross. See Cross.

EXA'MEN. *s.* (Lat.) Examination; disquisition; inquiry (*Brown*).

EXA'MINATE. *s.* (*examinatus*, Lat.) The person examined (*Bacon*).

EXAMINA'TION. *s.* (*examinatio*, Latin.) The act of examining by questions, or experiment; accurate disquisition (*Locke*).

EXAMINA'TOR. *s.* (Lat.) An examiner; an inquirer (*Brown*).

To EXA'MINE *v. a.* (*examino*, Latin.) 1. To try a person accused or suspected by interrogatories (*Church Catechism.*) 2. To interrogate a witness (*Acts*). 3. To try the truth or falsehood of any proposition. 4. To try by experiment, or observation; to sift narrowly; to scan. 5. To make inquiry into; to search into; to scrutinize (*Locke*).

EXA'MINER. *s.* (from *examine.*) One who searches into the veracity of an evidence. 2. One who searches or tries any thing; one who scrutinizes.

EXAMINERS, in chancery, are two officers, whose business is to examine, on oath, the witnesses produced on both sides, upon such interrogatories as the parties to the suit do exhibit for the purpose.

EXA'MPLARY. *a.* (from *example.*) Serving for example or pattern (*Hooker*).

EXA'MPLE. *s.* (*exemple*, French.) 1. Copy or pattern; that which is proposed to be resembled (*Raleigh*). 2. Precedent; former instance of the like (*Shakspeare*). 3. Precedent of good (*Milton*). 4. A person fit to be proposed as a pattern (*Timothy*). 5. One punished for the admonition of others (*Jude*). 6. Influence which disposes to imitation (*Rogers*). 7. Instance; illustration of a general position by some particular specification (*Dryden*). 8. Instance in which a rule is illustrated by an application (*Dryden*).

To Exa'mple. *v. a.* (from the noun.) 1. To exemplify; to give an instance of (*Spen.*). 2. To set an example (*Shakspeare*).

EXA'NGUIOUS. *a.* (*exanguis*, Lat.) Having no blood; formed with animal juices, not sanguineous (*Brown*).

EXA'NIMATE. *a.* (*exanimatus*, Lat.) 1. Lifeless; dead. 2. Spiritless; depressed (*Thomson*).

EXANIMA'TION. *s.* (from *exanimate.*) Deprivation of life.

EXA'NIMOUS. *a.* (*exanimis*, Lat.) Lifeless; dead; killed.

EXANTHEMA. (*exanthema*, εξανθημα, from εξανθεω, to spring forth, to bud.) An eruption of the skin. Cullen makes exanthematæ an order in the class pyrexiæ. It includes contagious diseases, beginning with fever, and followed by an eruption on the skin.

EXANTHE'MATOUS. *a.* (from *exanthemata.*) Pustulous; efflorescent; eruptive.

To EXA'NTLATE. *v. a.* (*exantlo*, Latin.) 1. To draw out. 2. To exhaust; to waste away (*Boyle*).

EXANTLA'TION. *s.* (from *exantlate.*) The act of drawing out; exhaustion.

EXARATE, in botany, scored or underlined, as by a pen.

EXARA'TION. *s.* (*exaro*, Latin.) The manual act of writing.

EXARCH, in antiquity, an appellation given, by the emperors of the East, to certain officers sent into Italy, in quality of vicars, or rather prefects, to defend that part of Italy which was yet under their obedience; particularly the city of Ravenna against the Lombards, who had made themselves masters of the greatest part of the rest.

Exarch of a diocese, was, anciently, the same with primate. Exarch also denotes a kind of deputy, or *legate à latere* of the patriarch in the Greek church. It is likewise used in the Eastern church antiquity for a general or superiour over several monasteries.

EXARTICULA'TION. *s.* (*ex* and *articulus*, Latin.) The dislocation of a joint.

To EXA'SPERATE. *v. a.* (*exaspero*, Lat.) 1. To provoke; to enrage; to irritate (*Addison*). 2. To heighten a difference; to aggravate; to embitter (*Bacon*). 3. To exacerbate; to heighten malignity (*Bacon*).

Exasperate, in botany, roughened.

EXASPERA'TER. *s.* (from *exasperate.*) He that exasperates; a provoker.

EXASPERA'TION. *s.* (from *exasperate.*) 1. Aggravation; malignant representation (*K. Charles*). 2. Provocation; irritation (*Atterbury*).

To EXAU'CTORATE. *v. a.* (*exauctoro*, Lat.) 1. To dismiss from service. 2. To deprive of a benefice (*Ayliffe.*)

EXAUCTORATIO, in the Roman military discipline, a partial discharge, which took place after the soldiers had served seventeen years; at this period they lost their pay. The *missio*, or full discharge, took place after they had been in the army twenty years.

EXAUCTORA'TION. *s.* (from *exaucto-*

rate.) 1. Dismission from service. 2. Deprivation; degradation (*Ayliffe*).

EXCALCEATION, among the Hebrews, a law whereby a widow, whom her husband's brother refused to marry, might summon him to a court of justice, and, on his refusal, might pull off one of his shoes and spit in his face: both being reckoned very ignominious.

EXCANDE′SCENCE. Excande′scency. *s.* (*excandesco*, Lat.) 1. Heat; the state of growing hot. 2. Anger; the state of growing angry.

EXCANTA′TION. *s.* (*excanto*, Lat.) Disenchantment by a counter charm.

To EXCA′RNATE. *v. a.* (*ex* and *carnis*, Lat.) To clear from flesh (*Grew*).

EXCARNIFICA′TION. *s.* (*excarnifico*, Lat.) The act of taking away the flesh.

To E′XCAVATE. *v. a.* (*excavo*, Lat.) To hollow; to cut into hollows (*Blackmore*).

EXCAVA′TION. *s.* (from *excavate.*) 1. The act of cutting into hollows. 2. The hollow formed; the cavity (*Wotton*).

To EXCE′ED. *v. a.* (*excedo*, Latin.) 1. To go beyond; to outgo (*Woodward*). 2. To excel; to surpass (*Kings*).

To Exce′ed. *v. n.* 1. To go too far; to pass the bounds of fitness (*Taylor*). 2. To go beyond any limits (*Deuteronomy*). 3. To bear the greater proportion (*Dryden*).

EXCE′EDING. *part. a.* (from *exceed.*) Great in quantity, extent, or duration (*Raleigh*).

Exce′eding. *ad.* In a very great degree; eminently (*Raleigh*).

EXCE′EDINGLY. *ad.* To a great degree; greatly; very much (*Newton*).

To EXCE′L. *v. a.* (*excello*, Lat.) To outgo in good qualities; to surpass (*Prior*).

To Exce′l. *v. n.* To have good qualities in a great degree; to be eminent (*Temple*).

E′XCELLENCE. E′xcellency. *s.* (*excellence*, French; *excellentia*, Latin.) 1. The state of abounding in any good quality. 2. Dignity; high rank in existence (*Dryden*). 3. The state of excelling in any thing (*Locke*). 4. That in which one excels (*Addison*). 5. Purity; goodness (*Shakspeare*). 6. A title of honour. Usually applied to ambassadours and governours (*Shakspeare*).

E′XCELLENT. *a.* (*excellens*, Latin.) 1. Of great virtue, worth, or dignity (*Taylor*). 2. Eminent in any good quality (*Job*).

E′XCELLENTLY. *ad.* 1. Well; in a high degree (*Brown*). 2. To an eminent degree (*Dryden*).

EXCENTRIC, or Excentric circle, in the ancient Ptolemaic astronomy, was the orbit of the planet itself, which it was supposed to describe about the earth, and which was conceived excentric thereto, called also the deferent.

Excentric, or Excentric circle, in the new astronomy, is the circle described from the centre of the orbit of a planet, with half the greatest axis as a radius; or it is the circle that circumscribes the elliptic orbit of the planet.

Excentric anomaly. See Anomaly.

Excentric place of a planet, in its orbit, is the heliocentric place, or that in which it appears as seen from the sun.

Excentric place in the ecliptic, is the point of the ecliptic to which the planet is referred as viewed from the sun; and which coincides with the heliocentric longitude.

EXCENTRICITY. See Eccentricity.

Excentricity, in the old astronomy, is the distance between the centre of a planet and that of the earth.

Excentricity, in the new astronomy, is the distance between the sun and the centre of a planet's orbit: called also the simple or single excentricity.

Excentricities of the Planets at the commencement of 1801; *the semi-axis major of each orbit being expressed by unity.*

Mercury	0·20551494
Venus	0·00685298
The Earth	0·01683518
Mars	0·09313400
Jupiter	0·04817840
Saturn	0·05616830
Uranus, or Herschel	0·04667030

Secular Variations of Excentricities: all positive.

Mercury	0·000003867
Venus	0·000062711
The Earth	0·000041632
Mars	0·000090176
Jupiter	0·000159350
Saturn	0·000312402
Uranus	0·000025072

The excentricity of the moon's orbit is 0·0548553; the semi-axis major being unity.

Excentricities of the Orbits of the Telescopic Planets.

Ceres (discovered 1801)	0·0783486
Pallas (. . . 1802)	0·245384
Juno (. . . 1803)	0·254944
Vesta (. . . 1807)	0·093220

(*Laplace Mecanique Celeste, and Supplement.*)

The excentricity of a planet being added to the mean distance, gives the greatest distance; or, taken from the mean distance, leaves the least distance of the planet from the sun.

To EXCE′PT. *v. a.* (*excipio*, Latin.) To leave out, and specify as left out of a general precept, or position (*Corinthians*).

To Exce′pt. *v. n.* To object; to make objections (*Locke*).

Exce′pt. *preposit.* (from the verb.) 1. Exclusively of; without inclusion of (*Milton*). 2. Unless; if it be not so that (*Tillotson*).

EXCE′PTING. *preposit.* Without inclusion of; without exception of (*Dryden*).

EXCE′PTION. *s.* (*exceptio*, Latin.) 1. Exclusion from the things comprehended in a precept, or position (*South*). 2. Thing excepted, or specified in exception. 3. Objection; cavil (*Bentley*). 4. Peevish dislike; offence taken (*Bacon*).

EXCE'PTIONABLE. *a.* (from *exception.*) Liable to objection (*Addison*).

EXCE'PTIOUS. *a.* (from *except.*) Peevish; froward; full of objections (*South*).

EXCE'PTIVE. *a.* (from *except.*) Including an exception (*Watts*).

EXCE'PTLESS. *a.* (from *except.*) Omitting or neglecting all exceptions (*Shakspeare*).

EXCE'PTOR. *s.* (from *except.*) Objector (*Burton*).

To EXCE'RN. *v. a.* (*excerno*, Latin.) To strain out; to separate or emit by strainers (*Bacon*).

EXCE'RPTION. *s.* (*excerptio*, Lat.) The act of gleaning or selecting. 2. The thing gleaned or selected.

EXCE'SS. *s.* (*excessus*, Latin.) 1. More than enough; superfluity (*Hooker*). 2. Exuberance; state of exceeding (*Newton*). 3. Intemperance; unreasonable indulgence in meat and drink (*Duppa*). 4. Violence of passion. 5. Transgression of due limits (*Denham*).

Excess (Spherical), in trigonometry, the excess of the sum of the three angles of any spherical triangle, above two right angles. Let A,B,C, be the angles of a spherical triangle, a,b,c, the sides opposite to the angles A,B,C, respectively, $\pi =$ two right angles, $r =$ the radius of a great circle of the sphere, and R″ the number of seconds comprised in radius; then the spherical excess may be ascertained by the following elegant theorem, first given by Simon Lhuillier of Geneva:

$$\text{Tan.}\,\tfrac{1}{4}\,(A+B+C-\pi) = \frac{1}{r}\sqrt{\left(\text{tan.}\,\frac{a+b+c}{4}\ \text{tan.}\,\frac{a+b+c}{4}\ \text{tan.}\,\frac{a+c-b}{4}\ \text{tan.}\,\frac{b+c-a}{4}\right)}.$$

M. Puissant gives the following theorems for ϵ the excess:

$$\epsilon = \tfrac{1}{2}\left(\frac{R''}{2r^2}\right) a^2 \sin.\,2C + \tfrac{1}{2}\left(\frac{R''}{2r^2}\right) c^2 \sin.\,2A.$$

$\epsilon = \tfrac{1}{2}\left(\frac{R''}{r^2}\right) bh$, where $b =$ the base, and $h =$ the height of the triangle. It will hence be easy to form a table, from which the spherical excess of any triangle measured may be learnt from its base and height.

EXCE'SSIVE. *a.* (*excessif*, French.) 1. Beyond the common proportion of quantity or bulk (*Bacon*). 2. Vehement beyond measure in kindness or dislike (*Hayward*).

EXCE'SSIVELY. *ad.* Exceedingly; eminently; in a great degree (*Addison*).

To EXCHA'NGE. *v. a.* (*exchanger*, Fr.) 1. To give or quit one thing for the sake of gaining another (*Locke*). 2. To give and take reciprocally (*Rowe*).

Exchange, *s.* (from the verb.) 1. The act of giving and receiving reciprocally (*Waller*). 2. Traffic by permutation (*South*). 3. The form or act of transferring (*Shakspeare*). 4. The balance of the money of different nations (*Hayward*). 5. The thing given in return for something received (*Locke*). 6. The thing received in return for something given (*Dryden*). See the article immediately following.

Exchange (Permutation). In commerce, an agreement, whereby one thing is trucked or given for another. The first commerce carried on among men, was by exchange; people furnished each other mutually with what things they wanted; but such exchanges were clogged with two considerable difficulties. 1. On account of the unequal values of commodities; and, 2. Because every body had not just what might accommodate the person with whom he would exchange. To remove these inconveniencies, money was invented for a common medium; and instead of exchanging, buying and selling were introduced. Yet there are nations among whom the primitive way of exchange still obtains; and even among the most civilised people, there are frequent occasions, in which they have recourse to this method. Such, for instance, is the trade of several cities of the North, and Baltic sea, where the French exchange their wines and brandies for woods, metals, hemp, and furs.

The commerce of bills of exchange is, itself, a mere trading by exchange; a truck of money for money. Exchange, therefore, properly denotes the business or trade of money, as carried on between one place and another, by means of bills of exchange, i. e. by giving money in one city, and receiving a bill to entitle the giver to receive the value in another city. See Bill of exchange.

In professor Beckmann's History of Inventions the reader will find an ordinance of the year 1394, concerning the acceptance of bills of exchange, and also copies of two bills of the year 1404, which sufficiently prove that the method of transacting business by bills of exchange was fully established in Europe so early as the fourteenth century: and that the present form and terms were even then used. The ordinance, which was issued by the city of Barcelona, decreed that bills of exchange should be accepted within twenty-four hours after they were presented, and that the acceptance should be written on the back of the bill.

There is also another species, called dry exchange, *cambium siccum*, or usurer's exchange, which consists in giving money at one place, to be repaid it after a certain time in the same place, with a certain sum over, which is usually more than common interest. The ceremony of a real exchange is observed in this fictitious kind, which is only a method of borrowing money. The borrower draws a bill of exchange on any imaginary person, perhaps at Amsterdam, at the price the exchange then goes at, and delivers it to the lender. After the time fixed, comes a protest from Amsterdam for non-payment, with the re-exchange of the money from thence to London; all which, with costs, besides a deduction perhaps at the making of the bargain, the borrower must pay.

Exchange is also used for the profit which a merchant, negociant, or broker makes of a sum of money received, and for which a bill of exchange is drawn, payable in some other place, and by some other person, for the interest of his money, and the reward of his negotiation. This profit is exceedingly various; being sometimes 2, sometimes 3, 4, or even 10 and 15 per cent, according as the alloy of the species differs, or as money is more or less plentiful, or bills of exchange more or less scarce, in the places. This kind is ordinarily called real exchange, and sometimes mercantile or mixed exchange.

Exchange is sometimes used for the agio, or difference between the current money or cash, and the exchange, or bank money. Sometimes again, it is used to denote the difference between the par of exchange (or the intrinsic value of the money of one country in coin of another), and the course of exchange (or the value agreed upon by merchants, or their factors). In this sense the exchange is continually fluctuating.

Exchange, in arithmetic, is the reduction of different coins, or any denominations of money, whether there be real coins answering to them, or no, from one to another: or the method of finding how many of one species, or denomination, are equal in value to a given number of another; in order to which it is necessary to know the value of the coins and monies of account of different countries, and their proportion to each other according to the settled rate of exchange. The several operations in this case are only different applications of the rule of three. See *Hutton's* and *Keith's Arith.*

Exchange (Arbitration of). See Arbitration.

Exchange signifies also a place in most considerable trading cities, wherein the merchants, agents, bankers, brokers, and other persons concerned in commerce, meet on certain days, and at certain times thereof, to confer and treat together of matters relating to exchanges, remittances, payments, assurances, freights, and other mercantile negociations, both by sea and land.

In Flanders, Holland, and several cities of France, these places are called burses; at Paris and Lyons, places de change; and in the Hanse towns, colleges of merchants. The most considerable exchanges in Europe are, that of Amsterdam, that of London called the Royal Exchange, and that of Manchester.

EXCHA'NGER. *s.* (from *exchange.*) One who practises exchange (*Locke*).

EXCHE'AT. *s.* See Escheat (*Spenser*).

EXCHE'ATOR. *s.* See Escheator. (*Car.*)

EXCHEQUER, in the British jurisprudence, an ancient court of record, in which all causes concerning the revenues and rights of the crown are heard and determined, and where the crown revenues are received. It took its name from the chequered cloth which covered the table of the court.

This court is said to have been erected by William the Conqueror, its model being taken from a like court established in Normandy long before that time. Anciently its authority was so great, that it was held in the king's palace, and the acts thereof were not to be examined or controlled in any other of the king's courts; but, at present, it is the last of the four courts at Westminster.

The exchequer, for the dispatch of business, is generally divided into two parts; one of which is chiefly conversant in the judicial hearing and deciding of all causes relating to the king's coffers, formerly termed the exchequer of accounts: the other is called the receipt of the exchequer, as being principally employed in receiving and paying of money.

The judicial part of the exchequer is a court both of law and equity. The court of law is held in the office of pleas, according to the course of common law, before the barons: in this court, the plaintiff ought to be a debtor or accountant to the king; and the leading process is either a writ of subpœna, or quo minus, which last goes into Wales, where no process out of courts of law ought to run, except a capias utlagatum.

The court of equity is held in the exchequer chamber before the treasurer, chancellor, and barons; but, generally, before the barons only: the lord chief baron being the chief judge to hear and determine all causes. The proceedings in this part of the exchequer are by English bill and answer, according to the practice of the court of chancery; with this difference, that the plaintiff here must set forth that he is a debtor to the king, whether he be so or not. It is in this court of equity that the clergy exhibit bills for the recovery of their tythes, &c.

But, besides the business relating to debtors, farmers, receivers, accountants, &c. all penal punishments, intrusion, and forfeitures upon popular actions, are matters likewise cognizable by this court; where there also sits a puisne-baron who administers the oaths to high sheriffs, bailiffs, auditors, receivers, collectors, comptrollers, surveyors, and searchers of all the customs, &c. The exchequer in Scotland has the same privileges and jurisdiction as that of England; and all matters competent to the one are competent to the other also.

Barons and *Chancellor of the* Exchequer. See Barons and Chancellor.

Exchequer-bills are a species of paper first established in 1696, to supply the want of circulating cash, during the re-coinage at that period. They were then taken at the exchequer for all payments of the revenue, and, when re-issued, they were allowed 7*l.* 12*s.* per cent. interest. They have since been issued yearly; and the bank of England, ever since the year 1706, have been the contractors for their circulation, at a certain premium. The commissioners of the treasury are empowered, by various statutes, to borrow money, within a specific sum, limited by those statutes, by issuing exchequer bills on the credit of certain duties; which bills, by 12 Anne, cap. 11. and 12 Geo. I. cap. 11. bear an interest of 2*d.* a day per cent. payable to the bearers. These bills are numbered arithmetically, and registered accordingly, so that the principal sums may be paid off in course, and the interest shall be payable every three months. The said exchequer bills shall be current to all receivers and collectors of the customs, excise, or any revenue, and at the receipt of the exchequer.

If any exchequer bills be lost, upon affidavit before a baron of the exchequer, and certificate from him, and security given to pay the same if found, duplicates are to be made out; and when bills are defaced, new ones shall be delivered. Forging of these bills, or of the indorsements on them, is felony.

The sum of 2,750,000*l.* is usually raised by exchequer bills on credit of the malt tax, and tax on personal estates, although it is well known that these taxes never produced so much, the deficiency being always made good out of the next supplies. The sum to be issued out of the produce of the consolidated fund is likewise usually raised by these bills, charged upon the growing produce of the surplus of the said fund; also other sums for ordinary and extraordinary expenses, by bills charged upon the first supplies of the next session: so that of late years the total amount of outstanding exchequer bills has usually been about ten millions. The bank, since 1706, have contracted with government for the circulation of these bills at a certain premium. The interest they carry has been at various rates, from 7*l.* 12*s.* to 3 per cent.; those at present in circulation bear interest at the rate of threepence halfpenny a day per cent. which is computed up to the day of sale, from the respective dates of the bills. They are generally for 100*l.* each, but many of those issued on the vote of credit are for 1000*l.* and they have sometimes been made out for much larger sums: they are numbered arithmetically, and registered accordingly, for the purpose of paying them off in a regular course. They are paid at the exchequer bill office, and the time of payment is notified by advertisement.

The daily transactions between the bank and the exchequer are chiefly carried on by bills of 1000*l.* each, which are deposited by the bank in the exchequer to the amount of the sums received by them on government account: the banknotes and cash thus received by the bank being retained by them, as the detail part of the money-concerns of government is all transacted at the bank. The instalments on loans are paid into the receipt of the exchequer by these exchequer bills of 1000*l.* each, which are received again by the bank as cash, either for the amount of dividends due, or in re-payments of advances; and as, while deposited in the exchequer, they are considered merely as a pledge or security, they of course continue to bear interest, till the advance on which the bank first received them is paid off.

In October, 1796, the 5 per cent. exchequer bills, issued on the vote of credit, being at a considerable discount, it was thought proper to fund them; and the terms agreed upon were as follows:—The holders to be entitled for every 100*l.* to eithei of the following capitals:

£.	*s.*	*d.*	
176	19	9¾	in the 3 per cents.
137	18	7¼	in the 4 per cents.
118	6	10¼	in the 5 per cents.

The amount of the bills thus funded was 1,433,870*l.* and the capital stock created in the different funds, 2,374,333*l.* 14*s.* 8*d.*

In November, 1801, it was again found necessary to fund a considerable part of the outstanding exchequer bills, which was effected on the following conditions: for each 100*l.* principal to receive the under-mentioned proportions of stock:

		Estimated value.		
£.		*£.*	*s.*	*d.*
25	Three per cent. consols . . .	17	1	10½
25	Three per cent. reduced . .	16	16	10½
50	Four per cent. consols	42	7	6
25	New 5 per cents	24	15	0
	1*s.* 9*d.* Long annuity . . .	1	14	4
	£.	102	15	7

And the proprietors to have the liberty of subscribing 50*l.* additional in money for every 100*l.* they held in bills, the money thus raised to be applied in paying off the sum of about 2,400,000*l.* in exchequer bills in the possession of the bank. The amount of the bills funded and redeemed was 8,910,450*l.*

As there is always a considerable sum outstanding in exchequer bills, the interest paid thereon forms a constant addition to the annual charge of the funded debt; the amount paid for interest on exchequer bills in the years 1803, 1804, and 1805, respectively, was as follows:

	£.	*s.*	*d.*
1803	801,787	10	5½
1804	624,859	18	10
1805	1,478,316	3	3½

The premium or discount at which exchequer bills sell, depends on the proportion which the interest payable on them bears to the interest produced by the public funds according to their current prices.

Exchequer bills, though the same in their nature and solidity, differ in their origin from navy bills in this, that they are issued in anticipation of revenue, and circulated by the bank of England to raise money. During the recess of parliament, there is a sum left to the credit of the chancellor of the exchequer, to serve in cases of exigency. The bank makes advances to the amount voted, for which the exchequer issues bills. There is a standing contract between government and the bank for the trouble and expense attending the issue and circulation of these bills. (*Chambers, Fairman, Fortune, Gregory, Grellier*).

Black book of the **Exchequer**, a book containing a description of the court of England in 1175, and its officers, with their ranks, privileges, wages, &c. also the revenues of the crown, both in money and cattle.

EXCISE, from the Belgic *accüsse*, tributum, tribute, an inland duty or imposition, paid sometimes upon the consumption of a commodity, or frequently upon the wholesale, which is the last stage before the consumption. This is doubtless, impartially speaking, the most economical way of taxing the subject; the charges of levying, collecting, and managing the excise duties, being considerably less in proportion than in other branches of the revenue. It also renders the commodity cheaper to the consumer, than charging it with customs to the same amount would do; for the reason just now given, because generally paid in a much later stage of it. But at the same time, the rigour and arbitrary proceedings of excise laws seem hardly compatible with the temper of a free nation. For the frauds that might be committed in this branch of the revenue, unless a strict watch is kept, make it necessary, wherever it is established, to give the officers a power of entering and searching the houses of such as deal in excisable commodities, at any hour of the day, and, in many cases, of the night likewise. And the proceedings, in case of transgressions, are so summary and sudden, that a man may be convicted in two days time in the penalty of many thousand pounds, by two commissioners or justices of the peace; to the exclusion of the trial by jury, and disregard of the common law. For these reasons, though lord Clarendon tells us, that to his knowledge the earl of Bedford (who was made lord treasurer by king Charles I. to oblige his parliament) intended to have set up the excise in England, yet it never made a part of that unfortunate prince's revenue; being first introduced, on the model of the Dutch prototype, by the parliament itself after its rupture with the crown. Yet such was the opinion of its general unpopularity, that when in 1642 aspersions were cast by malignant persons upon the house of commons, that they intended to introduce excises, the house for its vindication therein did declare, that these rumours were false and scandalous, and that their authors should be apprehended and brought to condign punishment. Its original establishment was in 1643, and its progress was gradual; being at first laid upon those persons and commodities where it was supposed the hardship would be least perceivable, viz. the makers and venders of beer, ale, cider, and perry; and the royalists of Oxford soon followed the example of their brethren at Westminster, by imposing a similar duty: both sides protesting, that it should be continued no longer than to the end of the war, and then be utterly abolished. But the parliament at Westminster soon after imposed it on flesh, wine, tobacco, sugar, and such a multitude of other commodities, that it might be fairly denominated general: in pursuance of the plan laid down by Mr. Pymme (who seems to have been the father of the excise), in his letter to sir John Hotham, signifying, that they had proceeded in the excise to many particulars, and intended to go on farther; but that it would be necessary to use the people to it by little and little. And afterwards, when the nation had been accustomed to it for a series of years, the succeeding champions of liberty boldly and openly declared the impost of excise to be the most easy and productive levy that could be laid upon the people; and accordingly continued it during the whole usurpation. Upon king Charles's return, it having then been long established and its produce well known, some part of it was given to the crown, in 12 Car. II. by way of purchase for the feudal tenures and other oppressive parts of the hereditary revenue. But, from its first original to the present time, its very name has been odious to the people. It has, nevertheless, been imposed on abundance of other commodities in the reigns of king William III. and every succeeding prince, to support the enormous expenses occasioned by our wars on the continent. Thus brandies and other spirits are now excised at the distillery; printed cottons and linens, at the printer's; starch and hair-powder, at the maker's; gold and silver wire, at the wiredrawer's; all plate whatsoever, first in the hands of the vender, who pays yearly for a licence to sell it, and afterwards in the hands of the occupier, who also pays an annual duty for having it in his custody: and coaches and other wheel carriages, for which the occupier is excised; though not with the same circumstances of arbitrary strictness with regard to plate and coaches as in the other instances. To these we may add coffee and tea, chocolate and cocoa paste, for which the duty is paid by the retailer; all artificial wines, commonly called sweets; paper and pasteboard, first when made, and again if stained or printed; malt, as before mentioned; vinegars; and the manufacture of glass; for all which the duty is paid by the manufacturer; hops, for which the person that gathers them is answerable; candles and soap, which are paid for at the maker's; malt liquors brewed for sale, which are excised at the brewery; cider and perry at the vender's; leather and skins, at the tanner's; and, lately, tobacco, at the manufacturer's: a list, which no friend to his country would wish to see farther increased.

The excise was formerly farmed out; but is now managed for the king by commissioners in both kingdoms, who receive the whole product of the excise, and pay it into the exchequer. These commissioners are nine in number in England, and five in Scotland. The former have a salary of 1000*l.* a year, the latter 600*l.* They are obliged by oath to take no fee or reward but from the king himself; and from them there lies an appeal to five other commissioners called commissioners of appeals.

Total gross produce of the Excise Duties in England, in the year ending the 5th of January, 1807.

	£.	s.	d.
Auctions	249,891	14	1¼
Beer and ale	2,971,351	15	7¼
Bricks and tiles	306,661	10	0¼
Candles	311,449	4	8
Cocoa-nuts and coffee	124,178	5	7½
Cider and perry	19,772	5	1¾
Glass	424,786	3	9¾
Hides and skins	311,322	17	1
Hops	56,339	15	2½
Licences	301,083	17	11¼
Malt	1,388,130	8	8¼
Metheglin, or mead	161	8	9
Paper	359,158	5	5½
Printed goods	698,373	17	8
Salt	1,470,704	13	2¾
Soap	586,564	5	7½
Spirits, British	1,201,200	19	11
Ditto, Foreign	1,772,866	14	5¾
Starch	60,025	14	0¼
Sweets	24,771	0	6¼
Tea	1,280,751	16	8½
Tobacco and snuff	196,188	10	10¼
Vinegar and verjuice	38,024	14	7½
Wine	1,149,313	8	7¾
Wire	13,388	9	11
WAR TAXES.			
Wine	210,292	7	3¼
Malt	2,713,172	10	8¾
Spirits, British and foreign	1,473,936	6	11¼
Sweets	4,483	12	3¼
Tea	1,313,664	13	7¼
Tobacco and snuff	162,342	18	10½
ANNUAL DUTIES.			
Old malt duty	676,810	12	0¾
Additional malt duty	1,115,491	1	9
Tobacco and snuff	428,140	4	9¼
Total £.	23,414,796	6	7¼

The balance of cash at the commencement of the year being 27,790*l.* 3*s.* 3¾*d.* added to the above sum, makes the total to be accounted for 23,442,586*l.* 9*s.* 11*d.* This amount is subject to various deductions, consisting principally of the expenses of management, drawbacks of duty on goods exported, allowances and bounties on several commodities, annual payments to the officers of the late wine licence office and of the old salt duties, and pensions granted by patent out of the excise while it formed part of the hereditary revenue of the crown. The amount of these payments in the year ending the 5th of January, 1807, was as follows:

	£.	s.	d.
Charges of Management	569,341	0	4¼
Taxes repaid to officers	30,513	15	8¾
Exports	920,712	3	10
Allowances	69,242	5	11¼
Bounties	20,304	19	5¼
Overcharges, overpayments, repayments per treasury warrants, &c.	29,701	15	0¾
Payments to officers of late wine licence office and salt duties	10,599	4	5¼
Pensions to the duke of Grafton and others	14,000	0	0
Payments into the exchequer	21,739,067	12	10
Balance of cash remaining the 5th of Jauuary, 1807, carried to the next year's account	39,103	12	3
Total £.	23,442,586	9	11½

The total gross produce of the excise duties in Scotland, in the above year, was 1,824,394*l.* 0*s.* 6½*d.*; of which the sum of 1,445,000*l.* was paid into the exchequer during the year. The total gross produce of the excise duties in Ireland, for the same year, was 1,453,500*l.* 0*s.* 2*d.* (*Brit. Ency.*)

EXCISE LAWS. For more easily levying the revenue of the excise, the kingdom of England and Wales is divided into about fifty collections, some of which are called by the names of particular counties, others by the names of great towns; where one county is divided into several collections, or where a collection comprehends the contiguous parts of several counties, every such collection is subdivided into several districts, within which there is a supervisor; and each district is again subdivided into outrides and footwalks, within each of which there is a gauger or surveying officer.

The commissioners or sub-commissioners, in their respective circuits and divisions, shall constitute, under their hands and seals, so many gaugers as they shall find needful.

Arrears of duties.—By several acts of parliament, all articles in the possession of persons subject to the excise laws, together with all the materials and utensils of whatsoever description, are made liable for the arrears of duties, whether these be single or double duties; and if a trader, being in arrears for the single duties, becomes a bankrupt, and is convicted after the assignment of his effects, the double duties are a lien upon the exciseable commodities, utensils, and materials in the hands of his assignees, and the commissioners or magistrates may authorize the penalty to be levied upon all such commodities, and all the materials, preparations, utensils, and vessels for making thereof, in the custody of the bankrupt, or any person or persons in trust for him. 2 *Doug.* 411.

Bonds, for the exportation of exciseable commodities are to be taken by officers of excise, and they are to be given generally upon all exciseable articles, at the place where exported.

Forgery of any stamps, licences, certificates, permits, or any other excise documents, is by various statutes made a capital felony.

Licences.—In all cases where licences are required, the licence will only sanction the business carried on in that particular place for which such licence was granted; but when the business is carried on by partners, one licence will be sufficient to cover the firm.

Officers of excise.—The officers of excise are to be appointed, and may be dismissed, replaced, or altered, by the commissioners, under their hands and seals; their salaries are allowed and established by the treasury; and by 1 W. & M. c. 24. s. 15. if it is proved by two witnesses, that any officer has demanded or taken any money, or other reward whatever, except of the king, such offender shall forfeit his office.

By several statutes, no process can be sued out against any officer of excise, for any act done in the execution of his office, until one month after notice given, specifying the cause of action, and the name and abode of the person who is to begin, and the attorney who is to conduct the action; and within one month after such notice, the officer may tender amends, and plead such tender in bar; and having tendered insufficient or no amends, he may, with leave of the court, before issue joined, pay money into court.

Officers of excise are empowered to search, at all times of the day, entered warehouses, or places for tea, coffee, &c. But private houses can only be searched upon oath of the suspicion before a commissioner or justice of peace, who can by their warrant authorize a search.

Permits.—Persons dealing in exciseable commodities are entitled to permits for removing the same to different places in certain quantities, and under certain regulations. These permits are written upon a peculiar species of paper, manufactured expressly for the purpose; and by 23 Geo. III. c. 70. s. 11. no permit paper is to be delivered out before it shall be filled up agreeably to the request note of a trader; and officers knowingly granting any false permit, making false entries in the counterpart thereof, or receiving any commodities into stock with a false or forged permit, are to be transported for seven years.

Samples.—Officers of excise are, by various acts, empowered to take samples of exciseable commodities, paying the prices therein regulated for the same.

Seizures.—When an officer makes a seizure of any spirits, or other articles, he must lay his hand on the casks, vessels, &c. so seized, and declare that he seizes such spirits, &c. and the casks or vessels containing the same, for the use of his majesty and of himself; but if the officer happens to be alone when he makes such seizure, he must afterwards, in the presence of witnesses, again lay his hand on such cask, vessel, &c. and repeat the former declaration of seizure.

All informations on seizures must be laid in the names of the officers making the same.

By 41 Geo. III. c. 96. commissioners of excise are empowered to make restitution of exciseable goods.

Scales and weights.—By various acts of parliament, traders subject to the excise laws are to keep just and sufficient scales and weights, under the penalty of 100*l.* for every such offence, and the scales and weights may be seized by the officers.

Traders, manufacturers, and dealers liable to the excise duties, are to assist the officers in weighing stock; and forcibly obstructing, or using any art or contrivance to prevent or impede the officers from taking a true account, incurs a penalty of 100*l.* (*Gregory's Dict.*)

To EXCI'SE. *v. a.* (from the noun.) To levy excise upon a person or thing (*Pope*).

EXCI'SEMAN. *s.* An officer who inspects commodities, and rates their excise.

EXCI'SION. *s.* (*excisio*, Latin.) Extirpation; destruction; ruin (*Decay of Piety*).

EXCI'TABILITY. EXCITEMENT. In medicine, terms almost peculiar to the Brunonian system. (See BRUNONIAN SYSTEM.) In all the states of life, observes Dr. Brown, man and other animals differ from themselves in their dead state, or from any other inanimate matter, in this property alone; they can be affected by external agents, as well as by certain functions peculiar to themselves, in such a manner, that the phænomena peculiar to the living state can be produced. This proposition extends to every thing that is vital in nature, and therefore applies to vegetables.

The external agents are reducible to heat, diet, and other substances taken into the stomach, blood, the fluids secreted from the body and air.

The functions of the system itself, producing the same effect, are muscular contraction, sense, or perception, and the energy of the brain in thinking, and in exciting passion and emotion. These affect the system in the same manner as the other agents; and they arise both from the other and from themselves.

If the property which distinguishes living from dead matter, or the operation of either of the two sets of powers, be withdrawn, life ceases. Nothing else than the presence of these is necessary to life.

The property on which both sets of powers act may be named excitability, and the powers themselves exciting powers. By the word body is meant, both the body simply so called, and also as endued with an intellectual part, a part appropriated to passion and emotion, or a soul: the usual appellation in medical writings is system.

The effects common to all the exciting powers are, sense, motion, mental exertion, and passion. Now their effects being the same, it must be granted that the operation of all the powers is the same.

The effects of the exciting powers acting upon the excitability may be denominated *excitement.*

The excitability of the whole body, therefore, as well as of particular parts, is supposed to be in a state of perpetual variation, depending upon the time and manner of application of the internal and external stimuli employed; and the care upon this theory consists in proportioning the stimuli to the degree of excitability present in the patient till healthy excitement is restored.

EXCITA'TION. *s.* (from *excito*, Latin.) 1. The act of exciting, or putting into motion (*Bacon*). 2. The act of rousing or awakening (*Watts*).

To EXCI'TE. *v. a.* (*excito*, Latin.) 1. To rouse; to animate; to stir up; to encourage (*Spenser*). 2. To put into motion; to raise.

EXCI'TEMENT. *s.* (from *excite.*) The motive by which one is stirred up (*Shakspeare.*)

EXCI'TER. *s.* (from *excite.*) 1. One that stirs up others, or puts them in motion (*King Charles*). 2. The cause by which any thing is raised or put in motion (*Decay of Piety*).

EXCI'TING CAUSE. In medicine. Occasional cause. Procatarctic cause. Remote cause. That which, when applied to the body under a state of predisposition, excites a disease. The exciting or remote causes of diseases are either external or internal.

To EXCLA'IM. *v. a.* (*exclamo*, Latin.) 1. To cry out with vehemence; to make an outcry (*Decay of Piety.*) 2. To declare with loud vociferation (*Shakspeare*).

Excla'im. *s.* (from the verb.) Clamour; outcry; not used (*Shakspeare*).

EXCLA'IMER. *s.* (from *exclaim.*) One that makes vehement outcries (*Atterbury*).

EXCLAMA'TION. *s.* (*exclamatio*, Lat.) 1. Vehement outcry; clamour; outrageous vociferation (*Hooker*). 2. An emphatical utterance (*Sidney*). 3. A note by which a pathetical sentence is marked thus (!).

Exclamation. In rhetoric, a figure that expresses the violent and sudden breaking out and vehemence of any passion. Such is that in the eleventh book of Milton's Paradise Lost:

> O unexpected stroke, worse than of death!
> Must I thus leave thee, Paradise? Thus leave
> Thee, native soil; these happy walks and shades,
> Fit haunt of gods?

EXCLA'MATORY. *a.* (from *exclaim.*) 1. Practising exclamation. 2. Containing exclamation.

To EXCLU'DE. *v. a.* (*excludo*, Latin.) 1. To shut out; to hinder from entrance or admission (*Dryden*). 2. To debar; to hinder from participation; to prohibit (*Dryden*). 3. To except in any position. 4. Not to comprehend in any grant or privilege (*Hooker*). 5. To dismiss from the womb or egg (*Brown.*)

EXCLU'SION. *s.* (from *exclude.*) 1. The act of shutting out or denying admission (*Bacon*). 2. Rejection; not reception (*Addison.*) 3. The act of debarring from any privilege. 4. Exception (*Bacon*). 5. The dismission of the young from the egg or womb (*Ray*). 6. Ejection; emission; thing emitted (*Brown*).

Exclusion, or Bill of exclusion, a bill proposed about the close of the reign of king Charles II. for excluding the duke of York, the king's brother, from the throne, on account of his being a papist.

Exclusion, in mathematics, is a method of coming at the solution of numerical problems, by previously throwing out of our consideration such numbers as are of no use in solving the question.

EXCLU'SIVE. *a.* (from *exclude.*) 1. Having the power of excluding or denying admission (*Milton*). 2. Debarring from participation (*Locke*). 3. Not taking into an account or number. 4. Excepting.

EXCLU'SIVELY. *ad.* 1. Without admission of another to participation (*Boyle*). 2. Without comprehension in an account or number; not inclusively (*Ayliffe*).

To EXCO'CT. *v. a.* (*excoctus*, Latin.) To boil up; to make by boiling (*Bacon*).

EXCŒCA'RIA. In botany, a genus of the class dioecia, order triandria. Ament naked, covered with florets; calyxless; corolless. Fem. styles three; capsules three-grained; seeds solitary. There are two species, e. agallocha, and e. cochinchinensis.

The agallochum, which is known by the name of aloe-wood, or the aromatic aloe, is one of the most valuable spices imported from the East, and has been in high estimation, even in the earliest ages. According to the different species of the plant, it is called *lignum aloes*, *agallochi veri*, *aquilæ*, and *calambac*, all of which differ remarkably in their sensible properties. It is, however, very difficult to ascertain the botanical character of these various species.

The aromatic wood of aloe is properly a resin, which has pervaded the pores of the tree. The genuine sort of this resinous wood is as precious as gold, and is used only by the great and affluent in the East Indies, China, and Japan, as an agreeable perfume, with which they fumigate houses: hence it is but rarely imported into Europe. It is black, and variegated with grey veins, swims on water, and if strongly rubbed on glass, leaves behind resinous particles, which neither water, saliva, expressed oils, nor an alkaline lye, but spirit of wine only will dissolve and remove. Its odour is very grateful.

This substance has, in former times, been much used as a medicine, not only in biliary complaints, diseases of the liver and stomach, and dysentery, but likewise as a remedy for the maw-worm; but at present it is entirely neglected—a revolution to which several of the ancient remedies have been subject, and which is likely to take place with many of the modern.

Father De Loureiro assures us, that he discovered in the province of Cochin-China the tree which affords the true aloe. This aromatic wood is found in resinous masses, only in old half-decayed, hollow trees. According to this writer, the tree belongs, in the system of Linnéus, to the first division of the tenth class, the decandria monogynia: he called it *aloexylum agallochum*. It grows on the highest mountains of Cochin-China, on the banks of the river Lav, which flows through the whole of that province. Loureiro had no opportunity of seeing the blossoms on the tree; he could only once obtain them dried, and transmitted by a friend, so that the parts of fructification were much bruised and lacerated on a long journey, and he could with difficulty give the following description:—

Aloexylum agallochum. Differ. spec. aloe. foliis lanceolatis, alternis: pedunculis polyfloris, terminalibus.

Hab. Arbor magna: trunco et ramis erectis, altissimis: cortice cannabino, fusco, glabro, nec crasso.

Folia lanceolata, octo polyces longa, integerrima, plana, glabra, subcoriacea, alterna, petiolata. Flos terminalis, pedunculis polyfloris.

Usus. Ligni hujus suffimenta inter omnia maxime æstimantur apud nationes Orientales. Ex arboris cortice fit vulgaris charta, in quâ Conchin-chinenses scribunt, sicut in Japonia fit ex cortice mori.

Virtus medica. Excitans, corroborans, cephalica, cardiaca. Suffitus valet contra vertiginem et paralysim. Pulvis cohibet vomitum et fluxus ventris, præcipue lientricos, quod non proprie astringendo, sed corroborando agit.

This tree is not of a poisonous nature, and yields no milky sap when perforated. With respect to the genuine wood of aloe, Loureiro maintains that the various species differ remarkably, both in colour and flavour. By some botanists, this aromatic wood has been confounded with the lignum aquilæ, which is likewise esteemed for its agreeable odour, and, like the agallochum verum, calambac, and garo de Malacca, affords different species of perfume.

To EXCO'GITATE. *v. a.* (*excogito*, Lat.) To invent; to strike out by thinking (*More*).

EXCOMMU'NICABLE. *a.* Liable or deserving to be excommunicated (*Hooker*).

To EXCOMMU'NICATE. *v. a.* (*excommunico*, Lat.) To eject from the communion of the church by an ecclesiastical censure (*Ham.*).

EXCOMMUNICATION, an anathema, or ecclesiastical censure, and punishment; whereby a heretic is cut off from the society of the faithful, or an obstinate sinner from the communion of the church, and the participation of the sacraments.

This censure of excommunication was originally instituted for preserving the purity of the church; but ambitious ecclesiastics converted it by degrees into an engine for promoting their own power, and inflicted it on the most frivolous occasions.

The power of excommunication properly belongs to the bishop; but he may delegate it to any grave priest, with the chancellor.

Every excommunication should be preceded by three public admonitions, two days at least distant from each other; but this is to be understood of excommunications imposed by the ecclesiastical judge; for those imposed by the law are incurred to all intents and purposes the moment the action is committed.

These latter are called excommunications by the canon, or *latæ sententiæ*; and are so very numerous, that it would be difficult, even for the best canonists, to give an exact list of them; there are fifty in the Clementines; twenty in the bull Cœna Domini, &c. Wilkins's Mag. Conc. vol. iv. p. 664. Rebuffe, on the Concordat, reckons up sixty penalties accruing upon excommunication.

Excommunication is founded on a natural right which all societies have, of excluding out of their body such as violate the laws thereof.

Excommunication is either *major* or *minor*; i. e. greater or less; the first, which is that understood when we say, simply, excommunication, separates or cuts off the delinquent from all communication and fellowship with other Christians; disables him from defending his rights, bringing an action at law, being a witness, &c. The second, or lesser, only excludes from the communion of the Lord's supper.

The greater excommunication, called also *ab homine*, is when a prelate, or his deputy, excommunicates any man personally, and interdicts him all society with the faithful, all use of sacraments, &c.

In the ancient church, the sentences of the greater excommunication were solemnly promulged four times in the year, with candles lighted, bells tolling, the cross, and other solemnities.

The lesser excommunication is incurred *pleno jure*, by having any communication with a person excommunicated in the greater excommunication. And this too imports a privation of communion, but not an interdiction from entering the church, nor having commerce with the faithful.

Anciently, the excommunicated were obliged to procure absolution from their bishop, and make satisfaction to the church, in forty days time; otherwise they were compelled to it by the secular judge, by a seizure of their effects, imprisonment of their persons, &c.

Excommunication, among the pagans, excluded the persons from the sacrifices and the temples, and delivered them over to the Furies, which was called *execrare*, and *Diris devovere*. When Marcus Crassus set out on his expedition against the Parthians, Atteius, tribune of the people, not being able to prevent him, ran to the gate of the city through which the general was to pass, and setting a chafing-dish in the middle of the way with fire in it, when Crassus drew near, he threw some perfumes into the chafing-dish, and pronounced curses against Crassus with great exclamation, and thus excommunicated him.

Excommunication, in the church of England, is the highest ecclesiastical censure which can be pronounced by a spiritual judge against a Christian: for thereby he is excluded from the body of the church, and disabled to bring any action, or sue any person in the common law courts. Co. Lit. 133.

The sentence of excommunication was instituted originally for preserving the purity of the church; and it seems agreed, that wherever the spiritual court has jurisdiction in any cause, and the party refuses to appear to their citation, or after sentence, being admonished to obey their decree, that he may be excommunicated. 1 Rol. Abr. 883.

A person excommunicated is disabled to be a witness in any cause: he cannot be attorney or procurator for another; he is to be turned out of the church by the church-warden, and not to be allowed Christian burial. Gibs. Cod. 435.

The sentence of excommunication can only be pronounced by the bishop, or other person in holy orders, being a master of arts at least; also the priest's name pronouncing such sentence, is to be expressed in the instrument issuing under seal out of the court. Gibs. Cod. 1095.

EXCO'MMUNICATO CAPIENDO, or SIGNIFICAVIT, a writ directed to the sheriff, for the apprehension of one who stands obstinately excommunicated the space of forty days. Such a one, not seeking absolution, hath, or may have, his contempt certified into the chancery; whence this writ issues for laying him up, without bail or mainprize, until he conform himself.

EXCOMMUNICATO DELIBERANDO, is a writ directed to the under sheriff, for the delivery of an excommunicated person out of prison; upon certificate of the ordinary of his conformity to the ecclesiastical jurisdiction.

EXCOMMUNICATO RECIPIENDO, is a writ whereby persons excommunicated, being for their obstinacy committed to prison, and unlawfully delivered from thence before they have given security to obey the authority of the church, are commanded to be sought for, and laid up again.

To EXCO'RIATE. *v. a.* To flay; to strip off the skin (*Wiseman*).

EXCORIATION. (*excoriatio*, from *excorio*, to take off the skin.) An abrasion of the skin.

EXCORIATION is also sometimes used to signify the act of flaying: and figuratively to denote plunder or spoil.

EXCORTICA'TION. *s.* (from *ex* and *cortex*, Latin.) Pulling the bark off any thing (*Quincy*).

To E'XCREATE. *v. a.* (*excreo*, Latin.) To eject at the mouth by hawking.

EXCREMENT. (from *excerno*, to separate from.) Whatever is separated or excreted from the blood as useless, as well as the remnants of those substances, both animal and vegetable, which after having undergone the process of digestion, and supplied the body with nourishment, are only retained till there is an opportunity or a necessity for evacuating them, may be denominated excrement

Excrements are found in a fluid or a solid state. The first comprehends the urine and sweat: the second the feces. Between the first two a great analogy has been found to exist, and in many cases they are perceived mutually to answer the same purposes. Fewer experiments, however, have been made upon the matter of perspiration than upon urine. Like the latter it appears to be loaded with salts of various kinds, and to tinge linen with different shades of yellow. Berthollet affirms that it reddens blue paper, and that this effect is produced more particularly from that which is produced from those parts affected with gout: he thinks it contains phosphoric acid; and Hershall saw a person whose body, during perspiration, was become phosphorescent.

Human urine is peculiarly characterised by its possession of lithic acid, an acid secreted by the kidneys of no other animal than man; and which, when in large quantity, usually crystallizes round the sides of the vessel in which it is deposited, in the form of red polygonal salts, vulgarly denominated red sand. It contains also a large quantity of extractive matter of a peculiar kind, denominated by the French chemists *urée*, and a considerable portion of phosphoric acid. The urine of animals that feed on vegetables alone is proved by Fourcroy to contain benzoic acid instead of phosphoric, but to hold a larger portion of extractive matter.

This extractive matter is applied to a promotion of the arts in various ways, but chiefly in the four following. 1. The artificial formation of nitre. 2. The scouring of woollen cloths. 3. The extraction of ammonia. 4. The extraction of muriat of ammonia. For the rest, see URINE.

With respect to the feces, the cupidity of the alchemists was excited by some wild dreams of being able to extract from this substance an oil capable of fixing mercury (the first step to its supposed conversion into gold;) and hence many experiments were undertaken upon human feces, into which subject we shall not enter. Homberg, one of the most respectable of this tribe, made very numerous experiments; one of the results of which was a discovery of the pyrophorus, which bears his name, and which is now obtained by a perfectly unoffensive process.

The dung of different animals is employed for a variety of important purposes. That of the herbivorous quadrupeds appears a mixture of bile and animal fluids, with a considerable portion of the fibrous or least digestible part of vegetable food. Hence the great use of camels dung in Arabia and Egypt as fuel, being the chief and almost the only substance procurable for the purpose. A considerable quantity of ammonia is always produced by the burning of dung, from which, mixed with sea-salt, the earliest sal-ammoniac was obtained. Cowdung is of no small use in a number of processes for the preparation of cloth either for dyeing or bleaching. It mixes uniformly with water, and possesses cleansing powers similar to those of soap. The feces of dogs and carnivorous animals are distinguished by their excessively offensive smell, and the extremely corroding effect which they have upon organized matter when the putrid fermentation is established. This excrement is used in the preparation of leather by tawing, as it is called, and its effect is first to loosen and destroy the adhesion of the hair, then to render the whole skin extremely flexible and open in texture;

and if the process be continued only a few hours too long, the whole consistence of the skin will be destroyed, and it will fall to pieces like a mucilaginous jelly. If the process of analysis were less repulsive, an examination into the properties of this powerful agent would prove highly interesting.

EXCREME'NTAL. *a.* (from *excrement.*) That is voided as excrement (*Raleigh*).

EXCREMENTI'TIOUS. *a.* (from *excrement.*) Containing excrements; consisting of matter excreted from the body (*Bacon*).

EXCRE'SCENCE. EXCRE'SCENCY. *s.* (*excresco*, Lat.) Somewhat growing out of another without use, and contrary to the common order of production (*Bentley*).

EXCRE'SCENCE. (*excrescentia*, from *excresco*, to grow from.) In surgery. Any preternatural formation of flesh, or other part of the body, as wens, warts, &c.

EXCRE'SCENT. *a.* (*excrescens*, Latin.) That grows out of another with preternatural superfluity (*Pope*).

EXCRE'TION. (*excretio*, from *excerno*, to separate from.) This term is applied to the separation or secretion of those fluids from the blood of an animal, that are supposed to be useless, as the urine, perspiration, and alvine fæx.

EXCRE'TIVE. *a.* (*excretus*, Latin.) Having the power of separating and ejecting excrements (*Harvey*).

E'XCRETORY. *a.* (from *excretion.*) Having the quality of separating and ejecting superfluous parts.

E'XCRETORY. *s.* The duct or instrument of excretion. See ANATOMY.

EXCRU'CIABLE. *a.* (from *excruciate.*) Liable to torment.

To EXCRU'CIATE. *v. a.* (*excrutio*, Lat.) To torture; to torment (*Chapman*).

EXCUBA'TION. *s.* (*excubatio*, Latin.) The act of watching all night.

EXCUBIÆ. In antiquity, the watches and guards kept in the day by the Roman soldiers. They are contradistinguished from the *Vigiliæ*, which are kept in the night.

To EXCU'LPATE. *v. a.* (*ex* and *culpo*, Lat.) To clear from the imputation of a fault (*Clarendon*).

EXCU'RSION. *s.* (*excursion*, French.) 1. The act of deviating from the stated or settled path; a ramble (*Pope*). 2. An expedition into some distant part (*Locke*). 3. Progression beyond fixed limits (*Arbuth.*). 4. Digression; ramble from a subject (*Boyle*).

EXCU'RSIVE. *a.* (from *excurro*, Latin.) Rambling; wandering; deviating (*Thomson.*)

EXCU'SABLE. *a.* (from *excuse.*) Pardonable; that may be excused (*Tillotson*).

EXCU'SABLENESS. *s.* (from *excusable.*) Pardonableness; capability to be excused (*Boyle*).

EXCUSATI. In church history, a term used to denote slaves, who flying to any church for sanctuary, were excused and pardoned by their masters; but these were obliged to take an oath to that purpose before they could have them again; and, if they broke the oath, they were punished and fined as persons guilty of perjury.

EXCU'SATION. *s.* (from *excuse.*) Excuse; plea; apology (*Bacon*).

EXCU'SATORY. *a.* (from *excuse.*) Pleading excuse; apologetical; making apology.

To EXCU'SE. *v. a.* (*excuso*, Latin.) 1. To extenuate by apology (*Ben Jonson*). 2. To disengage from an obligation (*Clarend.*). 3. To remit; not to exact. 4. To weaken or mollify obligation to any thing; to obtain remission (*South*). 5. To pardon by allowing an apology (*Addis.*). 6. To throw off imputation by a feigned apology (*Corinthians.*)

EXCU'SE. *s.* (from the verb.) 1. Plea offered in extenuation; apology (*Sid.*). 2. The act of excusing or apologizing (*Shaks.*). 3. Cause for which one is excused (*Roscom.*).

EXCU'SELESS. *a.* (from *excuse.*) That for which no excuse can be given (*Decay of Piety*).

EXCU'SER. *s.* (from *excuse.*) 1. One who pleads for another (*Swift*). 2. One who forgives another.

To EXCU'SS. *v. a.* (*excussus*, Latin.) To seize and detain by law (*Ayliffe*).

EXCU'SSION. *s.* (*excussio*, Lat.) Seizure by law.

E'XECRABLE. *a.* (*execrabilis*, Lat.) Hateful; detestable; accursed (*Hooker*).

E'XECRABLY. *ad.* (from *execrable.*) Cursedly; abominably (*Dryden*).

To E'XECRATE. *v. a.* (*execror*, Latin.) To curse; to imprecate ill upon (*Temple*).

EXECRA'TION. *s.* (from *execrate.*) Curse; imprecation of evil (*Stillingfleet.*—At the taking and demolishing of a city, it was frequent to pronounce direful curses and execrations upon any person who should endeavour to rebuild it.

To EXE'CT. *v. a.* (*execo*, Lat.) To cut out; to cut away (*Harvey*).

EXE'CTION. *s.* (from *exect.*) The act of cutting out.

To E'XECUTE. *v. a.* (*exequor*, Latin.) 1. To perform; to practise (*South*). 2. To put in act; to do what is planned or determined (*Locke*). 3. To put to death according to form of justice; to punish capitally (*Davies*). 4. To put to death; to kill (*Shaksp.*).

E'XECUTER. *s.* (from *execute.*) 1. He that performs or executes any thing (*Shaksp.*). 2. He that is intrusted to perform the will of a testator. In this sense the accent is on the second syllable (*Shakspeare*). 3. An executioner; one who puts others to death; not used (*Shakspeare.*)

EXE'CUTERSHIP. *s.* (from *executer.*) The office of him that is appointed to perform the will of the defunct (*Bacon*).

EXECU'TION. *s.* (from *execute.*) 1. Performance; practice (*Bacon*). 2. The last act of the law in civil causes, by which possession is given of body or goods. 3. Capital punishment; death inflicted by forms of law (*Creech*. 4. Destruction; slaughter (*Hayward*).

EXECUTION. In law, the completing or

finishing some act, as of judgment, deed, &c. and it usually signifies the obtaining possession of any thing recovered by judgment of law.

Sir Edward Coke observes, that there are two sorts of executions: the one final, and the other *a quousque*, that tends to an end. An execution final, is that which makes money of the defendant's goods; or extends to his lands, and delivers them to the plantiff, who accepts the same in satisfaction; and this is the end of the suit, and the whole that the king's writ requires to be done. The writ of execution with a *quousque*, though it tends to an end, yet is not final, as in the case of a *capias ad satisfac.* where the defendant's body is to be taken, in order that the plaintiff may be satisfied for his debt. See CAPIAS.

Executions are either in personal, real, or mixed actions. In a personal action, the execution may be made three ways, viz. by the writ of *capias ad satisfaciendum*, against the body of the defendant; *fieri facias*, against his goods; or *elegit*, against his lands.

In a real and mixed action, the execution is by writ of *habere facias sasinam*, and *habere possessionem*. See HABERE. Writs of execution bind the property of goods only from the time of delivery of the writ to the sheriff; but the land is bound from the day of the judgment obtained; and here the sale of any goods for valuable consideration, after a judgment, and before the execution awarded, will be good. It is otherwise as to lands, of which execution may be made, even on a purchase after the judgment, though the defendant sell such land before execution. Likewise, sheriffs may deliver in execution all the lands whereof others shall be seized in trust for him against whom execution is had on a judgment, &c.

When any judgment is signed, the execution may be taken out immediately thereon; but if it be not issued within a year and a day after, where there is no fault in the defendant, as in the case of an injunction, writ of error, &c. there must be a *scire facias*, to revive the judgment; though, if the plaintiff sues out any writ of execution within the year, he may continue it after the year is expired. After judgment against the defendant, in an action wherein special bail is given, the plaintiff is at liberty to have execution against such defendant, or against his bail: but this is understood where the defendant does not render himself, according to law, in safeguard of the bail; and execution may not regularly be sued forth against a bail, till a default is returned against the principal: also if the plaintiff takes the bail, he shall never take the principal. It is held that an execution may be executed after the death of the defendant; for his executor, being privy thereto, is liable as well as the testator. The execution is an entire thing, so that he who begins must end it: therefore, a new sheriff may distrain an old one, to sell the goods seized on a distringas, and to bring the money into court.

EXECUTION, in criminal cases, the completion of human punishment. This follows judgment; and must in all cases, capital as well as otherwise, be performed by the legal officer, the sheriff or his deputy: execution of criminals, must be according to the judgment; and the king cannot alter a judgment from hanging to beheading, because no execution can be warranted, unless it be pursuant to the judgment. Murderers are to be executed the day next but one after conviction, unless it be Sunday, and anatomized; for which reason they are generally tried on a Friday.

EXECUTION, in music, is sometimes particularly used to express a facility of voice or finger in running rapid divisions, and other intricate parts.

EXCU'TIONER. *s.* (from *execution.*) 1. He that puts in act, or executes (*Shakspeare*). 2. He that inflicts capital punishments (*Sid.*) 3. He that kills; he that murders (*Shaksp.*). 4. The instrument by which any thing is performed (*Crashaw*).

EXE'CUTIVE. *a.* (from *execute.*) 1. Having the quality of executing or performing (*Hale*). 2. Active; not deliberate; not legislative; having in power to put in act the laws (*Swift*).

EXE'CUTOR, is a person appointed by the testator, to carry into execution his will and testament after his decease. The regular mode of appointing an executor is by naming him expressly in the will: but any words indicating an intention of the testator to appoint an executor will be deemed a sufficient appointment.

Any person capable of making a will, is also capable of being an executor: but in some cases, persons who are incapable of making a will may nevertheless act as executors, as infants, or married women; to obviate, however, inconveniences which have occurred respecting the former, it is enacted by stat. 38 Geo. III. c. 89, that where an infant is sole executor, administration, with the will annexed, shall be granted to the guardian of such infant, or such other person as the spiritual court shall think fit, until such infant shall have attained the age of twenty-one; when, and not before, probate of the will shall be granted him.

An executor derives his authority from the will and not from the probate, and is therefore authorized to do many acts in execution of the will, even before it is proved, such as releasing, paying, or receiving of debts, assenting to licenses, &c. but he cannot proceed until he has obtained probate.

If an executor dies before probate, administration must be taken out with the will annexed; but if an executor dies, his executor will be executor to the first testator, and no fresh probate will be needed. It will be sufficient if one only of the executors prove the will; but if all refuse to prove, they cannot afterwards administer, or in any respect act as executors.

If an executor becomes a bankrupt, the

court of chancery will appoint a receiver of the testator's effects, as it will also upon the application of a creditor, if he appears to be wasting the assets.

If an executor once administers, he cannot afterwards renounce; and the ordinary may in such case issue process to compel him to prove the will. 1 Mod. 213.

If an executor refuses to take upon him the execution of the will, he shall lose the legacy therein contained.

If a creditor constitutes his debtor his executor, this is at law a discharge of the debt, whether the executor acts or not, provided however there be assets sufficient to discharge the debts of the testator.

The first duty of an executor or administrator is to bury the deceased in a suitable manner; and if the executor exceeds what is necessary in this respect, it will be a waste of the substance of the testator.

The next thing to be done by the executor is to prove the will, which may be done either in the common form, by taking the oath to make due distribution, &c. or in a more solemn mode, by witnesses to its execution.

By stat. 37 Geo. III. c. 9. s. 10. every person who shall administer the personal estate of any person dying, without proving the will of the deceased, or taking out letters of administration within six calendar months after such person's decease, shall forfeit 50*l.*

Upon proving the will, the original is to be deposited in the registry of the ordinary, by whom a copy is made upon parchment under his seal, and delivered to the executor or administrator, together with a certificate of its having been proved before him, and this is termed the probate.

If all the goods of the deceased lie within the same jurisdiction, the probate is to be made before the ordinary or bishop of the diocese, where the deceased resided; but if he had goods and chattels to the value of 5*l.* in two distinct dioceses or jurisdictions, the will must be proved before the metropolitan or archbishop of the province in which the deceased died. An executor, by virtue of the will of the testator, has an interest in all the goods and chattels, whether real or personal, in possession or in action of the deceased; and all goods and effects coming to his hands will be the assets to make him chargeable to creditors and legatees. An executor or administrator stands personally responsible for the due discharge of his duty; if, therefore, the property of the deceased be lost, or through his wilful negligence become otherwise irrecoverable, he will be liable to make it good; and also where he retains money in his hands longer than is necessary, he will be chargeable not only with the interest but costs, if any have been incurred.

But one executor shall not be answerable for money received, or detriment occasioned by the other, unless it has been by some act done between them jointly. An executor or administrator has the same remedy for recovering debts and duties, as the deceased would have had if living. Neither an executor nor administrator can maintain any action for a personal injury done to the deceased, when such injury is of such a nature for which damages may be received; in actions, however, which have their origin in breach of promise, although the suit may abate by the death of the party, yet it may be revived either by his executors or administrators, who may also sue for rent in arrear, and due to the deceased in his life-time. By the custom of merchants, an executor or administrator may indorse over a bill of exchange, or promissory note. An executor or administrator may also, on the death of a lessee for years, assign over the lease, and shall not be answerable for rent after such assignment, nor shall he be liable for rent due after the lessee's death, from premises which in his life-time he had assigned to another.

An executor, or administrator, is bound only by such covenants in a lease as are said to run with the land. The executor, or administrator previous to the distribution of the property of the deceased, must take an inventory of all his goods and chattels, which must, if required, be delivered to the ordinary upon oath. He must then collect, with all possible convenience, all the goods and effects contained in such an inventory; and whatever is so recovered that is of a saleable nature, and can be converted into money, is termed assets, and makes him responsible to such amount to the creditors, legatees, and kindred of the deceased.

The executor, or administrator, having collected in the property, is to proceed to discharge the debts of the deceased, which he must do according to the following priorities, otherwise he will be personally responsible. 1. Funeral expences, charges of proving the will, and other expenditures incurred by the execution of his trust. 2. Debts due to the king on record, or by speciality. 3. Debts due by particular statutes, as by 30 Geo. II. c. 23. forfeitures for not burying in woollen, money due for poor-rates, and money due to the post-office. 4. Debts of record, as judgments, statutes, recognizances, and those recognized by a decree of a court of equity, and debts due on mortgage. 5. Debts on special contract, as bonds, or rather instruments under seal; and also rent in arrear. 6. Debts on simple contract, viz. such as debts arising by mere verbal promise, or by writing not under seal, as notes of hand, servants' wages, &c.

The executor is bound at his peril to take notice of debts on record, but not of other special contracts, unless he receives notice.

If no suit is actually commenced against an executor or administrator, he may pay one creditor in equal degree the whole debt, though there should be insufficient remaining to pay the rest; and even after the commencement of a suit, he may, by confessing judgment to other creditors of the same degree, give them a preference.

Executors and administrators are also allowed, amongst debts of equal degree, to pay themselves first: but they are not allowed to retain their own debt, to the prejudice of others in a higher degree; neither shall they be permitted to retain their own debts, in preference to that of their co-executor or co-administrator of equal degree, but both shall be charged in equal proportion.

A mortgage made by the testator must be discharged by the representative out of the personal estate, if there is sufficient to pay the rest of the creditors and legatees. Where such mortgage, however, was not incurred by the deceased, it is not payable out of the personal estate. See Legacies, and Assets.

Executor de son tort, or an executor of his own wrong, a person that takes upon him the office of an executor by intrusion, without being so constituted by the testator, or appointed by the ordinary to administer. Such a person is chargeable to the rightful executor, as also to all the testator's creditors and legatees, so far as the goods amount which he wrongfully possessed.

EXECUTORY ESTATE. Estates executory, are when they pass presently to the person to whom conveyed, without any after-act; 2 Inst. 513; and leases for years, rents, annuities, conditions, &c. are called inheritances executory. Id. 293.

Executory devise, is defined a future interest, which cannot vest at the death of a testator, but depends upon some contingency, which must happen before it can vest: it is called so to distinguish it from a remainder from which it differs in being less strictly restrained by technical rules.

EXE'CUTRIX. *s.* (from *execute.*) A woman intrusted to perform the will of the testator.

EXEDRÆ, in antiquity, halls with many seats, where the philosophers and men of learning met for discourse and disputation.

EXEGESIS, or Exegetica, in algebra, is the finding of the roots of equations, either in the numbers or lines, according as the problem is numeral or geometrical.

EXEGE'TICAL. *a.* (εξηγητικὸς.) Explanatory; expository (*Walker*).

EXE'MPLAR. *s.* (*exemplar*, Lat.) A pattern; an example to be imitated (*Raleigh*).

EXE'MPLARILY. *ad.* (from *exemplary.*) 1. So as deserves imitation (*Howell.*) 2. So as may warn others (*Clarendon*).

EXE'MPLARINESS. *s.* State of standing as a pattern to be copied (*Tillotson*).

EXE'MPLARY. *a.* (from *exemplar.*) 1. Such as may deserve to be proposed to imitation (*Bacon*). 2. Such as may give warning to others (*K. Charles*). 3. Such as may attract notice and imitation (*Prior*).

EXEMPLIFICA'TION. *s.* (from *exemplify.*) A copy; a transcript.

Exemplification of letters patent, a transcript or duplicate of them, made from their enrolment, and sealed with the great seal. These exemplifications are by statute equally effectual, and may be pleaded as well as the originals. One may exemplify a patent under the great seal in chancery; also any record or judgment in any of the courts at Westminster, under the seal of each court; which exemplifications may be given in evidence to a jury. It is held, that nothing but matter of record ought to be exemplified.

To EXE'MPLIFY. *v. a.* (from *exemplar.*) 1. To illustrate by example (*Hooker*). 2. To transcribe; to copy.

To EXE'MPT. *v. a.* (*exemptus*, Latin.) To privilege; to grant immunity from (*Knolles*).

Exe'mpt. *a.* (from the verb.) 1. Free by privilege (*Ayliffe*). 2. Not subject; not liable to (*Ben Jonson*). 3. Clear; not included (*Lee*). 4. Cut off from; not used (*Shaks*).

EXE'MPTION. *s.* (from *exempt.*) Immunity; privilege; freedom from imposts (*Bacon*).

EXEMPTI'TIOUS. *a.* (from *exemptus*, Latin.) Separable; that may be taken from another (*More*).

To EXE'NTERATE. *v. a.* (*exentero*, Lat.) To embowel (*Brown*).

EXE'NTERATION. *s.* (*exenteratio*, Lat.) The act of taking out the bowels (*Brown*).

EXE'QUIAL. *a.* (from *exequiæ*, Latin.) Funeral; relating to funerals.

E'XEQUIES. *s.* Without a singular. (*exequiæ*, Latin.) Funeral rites; the ceremony of burial; the procession of burial (*Dryden*).

EXE'RCENT. *a.* (*exercens*, Latin.) Practising; following any calling (*Ayliffe*).

E'XERCISE. *a.* (*exercitium*, Latin.) 1. Labour of the body; labour considered as conducive to health (*Bacon*). 2. Something done for amusement (*Bacon*). 3. Habitual action by which the body is formed to gracefulness (*Sidney*). 4. Preparatory practice in order to skill. 5. Use; actual application of any thing (*Hooker*). 6. Practice; outward performance (*Addison*). 7. Employment (*Locke*). 8. Task; that which one is appointed to perform (*Milton*). 9. Act of divine worship whether public or private (*Shakspeare*).

Upon some of these meanings we think it necessary to enlarge, as below.

Exercise, among physicians, such an agitation of the body as produces salutary effects in the animal economy. Those exercises of the body are more especially serviceable which give delight to the mind at the same time, as tennis, fencing, &c.; for which reason, the wisdom of antiquity appointed rewards for those who excelled in these gymnastic exercises, that by this means the bodies of their youth might be hardened for warlike toils. But as nothing is more conducive to health than moderate exercise, so violent exercise lowers the spirits, weakens the body, destroys the elasticity of the fibres, and exhausts the fluid parts of the blood. According to the strength of the party using it, the exercise chosen should be either active, such as walking, hunting, dancing, &c. or passive, as riding in a coach or on horseback, sailing, &c. A very eligible sort of exercise for consumptive persons is swinging, from whence very striking good effects have in some instances been produced. In this case the motion should be very gently applied, and the patient placed so securely as to feel no apprehensions of falling.

The exercise of a soldier in camp, considered as conducive to health, Dr. Pringle distinguishes into three heads; the first relating to his duty, the second to his living more commodiously, and the third to his diversions. The first, consisting chiefly in the exercise of his arms, will be no less the means of preserving health than of making him expert in his duty: and frequent returns of this, early, and before the sun grows hot, will be made more advantageous than repeating it seldom, and staying out long at a time; for a camp affording little convenience for refreshment, all unnecessary fatigue is to be avoided. As to the second article, cutting boughs for shading the tents, making trenches round them for carrying off the water, airing the straw, cleaning their clothes and accoutrements, and assisting in the business of the mess, ought to be no disagreeable exercise to the men for some part of the day. Lastly, as to diversions, the men must be encouraged to them either by the example of their officers, or by small premiums to those who shall excel in such kind of sports as shall be judged most conducive to health: but herein great caution is necessary, not to allow them to fatigue themselves too much, especially in hot weather or sickly times: but above all, that their clothes be kept dry, wet clothes being the most frequent cause of camp-diseases.

Exercise of animals, generally, that kind of bodily exertion which they use spontaneously, according to the share of activity naturally belonging to them; or to which it may be necessary to urge them, for the preservation of their health. Almost all domestic animals require the stimulus of exercise, but especially those that are distinguished for their fleetness, and of all others the horse. Such of these animals as stand too much at rest, are at the same time full fed, and breathe constantly a hot, foul, stagnated air in close stables, cannot, it is well known, be long preserved in a proper habit of body, or remain fit for active service to their owners. In order that they may perform the labour expected from them with ease and freedom to themselves, and with pleasure to their riders, it is the interest of the latter to attend very particularly to this important article.

There is no veterinary writer who has done greater justice to this interesting subject than Mr. Clark. This author asserts, that a much greater number of horses which are high fed, and stand inactive in close warm stables, die of diseases arising from the want of regular exercise, than from any other cause whatever.

Horses, says he, are formed for labour: inactivity, however, with full feeding, renders the body dull and sluggish. The stomach is loaded with food, which it cannot properly digest; the food is detained too long in the bowels: hence indigestion, costiveness, and flatulencies. The intestines, in this loaded state, press upon the surrounding viscera, and obstruct the circulation of the different fluids in them. The liver, messentery, and spleen, are exposed to be injured from this cause; their natural functions are impeded; the animal economy is disturbed: and when this is the case, the constitution cannot but be injured, and diseases ensue. The natural secretions are not in due quantity: they, together with the perspiration, are retained in the body, and are absorbed or taken up again into the mass of humours; and hence arises another source of disease. The circulation of blood through the whole system is slow and languid: hence the humours or juices are not properly prepared; glandular obstructions are formed in different organs of the body; the sheath and legs swell; running sores take place in the latter, commonly called grease; and the whole mass of fluids is greatly disposed to putrefaction: diseases follow, and death frequently concludes the scene.

On the other hand, constant and habitual exercise renders the body strong and active, and at the same time, fit for the most violent exertions of strength; it assists the heart in promoting a free circulation of the blood and juices through every part of the body; it creates an appetite, and promotes digestion, and thereby greatly assists in converting the food to nourishment; it promotes all the secretions and excretions, which enlivens the body, and gives room for fresh supplies of nourishment; it invigorates the whole system; it gives a flow of spirits, and adds firmness and strength to the muscles and sinews. In short, without a certain proportion of exercise no animal body can enjoy health.

The effects of exercise to horses, however, are not limited to the preservation of their health; but, in many cases of incipient disease, its good effects likewise soon become visible. For instance, when it is used as a medicine in those horses that have swelled legs, &c. from standing idle in the stable; for although such horses may have been declared full of humours, and that nothing could relieve them from these supposed humours but purging, diuretic, or alterative medicines, yet it has been frequently found, that regular exercise, frequent rubbing of the legs (which is topical exercise), with a roomy stall to stretch their legs when they lie down, have removed these complaints without any medicine whatever being administered.

In great towns, rides or covered ways, for exercising horses in all weathers, are extremely useful; and no stable-yard, in a large town, should be without one; although, at the same time, the open air is preferable.

From what has been said, it may be inferred, that they should be accustomed to exercise by degrees; for all sudden changes, whether from idleness to active exercise, or from exercise to idleness, produce considerable changes in the system, and render both the solids and fluids liable to disease. This we experience from our own feelings; and it is the same with horses on their being first set to hard labour, or violent exercises, although they cannot express their uneasy sensations except by their stiff and contracted steps, which may be observed upon moving them about after a hard day's work. We should accustom them, therefore, gradually and regularly to exercise or labour; and it then becomes easy to them, nor will any stiffness or difficulty of breathing follow from it. When a horse has arrived at this state or habit of body, he is then said, in the stable phrase, to be in wind.

But one great source of disease in horses arises from the improper treatment of them after they have been overheated by labour. Although a horse be all over wet and smoking with sweat, still ignorant grooms and hostlers will insist, according to their own way of expressing themselves, that he is not heated at heart, and will rashly expose him to the cold air uncovered, tied at the stable-door, and even allow him to drink his belly-full of cold water in this condition. Mr. Clark observes, that it would fill a volume to enumerate the cases that have occurred where this treatment has proved fatal to horses. By being exposed to cold air, or drinking cold water, the blood-vessels contract suddenly (for it is the same, in effect, whether cold be applied to the internal organs, as the stomach or lungs, or to the external surface of the body); and hence violent inflammation of the lungs or other vital parts, gangrene, &c. and all the well-known diseases that are consequent upon obstructed perspiration. Death indeed is frequently the consequence, or the horse so treated is seized with the most violent acute diseases. To avoid these consequences, we should not only resist the evil practices alluded to, but be careful, in hunting, where it is necessary to ride through rivers or pits, to do it with as much caution as the case will admit. Indeed, every one who has a regard for his horse, will, when the animal is in a profuse sweat, if possible, endeavour to shun these entirely, or go to a part where the water is less deep, or to a bridge, although it may be at a considerable distance: for, otherwise, the sudden cold will either not only endanger the creature's life, from the most violent acute diseases which will probably occur, or, if he survive the shock, the most obstinate chronic complaints in the chest, legs, and feet, destroy his constitution, and may render him totally useless.

It is to be observed, however, that, like many other things relating to horses, exercise, given for the mere purposes of health, may be carried to excess, and, consequently, may prove rather hurtful than beneficial; therefore the time and manner of regulating it deserves attention. Thus, it would be imprudent to cause a horse to exert himself too suddenly after he is newly fed and watered, because his stomach is then too full. Horses, in this case, should be made to move slowly and gently at first setting out. They will naturally mend their pace of themselves. Their exercise should be continued in proportion to their strength, manner of feeding, and the labour, &c. required of them; and this should not only be repeated every day when it is practicable, but increased as circumstances may require. From not attending to the above precautions in exercising horses, how many are the cases of broken wind, and other asthmatic complaints, which have occurred?

It is likewise improper to take out horses to exercise in wet or rain, or when they are not able to bear it, either from former fatigue, from hard labour, or when they are sick or lame.

But still greater caution is necessary to be observed with regard to horses that are very fat. These require a long course of very moderate and regular exercise before they can with safety be put to that which is the least violent. The want of attention to this circumstance frequently occasions sudden death; many instances of which Mr. Clark says he has known, particularly in horses that have been fed with a great deal of boiled meat, in order to fatten them for sale. Thus a pair of strong heavy carriage-horses, he says, were once offered him for sale: he declined purchasing them, on account of their extreme fatness; which was thought a very singular reason. A gentleman in the neighbourhood, however, who was not so scrupulous, purchased them, and they were exercised with the greatest care and attention for a considerable time, in order to bring them into a proper condition for work. After some weeks, they had occasion to travel pretty smartly a very short stage of seven miles out and home, which finished one of them after a short illness. This, and a variety of similar cases, show the danger of putting horses that are too fat and full of juices, suddenly, on violent exercise of any kind; for there is no state or habit of body a horse can be in more dangerous, or more liable to disease, than that of his being too fat.

Thus it is evident, that, under proper regulation, the greatest advantages arise to horses from the constant habit of exercise. The effects it produces when carried to excess, as is frequently the case in hunting, and still more in contests on the race-course, where the efforts of the horse are often prodigious, are in some cases curious. It has been observed, in animals that have been hard hunted before they were killed, that, upon taking off the skin, the whole panniculus adiposus, and even the muscular parts, have been found almost black, from the blood being extravasated under the skin, or by the extreme heat of the body, together with the velocity of the circulating fluid; and that the blood has been forced into parts in which it does not commonly circulate. The same appearance, Mr Clark says, he has observed in horses, particularly one that suddenly fell down dead in a race on coming up to the starting-post the last heat. On taking off his skin, the blood appeared as if it had been extravasated between the flesh and the skin, and ran down in a considerable quantity, as the horse was then hardly cold. It is likewise observed, in cattle that are driven too hard immediately before they are slaughtered, that the blood is too much mixed with the flesh, &c. All these circumstances demonstrate, that, in violent exercises, the blood is forced, by the rapidity of the circulation and extreme heat of the body, out of its natural limits.

To the mischievous effects of extreme and unnatural degrees of exercise, such as are here mentioned, together with those which certainly follow, if, while in this heated state, cold water be thrown upon the body of the horse, or if he be plunged into it, Mr. Clark attributes certain diseases, of which we shall treat under their proper heads, but particularly that called the FOUNDER. See that article.

EXERCISE, in military affairs, is the ranging a body of soldiers in form of battle, and making them perform the several motions and military evolutions with different management of their arms, in order to make them expert therein.

EXERCISE, in a naval sense, is the preparatory practice of managing the artillery and small arms, in order to make the ship's crew perfectly skilled therein, so as to direct its execution successively in time of battle. The words of command introduced, during the late war, for the exercise of the great guns, are the following: Silence; cast loose your guns; level your guns; take out your tompions; run out your guns; prime; point your guns; fire; spunge your guns; load with cartridge; shot your guns; put in your tompions; house your guns; and secure your guns.

EXERCISE, may also be applied with propriety to the forming our fleets into orders of sailing, lines of battle, &c. an art which the French have termed *evolutions*, or *tactiques*. In this sense exercise may be defined, the execution of the movements which the different orders and disposition of fleets occasionally require, and which the several ships are directed to perform by means of signals. See TACTICS.

To E'XERCISE. *v. a.* (*exerceo*, Latin.) 1. To employ; to engage in employment (*Locke*). 2. To train to use by any act (*Locke*). 3. To make skilful or dexterous by practice; to habituate (*Hebrews*). 4. To busy; to keep busy (*Atterbury*). 5. To task; to keep employed as a penal injunction (*Milton*). 6. To practise; to perform (*Bacon*). 7. To exert; to put in use (*Locke*). 8. To practise or use in order to habitual skill (*Addison*).

To EXERCISE. *v. n.* To use exercise; to labour for health or amusement (*Broome*).

E'XERCISER. *s.* (from *exercise*.) He that directs or uses exercise.

EXERCISES, are also understood of what young gentlemen learn in the academies and riding-schools, such as fencing, drawing, riding the great horse, &c. How useful and agreeable soever study may be to the mind, it is very far from being equally salutary to the body. Every one observes that the Creator has formed an intimate connection between the body and the mind; a perpetual action and reaction, by which the body instantly feels the disorders of the mind, and the mind those of the body. The delicate springs of our frail machines lose their activity and become enervated, and the vessels are liable to obstructions when we totally desist from exercise, and the consequences necessarily affect the brain: a very studious and sedentary life is therefore equally prejudicial to the body and the mind. The limbs likewise become stiff; we contract an awkward constrained manner; a certain disgustful air attends all our actions, and we are very near being as disagreeable to ourselves as to others. An inclination to study is highly commendable; but it ought not, however, to inspire us with an aversion to society. The natural lot of man is to live among his fellows: and whatever may be the condition of our birth, or our situation in life, there are a thousand occasions where a man must naturally desire to render himself agreeable; to be active and adroit; to dance with grace; to command the fiery steed; to defend himself against a brutal enemy; to preserve his life by dexterity; as by leaping, swimming, &c. Many rational causes have therefore given rise to the practice of particular exercises; and the most sagacious and benevolent legislators have instituted, in their academies and universities, proper methods of enabling youth, who devote themselves to study, to become expert also in athletic exercises.

EXERCITA'TION. *s.* (*exercitatio*, Latin.) 1. Exercise (*Brown*). 2. Practice; use (*Felton*).

EXERGUM, a little space around or without the figures of a medal; left for the inscription, device, date, &c.

To EXE'RT. *v. a.* (*exero*, Latin.) 1. To use with an effort (*Rowe*). 2. To put forth; to perform (*South*). 3. To enforce; to push to an effort (*Dryden*). 4. To bring out (*Dryden*). 5. To emit; to push out (*Philips*).

EXE'RTION. *s.* (from *exert*.) The act of exerting; effort.

EXE'SION. *s.* (*exesus*, Latin.) The act of eating through (*Brown*).

EXESTUA'TION. *s.* (*exæstuo*, Latin.) The state of boiling; effervescence; ebullition (*Boyle*).

EXETER, (the *Augusta* of the Romans, and the *Exancester* of the Saxons, afterwards abbreviated to *Excester* or Exeter), a city of England, and capital of Devonshire, situated on the river Ex, about ten miles from the English channel; the see of a bishop, suffragan of the archbishop of Canterbury, removed to this city from Crediton, by Edward the Confessor. The city is ancient, probably built at the time the Romans were in possession of Britain; it was surrounded with walls, and had six gates, most of which are pulled down. Besides the cathedral, which is a magnificent pile of building, there are eighteen other churches, a few chapels, and five large meeting-houses. The city is governed by a mayor, recorder, town-clerk, &c. and was incorporated by king John, and erected into a county by Henry VIII. All pleas and civil causes are tried by the mayor, aldermen, recorder, and common-council; criminal causes, and private wrongs, are judged by eight aldermen, who are justices of the peace. In the north-west corner of the city stood the castle, called Rougemont, from the colour of the hill on which it was built, supposed to have been founded by the West Saxon kings, and afterwards made the seat of the earls of Cornwall. Nothing but the outer walls remain. This castle was completely ruined in the civil wars, when the city held out against Fairfax, who blockaded it for two months. The principal public buildings are the guildhall and public hospital. The guildhall is a spacious and convenient building, built in its present form in the year 1593, but repaired in 1720. The public hospital was erected by subscription, in the year 1740, for the sick and lame of the city and county of Devon. The trade of the city of Exeter consists principally in the exportation of coarse woollen goods, manufactured in the counties of Devon, Cornwall, and Somerset; these goods the merchants of Exeter buy rough from the loom, mill, dye, and finish them for use, and afterwards export them; they chiefly consist of druggets, duroys, kerseys, and everlastings. Ships of burden formerly came up to this city; but the navigation was almost destroyed by one of the Courtenays earls of Devon, and, though repaired, in some degree, could never be restored to its former state. The port of Exeter, therefore, is properly at Topsham, five miles below. It is, however, a principal city, for size and consequence, in the W. of England, the residence of many genteel families, and the seat of an extensive foreign and domestic commerce; and, particularly, it has a share in the fisheries of Newfoundland and Greenland. It contains 2836 houses, and 17,398 inhabitants: it is governed by a mayor, recorder, 24 aldermen, &c. and sends two members to parliament. Lat. 50. 44 N. Lon. 3. 33 W.

Exeter is also the name of two towns in North America: the one being in N. Carolina; the other in New Hampshire.

To EXFO'LIATE. *v. n.* (*ex.* and *folium*, Latin.) To shell off; to separate, as a corrupt bone from the sound part (*Wiseman*).

EXFO'LIA'TION. *s.* (from *exfoliate.*) The process by which the corrupted part of the bone separates from the sound (*Wiseman*).

EXFO'LIATIVE. *a.* (from *exfoliate.*) That has power of procuring exfoliation (*Wiseman*).

EXHA'LABLE. *a.* (from *exhale.*) That may be evaporated (*Boyle*).

EXHALA'TION. *s.* (*exhalatio*, Latin.) 1. The act of exhaling or sending out in vapours; emission. 2. The state of evaporating or flying out in vapours; evaporation. 3. That which rises in vapours (*Milton*).

The terms *exhalation* and *vapour* are ordinarily used indifferently, but the more accurate writers now distinguish them; appropriating the term *vapour* to the moist fumes raised from water and other liquid bodies; and *exhalation* to the dry ones emitted from solid bodies; as earth, fire, minerals, sulphurs, salts, &c. We are not aware, however, that any great advantages have arisen from the distinction: and it is certainly not suggested by the etymology of the word; the Latin verb *exhalo*, from which it is derived, signifying literally to breathe out, or to send forth.

To EXHA'LE. *v. a.* (*exhalo*, Latin.) 1. To send or draw out in vapours (*Temple*). 2. To draw out (*Shakspeare*).

EXHA'LEMENT. *s.* (from *exhale.*) Matter exhaled; vapour (*Brown*).

To EXHA'UST. *v. a.* 1. To drain; to diminish (*Bacon*). 2. To draw out totally; to draw until nothing is left (*Locke*).

EXHAUSTED RECEIVER, a glass, or other vessel, applied on the plate of an air-pump, and having the air extracted out of it by the working of the engiue. (See Air-pump.) Things placed in an exhausted receiver, are said to be *in vacuo.* See Vacuum.

EXHA'USTION. *s.* (from *exhaust.*) The act of drawing or draining.

EXHAUSTIONS, or the Method of exhaustions, a method of demonstration founded upon a kind of exhausting a quantity by continually taking away certain parts of it.

The method of exhaustions was of frequent use among the ancient mathematicians; as Euclid, Archimedes, &c. It is founded on what Euclid says in the 10th book of his Elements; viz. that those quantities are equal, whose difference is less than any assignable quantity.

This principle is used in the first prop. of the 10th book, which imports, that if from the greater of two quantities be taken more than its half, and from the remainder more than its half, and so on; there will at length remain a quantity less than either of those proposed. On this foundation it is demonstrated, that if a regular polygon of infinite sides be inscribed in a circle, or circumscribed about it; then the space, which is the difference between the circle and the polygon, will by degrees be quite exhausted, and the circle become ultimately equal to the polygon. And in this way it is that Archimedes demonstrates, that a circle is equal to a right-angled triangle, whose two sides about the right angle, are equal, the one to the semidiameter, and the other to the perimeter of the circle. Prop. 1. De Dimensione Circuli.

This kind of demonstration, though attended with strict mathematical evidence, is necessarily prolix: for which reason Cavalerius introduced a shorter method of proof. See Indivisibles.

EXHA'USTLESS *a.* (from *exhaust.*) Not to be emptied; inexhaustible (*Blackmore*).

To EXHI'BIT. *v. a.* (*exhibeo*, Latin.) 1. To offer to view or use; to offer or propose in a formal manner (*Clarendon*). 2. To show; to display (*Pope*).

EXHI'BITER. *s.* (from *exhibit.*) He that offers any thing in a public manner (*Shakspeare*).

EXHIBI'TION. *s.* (from *exhibit.*) 1. The act of exhibiting; display (*Grew*). 2. Allowance; salary; pension (*Swift*). 3. Payment; recompence (*Shakspeare*).

EXHI'BITIVE. *a.* (from *exhibit.*) Representative; displaying (*Norris*).

To EXHI'LARATE. *v. a.* (*exhilaro*, Lat.) To make cheerful; to cheer; to fill with mirth; to enliven (*Philips*).

EXHILARA'TION. *s.* (from *exhilarate.*) 1. The act of giving gayety. 2. The state of being enlivened (*Bacon*).

To EXHO'RT. *v. a.* (*exhortor*, Latin.) To incite by words to any good action (*Common Prayer*).

EXHORTA'TION. *s.* (from *exhort.*) 1. The act of exhorting; incitement to good (*Atterbury*). 2. The form of words by which one is exhorted (*Shakspeare*).

EXHO'RTATORY. *a.* (from *exhort.*) Tending to exhort.

EXHO'RTER. *s.* One who exhorts.

EXHUMATION. (of *ex*, out of, and *humus*, ground). The act of digging up a body interred in holy ground, by the authority of the judge.

To EXI'CCATE. *v. a.* (*exsicco*, Latin.) To dry.

EXICCA'TION. *s.* (from *exiccate.*) Arefaction; act of drying up; state of being dried up (*Bentley*).

EXI'CCATIVE. *a.* (from *exiccate.*) Drying in quality; having the power of drying.

E'XIGENCE. E'XIGENCY. *s.* (from *exigent.*) 1. Demand; want; need (*Atterbury*). 2. Pressing necessity; sudden occasion (*Pope*).

E'XIGENT. *s.* (*exigens*, Latin.) 1. Pressing business; occasion that requires immediate help (*Waller*). 2. (A law term.) A writ sued when the defendant is not to be found. 3. End (*Shakspeare*).

EXIGENTERS, four officers of the court of common pleas, who make all exigents and proclamations, in all actions where the process of outlawry lies.

EXIGU'ITY. *s.* (*exiguitas*, Latin.) Smallness; diminutiveness; slenderness (*Boyle.*)

EXI'GUOUS. *a.* (*exiguus*, Latin.) Small; diminutive; little: not used (*Harvey*).

EXILE. 1. Banishment. 2. The person banished.

Among the Romans, the word exile, *exilium*, properly signified an interdiction, or exclusion from water and fire; the necessary consequence of which was, that the interdicted person must betake himself into some other country, since there was no living without fire and water.

EXI'LE. *a.* (*exilis*, Latin.) Small; slender; not full; not powerful (*Bacon*).

To E'XILE. *v. a.* (from the noun.) To banish; to drive from a country (*Shakspeare*).

EXI'LEMENT. *s.* Banishment (*Wotton.*)

EXILI'TION. *s.* (*exilitio*, Latin.) The act of springing out suddenly (*Brown*).

EXI'LITY. *s.* (*exilis*, Latin.) Smallness; slenderness; diminution (*Grew*).

EXILIUM, in law, signifies a spoiling. It is applied to the injury done to tenants, by ejecting them, &c.

EXI'MIOUS. *a.* (*eximius*, Latin.) Famous; eminent; conspicuous; excellent.

EXINANI'TION. *s.* (*exinanitio*, Latin.) Privation; loss (*Decay of Piety*).

To EXI'ST. *v. n.* (*existo*, Latin.) To be; to have a being (*South*).

EXI'STENCE. EXI'STENCY. *s.* (*existentia*, low Latin.) State of being; actual possession of being. Or existence is that whereby a thing has an actual essence, or is said *to be*, *esse*.

The notion of existence is applicable not only to a created but an uncreated substance: but it must be added, that the existence of created substances, and especially corporeal ones, implies a respect to place, time, and even an efficient cause; whence the schoolmen generally define it, that whereby a thing is formally and extrinsically without (*extra*) its causes, and that here, and now.

Existence and essence come very near the nature of each other; in effect, they only differ in that we have different manners of conceiving the same thing.

For, 1. Essence is usually explained either by the first, noblest, and radical attribute of the thing, e. gr. that of body, by extension; that of mind, by thinking, &c. or by specifying all the intrinsic attributes; and existence, either by specifying all place, and all time, as in that of God; or by specifying some definite place, and time, together with the cause, as in the creatures.

2. The foundation and occasion of this distinction is this; that essence belongs to the question, *What is it? Quid est?* but existence to the question, *Is it? An est?*

3. Existence necessarily pre-supposes essence, and cannot be conceived without it; but essence may be conceived without existence; in that essence belongs equally to things that are in *potentia*, and in *actu*; but exisence only to those in *actu*. Note, however, that this does not obtain in God, about whose nature and essence the mind cannot think without conceiving his existence.

We have divers ways of arriving at the knowledge of the existence of things. Our own existence we know by intuition; the existence of a God, by demonstration; and that of other things, by sensation.

As for our own existence, we perceive it so plainly, that it neither needs nor is capable of any proof. *I think, I reason, I feel pleasure and pain:* can any of these be more evident to me than my own existence? If I doubt of all other things, that very doubt makes me perceive my own existence, and will not suffer me to doubt of that. If I know I doubt, I have as certain a perception of the thing doubting, as of that thought which I call doubt. Experience then convinces us, that we have an intuitive knowledge of our own existence, and an internal infallible perception that we are. In every act of sensation, reasoning, or thinking, we are conscious to ourselves of our own being; and in this manner come not short of the highest degree of certainty.

As to our knowledge of the existence of a God, though he has given us no innate ideas of himself, yet, having furnished us with faculties of sense, perception, and reason, we can never want a clear proof thereof. See God.

The knowledge of the existence of any other thing, we can have only by sensation: for, there being no necessary connection of real existence with any idea a man hath in his memory; nor of any other existence, but that of God, with the existence of any particular man; no particular man can know the existence of any other being, but only when, by actually operating upon him, it makes itself be perceived by him. The having the idea of any thing in our mind, no more proves the existence of that thing, than the picture of a man evidences his being in the world, or the visions of a dream make thereby a true history. It is therefore the actual receiving of ideas from without, that gives us notice of the existence of other things, and makes us know that something doth exist at that time without us, which causes that idea in us, though perhaps we neither know nor consider how it does it; for it takes not from the certainty of our senses, and the ideas we receive by them, that we know not the manner wherein they are produced. This notice we have by our senses, of the existing of things without us, though it be not altogether so certain as intuition and demonstration, deserves the name of knowledge, if we persuade ourselves that our faculties act and inform us right concerning the existence of those objects that affect them. But besides the assurance we have from our senses themselves, that they do not err in the information they give us of the existence of things without us, we have other concurrent reasons: As, 1. It is plain those perceptions are produced in us by exterior causes affecting our senses, because those that want the organs of any sense never can have the ideas belonging to that sense produced in their minds. This is too evident to be doubted; and therefore we cannot but be assured, that they come in by the organs of that sense, and no other way.

Secondly, Because we find sometimes that we cannot avoid the having those ideas produced in our minds. When my eyes are shut, I can with pleasure recal to my mind the ideas of light or the sun, which former sensations had lodged in my memory: but if I turn my eyes towards the sun, I cannot avoid the ideas which the light or the sun then produces in me. Which shews a manifest difference between those ideas laid up in the memory, and such as force themselves upon us and we cannot avoid having. And therefore it must needs be some exterior cause, whose efficacy I cannot resist, that produces those ideas in my mind, whether I will or no. Besides, there is nobody who doth not perceive the difference in himself, between actually looking upon the sun, and contemplating the idea he has of it in his memory; and therefore he hath certain knowledge, that they are not both memory or fancy, but that actual seeing has a cause without.

Thirdly, add to this, that many ideas are produced in us with pain, which we afterwards remember without the least offence. Thus the pain of heat or cold, when the idea of it is received in our minds, gives us no disturbance, which, when felt, was very troublesome; and we remember the pain of hunger, thirst, headach, &c. without any pain at all, which would either never disturb us, or else constantly do it as often as we thought of it, were there nothing but ideas floating in our minds, and appearances entertaining our fancies without the real existence of things affecting us from abroad.

Fourthly, Our senses in many cases bear witness to the truth of each other's report concerning the existence of sensible things without us: he that doubts when he sees a fire whether it be real, may, if he please, feel it too; and by the exquisite pain he will be convinced that it is not a bare idea or phantom.

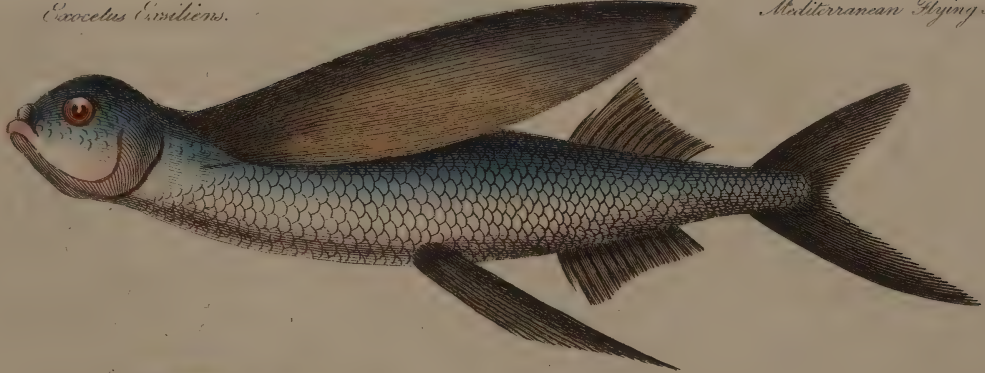
After all, there are some who are so sceptical as to distrust their senses, and to doubt the existence of all things: one of the most ingenious in this class, was the late bishop Berkeley, who asserts that bodies have no existence but in a mind perceiving them; that is, they only exist when they are perceived. We shall not enter into a formal refutation of this singular hypothesis, but refer for a few remarks on the subject to the article Idea. Our readers will, we hope, forgive us, if we here relate an anecdote of the late Dr. Samuel Johnson. It will supply the place of many arguments. Being once in company with a gentleman who warmly defended this notion of Berkeley; as the gentleman was quitting the room, the doctor called out, "Nay, sir, do not go." The disciple of Berkeley asking why? "because," replied Johnson, "when you are gone we shall cease to think of you, and then you will cease to exist!"

As when our senses are actually employed about any object, we know that it does exist; so by our memory we may be assured, that heretofore things that affected our senses have existed: and thus we have a knowledge of the past existence of several things, whereof our senses having informed us our memories still retain the ideas: and of this we are past all doubt, so long as we remember well.

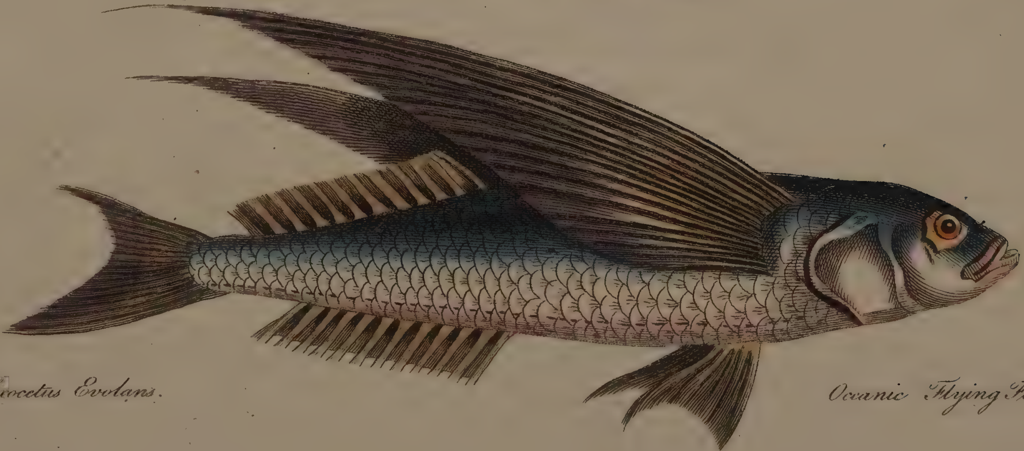
As to the existence of spirits, our having ideas of them does not make us know that any such things do exist without us, or that there are any finite spirits, or any other spiritual beings but the eternal God. We have ground from revelation, and several other reasons, to believe with assurance, that there are such creatures; but our senses not being able to discover them, we want the means of knowing their particular existence; for we can no more know that there are finite spirits really existing, by the ideas we have of such beings, than by the ideas any one has of fairies, or centaurs, he can come to know, that things answering those ideas do really exist.

Hence we may gather, that there are two sorts of propositions: one concerning the ex-

PL. XCIX.



Exocetus Exiliens. *Mediterranean Flying Fish.*



Exocetus Evolans. *Oceanic Flying Fish.*

London, Published by Sherwood & C.o Paternoster Row, Oct.r 2. 1811.

istence of any thing answerable to such an idea, as that of an elephant, phœnix, motion, or angel, viz. whether such a thing does any where exist: and this knowledge is only of particulars, and not to be had of any thing without us, but only of God, any other way than by our senses.

Another sort of proposition is, wherein is expressed the agreement or disagreement of our abstracted ideas, and their dependence on one another. And these may be universal and certain: so having the idea of God and myself, of fear and obedience, I cannot but be sure that God is to be feared and obeyed by me: and this proposition will be certain concerning man in general, if I have made an abstract idea of such a species, whereof I am one particular. But such a proposition, how certain soever, proves not to me the existence of men in the world; but will be true of all such creatures, whenever they do exist: which certainty of such general propositions depends on the agreement or disagreement discoverable in those abstract ideas. In the former case, our knowledge is, the consequence of the existence of things producing ideas in our minds by our senses: in the latter, the consequences of the ideas that are in our minds, and producing these general propositions, many whereof are called *eternæ veritates:* and all of them indeed are so; not from being written all or any of them in the minds of all men, or that they were any of them propositions in any one's mind, till he, having got the abstract ideas, joined or separated them by affirmation or negation; but wheresoever we can suppose such a creature as man is, endowed with such faculties, and thereby furnished with such ideas as we have, we must conclude he must needs, when he applies his thoughts to the consideration of his ideas, know the truth of certain propositions that will arise from the agreement or disagreement he will perceive in his own ideas. Such propositions being once made about abstract ideas, so as to be true, they will, whenever they can be supposed to be made again, at any time past, or to come, by a mind having those ideas, always be true: for names being supposed to stand perpetually for the same ideas, and the same ideas having immutably the same habitudes one to another, propositions concerning any abstract ideas that are once true must needs be eternal verities.

EXI'STENT. *a.* (from *exist.*) Having being; in possession of being (*Dryden*).

EXISTIMA'TION. *s.* (*existimatio*, Lat.) 1. Opinion. 2. Esteem.

E'XIT. *s.* (Latin.) 1. The term set in the margin of plays to mark the time at which the player goes off. 2. Recess; departure; act of quitting the theatre of life (*Shakspeare*). 3. Passage out of any place (*Glanville*). 4. Way by which there is a passage out (*Woodward.*)

EXITERIA, in antiquity, oblations or prayers, for a prosperous expedition or journey.

EXI'TIAL. Exi'tious. *a.* (*exitialis*, Lat.) Destructive; fatal; mortal (*Harvey*).

EXMOOR, a forest in Somersetshire, in the N.W. corner of that county, extending thence into Devonshire.

EXMOUTH, a village in Devonshire, on the E. side of the bay which forms the mouth of the river Ex. It is much frequented for sea-bathing.

EXOACA'NTHA, in botany, a genus of the class pentandria, order digynia. Involucre spinous: involucels halved, with unequal rays; all the flowers hermaphrodite; with equal, heart-shaped petals; seeds two; ovate, striate on one side, and flat on the other. One species only, a native of Syria, but of no pre-eminence.

EXOCATACŒLUS, in antiquity, a general denomination, under which were included several grand officers of the church at Constantinople.

EXOCŒTUS. Flying-fish. In zoology, a genus of the class pisces, order abdominales. Head scaly; mouth without teeth; the jaws connected at each side; gill-membrane seven-rayed; body whitish; belly angular; pectoral fins very large and long, the rays carinate on the fore-part. Three species, as follow. See Nat. Hist. Plate XCVII.

1. E. volans. Belly carinate on each side. Inhabits European, American, and Red seas; sometimes those of our own coasts; but is chiefly found between the tropics. By means of its long pectoral fins it is able to raise itself out of the water, and suspend itself in the air, and fly forwards to some distance till the fins become dry; by which means it often escapes from the jaws of sharks, dolphins, and other predatory fishes; but during its flight it is exposed to the talons of aquatic birds, the pelican, eagle, and albatross, which hover over the water for the purpose of catching it. There is a variety which is incapable of flight.

2. E. evolans. Belly not carinate. Inhabits the Spanish seas, and is perhaps only a variety of the last.

3. E. exiliens. Ventral fins reaching to the tail. Inhabits Carolina; and is larger than e. volitans.

EXODIARY, in the ancient Roman tragedy, was the person who, after the drama or play was ended, sung the exodium.

EXODIUM, in the ancient Greek drama, one of the four parts or divisions of tragedy, being so much of the piece as included the catastrophe and unravelling of the plot, and answering nearly to our fourth and fifth acts.

Exodium, among the Romans, consisted of certain humorous verses rehearsed by the exodiary at the end of the Fabulæ Atellanæ.

Exodium, in the Septuagint, signifies the end or conclusion of a feast. Particularly it is used for the eighth day of the feast of tabernacles, which, it is said, had a special view to the commemoration of the exodus or departure out of Egypt.

EXODUS, a canonical book of the Old Testament; being the second of the pentateuch, or five books of Moses. It is so called from the Greek εξοδος, the going out, or departure of the children of Israel from the land of Egypt; the history of which is delivered in this book, together with the many miracles wrought on that occasion. For the best proof of the authenticity of this book of Scripture, as well as of the others ascribed to Moses, with which we are acquainted, we refer to Dr. Graves's Lectures on the Pentateuch.

EXOLE'TE. *a.* (*exoletus*, Lat.) Obsolete; out of use.

To EXO'LVE. *v. a.* (*exolvo*, Latin.) To loose; to pay.

EXOMIS, in antiquity, a strait garment through which the shoulders appeared, worn by slaves, &c.

EXO'MPHALUS. (*exomphalus*, εξομφαλος, from εξ, out, and ομφαλος, the navel.) Exomphalos. An umbilical hernia. See HERNIA.

To EXO'NERATE. *v. a.* (*exonero*, Latin.) To unload; to disburden (*Ray*).

EXONERA'TION. *s.* (from *exonerate.*) The act of disburdening, or discharging (*Grew*).

EXO'PTABLE. *a.* (*exoptabilis*, Lat.) Desirable; to be sought with eagerness or desire.

EXOPHTHA'LMIA. (*exophthalmia*, εξοφθαλμια, from εξ, out, and οφθαλμος, the eye.) A swelling or protrusion of the bulb of the eye, to such a degree, that the eyelids cannot cover it. It may be caused by inflammation, when it is termed *exophthalmia inflammatoria*; or from a collection of pus in the globe of the eye, when it is termed *exophthalmia purulenta*; or from a congestion of blood within the globe of the eye, *exophthalmia sanguinea*.

E'XORABLE. *a.* (*exorabilis*, Lat.) To be moved by entreaty.

EXO'RBITANCE. EXO'RBITANCY. *s.* (from *exorbitant.*) 1. The act of going out of the track prescribed. 2. Enormity; gross deviation from rule or right (*Dryden*). 3. Boundless depravity (*Garth*).

EXO'RBITANT. *a.* (*ex* and *orbito*, Latin.) 1. Going out of the prescribed track. 2. Deviating from the course appointed or rule established (*Woodward*). 3. Anomalous; not comprehended in a settled rule or method (*Hooker*). 4. Enormous; beyond due proportion; excessive (*Addison*).

To EXO'RBITATE. *v. n.* (*ex* and *orbito*, Latin.) To deviate; to go out of the track or road prescribed (*Bentley*).

To E'XORCISE. *v. a.* (εξορκιζω.) 1. To adjure by some holy name. 2. To drive away spirits by certain forms of adjuration. 3. To purify from the influence of malignant spirits by religious ceremonies (*Dryden*).

E'XORCISER. *s.* (from *exorcise.*) One who practises to drive away evil spirits.

EXORCISM, the expelling of devils from persons possessed by means of conjurations and prayers. The Jews made great pretences to this power. Josephus tells several wonderful tales of the great success of several exorcists. One Eleazer, a Jew, cured many dæmoniacs, he says, by means of a root set in a ring. This root, with the ring, was held under the patient's nose, and the devil was forthwith evacuated. The generality of conjurors of this class were impostors, each pretending to a secret nostrum or charm, which was an overmatch for the devil. Our Saviour communicated to his disciples a real power over dæmons. (See DÆMONIAC.) Exorcism makes a considerable part of the superstition of the church of Rome, the rituals of which forbid the exorcising any person without the bishop's leave.

E'XORCIST. *s.* (εξορκιστης.) 1. One who by adjurations, prayers, or religious acts, drives away malignant spirits (*Acts*). 2. An enchanter; a conjurer: improperly (*Shakspeare*).

EXORDIUM, in oratory, the preamble, or beginning of a discourse or speech, serving to prepare the audience, and introduce the matter in hand. The word is formed from the Latin *ordiri*, to begin, by a metaphor taken from the weavers, who are said, *ordiri telam*, to begin or warp a web, by disposing and ordering the threads in a certain manner for the future work. See WARP.

The exordium, on other occasions, is called the prologue, prælude, and proem.

Cicero defines exordium a part of an oration, whereby the minds of the audience are duly prepared for what remains to be said. The exordium is a part of principal importance, and is to be laboured with extraordinary care; whence Tully calls it *difficillima pars orationis*.

Exordiums are of two kinds; either just and formal, or vehement and abrupt. In the first, the audience is prepared and conducted by due and easy steps; in the second, the orator, as if seized with some sudden passion, breaks out upon his audience at once. Such is that exordium of Isaiah: Hear, Oh heavens! and give ear, Oh earth! Or that of Cicero against Catiline: *Quousque tandem abutere patientia nostra, Catilina?* Abrupt exordiums are the most suitable on occasions of extraordinary joy, indignation, or the like; though we have instances of panegyrics of the greatest orators, begun abruptly, without any such occasions. Such is that of Gorgias, who began his eloge of the city and people of Elis with Ηλις, πολις ευδαιμων, *Elis beata civitas*. Abrupt, hasty exordiums, were more to the taste and manner of the Greeks than of the Latins. The objects which the orator should have in view in this part of his discourse, are to gain the good opinion of his hearers, to secure their attention, and to give them some general notion of his subject.

EXORNA'TION. *s.* (*exornatio*, Lat.) Ornament; decoration: embellishment (*Hooker*).

EXO'SSATED. *a.* (*exossatus*, Latin.) Deprived of bones.

EXO'SSEOUS. *a.* (*ex* and *ossa*, Lat.) Wanting bones; boneless (*Brown*).

EXO'STOSIS. *s.* (εκ and οστεον.) Any protuberance of a bone that is not natural (*Quincy*).

EXOSTO'SIS. (*exostosis*, εξοστωσις, from εξ, and οστεον, a bone.) Hyperostis. A morbid enlargement, or hard tumour of a bone. A genus of disease arranged by Cullen in the class locales, and order tumores.

EXOTERIC, and **Esoteric**, terms denoting external and internal, and applied to the double doctrine of the ancient philosophers: the one was public or exoteric, the other secret or esoteric. The first was that which they taught openly to the world, the latter was confined to a small number of disciples. See Peripatetics.

EXOTIC. (εξωτικος.) A term properly signifying foreign, or extraneous, i. e. brought from a remote or strange country. In which sense we sometimes say exotic, or barbarous terms or words, &c. The word is derived from the Greek εξω, εξωθεν, *extra*, without, on the outside.

Exotic, is chiefly applied to plants which are natives of foreign countries. The generality of exotics, or exotic plants, do not thrive in England without some peculiar care and culture; they require the warmth of their own climates; whence the use of hot-beds, glass-frames, green-houses, &c.

To **EXPA'ND.** *v. a.* (*expando*, Lat.) 1. To spread; to lay open as a net or sheet. 2. To dilate; to spread out every way (*Arbuthnot*).

EXPA'NSE. *s.* (*expansum*, Lat.) A body widely extended without inequalities (*Savage.*)

Expa'nse, in botany, expanded, spread out: as the calyx in helianthus.

EXPANSIBI'LITY. *s.* (from *expansible.*) Capacity of extension; possibility to be expanded or spread into a wider surface (*Grew*).

EXPA'NSIBLE. *a.* (from *expansus*, Lat.) Capable to be extended (*Grew.*).

EXPA'NSION. *s.* (from *expand.*) 1. The state of being expanded into a wider surface or greater space (*Bentley.*) 2. The act of spreading out (*Grew.*) 3. Extent; space to which any thing is extended (*Locke*). 4. Pure space, as distinct from extension in solid matter (*Locke*).

Expansion, in natural philosophy, the enlargement or increase of bulk in bodies, chiefly by means of heat. This is one of the most general effects of caloric, being common to all bodies whatever, whether solid or fluid, or in an aeriform state. In some cases bodies seem to expand as they grow cold, as water in the act of freezing; this, however, is known to be no exception to the general rule, but is owing to the arrangement of the particles, or to crystallization, and is not a regular and gradual expansion like that of metals, or other solid substances by means of heat. In various metals likewise an expansion takes place in passing from a fluid to a solid state, which is accounted for in the same way. The expansion of solids is exhibited by the Pyrometer (which see); a rod of iron, for instance, becomes sensibly longer and larger in all its dimensions in passing from a low to a high state of temperature. The expansion of fluids is shown by the thermometer, and is the principle upon which that useful instrument is constructed: by immersing a thermometer into hot water, the mercury, or other fluid, contained in it immediately expands. See Thermometer. The degree of expansion produced in different liquids, varies very considerably. In general, the denser the fluid, the less the expansion; water expands more than mercury, and alcohol, which is lighter than water, expands more than water. The expansion of aeriform fluids may be exhibited by bringing a bladder, partly filled with air, and the neck closely tied, near the fire; the bladder will soon be distended, and will, if the heat be strong enough, burst.

The following table will give the reader a precise notion of the rate of expansion of those liquids which have been hitherto examined by chemical philosophers.

Temp.	Mercury.	Linseed oil.	Sulphuric acid.	Nitric acid.	Water.	Oil of turpentine.	Alcohol.
30°	100000	100000	—	—	—	—	100000
40	100081	—	99752	99514	—	—	100539

212	101835	107250	—	—	104577	—	—

There are cases in which expansion is produced not by an increase, but by a diminution of temperature. These exceptions may be divided into two classes. The first class comprehends certain liquid bodies which have a maximum of density corresponding with a certain temperature; and which, if they are heated above that temperature, or cooled down below it, undergo in both cases an expansion or increase of bulk. The second class comprehends certain liquids which suddenly become solid when cooled down to a certain temperature; and this solidification is accompanied by an increase of bulk.

Water furnishes us with the most remarkable example of the first class of bodies. Its maximum of density corresponds with 42°.5 of Fahrenheit's thermometer, as has been lately ascertained by Mr. Dalton. If it is cooled down below 42°. 5, it undergoes an expansion for every degree of temperature which it loses; and at 32° the expansion amounts, according to Mr. Dalton, to $\frac{1}{160}$ of the whole expansion which water undergoes when heated from 42°.5 to 212°. With this, more recent experiments coincide very nearly; for by cooling 100000 parts in bulk of water from 42°.5 to 32°, they were converted to 100031 parts. We are indebted to the ingenuity of Mr. Dalton for the discovery of a very unexpected fact, that the expansion of water is the same for any number of degrees above or below the maximum of density. Thus if we heat water ten degrees above 42°.5, it occupies precisely the same bulk as it does when cooled down ten degrees below 42°.5. Therefore the density of water at 32° and at 53° is precisely the same. Mr. Dalton succeeded in cooling water down to the temperature of 5° without freezing, or 37°.5 below the maximum point of density; and during the whole of that range, its bulk precisely corresponds with the bulk of water the same number of degrees above 42°.5. Thus the bulk of water at 5° is the same as the bulk of water at 80°. The scale of expansion, therefore, which has been given for the expansion of water when heated, answers also for its expansion when cooled, provided the table begin at 42°.5, as is done in the table of the expansion of water. From this table it appears that the expansion of water, the original bulk being 10000, may be expressed pretty nearly by the following numbers:

Temp.	Expan.
82°.5.	$6.^2$
102°.5.	8^2
122°.5.	10^2
142°.5.	12^2
162°.5.	14^2

The greatest deviation from these numbers is towards the beginning of the scale, when, owing to the smallness of the expansion, it is difficult to measure it with precision. It leads us to this remarkable conclusion, that the squares of the natural numbers beginning at 6 indicate the increase of bulk which 10000 parts of water experience for every ten degrees they are heated above 82°.5, or cooled below 12°.5. This rule will give the reader a more precise idea of the rate at which water expands when heated or cooled, than a bare inspection of the table could do.

A considerable number of liquids has been tried to ascertain whether any of them, like water, have a temperature in which their density is a maximum, and which expand when cooled below that temperature. Sulphuric acid has no such point, neither have the oily bodies; but some solutions of salt in water begin to expand before they become solid. These solutions, however, when cooled down sufficiently, crystallize with such rapidity, that it is extremely difficult to be certain of the fact, that they really do begin to expand before they crystallize.

That class of bodies which undergo an expansion when they change from a liquid to a solid body of the diminution of temperature, is very numerous. Not only water when converted into ice undergoes such an expansion, but all bodies which by cooling assume the form of crystals.

The prodigious force with which water expands in the act of freezing has been long known to philosophers. Glass bottles filled with water are commonly broken in pieces when the water freezes. The Florentine academicians burst a brass globe whose cavity was an inch in diameter, by filling it with water and freezing it. The force necessary for this effect was calculated by Muschenbroeck at 27720 lbs. But the most complete set of experiments on the expansive force of freezing water, are those made by major Williams at Quebec, and published in the second volume of the Edinburgh transactions. This expansion has been explained, by supposing it the consequence of a tendency which water, in consolidating, is observed to have to arrange its particles in one determinate manner, so as to form prismatic crystals, crossing each other at angels of 60° and 120°. The force with which they arrange themselves in this manner must be enormous, since it enables small quantities of water to overcome so great mechanical pressures. Various methods have been tried to ascertain the specific gravity of ice at 32°; that which succeeded best was to dilute spirits of wine with water till a mass of solid ice put into it remained in any part of the liquid without either sinking or rising. The specific gravity of such a liquid is 0.92, which of course is the specific gravity of ice, supposing the specific gravity of water at 60° to be 1. This is an expansion much greater than water experiences even when heated to 212°. We see from this, that water, when converted into ice, no longer observes that equable expansion measured by Mr. Dalton, but undergoes a very rapid and considerable augmentation of bulk. See FREEZING.

The very same expansion is observed during the crystallization of most of the salts; all of them at least which shoot into prismatic forms. Hence the reason that the glass vessels in which such liquids are left, usually break to pieces when the crystals are formed.

This expansion of these bodies cannot be considered as an exception to the general fact, that bodies increase in bulk when heat is added to them; for the expansion is the consequence, not of the diminution of heat, but of the change in their state from liquids to solids, and the new arrangement of their particles which accompanies or constitutes that change.

It must be observed, however, that all bodies do not expand when they become solid. There are a considerable number which diminish in bulk; and in these the rate of diminution in most cases is rather increased by solidification. When liquid bodies are converted into solids, they either form prismatic crystals, or they form a mass in which no regularity of arrangement can be perceived. In the first case, expansion accompanies solidification; in the second place, contraction accompanies it. Water and all the salts furnish instances of the first, and tallow and oils are examples of the second. In these last bodies the solidification does not take place instantaneously, as in water and salts, but slowly and gradually: they first become viscid, and at last quite solid. Most of the oils, when they solidify, form very regular spheres. The same thing happens to honey, and to some metals. It has been thought that all combustible liquids contract, when they become solid, while incombustible liquids expand; but there are exceptions to this rule. Sulphuric acid does not by congelation alter its appearance; but cast iron, and perhaps sulphur also expand in the act of congealing.

According to the latest researches of Dalton, it appears that,

1st. All pure homogeneous liquids, as water and mercury, expand from the point of their congelation, or greatest density, a quantity always as the square of the temperature from that point.

2. The force of steam from pure liquids, as water, ether, &c. constitutes a geometrical progression to increments of temperature in arithmetical progression.

3. The expansion of permanent elastic fluids is in geometrical progression to equal increments of temperature.

4. The refrigeration of bodies is in geometrical progression in equal increments of time.

Judging from analogy we may conjecture that the expansion of solids is progressively increasing with the temperature: but whether it is a geometrical progression, like elastic fluids; or one increasing as the square of the temperature, like liquids; or as the third or any power of the temperature; still if it be estimated from absolute cold (supposed to be about 6150°, on Fahrenheit, below the temperature of freezing water) it must appear to be nearly uniform, or in arithmetical progression to the temperature, for so small and remote an interval of temperature as that between freezing and boiling water.

The following table exhibits the expansion of the principal subjects hitherto determined, for 180° of temperature; that is, from 32° to 212° of Fahrenheit. The bulk and length of the articles at 32° are denoted by 1.

SOLIDS.	EXPANSION.	
	In bulk.	In length
Brown earthen ware	·0012 = $\frac{1}{800}$	$\frac{1}{2400}$
Stone ware	·0025 = $\frac{1}{400}$	$\frac{1}{1200}$
Glasss, (thin) rods and tubes	·0025 = $\frac{1}{400}$	$\frac{1}{1200}$
bulbs	·0037 = $\frac{1}{270}$	$\frac{1}{810}$
Platinum	·0026 = $\frac{1}{385}$	$\frac{1}{1155}$

Nitric acid	·0110 = $\frac{1}{9}$	
ELASTIC FLUIDS.		
Gases of all kinds	·367 = $\frac{3}{8}$	

On the supposition that metals expand equably, the expansion of a mass of metal, by being heated a given number of degrees, is as follows: Let a = the expansion of the mass in length for 1°, which must be found by experiment; b = the number of degrees whose expansion is required; s = the solid contents of the metallic mass; x = the expansion sought; then $x = 3bas$. (*Borda*, *Dalton*, *Ellicott*, *Gregory*, *Smeaton*).

EXPA'NSIVE. *a.* (from *expand.*) Having the power to spread into a wider surface (*Ray*).

To EXPA'TIATE. *v. n.* (*expatior*, Latin.) 1. To range at large (*Addison*). 2. To enlarge upon in language (*Broome*). 3. To let loose; to allow to range (*Dryden*).

To EXPE'CT. *v. a.* (*expecto*, Latin.) 1. To have a previous apprehension of either good or evil (*Milton*). 2. To wait for; to attend the coming (*Dryden*).

To EXPE'CT. *v. n.* To wait; to stay (*Job*).

EXPE'CTABLE. *a.* (from *expect.*) To be expected; to be hoped or feared (*Brown.*)

EXPE'CTANCE. EXPECTANCY. *s.* (from *expect.*) 1. The act or state of expecting (*Ben Jonson*). 2. Something expected (*Shakspeare.*) 3. Hope (*Shakspeare*).

EXPE'CTANT. *a.* (French.) Waiting in expectation (*Swift*).

EXPE'CTANT. *s.* (from *expect.*) One who waits in expectation of any thing (*Pope*).

EXPECTA'TION. *s.* (*expectatio*, Latin.) 1. The act of expecting (*Shakspeare*). 2. The state of expecting either with hope or fear (*Rogers.*) 3. Prospect of any thing good to come (*Ps.*). 4. The object of happy expectation; the Messiah expected (*Milt.*). 5. A state in which something excellent is expected from us (*Ot.*).

EXPECTATION, in the doctrine of chances, is applied to any contingent event, upon the happening of which some benefit, &c. is expected. This is capable of being reduced to the rules of computation; for a sum of money in expectation when a particular event happens, has a determinate value before that event happens. Thus, if a person is to receive any sum, as 10*l.* when an event takes place which has an equal chance or probability of happening and failing, the value of the expectation is half that sum, or 5*l.*; but if there are three chances for failing, and only one for its happening, or one chance only in its favour out of all the four chances, then the probability of its happening is only one out of four, or $\frac{1}{4}$, and the value of the expectation is but $\frac{1}{4}$ of 10*l.* which is only 2*l.* 10*s.* or half the former sum. And in all cases, the value of the expectation of any sum is found by multiplying that sum by the fraction expressing the probability of obtaining it. So the value of the expectation on 100*l.* when there are three chances out of five for obtaining it, or when the probability of obtaining it is 3-fifths, is 3-fifths of 100*l.* which is 60*l.* And if s. be any sum expected on the happening of an event, h the chances for that event happening, and f the chances for its failing; then, there being h chances out of $f+h$ for its happening, the probability will be $\frac{h}{f+h}$, and the value of the expectation is $\frac{h}{f+h} \times s$. See CHANCES.

EXPECTATION OF LIFE, in the doctrine of life annuities, is the share, or number of years of life, which a person of a given age may, upon an equality of chance, expect to enjoy.

By the expectation or share of life, says Mr. Simpson (Select Exercises, p. 273), is not here to be understood that particular period which a person hath an equal chance of surviving; this last being a different and more simple consideration. The expectation of a life, to put it in the most familiar light, may be taken as the number of years at which the purchase of an annuity, granted upon it, without discount of money, ought to be valued. Which number of years will differ more or less from the period above mentioned, according to the different degrees of mortality to which the several stages of life are incident. Thus it is much more than an equal chance, according to the table of the probability of the duration of life which the same author has given us, that an infant, just come into the world, arrives not to the age of ten years; yet the expectation or share of life due to it, upon an average, is nearly twenty years. The reason of which wide difference is the great excess of the probability of mortality in the first tender years of life, above that respecting the more mature and stronger ages. Indeed, if the numbers that die at every age were to be the same, the two quantities above specified would also be equal; but when the said numbers become continually less and less, the expectation must of consequence be the greater of the two.

Mr. Simpson has given a table and rule for finding this expectation, pa. 255 and 273 as above. Thus:

A Table of the Expectations of Life in London.

Age.	Expectation.	Age.	Expectation.
1	27·0	41	19·2
2	32·0	42	18·8
3	34·0	43	18·5
4	35·6	44	18·1
5	36·0	45	17·8
6	36·0	46	17·4
7	35·8	47	17·0
8	35·6	48	16·7
9	35·2	49	16·3
10	34·8	50	16·0
11	34·3	51	15·6
12	33·7	52	15·2
13	33·1	53	14·9
14	32·5	54	14·5
15	31·9	55	14·2
16	31·3	56	13·8
17	30·7	57	13·4
18	30·1	58	13·1
19	29·5	59	12·7
20	28·9	60	12·4
21	28·3	61	12·0
22	27·7	62	11·6
23	27·2	63	11·2
24	26·6	64	10·8
25	26·1	65	10·5
26	25·6	66	10·1
27	25·1	67	9·8
28	24·6	68	9·4
29	24·1	69	9·1
30	23·6	70	8·8
31	23·1	71	8·4
32	22·7	72	8·1
33	22·3	73	7·8
34	21·9	74	7·5
35	21·5	75	7·2
36	21·1	76	6·8
37	20·7	77	6·4
38	20·3	78	6·0
39	19·9	79	5·5
40	19·6	80	5·0

For example, if it be required to find the expectation or share of life due to a person of 30 years old. Opposite the given age in the first column of the table, stands 23·6 in the second col. for the years in the expectation sought.

See De Moivre's Doctrine of Chances applied to the Valuation of Annuities, p. 288; or Dr. Price's Observations on Reversionary Payments, p. 168, 364, 374, &c.; or Philos. Trans. vol. 59, p. 89.

EXPE'CTER, *s.* (from *expect*.) 1. One who has hopes of something (*Swift*). 2. One who waits for another (*Shakspeare*).

To EXPE'CTORATE. *v. a.* (*ex* and *pectus*, Latin.) To eject from the breast (*Arbuthnot*).

EXPECTORA'TION. *s.* (from *expectorate*.) 1. The act of discharging from the breast. 2. That discharge which is made by coughing (*Arbuthnot*).

EXPECTORA'TIVE. *a.* (from *expectorate*.) Having the quality of promoting expectoration (*Harvey*).

EXPECTORANTS. (*Expectorantia, sc. medicamenta*, from *expectoro*, to discharge from the breast.) Under this title are to be considered those medicines which can, with safety, be employed to increase the discharge of mucus from the lungs. The different articles referred to this class may be divided into the following orders; 1. *Nauseating expectorants*, as squills, ammoniacum, and garlic, which are to be preferred for the aged and phlegmatic. 2. *Stimulating expectorants*, as marrubium, which is adapted to the young and irritable, and those easily affected by expectorants. 3. *Antispasmodic expectorants*, as vesicatories, pediluvium, and watery vapours; these are best calculated for the plethoric and irritable, and those liable to spasmodic affections. 4. *Irritable expectorants*, as fumes of tobacco and acid vapours. The constitutions to which these are chiefly adapted are those past the period of youth, and those in whom there are evident marks of torpor, either in the system generally, or in the lungs in particular.

EXPEDIATE. (In forest-law.) A term applied to the barbarous operation of cutting out the centrical ball of the foot of a dog, or such claws as may totally prevent his pursuit of game. In earlier times, when the forest laws were more rigidly enforced, the owner of any dog not expediated, and living within a forest district, was liable to a fine.

EXPE'DIENCE. EXPE'DIENCY. *s.* (from *expedient*.) 1. Fitness; propriety; suitableness to an end (*South*). Expedition; adventure (*Shakspeare*). 3. Haste; dispatch (*Shakspeare*).

EXPE'DIENT. *a.* (*expedit*, Latin.) 1. Proper; fit; convenient; suitable (*Tillotson*). 2. Quick; expeditious (*Shakspeare*).

EXPE'DIENT. *s.* (from the adjective.) 1. That which helps forward, as means to an end (*Decay of Piety*). 2. A shift; means to an end contrived in an exigence, or difficulty (*Woodward*).

EXPEDIENTS FOR OBTAINING THE FIRST FIGURES OF THE ROOTS OF EQUATIONS. Among these the most common are such as are described or alluded to under the article CONSTRUCTION. But sir Isaac Newton found out two other expedients for the same purpose, the most commodious of which was this: Let there be several of those graduated lines, called Gunter's lines, placed in a frame thus: the first AB fixed upon the side of the frame, (fig. 11, Pl. 57.) and the rest upon parallel sliders; the first of which, CD, shall be the same with AB, the second EF shall have its divisions but half as long, the divisions of the third GH one third, and those of the fourth IK one fourth, of the divisions of the first: then, when the beginning of these lines stand under each other, if any line LM be drawn perpendicularly across them, it will mark upon the first of the sliders the same number as on the fixt line, upon the second slider the square of that number, upon the third the cube, and upon the fourth the biquadrate of the same. But if any one of these sliders be moved backwards, the transverse line LM will mark upon that slider the respective power of the forementioned number, multiplied by the number which in this slider, in its present situation, stands directly under the point A, the beginning of the fixed line. Now let an equation given be $az + bz^2 - cz^3 + dz^4 = m$. Move the slider CD back (fig. 12. Pl. 57.) till the number a upon it, stand directly under A: bring likewise b on the slider EF, c on GH and d on IK respectively under A. Then, when the transverse line LM is put in such a situation as to mark upon the line AB the true value of z the root of the equation, it will give upon CD the value of az, upon EF that of bz^2, upon GH that of cz^3, and upon IK that of dz^4; consequently, when the numbers marked upon the sliders by the transverse line amount to m, as collected together under their proper signs, a root z is marked upon AB. See Robins's Tracts, vol. ii. p. 349.

EXPE'DIENTLY. *ad.* (from *expedient*.) 1. Fitly; suitably; conveniently. 2. Hastily; quickly: not used (*Shakspeare*).

To E'XPEDITE. *v. a.* (*expedio*, Latin.) 1. To facilitate; to free from impediment. 2. To hasten; to quicken (*Swift*). 3. To dispatch; to issue from a publick office (*Bacon*).

E'XPEDITE. *a.* (*expeditus*, Latin.) 1. Quick; hasty; soon performed (*Sandys*). 2. Easy; disencumbered; clear (*Hooker*). 3. Nimble; active; agile (*Tillotson*). 4. Lightly armed (*Bacon*).

E'XPEDITELY. *ad.* (from *expedite*.) With quickness; readily; hastily (*Grew*).

EXPEDI'TION. *s.* (from *expedite*.) 1. Haste; speed; activity (*Hooker*). 2. A march or voyage with martial intentions (*Shaks*.).

EXPEDI'TIOUS. *a.* (from *expedite*.) 1. Speedy; quick; soon done. 2. Nimble; swift; acting with celerity.

EXPEDI'TIOUSLY. *ad.* Speedily; nimbly.

To EXPE'L. *v. a.* (*expello*, Latin.) 1. To drive out; to force away (*Burnet*). 2. To eject; to throw out (*Bacon*). 3. To banish;

to drive from the place of residence (*Dryden*). 4. To reject; to refuse (*Spenser*). 5. To keep off; to exclude (*Shakspeare*).

EXPE'LLER. *s.* One that expels or drives away.

To **EXPE'ND.** *v. a.* (*expendo*, Latin.) To lay out; to spend (*Hayward*).

EXPE'NDITURE. *s.* Money expended in a certain stated interval; as a year.

Abstract of the total Public Expenditure of Great-Britain, for the Year ending the 5th of January, 1808.

				l.	*s.*	*d.*
Interest on the Public Funded Debt unredeemed				20,701,252	0	4¾
Charges of Management on ditto				297,757	16	1½
Sums applicable to the Reduction of the Debt				9,479,164	12	3½
Interest on Exchequer Bills				1,574,361	18	5
The Civil List				958,000	0	0
Allowances to the Royal Family, Pensions, &c.				290,171	4	9½
Other Charges on the Consolidated Fund, viz. Courts of Justice, the Mint, Salaries, Allowances, Bounties, &c.				345,990	14	11½
The Civil Government of Scotland				85,359	3	3½
Bounties for promoting the Fisheries, Manufactures, Corn, &c.				438,991	13	8¼
Other Payments in Anticipation of the Exchequer Receipt, viz. Pensions on the Hereditary Revenue, Militia and Deserters' Warrants, Volunteers, &c.				235,897	10	0¾
The Navy	9,713,547	19	8	16,775,761	9	3
Victualling Department	4,932,777	19	9			
Transport ditto, sick and wounded Seamen and Prisoners	1,839,435	9	10			
Miscellaneous Services	300,000	0	0			
The Ordnance				4,190,748	6	6
The Army Ordinary Services	9,314,909	0	9	15,388,550	14	4
Extraordinary Services	5,431,867	0	11			
Volunteer Corps	641,774	12	8			
Loans to Ireland and Proportion of Lotteries				3,681,251	3	4
Miscellaneous Services at Home, viz. for maintaining and employing Convicts Prosecutions, Printing Journals of the House of Commons and other Papers, Naval Asylum, British Museum, Veterinary College, American Loyalists, Clergy and Laity of France, Toulonese, Dutch and Corsican Emigrants, &c.				1,049,205	7	8¾
Miscellaneous Services Abroad, viz. Foreign Secret Service, maintaining Forts and Settlements on the Coast of Africa, Civil Establishment of Canada, Nova Scotia, New South Wales, Sierra Leone, &c.				178,177	13	0
Total				£75,670,641	8	2

EXPE'NSE. *s.* (*expensum*, Latin.) Cost; charges; money expended (*Ben Jonson*).

EXPE'NSEFUL. *a.* Costly; expensive (*Wotton*).

EXPE'NSELESS. *a.* Without cost (*Milton*).

EXPE'NSIVE. *a.* (from *expense.*) 1. Given to expense; extravagant (*Temple*). 2. Costly; requiring expense. 3. Liberal; distributive (*Sprat*).

EXPE'NSIVELY. *ad.* With great expense.

EXPE'NSIVENESS. *s.* 1. Addition to expense; extravagance. 2. Costliness (*Arbuthnot*).

EXPE'RIENCE. *s.* (*experientia*, Latin.) 1. Practice; frequent trial. (*Raleigh*). 2. Knowledge gained by practice (*Shakspeare*).

To **Expe'rience.** *v. a.* 1. To try; to practise. 2. To know by practice (*Milton*).

EXPE'RIENCED *participial a.* 1. Made skilful by experience (*Locke*). 2. Wise by long practice (*Pope*).

EXPE'RIENCER. *s.* One who makes trial; a practiser of experiments (*Digby*).

EXPE'RIMENT. *s.* (*experimentum*, Lat.) Trial of any thing; something done in order to discover an uncertainty or unknown effect (*Bacon*).

To **Expe'riment.** *v. a.* (from the noun.) 1. To try; to search out by trial (*Ray*). 2. To know by experience (*Locke*).

EXPERIME'NTAL. *a.* 1. Pertaining to experiment. 2. Built upon experiment (*Brown*). 3. Known by experiment or trial (*Newton*).

Experimental philosophy, is that which proceeds on experiments, or which deduces the laws of nature and the properties and powers of bodies, and their actions upon each other, from sensible experiments and observations.

Experiments are of the utmost importance in philosophy; and the great advantages the modern physics have over the ancient is chiefly owing to this, viz. that we abound much more in experiments, and that we make more use of the experiments we have. The method of the ancients was chiefly to begin with the causes of things, and thence argue to the phenomena and effects; on the contrary, that of the moderns proceeds from experiments and observations, from whence the properties and laws of natural things are deduced, and general theories are formed.

Several of the ancients, indeed, thought as highly of experiments as the moderns, and practised them also. Plato omits no occasion of speaking of the advantages of them; and Aristotle's history of animals bears ample testimony for him. Democritus's great employment was to make experiments; and even Epicurus himself owes part of his fame to the same cause.

Among the moderns, the making of experiments was chiefly begun by friar Bacon, in the thirteenth century, who it seems spent a great deal of money and labour in this way. After him, the lord chancellor Bacon is looked upon as the founder of the present mode of philosophising by experiments. And his method has been prosecuted with laudable emulation by the Academy del Cimento, the Royal Society, the Royal Academy at Paris; by Mr. Boyle, and above all, by sir Isaac Newton, as well as by many other illustrious philosophers.

Indeed, experiments, within the last century, are come so much into vogue, that nothing will pass in philosophy, but what is either founded on experiments, or confirmed by them; so that the new philosophy is almost wholly experimental.

Yet there are some, even among the learned, who speak of experiments in a different manner, or perhaps rather of the abuse of them, and in derision of the pretenders to the practice. Thus, though Dr. Keil allows that philosophy has received very considerable advantages from the makers of experiments; yet he complains of their disingenuousness, in too often wresting and distorting their experiments and observations to favour some darling theories they had espoused. Nay more, M. Hartsoeker, in his Recueil de plusieurs Pieces de Physique, undertakes to show, that such as employ themselves in the making of experiments are not properly philosophers, but as it were the labourers or operators of philosophers, who work under them, and for them, furnishing them with materials to build their systems and hypotheses upon. And the learned M. Dacier, in the beginning of his discourse on Plato, at the head of his translation of the works of that philosopher, deals still more severely with the makers of experiments. He breaks out with a kind of indignation at a tribe of idly-curious people, whose sole employment consists in making experiments on the gravity of the air, the equilibrium of fluids, the loadstone, &c. and yet arrogate to themselves the noble title of philosophers. It does not follow, however, that because experiments are sometimes diverted into an improper or a worthless channel, therefore they can never be employed with propriety or advantage.

The object of experimental philosophy is the knowledge of nature in general, or, more strictly, that of the properties of natural substances, and of the changes of those properties in different circumstances. This knowledge can only be obtained by experiment or observation; as that clay is capable of becoming hard by means of fire, and thereby being made into bricks, and that by the same means limestone can be converted into quick-lime, and, by the addition of water and sand, make mortar. It is by observation also that we discover that stones and other heavy bodies fall to the ground, and that a magnet will attract iron. In other words, experimental philosophy is an investigation of the wisdom of God in the works and the laws of nature, so that it is one of the greatest objects to the mind of man, and opens a field of inquiry which has no bounds; every advance we make suggesting new doubts and subjects of farther inquiry.

The uniformity we discover in the properties of natural substances enables us to lay down general rules or principles, which, being invariable, we call the laws of nature; and by our knowledge of these laws we are able to predict, and at our own pleasure to produce, particular results; and this is the source of all the powers of man. It is the direction we acquire of the powers of nature; so that, as lord Bacon observed, knowledge is power.

In our inquiries into nature, we are to be conducted by those rules and maxims which are found to be genuine, and consonant to a just method of physical reasoning; and these rules of philosophizing are by the greatest master in science, sir Isaac Newton, reckoned four, which are as follows:

1. More causes of natural things are not to be admitted, than are both true, and sufficient to explain the phænomena; for nature does nothing in vain, but is simple, and delights not in superfluous causes of things.

2. And, therefore, of natural effects of the same kind, the same causes are to be assigned, as far as it can be done; as of respiration in man and beasts, of the descent of stones in Europe and America, of light in a culinary fire and in the sun, and of the reflection of light in the earth and in the planets.

3. The qualities of natural bodies which cannot be increased or diminished, and agree to all bodies in which experiments can be made, are to be reckoned as the qualities of all bodies whatsoever: thus, because extension, divisibility, hardness, impenetrability, mobility, the vis inertiæ, and gravity, are found in all bodies which fall under our cognizance or inspection, we may justly conclude they belong to all bodies whatsoever, and are, therefore, to be esteemed the original and universal properties of all natural bodies.

4. In experimental philosophy, propositions collected from the phænomena by induction, are to be deemed (notwithstanding contrary hypotheses) either exactly or very nearly true, till other phænomena occur, by which they may be rendered either more accurate, or liable to exception. This ought to be done, lest arguments of induction should be destroyed by hypotheses.

These four rules of philosophizing are premised by sir Isaac Newton to his third book of the Principia; and more particularly explained by him in his Optics, where he exhibits the method of proceeding in philosophy, the first part of which is as follows:

"As in mathematics, so in natural history, the investigation of difficult things, by way of analysis, ought always to precede the method of composition. This analysis consists in making experiments and observations, and in drawing general conclusions from them by induction (i. e. reasoning from the analogy of things by natural consequence) and admitting no objections against the conclusions, but what are taken from experiments or certain truths. And although the arguing from experiments and observation, by induction, be no demonstration of general conclusions, yet it is the best way of arguing which the nature of things admits of, and may be looked on as so much the stronger, by how much the induction is more general; and if no exception occur from phænomena, the conclusion may be pronounced generally; but if, at any time afterwards, any exception shall occur from experiments, it may then be pronounced with such exceptions: by this way of analysis we may proceed from compounds to ingredients, and from motions to the causes producing them; and, in general, from effects to their causes; and from particular causes to more general ones, till the argument ends in the most general: this is the method of analysis. And that of synthesis, or composition, consists in assuming causes, discovered and established as principles, and by them explaining the phænomena, proceeding from them, and proving the explanations."

It is unnecessary to say more, in this place, on experimental philosophy generally: the reader will turn for information on individual subjects, as he has occasion, to Catoptrics, Dioptrics, Hydrostatics, Mechanics, Optics, Pneumatics, Electricity, Magnetism, &c. &c. &c. Also Aerostation, Atmosphere, Burning glass, Cold, Colour, Freezing, Evaporation, Fire, Fluidity, Heat, Ignition, Light, Sound, Steam, Water, Wind, &c.

EXPERIME'NTALLY. *ad.* By experience; by trial (*Evelyn*).

EXPERIME'NTER. *s.* (from *experiment.*) One who makes experiments (*Digby*).

EXPERIMENTUM CRUCIS, a capital, leading, or decisive experiment; thus termed, either on account of its being like a cross or direction post, placed in the meeting of several roads, guiding men to the true knowledge of the nature of that thing they are inquiring after; or, on account of its being a kind of torture, whereby the nature of the thing is, as it were, extorted by force.

EXPE'RT. *a.* (*expertus*, Lat.) 1. Skilful; addressful; intelligent (*Prior*). 2. Ready; dexterous (*Dryden*). 3. Skilful by practice or experience (*Bacon*).

EXPE'RTLY. *ad.* In a skilful ready manner.

EXPE'RTNESS. *s.* (from *expert.*) Skill; readiness; dexterity (*Knolles*).

E'XPIABLE. *a.* Capable to be expiated.

To E'XPIATE. *v. a.* (*expio*, Latin.) 1. To annul the guilt of a crime by subsequent acts of piety; to atone for (*Bacon*). 2. To avert the threats of prodigies. 3. To make reparation for (*Clarendon*).

EXPIA'TION. *s.* (from *expiate.*) 1. The act of expiating or atoning for any crime. 2. The means by which we atone for crimes; atonement (*Dryden*). 3. Practices by which the threats of ominous prodigies were averted (*Hayward*).

Expiation (Feast of), among the Jews, called by our translators the day of atonement, was held on the tenth day of Tisri, or the seventh month of the Jewish year, answering to part of our September and October. It was instituted by God himself, Levit. xxiii. 27, &c. On that day the high-priest, the figure or type of Jesus Christ, entered into the most holy place, and confessed his sins; and, after several ceremonies, made an atonement for all the people to wash them from their sins. Lev. chap. xvi.

E'XPIATORY. *a.* (from *expiate.*) Having the power of expiation (*Hooker*).

EXPILA'TION. *s.* (*expilatio*, Lat.) Robbery; the act of committing waste upon land to the loss of the heir.

EXPIRA'TION. *s.* (from *expire.*) 1. That act of respiration which thrusts the air out of the lungs (*Arbuthnot*). 2. The last emission of breath; death (*Rambler*). 3. Evaporation; act of fuming out. 4. Vapour; matter expired (*Bacon*). 5. The cessation of any thing to which life is figuratively ascribed (*Boyle*). 6. The conclusion of any limited time (*Shakspeare*).

To EXPI'RE. *v. a.* (*expiro*, Lat.) 1. To breathe out (*Spenser*). 2. To exhale; to send out in exhalations (*Woodward*). 3. To close; to conclude; obsolete (*Spenser*).

To Expi're. *v. n.* 1. To make an emission of the breath (*Walter*). 2. To die; to breathe the last (*Pope*). 3. To perish; to fall; to be destroyed (*Spenser*). 4. To fly out with a blast (*Dryden*). 5. To conclude; to come to an end (*Shakspeare*).

To EXPLA'IN. *v. a.* (*explano*, Lat.) To expound; to illustrate; to clear (*Gay*).

EXPLA'INABLE. *a.* (from *explain.*) Capable of being explained or interpreted (*Brown*).

EXPLAI'NER. *s.* (from *explain.*) Expositor; interpreter; commentator.

EXPLANA'TION. *s.* (from *explain.*) 1. The act of explaining or interpreting. 2. The sense given by an explainer (*Swift*).

EXPLA'NATORY. *a.* (from *explain.*) Containing explanation (*Swift*).

E'XPLETIVE. *s.* (*expletivum*, Lat.) Something used only to take up room (*Swift*).

E'XPLICABLE. *a.* (from *explicate.*) Explainable; possible to be explained (*Hale*).

To E'XPLICATE. *v. a.* (*explico*, Latin.) 1. To unfold; to expand (*Blackmore*). 2. To explain; to clear (*Taylor*).

EXPLICA'TION. *s.* (from *explicate.*) 1. The act of opening, unfolding, or expanding. 2. The act of explaining; interpretation; explanation (*Hooker*). 3. The sense given by an explainer (*Burnet*).

E'XPLICATIVE. *a.* (from *explicate.*) Having a tendency to explain (*Watts*).

EXPLICA'TOR. *s.* (from *explicate.*) Expounder; interpreter; explainer.

EXPLI'CIT. *a.* (*explicitus*, Latin.) Unfolded; plain; clear; not merely implied (*Burnet*).

EXPLI'CITLY. *ad.* Plainly; directly; not merely by inference (*Govern. of the Tongue*).

To EXPLO'DE. *v. a.* (*explodo*, Lat.) 1. To drive out disgracefully with some noise of contempt (*Roscommon*). 2. To drive out with noise and violence, as from a gun (*Blackmore*).

EXPLO'DER. *s.* (from *explode.*) A hisser; one who drives out with open contempt.

EXPLO'IT. *s.* (*expletum*, Lat.) A design accomplished; an achievement; a successful attempt (*Denham*).

To Explo'it. *v. a.* (from the noun.) To perform; to achieve: not used (*Camden*).

To EXPLO'RATE. *v. a.* (*exploro*, Latin.) To search out; to explore (*Brown*).

EXPLO'RATION. *s.* (from *explorate.*) Search; examination (*Brown*).

EXPLORA'TOR. *s.* (from *explorate.*) One who searches; an examiner.

EXPLO'RATORY. *a.* (from *explorate.*) Searching; examining.

To EXPLO'RE. *v. a.* (*exploro*, Latin.) To try; to search into; to examine by trial (*Boyle*).

EXPLO'REMENT. *s.* Search; trial (*Br.*).

EXPLOSION, in natural philosophy, a sudden and violent expansion of an aërial or other elastic fluid, by which it instantly throws off any obstacle that happens to be in the way, sometimes with incredible force, and in such a manner as to produce the most astonishing effects upon the neighbouring objects. Explosion differs from expansion, in that the latter is the effect of a gradual and continued power, acting uniformly for some time; whereas the former is always sudden, and only of momentary duration. The expansions of solid substances do not terminate in violent explosions, on account of their slowness, and the small space through which the metal, or other expanding substance, moves; though their strength may be equally great with that of the most active aërial fluids. Thus we find, that though wedges of wood, when wetted, will cleave solid blocks of stone, they never throw them to any distance, as is the case with gunpowder. On the other hand, it is seldom that the expansion of any elastic fluid bursts a solid substance, without throwing the fragments of it to a considerable distance, the effects of which are often very terrible. The reasons of this may be comprised in the two following particulars: 1. The immense velocity with which the aërial fluids expand, when affected by a considerable degree of heat; and, 2. Their celerity in acquiring heat and being affected by it, which is much superior to that of solid substances. Thus air, heated as much as iron when brought to a white heat, is expanded to four times its bulk; but the metal itself will not be expanded the 500th part of that space. In the case of gunpowder, which is a violent and well-known explosive substance, the velocity with which the flame moves is calculated by Mr. Robins, in his Treatise upon Gunnery, to be no less than 7000 feet in a second, or little less than 79 miles per minute. Hence the impulse of the fluid is inconceivably great, and the obstacles on which it strikes are hurried off with vast velocity, though much less than that just mentioned; for a cannon ball with the greatest charge of powder that can be conveniently given, does not move at a greater rate than 2400 feet per second, or little more than 27 miles per minute. The velocity of a ball again is promoted by the sudden propagation of the heat through the whole body of air, as soon as it is extricated from the materials of which the gunpowder is made; so that it is enabled to strike all at once, and thus greatly to augment the momentum of the ball. It is evident that this contributes very much to the force of the explosion, by what happens when powder is wetted or mixed with any substance, which prevents it from taking fire all at once. In this case the force of the explosion, even when the same quantity of powder is made use of, is not to be compared to that of dry powder.

We may conclude, upon these principles, that the force of an explosion depends, 1. On the quantity of elastic fluid to be expanded; 2. On the velocity it acquires by a certain degree of heat; and, 3. On the celerity with which the degree of heat affects the whole of the expansile fluid. These three take place in the greatest perfection where the electric fluid is concerned, as in cases of lightning, earthquakes, and volcanoes.

Every one has heard of the prodigious effects of lightning when it happens to strike buildings, trees, or even the most solid rocks; and in some cases, where the quantity of electricity is still greater than in any flash of lightning, we hear of still more tremendous consequences ensuing. Dr. Priestley gives an instance of a large fireball rolling on the surface of the sea, which, after rising up to the top-mast of a ship of war, burst with such violence, that the explosion resembled the discharge of hundreds of cannons fired at once. Great damage was done by it; but there is not the least doubt that most of its force was spent on the air, or carried down to the sea by the mast and iron-work of the ship. Indeed, considering that in all cases a great part of the force of electric explosions is dissipated in this manner, it may justly be doubted whether they can be measured by any method applicable to the mensuration of other forces. Even in artificial electricity the force is prodigiously great, insomuch that Dr. Van Marum calculated that of the great battery belonging to the machine in Teyler's museum to be upwards of 900 pounds.

Whenever the electrical fluid acts like common fire, the force of the explosions, though exceedingly great, is capable of mensuration, by comparing the distances to which the bodies are thrown with their weight. This is most evident in volcanoes, where the projections of the burning rocks and lava manifest the greatness of the power, at the same time that they afford a method of measuring it. By means of the fire which kindles the volcanoes, the aërial fluids are suddenly restored to their elastic state; and not only so, but their natural elasticity is greatly augmented, so that the explosions take place with great violence. The case is the same with gunpowder. The reason of the extreme quickness of the explosion of gunpowder is, that it takes fire so readily by the intimate mixture and combustibility of all the materials. In volcanoes the explosions likewise follow one another very quickly, and are by no means inferior in strength to those of gunpowder; but here the quantity of vapour makes up for the comparative slowness with which it is affected by the heat. Thus, though we could not by any other means contrive to fire cannon in such quick succession as we can do with gunpowder, yet in the huge furnace of a volcano the elastic matter is supplied in such quantities, that the explosions are in a manner unremitting; and even in ordinary experiments the confinement of aërial vapours has often occasioned violent explosions in chemical vessels. Carbonic acid gas, though heavier than most of the other aërial fluids, yet by its expansion contributes equally to the force of the explosion, as is evident, in that of pulvis fulminans. This is compounded of sulphur, saltpetre, and salt of tartar. The latter we know contains much carbonic acid gas; and it is probable that the violence of the explosion is occasioned by this air; for it is said that the greater quantity of it the alkaline salt contains, the greater force does it explode with.

Next in strength to the aërial vapours are those of aqueous and other liquids. The most remarkable effects of these are observed in steam-engines; but there is one particular case from which it has been inferred that aqueous steam is vastly stronger than the flame of gunpowder. This is when water is thrown upon melted copper; for here the explosion is so strong as almost to exceed imagination; and the most terrible accidents have been known to happen from such a slight cause as one of the workmen spitting in the furnace where copper was melting. Here, however, it is most probable that a decomposition of the water takes place, and on this supposition, the phenomenon is easily solved. The water being thrown in substance upon the melted copper, is decomposed by the violent heat; and one part of it adheres to the metal, thus converting it into a kind of calx, while the other is converted into inflammable air, which expanding suddenly, throws the melted metal about with the greatest violence by means of its re-action.

In order to understand the manner in which this is accomplished, we must consider some of the principles of gunnery laid down by Mr Robins. One of these is, that though the air, in cases of ordinary velocity, makes no great resistance, it is far otherwise where the velocity of the moving body becomes very great. In all cases of explosion also, there is in the first instance a vacuum made by the exploding fluid; and consequently the weight of the atmosphere is to be overcome, which amounts to about fifteen pounds on every square inch of surface. Supposing the surface of the exploding fluid then, or that of melted copper, to contain an area of four square inches, it meets with a resistance of sixty pounds from the atmosphere, and consequently communicates an equal pressure to the fluid metal. Even this must of consequence throw it about, unless the same pressure was exactly diffused over every part of the surface. But much more must this effect be increased by the immense velocity with which the fluid moves, and by which the resistance of the atmosphere is augmented in a prodigious degree. The elastic fluid generated is then confined not only by the fluid metal and sides of the furnace, but by the air itself, which cannot get out of the way, so that the whole resembles a cannon closed at the mouth, and filled with inflamed gunpowder. Hence not only the melted metal, but the furnace itself, and the adjacent walls of the building, are hurried off as they would be by the firing of a great quantity of gunpowder in a small space, and which is well known to produce analogous effects.

Dr. Black, in explaining the phenomenon in question, supposes that the mere heat of the metal applied to the aqueous steam produces the explosion; and in proof of this, alleges that copper imbibes a greater quantity of heat during fusion than any other metal. Aqueous steam, however, seems to be too slow for producing such sudden and violent effects. Explosions, it is true, will be occasioned by it, but then it must be confined for a very considerable time, whereas the effects of water thrown upon melted copper are instantaneous.

It must be observed, that in all cases where a very hot body is thrown upon a small quantity of water in substance, an explosion will follow; but here the water is confined, and suddenly rarefied into steam, which cannot get away without throwing off the body which confines it. Examples of this kind frequently occur where masons, or other mechanics, are employed in fastening cramps of iron into stones; where, if there happens to be a little water in the hole into which the lead is poured, the latter will fly out in such a manner as sometimes to burn them severely. Terrible accidents of this kind have sometimes happened in founderies, when large quantities of melted metal have been poured into wet moulds. In these cases, the sudden expansion of the aqueous steam has thrown out the metal with violence; and if any decomposition has taken place at the same time, so as to convert the aqueous into an aërial vapour, the explosion must be still greater.

To this last kind of explosion, we must refer that which takes place on pouring cold water into boiling or burning oil or tallow. Here the case is much the same whether we pour the oil on the water, or the water on the oil.

In the former case, the water which lies at the bottom is rarefied into steam, and explodes; in the latter, it sinks down through the oil by its superior specific gravity, and explodes as it passes along. In either case, however, the quantity of aqueous fluid must be but small in proportion to that of the oil; a very great quantity would put out the flame, or destroy the heat, in whatever way we applied it.

Another kind of explosion is that which takes place in solid substances, where we can scarcely suppose either aqueous or aërial vapours to be concerned. The most remarkable of these are the volcanic bombs mentioned by sir William Hamilton in the great eruption of Vesuvius in 1779. They were large pieces of lava, which burst in pieces like bombs as they fell to the ground; but he does not inform us whether their bursting was attended with any great violence or not. Indeed, amidst such scenes of horror, and the continual tremendous explosions of the volcano, smaller phenomena of this kind would probably be overlooked.

The only other kind of explosion we have to take notice of, is that produced by hydrogen and oxygen gases, when mixed together and set on fire. This differs from any of those hitherto considered, because in reality there is an absolute condensation, rather than an expansion, throughout the whole of the operation; and could the airs be made to take fire throughout their whole substance absolutely at the same instant, there would be no explosion, but only a sudden production of heat. From this cause also is derived a very singular phenomenon, taken notice of by Dr. Priestley in his experiments on that subject. Having inclosed several quantities of these gases in a copper vessel, firing them afterwards by the electric spark, he found that the force of the explosion was directed more towards one part of the vessel than another; least on that part where the electrical discharge was made, and most upon that which was farthest from it. This inequality was very considerable; insomuch that he could not repeat his experiments any number of times without injuring the vessel in that part which was farthest from the discharge. The reason he gives for this is, that the mixture was not fired at the same instant, but first at the place where the discharge was made. This first explosion would have acted equally upon all parts of the vessel, had it not been for the intervention of the air. By the first momentary explosion, however, the air in the farthest part of the vessel was condensed, so that the next explosion was made stronger, while the copper in the forepart of the vessel had the whole of this strong explosion to resist, the hinder part being but little concerned, as the air in it was condensed and reduced almost to a vacuum.

Though the phenomena of explosions are sometimes very destructive, they are likewise of considerable use in life, by removing obstacles which could scarcely be got the better of by any mechanical power whatever. The principal of these are the blowing up of rocks, the separating of stones in quarries, and other purposes of that kind. The destruction occasioned by them in times of war, and the machines formed upon the principle of explosion for the destruction of the human race, are well known; and if we cannot call these useful, some take them at least to be necessary evils. For the production of explosions, gunpowder is the only substance that has yet been found to answer.

EXPLO'SIVE. *a.* (from *explode.*) Driving out with noise and violence.

EXPONENT OF A POWER, in arithmetic and algebra, from *expono*, I express, the number which expresses the degree or elevation of the power; or which shows how often a given power is to be divided by its root before it be brought down to unity. The exponent of a square number or quantity is 2; of a cube 3; and so on. Exponents are also now used to denote roots, and like those of the powers, are set above and somewhat to the right-hand of the numbers to which they belong: thus the square, cube, and fourth root of x, are denoted by $x^{\frac{1}{2}}$, $x^{\frac{1}{3}}$, $x^{\frac{1}{4}}$.

The notation of powers and roots by the present way of exponents, has introduced a new and general arithmetic of exponents or powers; for hence powers are multiplied by only adding their exponents, divided by subtracting the exponents, raised to other powers, or roots of them extracted, by multiplying or dividing the exponent by the index of the power or root.

So $a^2 \times a^3 = a^5$, and $a^{\frac{1}{2}} \times a^{\frac{1}{4}} = a^{\frac{3}{4}}$;

$a^5 \div a^3 = a^2$, and $a^{\frac{3}{4}} \div a^{\frac{1}{}} = a^{\frac{1}{4}}$;

the 2d power of a^3 is a^6,

and the 3d root of a^6 is a^2.

Exponent of a ratio, is, by some, understood as the quotient arising from the division of the antecedent of the ratio by the consequent: in which sense, the exponent of the ratio of 3 to 2 is $\frac{}{2}$; and that of the ratio of 2 to 3 is $\frac{2}{3}$.

But others, and those among the best mathematicians, understand logarithms as the exponents of ratios; in which sense they coincide with the idea of measures of ratios, as delivered by Kepler, Mercator, Halley, Cotes, &c.

EXPONENTIAL CURVE, is one whose nature is defined or expressed by an exponential equation; as the curve denoted by $a^x = y$, or by $x^x = y$.

Exponential equation, is one in which is contained an exponential quantity: as the equation $a^x = b$, or $x^x = ab$, &c.

Exponential equations are commonly best resolved by means of logarithms, viz. first taking the log. of the given equation: thus, taking the log. of the equation $a^x = b$, it is $x \times$ log. of $a =$ log. of b; and hence $x = \frac{\text{log. } b}{\text{log. } a}$.

Also, the log. of the equation $x^x = ab$, is $x \times$ log. $x =$ log. ab; and then x is easily found by trial-and-error, or the double rule of position.

Exponential quantity, is that whose

power is a variable quantity; as the expression a^x, or x^x.

Exponential quantities are of several degrees and orders, according to the number of exponents or powers, one over another. Thus,

a^x is an exponential of the 1st order,

a^{x^y}, is one of the 2d order,

$a^{x^{y^z}}$ is one of the 3d order and so on.

See Bernoulli Oper. tom. i. p. 182, &c.

To EXPO'RT. *v. a.* (*exporto*, Latin.) To carry out of a country (*Addison*).

E'XPORT. *s.* (from the verb.) Commodity carried out in traffick.

The following is an account of the total official and real value of all goods imported into, and exported from, Great-Britain, for three years ending 10th October, 1808, distinguishing the foreign and colonial merchandize from British products and manufactures

There are, it is to be observed, no official returns of the real value of foreign goods, either imported or exported, but only of such British products and manufactures, as are chargeable with duty *ad valorem*. The values below stated are, however, calculated according to the best information which could be procured.

	IMPORTS.				IMPORTS.	
	Official Value.				Real Value.	
EXPORTS.	Foreign and Colonial Merchandize.	British Produce and Manufactures.	Years ending 10th October.	EXPORTS.	Foreign and Colonial Merchandize.	British Produce and Manufactures.
l.	*l.*	*l.*		*l.*	*l.*	*l.*
22,058,003	8,395,269	24,947,782	1806	38,398,645	9,005,120	39,368,212
23,493,127	9,090,918	24,550,724	1807	40,947,300	9,679,652	39,041,854
20,707,323	6,680,024	21,925,538	1808	34,448,620	7,138,282	35,233,477

The above account is exclusive of the value of the imports and exports of Scotland, and likewise of the importations from China and the East Indies; the returns of which being made up and transmitted in annual periods, ending 5th January, are not yet received for the year 1808. The amount of both has, therefore, been omitted in the two preceding years of the account (1806 and 1807), in order to preserve the comparative view of one year with another.

On converting the totals of the accounts of the exports of France and America for 1800 and 1804 into British money, their respective amounts stand thus:

	l.
Exports of Great Britain in 1800	43,152,019
Exports of France in 1800 .	11,315,650
Exports of the American States in 1804	17,482,291

Had the comparison been made with the real value of the exports of Great Britain instead of the custom-house values, the superior extent of our foreign trade would have appeared still more striking.

EXPORTATION, the act of sending goods out of one country into another. In modern times it has been the principal object of commercial policy, in almost every country, to encourage exportation, except with respect to a few particular articles; the export of manufactured goods has been promoted with a view of encouraging the internal industry of the country, and the export of foreign produce, as a means of drawing wealth from our countries by the profits of the carrying trade. The excess of the value of goods exported, beyond that of the imports, has usually been considered as a criterion of the profits which a country derives from foreign trade; but this is a very fallacious mode of determining a point of great importance; advantageous foreign trade might long exist, even if the imports constantly exceeded the value of the exports. The laws in force relating to exportation consist principally of prohibitory or restrictive regulations respecting bullion, corn, wool, machinery, and tools, used in various branches of manufactures, the exportation of which, it is thought, might diminish the necessary supply of provisions for the consumption of the country, or enable foreigners to rival valuable branches of its manufactures. The acts relative to the exportation of wool prohibit the exportation, not only of the article itself, but also of live sheep, rams, or lambs, from Great Britain, Ireland, Jersey, Guernsey, Alderney, Sark, or Man, on penalty of the forfeiture thereof, and of the ships conveying the same; also 3*l.* for every sheep, &c. and the offender to suffer three monshs solitary imprisonment; for a second offence 5*l.* per sheep, &c. and six months imprisonment; except wether sheep for ships' use only, put on board by licence of the port-officer of the customs. A limited quantity of wool is, however, permitted to be exported from the port of Southampton to Jersey, Guernsey, Alderney, and Sark. The duties on exportation, payable in Great Britain and Ireland, which were formerly the principal branch of the revenue derived from foreign trade, are now of small amount in comparison with the duties payable on goods brought into the country.

EXPORTER. *s.* (from *export.*) He that carries out commodities.

To **EXPO'SE.** *v. a.* (*expositum*, Latin.) 1. To lay open; to make liable to (*Prior*). 2. To put in the power of any thing (*Dryden*). 3. To lay open; to make bare (*Dryden*). 4. To lay open to censure or ridicule (*Dryden*). 5. To lay open to examination (*Locke*). 6. To put in danger (*Clarendon*). 7. To cast out to chance (*Prior*). 8. To censure; to treat with dispraise (*Addison*).

EXPOSING OF CHILDREN, a barbarous custom practised by most of the ancients, excepting the Thebans, who had an express law to the contrary, whereby it was made capital to expose children, ordaining, at the same time, that such as were not in a condition to educate them should bring them to the magistrates, in order to be brought up at the public expense. (Pott. Archæol. Græc, tom. ii. p. 333.) Among the other Greeks, when a child was born, it was laid on the ground; and if the father designed to educate his child, he immediately took it up; but if he forbore to do this, the child was carried away and exposed. Many persons exposed their children only because they were not in a condition to educate them, having no intention that they should perish. It was the unhappy fate of daughters especially to be thus treated, as requiring more charges to educate and settle them in the world than sons.

EXPOSI'TION. *s.* (from *expose.*) 1. The situation in which any thing is placed with respect to the sun or air (*Arbuthnot*). 2. Explanation; interpretation (*Dryden*).

EXPO'SITOR. *s.* (*expositor*, Latin.) Explainer; expounder; interpreter (*South*).

EX POST FACTO, in law, something done after another: thus an estate granted may be good by matter *ex post facto*, that was not so at first, as in case of election.

A law is said to be *ex post facto* when it is enacted to punish an offence committed before the passing of the law. Such a proceeding is held to be against the constitution of England.

To **EXPO'STULATE.** *v. a.* (*expostulo*, Lat.) To canvass with another; to altercate; to debate without open rupture (*Cotton*).

EXPOSTULA'TION. *s.* (from *expostulate.*) 1. Debate; altercation; discussion of an affair without rupture (*Spectator*). 2. Charge; accusation (*Waller*).

EXPOSTULA'TOR. *s.* One that debates with another without open rupture.

EXPO'STULATORY. *a.* (from *expostulate.*) Containing expostulation (*L'Estrange*).

EXPO'SURE. *s.* (from *expose.*) 1. The act of exposing or setting out to observation. 2. The state of being open to observation (*Shakspeare*). 3. The state of being exposed to any thing. 4. The state of being in danger (*Shakspeare*). 5. Exposition; situation (*Evelyn*).

To **EXPO'UND.** *v. n.* (*expono*, Latin.) 1. To explain; to clear; to interpret (*Raleigh*). 2. To examine; to lay open (*Hudibras*).

EXPOU'NDER. *s.* (from *expound.*) Explainer; interpreter (*Hooker*).

To **EXPRE'SS.** *v. a.* (*expressus*, Latin.) 1. To copy; to resemble; to represent (*Dryden*). 2. To represent by any of the imitative arts; as poetry, sculpture, painting (*Smith*). 3. To represent in words; to exhibit by language; to utter; to declare (*Milton*). 4. To show or make known in any manner (*Prior*). 5. To denote; to designate (*Numbers*). 6. To squeeze out; to force out by compression (*Bacon*). 7. To extort by violence (*Ben Jonson*).

EXPRE'SS. *a.* (from the verb.) 1. Copied; resembling; exactly alike (*Milton*). 2. Plain; apparent; in direct terms (*Ben Jonson*). 3. Clear; not dubious (*Stilling-fleet*). 4. On purpose; for a particular end (*Atterbury*).

EXPRE'SS. *s.* (from the adjective.) 1. A message sent on purpose (*Clarendon*).

EXPRESSED OILS. Such oils as are obtained by pressing the substance containing them, as olives, which give out olive oil, almonds, &c.

EXPRESSION, in algebra, any algebraical quantity, simple or compound: as $4ab$, $3x \times cy$, or $\sqrt{a^3 +}\, x - y$.

EXPRESSION, in music, denotes the performing of a piece with that peculiar energy and judgment, which are best calculated to excite the suitable emotions in the hearer.

EXPRESSION, in painting, a natural and lively representation of the subject, or of the several objects intended to be shown. The expression consists chiefly in representing the human body and all its parts, in the action suitable to it: in exhibiting in the face the several passions proper to the figures, and observing the motions they impress on the external parts. See PAINTING.

EXPRESSION, signifies farther, 4. The form or mode of language in which things are uttered. 5. A phrase; a mode of speech. 6. The act of squeezing or forcing out any thing by a press (*Arbuthnot*).

EXPRE'SSIVE. *a.* (from *express.*) Having the power of utterance or representation (*Pope*).

EXPRE'SSIVELY. *ad.* In a clear and representative way.

EXPRE'SSIVENESS. *s.* The power of expression, or representation by words (*Addison*).

EXPRE'SSLY. *ad.* (from *express.*) In direct terms; plainly; not by implication (*Stilling-fleet*).

EXPRE'SSURE. *s.* (from *express*: not used.) 1. Expression; utterance (*Shakspeare*). 2. The form; the likeness represented (*Shakspeare*). 3. The mark; the impression (*Shakspeare*).

To **EXPRO'BRATE.** *v. a.* (*exprobro*, Lat.) To charge upon with reproach; to impute only with blame; to upbraid (*Brown*).

EXPROBRA'TION. *s.* (from *exprobrate.*) Reproachful accusation (*Hooker*).

To **EXPRO'PRIATE.** *v. a.* (*ex* and *proprius*, Latin.) To make no longer our own (*Boyle*).

To **EXPU'GN.** *v. a.* (*expugno*, Latin.) To conquer; to take by assault.

EXPUGNA'TION. *s.* (from *expugn.*) Conquest; the act of taking by assault (*Sandys*).

To EXPU'LSE. *v. a.* (*expulsus*, Latin.) To drive out; to expel; to force away (*Bacon*).

EXPU'LSION. *s.* (from *expulse.*) 1. The act of expelling or driving out (*Arbuthnot*). 2. The state of being driven out (*Raleigh*).

EXPU'LSIVE. *a.* (from *expulse.*) Having the power of expulsion (*Wiseman*).

EXPU'NCTION. *s.* (from *expunge.*) Abolition; the act of expunging, or effacing.

To EXPU'NGE. *v. a.* (*expugno*, Lat.) 1. To blot out; to rub out (*Swift*). 2. To efface; to annihilate (*Sandys*).

EXPURGA'TION. *s.* (*expurgatio*, Latin). 1. The act of purging or cleansing (*Wiseman*). 2. Purification from bad mixture, as of errour or falsehood (*Brown*). 3. In astronomy. See EMERSION.

EXPU'RGATOR. *s.* One who corrects by expunging (*Digby*).

EXPU'RGATORY. *a.* (*expurgatorius*, Lat.) Employed in purging away what is noxious (*Brown*).

E'XQUISITE. *a.* (*exquisitus*, Latin.) 1. Far-sought; excellent; consummate; complete (*Raleigh*). 2. Consummately bad (*K. Charles*). 3. Very sensibly felt (*Cheyne*).

E'XQUISITELY. *ad.* Perfectly; completely.

EXQUISITENESS. *s.* Nicety; perfection.

E'XSCRIPT. *s.* (*exscriptum*, Latin.) A copy; a writing copied from another.

EXSI'CCANT. *a.* (from *exsiccate.*) Drying; having the power to dry up (*Wiseman*).

To EXSI'CCATE. *v. a.* (*exsicco*, Lat.) To dry (*Mortimer*).

EXSICCA'TION. *s.* (from *exsiccate.*) The act of drying (*Brown*).

EXSI'CCATIVE. *a.* (from *exsiccate.*) Having the power of drying.

EXSPUITION. (from *exspuo*, to spit out.) The discharge of mucus from the lungs or bronchia.

EXSTIPULATE, in botany, without stipules. As in many sorts of cistus, cardamine parviflora, &c.

EXSUCCOUS, in botany, juiceless, without juice; opposed to succulent. It respects the substance of leaves.

EXSU'CTION. *s.* (*exugo*, Lat.) The act of sucking out (*Boyle*).

EXSUDA'TION. *s.* (from *exudo*, Lat.) A sweating out; an extillation (*Derham*).

EXSUFFLA'TION. *s.* (*ex* and *sufflo*, Lat.) A blast working underneath (*Bacon*).

To EXSU'FFOLATE. *v. a.* (*suffolar*, Italian.) To whisper; to buzz in the ear (*Shakspeare*).

To EXSU'SCITATE. *v. a.* (*exsuscito*, Lat.) To rouse up; to stir up.

E'XTANCY. *s.* (from *extant.*) 1. The state of rising above the rest. 2. Parts rising up above the rest (*Boyle*).

E'XTANT. *a.* (*extans*, Latin.) 1. Standing out to view; standing above the rest (*Ray*). 2. Public; not suppressed (*Graunt*).

EXTA'TICAL. EXTA'TIC. *a.* (εκστατικος. See ECSTACY). 1. Tending to something external (*Boyle*). 2. Rapturous (*Pope*).

EXTE'MPORAL. *a.* (*extemporalis*, Lat.) 1. Uttered without premeditation; quick; ready; sudden (*Wotton*). 2. Speaking without premeditation (*Ben Jonson*).

EXTE'MPORALLY. *ad.* (from *extemporal.*) Quickly; without premeditation (*Shakspeare*).

EXTEMPORA'NEOUS. *a.* (*extemporaneus*, Lat.) Unpremeditated; sudden.

EXTE'MPORARY. *a.* (*extemporarius*, Lat.) Uttered or performed without premeditation; sudden; quick (*More*).

EXTE'MPORE. *ad.* (*extempore*, Latin.) Without premeditation; suddenly; readily (*South*).

EXTE'MPORINESS. *s.* (from *extempore.*) The faculty of speaking or acting without premeditation.

To EXTE'MPORIZE. *v. n.* (from *extempore.*) To speak without premeditation (*South*).

To EXTE'ND. *v. a.* (*extendo*, Lat.) 1. To stretch out in any direction (*Pope*). 2. To amplify; opposed to *contract* (*Wotton*). 3. To spread abroad; to diffuse; to expand. 4. To widen to a large comprehension (*Locke*). 5. To stretch into assignable dimensions; to make local; to magnify so as to fill some assignable space (*Prior*). 6. To enlarge; to continue (*Pope*). 7. To increase in force or duration (*Shakspeare*). 8. To enlarge the comprehension of any position (*Hooker*). 9. To impart; to communicate (*Psalms*). 10. To seize by course of law (*Hudibras*).

To EXTE'ND. *v. n.* To reach to any distance (*Graunt*).

EXTE'NDER. *s.* (from *extend.*) That by which any thing is extended (*Wiseman*).

EXTE'NDIBLE. *a.* (from *extend.*) Capable of extension (*Arbuthnot*).

EXTENSIBI'LITY. *s.* (from *extensible.*) The quality of being extensible (*Grew*).

EXTE'NSIBLE. *a.* (*extensio*, Latin.) 1. Capable of being stretched into length or breadth (*Holder*). 2. Capable of being extended to a larger comprehension (*Glanville*).

EXTE'NSIBLENESS. *s.* (from *extensible.*) Capacity of being extended.

EXTE'NSION. *s.* (from *extensio*, Lat.) 1. The act of extending. 2. The state of being extended (*Burnet*). 3. That essential property of a body by which it possesses or occupies some part of universal space, which is called the place of that body.

EXTE'NSIONAL. *a.* (from *extension.*) Long drawn out; having great extent (*More*).

EXTE'NSIVE. *a.* (*extensivus*, Latin.) 1. Wide; large (*Watts*). 2. That may be extended: not used (*Boyle*).

EXTE'NSIVELY. *ad.* Widely; largely (*Watts*).

EXTE'NSIVENESS. *s.* 1. Largeness; diffusiveness; wideness (*Watts*). 2. Possibility to be extended (*Ray*).

EXTE'NSOR. (*extensor*, from *extendo*, to stretch out.) A term in anatomy, given to those muscles whose office it is to extend any part; the term is in opposition to flexor.

Extensor bre'vis digito'rum pedis. Extensor brevis of Douglas. A muscle of the toes situated on the foot. It arises fleshy and tendinous from the fore and upper part of the os calcis, and soon forms a fleshy belly, divisible into four portions, which send off an equal number of tendons that pass over the upper part of the foot under the tendons of the extensor longus digitorum pedis, to be inserted into its tendinous expansion. Its office is to extend the toes.

E. carpi radialis brevior. Radialis externus brevior of Albinus. Radialis secundus of Winslow. An extensor muscle of the wrist, situated on the fore-arm. It arises tendinous from the external condyle of the humerus, and from the ligament that connects the radius to it, and runs along the outside of the radius. It is inserted by a long tendon into the upper and back part of the metacarpal bone of the middle finger. It assists in extending and bringing the hand backward.

E. carpi radialis longior. Radialis externus longior of Albinus. Radialis externus primus of Winslow. An extensor muscle of the carpus, situated on the fore-arm, that acts in conjunction with the former. It arises thin, broad, and fleshy, from the lower part of the external ridge of the os humeri, above its external condyle, and is inserted by a round tendon into the posterior and upper part of the metacarpal bone that sustains the fore fingers.

E. carpi ulnaris. Ulnaris externus of Albinus and Winslow. It arises from the outer condyle of the os humeri, and then receives an origin from the edge of the ulna: its tendon passes in a groove behind the styloid process of the ulna: to be inserted into the inside of the basis of the metacarpal bone of the little finger.

E. digitorum communis. A muscle situated on the fore-arm, that extends all the joints of the fingers. It arises from the external protuberance of the humerus: and at the wrist it divides into three flat tendons, which pass under the annular ligament, to be inserted into all the bones of the fore, middle, and ring fingers.

E. digitorum longus. See Extensor longus digitorum pedis.

E. indicis. See Indicator.

E. longus digitorum pedis. Extensor longus of Douglas. A muscle situated on the leg, that extends all the joints of the four small toes. It arises from the upper part of the tibia and fibula, and the interosseous ligament; its tendon passes under the annular ligament, and then divides into five, four of which are inserted into the second and third phalanges of the toes, and the fifth goes to the basis of the metatarsal bone. This last Winslow reckons a distinct muscle, and calls it peronæus brevis.

E. longus pollicis pedis. See Extensor proprius pollicis pedis.

E. magnus. See Gastrocnemius internus.

E. major pollicis manus. See Extensor secundi internodii.

E. minor pollicis manus. See Extensor primi internodii.

E. ossis metacarpi pollicis manus. Abductor longus pollicis manus of Albinus. Extensor primi internodii of Douglas. It arises fleshy from the middle and posterior part of the ulna, from the posterior part of the middle of the radius, and from the interosseous ligament, and is inserted into the os trapezium, and upper part of the metacarpal bone of the thumb.

E. pollicis primus. See Extensor primi internodii.

E. pollicis secundus. See Extensor secundi internodii.

E. primi internodii. Extensor minor pollicis manus of Albinus. This muscle, and the extensor ossis metacarpi pollicis manus, are called extensor pollicis primus by Winslow, and extensor secundi internodii by Douglas. A muscle of the thumb, situated on the hand, that extends the first bone of the thumb obliquely outwards. It arises fleshy from the posterior part of the ulna, and from the interosseous ligament, and is inserted tendinous into the posterior part of the first bone of the thumb.

E. proprius pollicis pedis. Extensor longus pollicis pedis of Douglas. An extensor muscle of the great toe, situated on the foot. It arises by an acute, tendinous, and fleshy beginning, some way below the head and anterior part of the fibula, along which it runs to near its lower extremity, connected to it by a number of fleshy fibres, which descend obliquely, and form a tendon which is inserted into the posterior part of the first and last joint of the great toe.

E. secundi internodii. Extensor major pollicis manus of Albinus. Extensor pollicis secundus of Winslow. Extensor tertii internodii of Douglas. A muscle of the thumb, situated on the hand, that extends the last joint of the thumb obliquely backwards. It arises tendinous and fleshy from the middle part of the ulna, and the interosseous ligament; it then forms a tendon, which runs through a small groove at the inner, and back part of the radius to be inserted into the last bone of the thumb.

E. secundi internodii indicis proprius. See Indicator.

E. tarsi minor. See Plantaris.

E. tarsi suralis. See Gastrocnemius internus.

E. tertii internodii minimi digiti. See Abductor minimi digiti manus.

E. tertii internodii indicis. See Prior indicis.

E. mallei. See Laxator tympani.

EXTE'NT. *part.* Extended (*Spenser*).

Exte'nt. *s.* (*extensus*, Latin.) 1. Space or degree to which any thing is extended (*Milton*). 2. Bulk; size; compass (*Milton*). 3. Communication; distribution (*Shakspeare*). 4. Execution; seizure (*Shakspeare*).

Extent, in law, is used in a double sense: sometimes it signifies a writ or command to the sheriff for the valuing of lands or tenements; and sometimes the act of the sheriff, or other commissioner, upon this writ; but most commonly it denotes an estimate or valuation of lands, and hence come our extended or rack rents. Every extent ought to be made on inquisition and verdict, without which the sheriff cannot legally execute the writ.

To EXTE'NUATE, *v. a.* (*extenuo*, Lat.) 1. To lessen; to make small in bulk (*Grew*). 2. To lessen; to diminish in any quality (*Dryden*). 3. To lessen; to degrade (*Milton*). 4. To lessen; to palliate (*Milton*). 5. To make lean.

EXTENUA'TION. *s.* (from *extenuate.*) 1. The act of representing things less ill than they are; palliation. 2 Mitigation; alleviation of punishment (*Atterbury*). 3. A general decay in the muscular flesh of the whole body (*Quincy*).

EXTE'RIOR. *a.* (*exterior*, Lat.) Outward; external; not intrinsic (*Boyle*).

EXTE'RIORLY. *ad.* Outwardly; externally.

To EXTE'RMINATE. *v. a.* (*extermino*, Lat.) To root out; to tear up; to drive away; to abolish; to destroy (*Bentley*).

EXTERMINA'TION. *s.* (from *exterminate.*) Destruction; excision (*Bacon*).

EXTERMINATION, or EXTERMINATING, in algebra, is used for taking away. Thus algebraists speak of exterminating surds, fractions, or any particular letter, out of an equation.

Different rules of extermination are necessary, according to the forms of the equation, and the number of unknown quantities: some of the best may be found in Maclaurin's and Emerson's Algebra, and our article ALGEBRA.

EXTERMINA'TOR. *s.* (*exterminator*, Lat.) That by which any thing is destroyed.

To EXTE'RMINE. *v. a.* (*extermino*, Lat.) To exterminate: not used (*Shakspeare*).

EXTE'RN. *a.* (*externus*, Lat.) 1. External; outward; visible (*Shakspeare*). 2. Without itself; not inherent; not intrinsic; not depending on itself (*Digby*).

EXTE'RNAL. *a.* (*externus*, Lat.) 1. Outward; not proceeding from itself: opposite to *internal* (*Tillotson*). 2. Having the outward appearance (*Stillingfleet*).

EXTE'RNALLY. *ad.* Outwardly (*Taylor*).

To EXTI'L. *v. n.* (*ex* and *stillo*, Latin.) To drop or distil from.

EXTILLA'TION. *s.* (from *ex* and *stillo*, Lat.) The act of falling in drops (*Derham*).

To EXTI'MULATE. *v. a.* (*extimulo*, Lat.) To prick; to incite by stimulation (*Brown*).

EXTIMULA'TION. *s.* (from *extimulatio*, Lat.) Pungency; power of exciting motion or sensation (*Bacon* .

EXTI'NCT. *a.* (*extinctus*, Latin.) 1. Extinguished; quenched; put out (*Pope*). 2. At a stop; without progressive succession (*Dryden*). 3. Abolished; out of force (*Ayliffe*).

EXTI'NCTION. *s.* (*extinctio*, Lat.) 1. The act of quenching or extinguishing. 2. The state of being quenched (*Harvey*). 3. Destruction; excision (*Rogers*). 4. Suppression (*Thomson*).

To EXTI'NGUISH. *v. a.* (*extinguo*, Lat.) 1. To put out; to quench (*Dryden*). 2. To suppress; to destroy (*Hayward*). 3. To cloud; to obscure (*Shakspeare*).

EXTI'NGUISHABLE *a.* (from *extinguish.*) That may be quenched, or destroyed.

EXTI'NGUISHER. *s.* (from *extinguish.*) A hollow cone put upon a candle to quench it.

EXTI'NGUISHMENT. *s.* 1. Extinction; suppression; act of quenching: destruction (*Davies*). 2. Abolition; nullification (*Hooker*). 3. Termination of a family (*Davies*).

EXTINGUISHMENT, in law, wherever a right, title, or interest is destroyed, or taken away by the act of God, operation of law, or act of the party, this is called an extinguishment.

Of the extinguishment of rents.—If a lessor purchases the tenantcy from his lessee, he cannot have both the rent and the land; nor can the tenant be under any obligation to pay the rent when the land, which was the consideration thereof, is returned by the lessor into his own hands; and this resumption or purchase of the tenantcy makes what is properly called an extinguishment of the rent.

As to the extinguishment of copyholds, it is laid down as a general rule, that any act of the copyholder, which denotes his intention to hold no longer of his lord, amounting to a determination of his will, is an extinguishment of his copyhold. (*Hutt.* 81.)

Of the extinguishment of common.—If a commoner release his common in one acre, it is an extinguishment of the whole common. (*Show.* 350.)

Of the extinguishment of debts.—A creditor's accepting a higher security than he had before, is an extinguishment of the first debt; as if a creditor by simple contract accepts an obligation, this extinguishes the simple-contract debt. (1 *Rol. Abr.* 470 *and* 471.)

To EXTI'RP. *v. a.* (*extirpo*, Lat.) To eradicate; to root out: not used (*Shakspeare*).

To EXTI'RPATE. *v. a.* (*extirpo*, Lat.) To root out; to eradicate; to exscind (*Locke*).

EXTIRPA'TION. *s.* (from *extirpate.*) Eradication; excision; destruction (*Tillotson*).

EXTIRPA'TOR. *s.* (from *extirpate.*) One who roots out; a destroyer.

EXTISPEX, in antiquity, the person who drew presages from viewing the entrails of animals offered in sacrifice.

EXTISPI'CIOUS. *a.* (*extispicium*, Latin.) Augurial; relating to the inspection of entrails in order to prognostication (*Brown*).

To EXTO'L. *v. a.* (*extollo*, Lat.) To praise; to magnify; to laud; to celebrate (*Dryden*).

EXTO'LLER. *s.* A praiser; a magnifier.

EXTO'RSIVE. *a.* (from *extort.*) Having the quality of drawing by violent means.

EXTO'RSIVELY. *ad.* In an extorsive manner; by violence.

To EXTO'RT. *v. a.* (*extorqueo*, *extortus*, Lat.) 1. To draw by force; to force away; to wrest; to wring from one (*Rowe*). 2. To gain by violence or oppression (*Spenser*).

To Exto'rt. *v. n.* To practise oppression and violence: not in use (*Davies*).

EXTO'RTER. *s.* One who practises oppression or extortion (*Camden*).

EXTO'RTION. *s.* (from *extort.*) 1. The act or practice of gaining by violence and rapacity (*Davies*). 2. Force by which any thing is unjustly taken away (*King Charles*).

Extortion, in law, signifies any oppression by colour or pretence of right; and in this respect it is said to be more heinous than robbery itself, as also that it is usually attended with the aggravating sin of perjury. (*Co. Lit.* 368.)

At common law extortion is severely punishable at the king's suit by fine and imprisonment, and by a removal from the office in the execution whereof it was committed. (31 Eliz. c. 5.) And this statute adds a greater penalty than the common law gave; for hereby the plaintiff shall recover his double damages. (2 *Inst.* 210.) See Colour of office.

EXTO'RTIONER. *s.* (from *extortion.*) One who practises extortion (*Camden*).

To EXTRA'CT. *v. a.* (*extractum*, Lat.) 1. To draw out of something (*Bacon*). 2. To draw by chemical operation (*Philips*). 3. To take from something (*Milton*). 4. To draw out of any containing body or cavity (*Burnet*). 5. To select and abstract from a larger treatise (*Swift*).

E'xtract. *s.* (from the verb.) 1. The substance extracted; the chief parts drawn from any thing (*Boyle*). 2. The chief heads drawn from a book; an abstract; an epitome (*Camden*).

Extract (Vegetable), *l'extractif*, Fr. *extract-auszug*, German. We must distinguish between this term as used for ages in pharmacy, and as lately applied to describe a peculiar property of vegetables in the language of modern chemistry.

In the former sense, extract implies a substance of any kind extracted from the heterogeneous mass of vegetable matter, by the action of any menstruum, and reduced to a consistent form by the evaporation of that menstruum. Pharmaceutic extracts generally consist of gum, sugar, chemical extract, or extractive, tannin, cinchona, gallic acid, or resin, or of several of these mixed in different proportions. The menstrua most commonly employed are water and alcohol. The former is capable of extracting all these substances, except the resin, and the latter all except the gum. As extract, however, under this signification is a direct branch, and constitutes a distinct section of Pharmacy, we refer to that article for a more minute developement of its scope and manipulations.

In a chemical view, extract or extractive is a term designed to express a distinct principle which there is reason to suppose exists in all vegetables, which possesses characteristic properties that distinguish it from mucilage, resin, and gums, or other parts of vegetable matter, and which constitutes a very large portion of pharmaceutic extract from whatever plants or parts of plants it may be procured.

Chemistry is indebted to Fourcroy for a very valuable research into the chemical nature of extract, contained in his elaborate analysis of the cinchona of St. Domingo; and to Vauquelin for an excellent inquiry into the same subject, connected with the analysis of the sap and native juices of the succulent plants.

Fourcroy boiled sixteen ounces of cinchona, reduced to a powder, twelve times successively for a quarter of an hour, in about twenty-six pounds of water each time. The first decoction was of a deep brown red, very bitter, and strongly frothed in boiling. It yielded by evaporation in a gentle heat five or seven grains of a brown dry extract. The second decoction was much less coloured, and gave only nine drams of extract: the third gave only two grains; and the sensible qualities of each decoction regularly diminished to the twelfth, which was little else than pure water. The entire quantity of extract obtained was nine ounces, fifty-six grains; which by being submitted to the action of alcohol, and an additional series of boilings, gave as follows:

	oz.	drs.	grs.
Mucilage	1	1	0
Crystalline grains separated from an alcoholic solution .	0	1	0
Flosculi separated by adding water to the solution . . .	0	1	12
Red powder insoluble in alcohol	0	2	0
Extract left at last	7	0	44
Loss	0	3	0
	9	0	56

Such are the general properties of the extract obtained from a decoction of Peruvian bark; and they will apply with some latitude to that of most other barks and woods. With many, however, a large portion of tan is mixed, which may be separated by a solution of isinglass or any other gelatin.

The properties of the extract contained in the native juices of plants are probably in a purer state; at least, being in a state of solution, all the changes liable to be produced by decoction with water are avoided. The experiments of Vauquelin on this subject are of high importance. When the sap of any tree is first drawn, it is always colourless or nearly so, but in the process of evaporation invariably becomes brown; and a certain though small quantity of pulverulent insoluble brown or red matter is precipitated. The extract obtained by evaporation to dryness is always a very mixed substance, containing often tan, often saccharine mucilage, and always several earthy and saline matters, among which are lime, potash, acetous acid, and generally ammonia. The existence of acetous acid in all extracts whatever is ascertained by pouring a few drops of sulphuric acid upon them, which immediately produces a pungent agreeable vapour of acetous acid, and with sufficient quantities this acid may be collected in a receiver. Ammonia is also discovered in extracts, for if some quick lime be rubbed with any of them, the vapour of this alkali immediately arises. All the extracts made by water constantly attract moisture from the air, whereby in no great length of time they grow mouldy, to the great detriment of their medicinal virtues. This disposition to moisture is doubtless principally owing (as Vauquelin has observed) to the acetite of potash and ammonia which they contain, and which are very deliquescent salts.

All the soft extracts have also an excess of this acid, and hence they invariably redden litmus. Extracts appear to form a great portion of the colouring matter of vegetables, the affinity of which with different mordants has been amply detailed under the article DYEING. Thus if a solution of alum be added to any extract dissolved in water, a copious coloured precipitate is formed, insoluble in water, and consisting of extract intimately combined with alumine, whilst the supernatant liquor is rendered nearly colourless. Most of the metallic salts also occasion a precipitate, consisting of the extract with the metallic oxyd. The colour of the greater number of extracts is brown, red, or fawn.

From the foregoing observations, it appears to be as clearly demonstrated as in any other case of vegetable analysis (in itself difficult and complicated) that there exists a peculiar and immediate vegetable principle to which the term Extract may be given, that it is almost invariably contained in greater or less degree in the part which is soluble in water, that it is naturally colourless when in solution in the vegetable juices, but when condensed in the solid parts, or when exposed to air or to heat, it always becomes more or less brown and coloured; that it is freely miscible with water in the state of colourless solution, but when altered by long exposure to heat and moisture, it becomes scarcely soluble in cold water, and much of it spontaneously separates from its solution by hot water, in proportion as it parts with heat; that it has a very strong affinity for alumine and metallic oxyds, separating them from their respective solutions, and forming compounds scarcely decomposable but by the agency of fire; and lastly, that it is found by destructive distillation to be composed of carbon, oxygen, and hydrogen; and probably a small portion of azot. These chemical properties are sufficient to distinguish it from every other of the immediate vegetable principles; but to them is added, by some acute and excellent chemists, another characteristic, namely, a strong affinity for oxygen, to which the colouring and difficult solubility in water are attributed. This character, however, cannot be admitted without some limitations.

When a colourless juice, such as the sap of any tree, is heated in an evaporating vessel, it gradually becomes of a dark brown, owing, as it is said, to the oxygen which the extract absorbs from the air. This opinion is certainly of itself sufficiently probable; but it also appears that the same change of colour takes place in vessels nearly closed as soon as the juice becomes heated, for Vauquelin adduces this as a convincing argument to show that it does not depend on a concentration of the extract. But it is difficult to conceive how sufficient oxygen should be acquired for this purpose from the narrow aperture of a vessel through which a quantity of heated vapour must be constantly expelled; and if the first change will take place independent of the effect of the external air, it deserves inquiry by experiment, whether an extract similar to that produced by evaporation in open vessels would not be obtained by the same process in closed vessels. Again, the chief argument adduced for the successive oxygenation of extract, is the formation of the red brown pulverulent, and sometimes crystalline deposit, from the watery solution of extract after long evaporation in open vessels, confirmed by the immediate production of a similar deposit by the oxymuriatic acid. But it has not yet been at all proved by analysis that this deposit differs from extract in no other circumstance than in an increased quantity of oxygen. The exact nature of this singular product still requires further explanation; but it appears to be a very intimate union of vegetable matter with lime, for when calcined, the residue is chiefly carbonat of lime. Neither is the production of this substance by passing oxymuriatic acid through a solution of brown extract conclusive of its being generated by the simple union of oxygen with extract, without being confirmed by a full examination of the solution that remains, and a proof that all the oxygen of the acid had passed into the red powder, and into that only. It cannot be doubted that in the course of common evaporation of the decoction or infusion of extract, the length of time to which it is exposed to air much influences the quantity of this supposed oxygenated extract; but though the above-mentioned eminent chemists express their full conviction that the whole extract might be successively changed in this manner, it does not appear that they have ever effected this change, even on any considerable portion of the extract, for in the experiments with oxymuriatic acid, after this had been added to full saturation, only thirty grains of the red powder could be obtained from seventy-two of the extract. This opinion, therefore, of the spontaneous oxygenation of extract, though ingenious, and by no means improbable, must still be considered as extremely hypothetical, and cannot be yet admitted as a distinctive character of this vegetable principle.

Much variety is found in the sensible properties of colour and taste, in the different extracts. The colour is generally brown or red with various modifications, and it is quite a characteristic of all the solid extracts to be deeply coloured, in which respect they differ essentially from mucilage, fecula, and many other vegetable principles.

Bitterness of taste is a much less constant character, and is even entirely absent from a very large number of individual extracts.

After all that has been done on this subject, there is strong reason to suspect that this substance is one of those which the most easily enters into combinations with all the other vegetable principles, and probably unites with them so strongly, that no chemical process has ever succeeded in producing it pure and unmixed.

EXTRA'CTION. *s.* (*extractio*, Latin.) 1. The act of drawing one part out of a compound (*Bacon*). 2. Derivation from an original; lineage; descent (*Clarendon*).

Extraction of roots, in arithmetic and algebra, the method of ascertaining the roots of given numbers or quantities. These roots are denominated from their powers, as the square, or 2d root; the cube, or 3d root; the biquadratic, or 4th root, &c. which are the roots of the 2d, 3d, 4th, &c. powers.

In the business of extraction no determinate roots can be obtained, unless the number whose root is required is a perfect power of that order which corresponds with the order of the root. Thus we can determine accurately both the square and cube root of 64; because it is both a square and a cube number: we can likewise find the square root of 81, and the cube root of 27; but the cube root of 81, and the square root of 27, are surd or indeterminate: though we can approximate to them nearer than by any assignable difference.

To extract the cube, or any higher root, of a number. In books of arithmetic, separate rules are given for the extraction of the cubic, and some higher roots; but they are so exceedingly tedious and difficult in their operation, that many mathematicians, of the greatest eminence, have invented approximating rules less difficult in use. Of these, none which we have seen is so simple in its form, and so well adapted for general practice, as that first given by Dr. Hutton in his Tracts, vol. i. p. 49, which is as follows: Let N be any number or power whose nth root is to be extracted; and let R be the nearest rational root of N, of the same kind, or R^n the nearest rational power to N, either greater or less than it; then shall the true root be very nearly equal to

$$\frac{\overline{n+1}.N+\overline{n-1}.R^n}{\overline{n-1}.N+\overline{n+1}.R^n}\times R;$$ which rule is general

for any root whose index is denoted by n. And expounding n successively by the numbers 2, 3, 4, &c. this theorem furnishes the following particular formulæ for the several roots, viz. the

2d or square root $\dfrac{3N+R^2}{N+3R^2}\times R;$

3d or cube root $\dfrac{4N+2R^3}{2N+4R^3}\times R$, or $\dfrac{2N+R^3}{N+2R^3}\times R;$

4th root $\dfrac{5N+3R^4}{3N+5R^4}\times R;$

5th root $\dfrac{6N+4R^5}{4N+6R^6}\times R$, or $\dfrac{3N+2R^5}{2N+3R^5}\times R;$

6th root $\dfrac{7N+5R^6}{5N+7R^6}\times R;$

7th root $\dfrac{8N+6R^7}{6N+8R^7}\times R$, or $\dfrac{4N+3R^7}{3N+4R^7}\times R;$
&c.

Or the theorem may be stated in the form of a proportion, thus:

as $\overline{n-1}.N+\overline{n+1}.R^n:\overline{n+1}.N+\overline{n-1}.R^n::R:$ the root sought very nearly.

For ex. suppose the problem proposed, of doubling the cube, or to find the cube root of the number 2. Here $N=2$, $n=3$, and the nearest power, and root too, is 1:

$$\text{Hence } 2N+R^3=4+1=5,$$
$$\text{and } N+2R^3=2+2=4;$$

then $4:5::1:\frac{5}{4}=1.25$ the first approximation.

Again, taking $R=\frac{5}{4}$, and conseq. $R^3=\frac{125}{64}$:

$$\text{Hence } 2N+R^3=4+\tfrac{125}{64}=\tfrac{381}{64}:$$
$$\text{and } N+2R^3=2+\tfrac{250}{64}=\tfrac{378}{64};$$

then $378:381::\frac{5}{4}:\frac{635}{504}=1{\cdot}259921$, for the cube root of 2, which is exact in the very last figure.

And again by taking $\frac{633}{504}$ for the value of R, as great many more figures may be found. For other methods of extraction, see our articles Algebra, Arithmetic, and Roots.

Extraction, in surgery, is the drawing any foreign matter out of the body by the hand, or by the help of instruments. See Surgery.

EXTRACTOR. *s.* (Latin.) The person or instrument by which any thing is extracted. In midwifery, it is an instrument or forceps for extracting a child by the head in difficult cases. See Midwifery.

EXTRADI'CTIONARY. *a.* (*extra* and *dictio*, Latin.) Not consisting in words, but realities (*Brown*).

EXTRADOS, in architecture, the exterior curvature or line of an arch. Sometimes it is used to denote the outer line of the structure, as the road-way in a bridge; but it is often employed to signify only the upper curve of the voussoirs. Writers on the theory of arches use it to signify the exterior curve appropriated to a given interior one or *intrados*, so that the whole shall form an arch of equilibration.

EXTRAFOLIACEOUS STIPULES. In botany. Growing on the outside of the leaves, or below them. Infra folium collocatæ. As in betula, tilia, and the class diadelphia. Opposite to intra-foliaceous. It is applied also to peduncles, and prickles.

EXTRAJUDI'CIAL. *a.* (*extra* and *judicium*, Latin.) Out of the regular course of legal procedure (*Ayliffe*).

EXTRAJUDI'CIALLY. *ad.* In a manner different from the ordinary course of legal procedure (*Ayliffe*).

EXTRAMI'SSION. *s.* (*extra* and *mitto*, Latin.) The act of emitting outward (*Brown*).

EXTRAMUNDA'NE. *a.* (*extra* and *mundus*, Latin.) Beyond the verge of the material world (*Glanville*).

EXTRA'NEOUS. *a.* (*extraneus*, Latin.) Not belonging to any thing; foreign; of different substance; not intrinsick (*Woodward*).

EXTRAORDINARII, amongst the Romans, was a body of men consisting of a third part of the foreign horse and a fifth of the foot, which was separated from the rest of the forces borrowed from the confederate states, with great policy and caution, to prevent any design that they might possibly entertain against the natural forces. A more choice body of men were drawn from among the extraordinarii under the name of ablecti.

EXTRAO'RDINARILY. *ad.* 1. In a manner out of the common method and order (*Hooker*). 2. Uncommonly; particularly; eminently; remarkably (*Howel*).

EXTRAO'RDINARINESS. *s.* (from *extraordinary*) Uncommonness; eminence; remarkableness (*Government of the Tongue*).

EXTRAO'RDINARY. *a.* (*extraordinarius*, Latin.) 1. Different from common order and method; not ordinary (*Davies*). 2. Different from the common course of law (*Clarendon*). 3. Eminent; remarkable; more than common (*Stillingfleet*).

Extrao'rdinary. *ad.* Extraordinarily.

EXTRAPARO'CHIAL. *a.* (*extra* and *parochia*, Latin.) Not comprehended within any parish.

EXTRAPROVI'NCIAL. *a.* (*extra* and *provincia*, Latin.) Not within the same province (*Ayliffe*).

EXTRARE'GULAR. *a.* (*extra* and *regula*, Latin.) Not comprehended within a rule (*Taylor*).

EXTRA'VAGANCE. Extra'vagancy. *s.* (*extravagans*, Latin.) 1. Excursion or sally beyond prescribed limits (*Hammond*). 2. Irregularity; wildness. 3. Outrage; violence; outrageous vehemence (*Tillotson*). 4. Unnatural tumour; bombast (*Dryden*). 5. Waste; vain and superfluous expense (*Arbuthnot*).

EXTRA'VAGANT. *a.* (*extravagans*, Lat.) 1. Wandering out of his bounds (*Shakspeare*). 2. Roving beyond just limits or prescribed methods (*Dryden*). 3. Not comprehended in any thing (*Ayliffe*). 4. Irregular; wild (*Milton*). 5. Wasteful; prodigal; vainly expensive (*Addison*).

Extra'vagant. *s.* One who is confined in no general rule or definition (*L'Estrange*).

EXTRAVAGANTES, those discretal epistles which were published after the Clementines. They were so called, because at first they were not digested or ranged with the other papal constitutions, but seemed to be, as it were, detached from the canon-law. They continued to be called by the same name when they were afterwards inserted in the body of the canon-law. The first extravagantes are those of John XXII. successor of Clement V. The last collection was brought down to the year 1483, and was called the common extravagantes, notwithstanding that they were likewise incorporated with the rest of the canon-law.

EXTRA'VAGANTLY. *ad.* 1. In an extravagant manner; wildly (*Dryden*). 2. In an unreasonable degree (*Pope*). 3. Expensively; luxuriously; wastefully.

EXTRA'VAGANTNESS. *s.* (from *extravagant.*) Excess; excursion beyond limits.

To EXTRA'VAGATE. *v. n.* (*extra* and *vagor*, Latin.) To wander out of limits.

EXTRA'VASATED. *a.* (*extra* and *vasa*, Latin.) Forced out of the properly containing vessels (*Arbuthnot*).

EXTRAVASA'TION. (*extruvasatio*, from *extra*, without, and *vas*, a vessel.) See Ecchymoma.

EXTRAVE'NATE. (*extra* and *vena*, Lat.) Let out of the veins (*Glanville*).

EXTRAVE'RSION. *s* (*extra* and *versio*, Latin.) The act of throwing out; the state of being thrown out (*Boyle*).

EXTRA'UGHT. *part.* Extracted (*Shak.*).

EXTRE'ME. *a.* (*extremus*, Latin.) 1. Greatest; of the highest degree (*Deuteronomy*). 2. Utmost (*Shakspeare*). 3. Last: that beyond which there is nothing (*Dryden.*) 4. Pressing in the utmost degree (*Hooker*). 5. Rigourous; strict (*Psalms*).

Extre'me. *s.* (from the adjective.) 1. Utmost point; highest degree of any thing (*Milton*). 2. Points at the greatest distance from each other; extremity (*Locke*).

Extreme and mean proportion, in geometry, is when a line is so divided that the whole line is to the greater segment, as that segment is to the other: or as it is expressed by Euclid, when the line is so divided, that the rectangle under the whole line and the less segment, is equal to the square of the greater segment.

Extremes, in logic, the two extreme terms of the conclusion of a syllogism; viz. the predicate and subject. They are called extremes from their relation to another term, which is a medium or mean between them. The predicate, as being likewise had in the first proposition, is called the *majus extremum*, greater extreme; and the subject, as being put in the second or minor proposition, is called the *minus extremum*, lesser extreme. Thus, in the syllogism, man is an animal; Peter is a man, therefore Peter is an animal; the word animal is the greater extreme, Peter the less extreme, and man the medium.

Extremes conjunct, and Extremes disjunct, in spherical trigonometry, are, the former the two circular parts that lie next the assumed middle part, and the latter are the two that lie remote from the middle part. These were terms applied by lord Napier, in his universal theorem for resolving all right-angled and quadrantal spherical triangles; for which see our article Circular parts.

EXTRE'MELY. *ad.* (from *extreme.*) 1. In the utmost degree (*Sidney*). 2. Very much; greatly (*Swift*).

EXTRE'MITY. *s.* (*extremitas*, Latin.) 1. The utmost point; the highest degree (*Hook.*). 2. The utmost parts; the parts most remote from the middle (*Brown*). 3. The points in the utmost degree of opposition (*Denham*). 4. Remotest parts; parts of the greatest distance (*Arbuthnot*). 5. Violence of passion (*Spenser.*) 6. The utmost violence, rigour, or distress (*Clarendon*). 7. The most aggravated state (*Dryden*).

To EXTRICATE. *v. a.* (*extrico*, Latin.) To disembarrass; to set free any one in a state of perplexity; to disentangle (*Addison*).

EXTRICA'TION. *s.* (from *extricate.*) The act of disentangling; disentanglement (*Boyle*).

EXTRI'NSICAL. EXTRINSIC. *a.* (*extrinsicus*, Latin.) External; outward; not intimately belonging; not intrinsic (*Ray*).

EXTRI'NSICALLY. *ad.* (from *extrinsical.*) From without (*Glanville*).

To EXTRU'CT. *v. a.* (*extructum*, Latin.) To build; to raise; to form into a structure.

EXTRU'CTOR. *s.* (from *extruct.*) A builder; a fabricator; a contriver.

To EXTRU'DE. *v. a.* (*extrudo*, Latin.) To thrust off; to drive off (*Woodward*).

EXTRU'SION. *s.* (*extrusus*, Latin.) The act of thrusting or driving out (*Bacon*).

EXTU'BERANCE. *s.* (*ex* and *tuber*, Lat.) Knobs, or parts protuberant (*Moxon*).

EXU'BERANCE. *s.* (*exuberatio*, Latin.) Overgrowth; superfluous shoots; useless abundance; luxuriance (*Garth*).

EXU'BERANT. *a.* (*exuberans*, Latin.) 1. Growing with superfluous shoots; overabundant; superfluously plenteous (*Pope*). 2. Abounding in the utmost degree (*Boyle*).

EXU'BERANTLY. *ad.* Abundantly; to a superfluous degree (*Woodward*).

To EXU'BERATE. *v. n.* (*exubero*, Latin.) To abound in the highest degree (*Boyle*).

EXU'CCOUS. *a.* (*exsuccus*, Lat.) Without juice; dry (*Brown*).

EXUDA'TION. *s.* (from *exudo*, Lat.) 1. The act of emitting in sweat (*Wiseman*). 2. The matter issuing out by sweat from any body (*Bacon*).

To EXU'DATE. *To* EXU'DE. *v. n.* (*exudo*, Latin.) To sweat out; to issue out by sweat (*Arbuthnot*).

To EXU'LCERATE. *v. a.* (*exulcero*, Latin.) 1. To make sore with an ulcer; to affect with a running or eating sore (*Ray*). 2. To afflict; to corrode; to enrage (*Milton*).

EXULCERA'TION, (*exulceratio*, from *exulcero*, to cause ulcers.) The same as ulcer, though occasionally applied to that species which is small and superficial.

EXU'LCERATORY. *a.* (from *exulcerate.*) Having a tendency to cause ulcers.

To EXU'LT. *v. n.* (*exulto*, Latin.) To rejoice above measure; to triumph (*Hooker*).

EXU'LTANCE. *s.* (from *exult.*) Transport; joy; triumph (*Gov. of the Tongue*).

EXULTA'TION. *s.* (*exultatio*, Latin.) Joy; triumph; rapturous delight (*Hooker*).

To EXU'NDATE. *v. a.* (*exundo*, Lat.) To overflow.

EXUNDA'TION. *s.* (from *exundate.*) Overflow; abundance (*Ray*).

EXU'PERABLE. *a.* (*exuperabilis*, Latin.) Conquerable; superable; vincible.

EXU'PERANCE. *s.* (*exuperantia*, Latin.) Overbalance; greater proportion (*Brown*).

To EXU'SCITATE. *v. a.* (*exsuscito*, Lat.) To stir up; to rouse.

EXU'STION. *s.* (*exustio*, Latin.) The act of burning up; consumption by fire.

EXU'VIÆ, (*exuviæ*, from *exuo*, to strip off.) The cuticle of the serpent, which is cast every spring. The word is also used to denote cast-off shells of some marine animals.

EY, EA, EE. May either come from ıᵹ, an island, or from ea, which signifies a water, river, &c. or from leaᵹ, a field (*Gibson*).

EY, in old writers. See EIA.

EY'AS. *s.* (*niais*, French.) A young hawk just taken from the nest (*Shakspeare*).

EY'ASMUSKET. *s.* A young unfledged male hawk of the musket kind (*Shak.*).

EYE. *s.* plural *eyne*, now *eyes*. (eaᵹ, Sax.) 1. The organ of vision (*Dryden*). 2. Sight; ocular knowledge (*Galatians*). 3. Look; countenance (*Shakspeare*). 4. Front; face (*Shakspeare*). 5. A posture of direct opposition (*Dryden*). 6. Aspect; regard (*Bacon*). 7. Notice; observation; watch (*Dryden.*) 8. Opinion formed by observation (*Denham*). 9. Sight; view (*Shakspeare*). 10. Any thing formed like an eye (*Newton*). 11. Any small perforation (*South*). 12. Any small catch for a hook (*Boyle*). 13. Bud of a plant (*Evelyn*). 14. A small shade of colour (*Boyle*). 15. Power of perception (*Deuteronomy*).

To EYE. *v. a.* (from the noun.) To watch; to keep in view; to observe (*More*).

To EYE. *v. n.* To appear; to show; to bear an appearance: not used (*Shakspeare*).

EYE. *Oculus.* In anatomy, the eye or organ of vision, situated in a socket called the orbit, at the side of the root of the nose, which is composed of seven bones, viz. the frontal, superior maxillary, jugal, lachrymal, palatine, ethmoid, and sphænoid, which almost surround and defend it. Anatomists have divided the soft parts which form the eye into external and internal. The external parts are the *supercilia* or eyebrows, *palpebræ* or eyelids, *cilia*, or eyelashes, lachrymal gland, lachrymal caruncle, nasal duct, muscles of the bulb of the eye, and the fat of the orbit. The internal parts are those which form the bulb, or eye, properly so called; they consist of eight membranes, viz. the sclerotic, transparent cornea, the choroid membrane, iris, uvea, retina, hyaloid, and capsule of the crystalline lens; two chambers, one anterior, and the other posterior; and three humours, the aqueous, crystalline lens, and vitreous humour. The arteries of this viscus are the internal orbital, the central, and the ciliary. The veins empty themselves into the external jugulars. The nerves are the optic, and branches from the third, fourth, fifth, and sixth pair. The various parts are described under the different heads of SUPERCILIA, CILIA, SCLEROTIC MEMBRANE, CHOROID, &c. The use of the eye is to form the organ of vision.

The whole structure and apparatus of the eye tend to this; that there be produced a distinct and vivid collection in the bottom of the eye, directly under the pupil, of the rays which proceeding from any point of an object and entering the eye, penetrate the crystalline humour; and that so many points be painted in the bottom of the eye as are conspicuous in an object, that so a small image similar to it may be represented on the retina.

In order to this, the rays from any radiant or reflecting point striking on the cornea are refracted towards the perpendicular, and thus determined to proceed through the aperture of the pupil to the surface of the crystalline; while other rays, which entered so obliquely as to be thrown upon the iris are reflected out again, that they may not disturb the distinctness of the sight; and others, whose less obliquity threw them between the uvea and vitreous humour, are extinguished in the darkness thereof, that none may be propagated through the vitreous but such as passing through the pupil strike on the crystalline.

In the mean time the iris, contracting by its circular, or dilating by its right fibres, the pupilla of the eye admits fewer or more rays, as the object is nearer or more vivid, or remoter and more languid. See Pupil.

Now the flatter the figure of the cornea is, the less does it collect the rays emitted from any lucid point; whence fewer arrive at the crystalline, and those more diverging, unless when they come from a very remote object: on the contrary, the rounder it is the more of the rays from any point does it collect, and throw on the crystalline, and those the more converging; whence one great cause of the defects in the eyes both of old men and myopes. Again, the rays transmitted through the pupil to the crystalline are there refracted anew, farther collected, and rendered converging; so that those which came from the same point of the object are now thrown in one point, through the vitreous upon the retina, where they paint or exhibit that precise point of the object whence they flowed. Accordingly, if the crystalline be very dense or spherical, the focus, or the point wherein they are united, will be too near; and if too flat, or rare, the point will be too remote; the effect of both which is confusion. And hence another cause of the defects of myopes and presbytæ.

It is not, however, myopes and old men alone that would labour under these defects, and have their vision in most cases confused, as in objects very near or very remote, very small or very great; but this would be the common condition of vision. Distinct vision, depending absolutely on the union of all the rays coming from the same point of the object on the same precise point of the retina, and rays from the objects at different distances being united at different distances behind the crystalline; it were impossible, e. gr. for the same eye to see distinctly any two objects differently distant from it: but nature has made a provision against these defects; and that principally by bringing the crystalline nearer to the cornea, or farther from it, occasionally; which is effected two ways, viz. either by compressing the bulb of the eye by the four muscles, all strongly contracted at once, which changes the figure of the aqueous humour, and renders the eye oblong; or by the ligamentum ciliare augmenting and diminishing the convexity of the crystalline, and setting it nearer or farther from the retina. As complex as the mechanism of the eye may seem, and as manifold as the parts are which have a relation thereto, the justness of vision seems to require an exact habitude in them all: thus, though the pupil be no substantial part of the eye, but only an aperture of the uvea almost perpetually changing its bigness, according to the different degrees of light the eye chances to be exposed to; and therefore should seem, while this hole remains open, to perform its office, by giving entrance to the incident rays of light; yet Mr. Boyle saw a woman, who, after a fever, not being able to dilate the pupillæ of her eyes as before, though they were little narrower than ordinary, yet had she thereby almost lost her sight; and on the other side, though a competent wideness of the pupil be requisite to a clear and distinct vision, yet if its dilatation exceeds the due limits, there is thereby produced a considerable distemper of sight. It may seem also but a slight circumstance that the transparent coats of the eye should be devoid of colour, and of as little moment that the cornea should be very smooth, provided it remain transparent; yet when either of these circumstances is wanting, the sight is greatly vitiated. Thus, we see that in the yellow jaundice the adventitious colour wherewith the eye is tinged makes the patient think he sees many objects yellow which are of a contrary colour.

Motions of the eye are either external or internal. The external motion is that performed by its four straight and two oblique muscles, whereby the whole globe of the eye changes its situation or direction. The spherical figure of our eyes, and the loose connection to the edge of the orbit by the tunica conjunctiva, which is soft, flexible, and yielding, does excellently dispose them to be moved this or the other way, according to the situation of the object we would view. By the membranes the eye is connected to the edge of the orbit, which being soft and flexible, they do in such a manner as not in the least to impede its necessary motions; and that great quantity of fat placed all round the globe, betwixt it and the orbit, lubricates and softens the eye, and renders its motions more easy: hence arise the three following remarkable observations:

1. When nature has denied the head any motion, it is observable that she has, with great care and industry, provided for this defect. To this purpose belongs the surprising beautiful and curious mechanism observable in the immoveable eyes of flies, wasps, &c. They nearly resemble two protuberant hemispheres, each consisting of a prodigious number of other little segments of a sphere, all which segments are perforated by a hole, which may be called their pupil, in which this is remarkable; that every foramen, or pupil, is of a lenticular nature, so that we see objects

through them topsy-turvy, as through so many convex glasses: they even become a small telescope, when there is a due focal distance between them and the lens of the microscope by which they are viewed. Leuwenhoek's observations make it probable that every lens of the cornea supplies the place of the crystalline humour, which seems to be wanting in those creatures; and that each has a distinct branch of the optic nerve answering to it, upon which the images are painted: so that as most animals are binocular, and spiders for the most part octonocular, so flies, &c. are multocular, having in effect as many eyes as there are perforations in the cornea, by which means (as other creatures with but two eyes are obliged, by the contraction of the muscles above-enumerated, to turn their eyes to objects) these have some or other of their pupils always ready placed towards objects nearly all around them: whence they are so far from being denied any benefit of this noble and most necessary sense of sight, that they have probably more of it than other creatures, answering to their necessities and ways of living.

2. As in man and most other creatures the eyes are situated in the head, because, among other reasons, it is the most convenient place for their defence and security, being composed of hard bones, wherein are formed two large strong sinuses, or sockets, commonly called orbits, for the convenient lodging of these tender organs, and securing them against external injuries; so in those creatures whose head, like their eyes and the rest of their body, is soft and without bones, nature has provided for this necessary and tender organ a wonderful kind of guard, by enduing the creature with a faculty of withdrawing his eyes into his head, and lodging them in the same safety within his body. We have a very beautiful example of this in snails, whose eyes are lodged in four horns, like atramentous spots, one at the end of each horn, which they can retract at pleasure when in any danger. Here it may be also observed, that the cornea in all animals that want eyelids, as fishes, exactly resembles in hardness the horn of a lanthorn; and therefore is not hurt by such particles as their eyes are commonly exposed to. And in the mole, because this animal lives under ground, it was necessary its eyes should be well guarded and defended against the many dangers and inconveniences to which its manner of living exposes it: this is the reason why its eyes are so small, and that they are situated so far in the head, and covered so strongly with hair; and besides, they can protrude and retract them at pleasure. The eyes of insects are more varied than in any other class of animals: for their form and distribution see ENTOMOLOGY, as also COMPARATIVE ANATOMY.

3. The third and last reflection we shall make upon the external motion of our eyes, is what regards a problem which has very much perplexed both physicians and philosophers, viz. What is the cause of the uniform motion of both eyes?

In some creatures, such as fishes, birds, and among quadrupeds the hare, cameleon, &c. the eyes are moved differently; the one towards one object, and the other towards another. But in man, sheep, oxen, and dogs, the motions are so uniform that they never fail to turn both towards the same place: hence in operations upon the eye that require it to be kept immoveable, sometimes it is necessary to tie up the sound eye with a compress, by which means the other is easier kept fixed and immoveable.

The final cause of this uniform motion is, 1. That the sight may be thence rendered more strong and perfect: for since each eye apart impresses the mind with an idea of the same object, the impression must be more strong and lively when both eyes concur; and that both may concur, it is necessary that they move uniformly; for though the retina, or immediate organ of vision, is expanded upon the whole bottom of the eye, as far as the ligamentum ciliare, yet nothing is clearly and distinctly seen but what the eye is directed to. 2. A second advantage we reap from the uniform motion of the eyes, which is more considerable than the former, consists in our being thereby enabled to judge with more certainty of the distance of objects.

There is yet another advantage, full as considerable as any of the former, that is thought to arise from the uniform motion of our eyes, and that is, the single appearance of objects seen with both our eyes; which, though at first view it does not appear probable, is true: for if in looking at an object you turn one of your eyes aside with your finger, and alter its direction, every thing will be seen double.

By the internal motions of the eye we understand those motions which only happen to some of its internal parts, such as the crystalline and iris; or to the whole eye when it changes its spherical figure, and becomes oblong or flat. The internal motions of our eyes are either such as respect the change of conformation that is necessary for seeing distinctly at different distances, or such as only respect the dilatation and contraction of the pupil.

That our eyes change their conformation, and accommodate themselves to the various distances of objects, will be evident to any person who but reflects on the manner and most obvious phænomena of vision. See VISION.

EYES OF HORSES. The state of the eyes in every horse constitute so much of his comparative value, that the greatest circumspection ought to be used in the examination previously to a purchase. The best and most experienced judges of horses err sometimes in a superficial survey. If, however, at first sight you are struck by the bright, bold, prominent appearance of the eyes, and observe they are sufficiently clear and transparent to reflect your own figure as you stand before them, and the horse neither winks, blinks, or rolls the orbs of his eyes about, as if feeling for the light when brought out of the stable, there is every well-founded reason to believe they are not only safe, but perfectly good. On the contrary, when the eye appears flat, as if sunk in its orbit, with a vacuum round the orb, between it and the eye-lid, it is a very unfavourable indication; particularly if there should be no defluxion or inflammatory discharge from the eye, to justify the idea of a temporary injury by a blow, bite, or some similar accident. If there be a palpable indentation above the orbs, and a wrinkled contraction of the eye-lids towards the forehead, there can be no doubt of great danger, and it would not be advisable to purchase. A small pig-eye should be likewise carefully avoided, as it is seldom to be depended upon. The horse possessing an eye of this kind is frequently addicted to starting, and the future state of the eye is in general doubtful. A cloudy muddiness within the outer humour of the eye, or a milky thickening of the surface, denotes present defect, and great probability of approaching danger.

Eye, in architecture, any round window made in a pediment, an attic, or the like. Eye *of a dome*, an aperture at the top of a dome. Eye *of the volute*, the centre of its spiral.

Eye of a seed. See Hilum.

Eye (Bull's). In astronomy. See Aldebaran.

Eye, a borough in Suffolk, with a market on Saturdays. It has a manufacture of bone-lace, and sends two members to parliament. Lat. 52. 20 N. Lon. 1. 10 E.

Eye-ball, the apple of the eye.

Eye-bright. See Euphrasia.

Eye-brow. A layer of short hair which lies thick upon the lower part of the frontal bone, on the superior prominent part of the orbit.

EY'ED. *a.* (from *eye.*) Having eyes (*Spenser*).

EY'EDROP. *s.* (*eye* and *drop.*) Tear (*Shakspeare*).

EY'EGLANCE. *s.* (*eye* and *glance.*) Quick notice of the eye (*Spenser*).

EY'EGLASS. *s.* (*eye* and *glass.*) Spectacles; glass to assist the sight (*Shakspeare*).

EY'ELASH. *s.* (*eye* and *lash.*) The line of hair that edges the eyelid.

EY'ELESS. *a.* (from *eye.*) Without eyes; sightless; deprived of sight (*Milton*).

EY'ELET. *s.* (*œillet*, French.) A hole through which light may enter; any small perforation for a lace to go through (*Wiseman*).

EY'ELID. Palpebra. The semilunar moveable production of the skin which covers the eye when shut. It is distinguished into upper and under eyelid.

EY'EMOUTH, a seaport in Berwickshire. Lat. 55. 51 N. Lon. 1. 50 W.

EY'ESERVANT. *s.* (*eye* and *servant.*) A servant that works only while watched.

EY'ESERVICE. *s.* (*eye* and *service.*) Service performed only under inspection (*Colossians*).

EY'ESHOT. *s.* (*eye* and *shot.*) Sight; glance; view (*Spectator*).

EY'ESIGHT. *s.* (*eye* and *sight.*) Sight of the eye (*Samuel*).

EY'ESORE. *s.* (*eye* and *sore.*) Something offensive to the sight (*Clarendon*).

EYESPO'TTED. *a.* (*eye* and *spot.*) Marked with spots like eyes (*Spenser*).

EY'ESTRING. *s.* (*eye* and *string.*) The tendon by which the eye is moved (*Shakspeare*).

EY'ETOOTH. *s.* (*eye* and *tooth.*) The tooth in the upper jaw next on each side to the grinders; the fang (*Ray*).

EY'EWINK. *s.* (*eye* and *wink.*) A wink, as a hint or token (*Shakspeare*).

EYEWI'TNESS. *s.* (*eye* and *witness.*) An ocular evidence; one who gives testimony to facts seen with their own eyes (*Addison*).

EYMOUTIERS, a town of France, in the department of Upper Vienne, containing about 2000 inhabitants; and having a considerable trade in skins, leather, and rags. Lat. 46. 10 N. Lon. 1. 10 E.

EYNDHOVEN, a town of Dutch Brabant, in the district of Bois-le-Duc. Lat. 51. 31 N. Lon. 5. 26 E.

EYRAC, or Irac, Arabia, a province of Turkey in Asia, 345 miles in length, and 190 in breadth; of which Bagdad is the capital.

EYRE or Eire, in law, the court of itinerant justices.

EYRIE, among falconers, the nest where hawks sit, and hatch, and feed their young. Hence, a young hawk newly taken from the nest is called an *eyess.*

EZEKIEL, in scripture history, was one of those Jews who were carried captive to Babylon, along with Jehoiakim (or Jeconiah), king of Judah. In the fifth year of this captivity, the æra from which he dates his prophecies, he began his office, which he exercised about 21 years. The commencement of this period falls on the year before Christ 595, and 34 years after Jeremiah had begun his office; so that the last eight years of Jeremiah coincide with the first eight of Ezekiel. The design of this prophet seems to be chiefly to convince his fellow-captives in Babylon that they were mistaken in supposing that their brethren who still remained in Judea were in happier circumstances than they; and for this purpose, he describes the terrible judgments impending over that country; the final destruction of Jerusalem, both city and temple; and inveighs against those heinous sins which were the cause of such calamities.

More particularly, the first three chapters contain a glorious appearance of God to the prophet, who is commissioned to his office, with instructions and encouragements in the discharge of it. The prophet then (to chap. xxv.) treats of the sins and punishments of the Jews, especially of those left in Judea, by several apt visions and similitudes. From thence to chap. xxxiii. he foretels the destruction of several neighbouring nations, enemies to the Jews;

and from chap. xxxiii.—xl. censures the sins, murmurings, and hypocrisy of the Jewish captives in Babylon; with which, however, he intersperses promises of their approaching deliverance, together with intimations of a still more glorious redemption in future times under the Messiah. The last nine chapters contain a remarkable vision of the structure of a new temple and a new polity for Israel and strangers; applicable in the first instance to the return from the Babylonian captivity, but in its ultimate sense, to the glory and prosperity of the universal church of Christ in future times.

The style of Ezekiel is generally very bold and majestic. It assumes much of that species of the sublime which approximates to the terrible. From the nature of his visions, however, more than from his language, he is often obscure, especially towards the beginning and end of his book. The freedom with which he reproved his countrymen for their idolatry is said to have cost him his life; the common fate of most of the prophets.

EZRA, son of Seraiah, the priest of the Jews, and a descendant of Aaron. He was carried into captivity to Babylon by Nebuchadnezzar; but Artaxerxes Longomanus sent him to his own country with a colony of the Jews, and all the sacred vessels and ornaments of the temple, which he had in charge to rebuild. On his arrival at Jerusalem 467 B.C. he set about the reformation of abuses, particularly that of strange marriages. He also brought the writings of Moses into the temple; and restored the whole canon of the Old Testament in the same order in which it now stands, only changing the ancient Hebrew writing to the modern character, which is the same with the Chaldee. There is in the Bible a book under his name, and in the Apocrypha two others, called in our received version, the First and Second Books of Esdras.

F.

F, the fourth consonant, and sixth letter of the alphabet. The letter F is borrowed from the digamma or double gamma of the Æolians, as is evident from the inscription on the pedestal of the colossus at Delos; and was probably formed from the old Hebrew vau: and though this letter is not found in the modern Greek alphabet, yet it was in the ancient one.

This letter is derived to us from the Romans, who borrowed it from the Æolians; among whom it is called digamma, or double gamma, as resembling two Γ's, one over the other: add, that the digamma seems in its origin to have been no other than the Greek Φ, which being made at three strokes, degenerated at length into the figure F. For the letter Φ being compounded of an omicron with a perpendicular drawn through it, if that perpendicular be made first, and the O at two strokes afterwards, viz. first the upper, then the under part, it may happen, especially in writing fast, that the two parts shall not join; and even instead of two arches of circles, haste and conveniency may naturally enough make two straight lines.

What confirms this transmutation of the Φ into *F*, is, that on the medals of Philip, and the kings of Syria, in the words ΕΠΙΦΑΝΟΥΣ and ΦΙΛΑΔΕΛΦΟΥ, the phi is frequently seen in the form just mentioned; i. e. it has no circle or omicron; but across the middle of the perpendicular is a kind of right line, formed only of two dots, the one on the right side, and the other on the left, representing a cross †. Such appears to be the origin of the letter *F*, which of consequence is no other than a corruption of the Greek Φ; and accordingly, on the medals of the Falisci the *F* is ordinarily put in lieu of the Greek Φ: but it must be added, that though the Greek and Latin letter were thus the same thing, yet the sound was much softer among the Latins than among the Greeks, as was long ago observed by Terentianus.

The Romans for some time used an inverted F, Ⅎ, in lieu of a V consonant, which had no peculiar figure in their alphabet: thus, in inscriptions we meet with TERMINAℲIT, DIℲI, &c. According to Lipsius, in his Comment on the Annals of Tacitus, lib. xi. Covarruvias and Dausquius, this inverted digamma Ⅎ was first introduced by the emperor Claudius. See Tacit. An. lib. xi. cap. 4. and Suet. in Vit. Claud. cap. 41.

In the latter Roman writers we find the Latin *F* and Greek Φ *ph* frequently coufounded; as in *F*alanx for *Ph*alanx, *F*ilosophia for *Ph*ilosophia, which abuse is still retained by many French writers.

F is formed by compression of the whole lips, and a forcible breath. Though it has a name (*ef*) beginning with a vowel, it is numbered by grammarians among the semivowels; still it has this quality of a mute, that it is commodiously sounded before a liquid, as *flask*, *fly*, *freckle*. It has an unvariable sound, except that *of* is sometimes spoken nearly as *ov*.

F, or FA, in music, is the fourth note in rising in this order of the gamut, *ut*, *re*, *mi*, *fa*. It likewise denotes one of the Greek keys in music, destined for the bass.

F, in physical prescriptions stands for *fiat*, or "Let it be done." Thus *f. s. a.* signifies *fiat secundum artem*.

F was also a numeral letter, signifying 40; according to the verse, "Sexta quaterdenos gerit quæ distat ab alpha." And when a dash was added at top, thus F̄, it signified forty thousand.

F, in the civil law. Two f's joined together thus, *ff*, signify the pandects. See PANDECTS.

F, in criminal law, a stigma or brand put upon felons with a hot iron, on their being admitted to the benefit of clergy; by stat. 4 H. 7. c. 13.

FABA. (*faba.*) See BEAN, and VICIA.

FABA CRASSA. Telephium. Faba crassula. Anacampseros. The plant which bears these names in various pharmacopœias, is the orphine, *sedum telephium*; *foliis planiusculis serratis, corymbo folioso, caule erecto*, of Linnéus. It was formerly ranked as an antiphlogistic, but now forgotten.

FABA FEBRIFUGA. See FABA INDICA.

FABA INDI'CA. Faba sancti ignatii. Faba febrifuga. The seeds of a gourd-like fruit, the produce of the ignatia amara of Linnéus. They are of a roundish figure, very irregular and uneven, about the size of a middling nutmeg, semitransparent, and of a hard, horny texture. They have a very bitter taste, and no considerable smell. They are said to be used in the Philippine islands in all diseases, acting as a vomit and purgative. Infusions are given in the cure of intermittents, &c.

FABA PECHURIM. Faba pichurim. Faba pechuris. An oblong oval, brown, and ponderous seed, supposed to be the produce of a laurus, brought from the Brazils. The smell of these is like that of musk, between it and the scent of sassafras. They are exhibited as carminatives in flatulent colics, diarrhœas, and dysenteries.

Faba purgatrix. See Ricinus major.

Faba sancti ignatii. See Faba indica.

Faba suilla. See Hyosciamus.

FABA'CEOUS. *a.* (*fabaceus*, Lat.) Having the nature of a bean.

FABA'RIA. (*fabaria*, from *faba*, a bean, which it resembles.) Orphine. See Faba crassa.

FABARIÆ CALENDÆ, among the Romans, the calends of June.

FABATA'RIUM, in antiquity, a vessel to contain beans.

FABII. A noble and powerful family at Rome, who derived their name from *faba*, a bean, which their ancestors had cultivated.

FABIUS MAXIMUS RULLIANUS, who obtained the surname of Maximus, for lessening the power of the populace at elections. He was master of horse, five times consul, twice dictator, and once censor. He triumphed over seven different nations in the neighbourhood of Rome, and rendered himself illustrious by his patriotism.—2. Q. Maximus, a celebrated Roman, who, from inactive childhood, was raised to the highest offices of the state. In his first consulship he obtained a victory over Liguria, and the fatal battle of Thrasymenus occasioned his election to the dictatorship. In this important office he began to oppose Annibal, not by fighting him in the open field, like his predecessors, but he continually harassed his army by countermarches and ambuscades, from which he received the surname of Cunctator or delayer. Such operations, for the commander of the Roman armies, gave offence to some, and Fabius was even accused of cowardice. He, however, patiently bore to see his master of horse raised to share the dictatorial dignity with himself, by means of his enemies at home. Previously to the battle of Cannæ, he laid down his dictatorship, but shortly after obliged Tarentum to surrender to the Roman arms. He did not, however, live to see the success of the Roman arms under Scipio. He died in the 100th year of his age, after he had been five times consul, and twice honoured with a triumph. *Liv. Polyb.* &c.—3. His son bore the same name, and showed himself worthy of his noble father's virtues.—4. Pictor, the first Roman historian who gave an historical account of his country. He flourished B.C. 225. The work now extant, which is attributed to him, is a spurious composition.

FABLE, a tale, or feigned narration, designed either to instruct or divert; or, as Mons. de la Motte defines it, an instruction disguised under the allegory of an action.

Fable seems to be the most ancient way of teaching: the principal difference between the eloquence of the ancients and that of the moderns consists, according to Pere Bossu, in this; that our manner of speaking is simple and proper, and theirs full of mysteries and allegories: with them the truth was usually disguised under those ingenious inventions, called, by way of excellence, μυθοι, *fabulæ*, fables; that is, words, as intimating that there was the same difference between these fabulous discourses of the learned and the common language of the people, as between the words of men and the voices of beasts.

As to the laws of fable, the principal are, 1st. That to every fable there be some interpretation annexed to shew the moral sense or design thereof. This interpretation, if placed after the fable, is called επιμυθιον, or *affabulatio*; if before it, προμυθιον, *præfabulatio*. 2. That the narration be clear, probable, short, and pleasant. To preserve this probability the manners must be expressed and closely kept to, as in poetry.

M. de la Motte has some fine remarks on the subject of fables, at the beginning of his Fables Nouvelles, dediées au Roi, 1719. A fable, according to this polite writer, is a little epic poem, differing in nothing from the great one but in extent; and in that being less confined as to the choice of its persons, it may take in all sorts at pleasure, as gods, men, beasts, or genii; or even if occasion be, create persons; i. e. personify virtues, vices, rivers, trees, &c. Thus, M. de la Motte very happily introduces virtue, talent, and reputation as persons making a voyage together. See Epopoeia and Personifying.

That author suggests two reasons why fables have pleased in all ages and places. The first is, that self-love is spared in the instruction. The second, that the mind is exercised by the allegory. Men do not love direct precepts; too proud to condescend to those philosophers who seem to command what they teach, they require to be instructed in a more humble manner; they would never amend, if they thought that to amend were to obey: add, that there is a sort of activity in the mind which must be humoured; it pleases itself in a penetration which discovers more than is shewn; and in apprehending what is hid under a veil, fancies itself in some measure the author of it. The fable must always imply or convey some truth; in other works, delight alone may suffice; but the fable must instruct. Its essence is to be a symbol, and of consequence to signify somewhat more than is expressed by the latter. This truth should for the generality be a moral one; and a series of fictions conceived and composed in this view would form a treatise of morality preferable to any more direct and methodical treatise; accordingly Socrates, we are told, had a design to compose a course of morality in this way. This truth should be concealed under the allegory; and in strictness, it ought not to be explained either at the beginning or end.

The truth or idea intended should arise in the reader's mind from the fable itself. However, for the conveniency of the less discerning readers, it may be a good way to point out the truth or moral in preciser terms. To have the moral at the end of the fable seems much better than at the beginning: the mind is apt to be forestalled in the latter case; I carry the key along with me, so that there is no room to exercise my mind in finding any thing myself.

Jotham's beautiful fable of the trees is the oldest that is extant. Nathan's fable of the poor man and his lamb is the next in antiquity, and had so good an effect as to convey instruction to the ear of a king. We find Æsop in the most distant ages of Greece; and, in the early days of the Roman commonwealth, we find a mutiny appeased by a fable of the belly and the members. As fables had their rise in the very infancy of learning, they never flourished more than when learning was at its greatest height: witness Horace, Boileau, and Fontaine.

The English too have had some good fabulists, particularly Gay and Moore.

Fable is also used for the plot of an epic or dramatic poem; and, according to Aristotle, it is the principal part and soul as it were of a poem. In this sense the fable is defined a discourse invented with art to inform the manners by instruction, disguised under the allegory of an action. The contrivance of each fable must have two parts; namely, the intrigue and discovery. Every fable must have these two parts to be the subject of a just poem. Besides, the fable must, to be perfect, be admirable and probable; the admirable is that part of it which is contrary to the ordinary course of nature; the probable is whatever suits with the common opinion. But the most part of those that compose poems, by too great a passion to create admiration, take not sufficient care to temper it with probability. Almost all the ancient poets, however judicious in other respects, have been guilty of this fault; not to speak of the moderns. Probability gives credit to whatever is most fabulous in poetry; it serves also to give a greater lustre and air of perfection than even truth itself; for truth represents things only as they are, but probability renders them as they ought to be.

Fable, according to Mr. Pope, may be divided into the probable, the allegorical, and the marvellous. The probable fable is the recital of such actions as, though they did not happen, yet might in the common course of nature: or of such as, though they did, become fables by the additional episodes and manner of telling them. Of this sort is the main story of an epic poem, the return of Ulysses, the settlement of the Trojans in Italy, or the like. That of the Iliad is the anger of Achilles, the most short and single subject that ever was chosen by any poet. Yet this has Homer supplied with a vaster variety of incidents and events, and crowded with a greater number of councils, speeches, battles, and episodes of all kinds, than are to be found even in those poems whose schemes are of the utmost latitude and irregularity. The action is hurried on with the most vehement spirit, and its whole duration employs not so much as fifty days. Virgil, for want of so warm a genius, aided himself by taking in a more extensive subject, as well as a greater length of time, and contracting the design of both Homer's poems into one, which is yet but a fourth part as large as his. The other epic poets have used the same practice, but generally so far as to superinduce a multiplicity of fables, destroy the unity of action, and lose their readers in an unreasonable length of time. Nor is it only in the main design that they have been unable to add to his invention, but they have followed him in every episode and part of story. If he has given a regular catalogue of an army, they all draw up their forces in the same order. If he has funeral games for Patroclus, Virgil has the same for Anchises; and Statius (rather than omit them) destroys the unity of his action for those of Archemoras. If Ulysses visits the shades, the Æneas of Virgil, and Scipio of Silius, are sent after him. If he be detained from his return by the allurements of Calypso, so is Æneas by Dido, and Rinaldo by Armida. If Achilles be absent from the army, on the score of a quarrel, through half the poem, Rinaldo must absent himself just as long, on the like account. If he gives his hero a suit of celestial armour, Virgil and Tasso make the same present to theirs.

To proceed to the allegorical fable: if we reflect upon those innumerable knowledges, those secrets of nature and physical philosophy which Homer is generally supposed to have wrapt up in his allegories, what a new and ample scene of wonder may this consideration afford us! How fertile will that imagination appear, which was able to clothe all the properties of elements, the qualifications of the mind, the virtues and vices, in forms and persons; and to introduce them into actions agreeable to the nature of the things they shadowed! This is a field in which no succeeding poets could dispute with Homer: and whatever commendations have been allowed them on this head, are by no means for their invention for having enlarged his circle, but for their judgment in having contracted it. For when the mode of learning changed in following ages, and science was delivered in a plainer manner; it then became as reasonable in the more modern poets to lay it aside, as it was in Homer to make use of it. And perhaps it was no unhappy circumstance for Virgil that there was not in his time that demand upon him of so great an invention, as might be capable of furnishing all those allegorical parts of a poem.

The marvellous fable includes whatever is supernatural, and especially the machines of the gods. Homer seems the first who brought them into a system of machinery for poetry, and such a one as makes its greatest importance and dignity. For we find those authors who have been offended at the literal notion of the gods, constantly laying their accusation against Homer as the chief support of it. But whatever cause there might be to blame his machines in a philosophical or a religious view, they are so perfect in the poetic, that mankind have been ever since contented to follow them: none have been able to enlarge the sphere of poetry beyond the limits he has set: every attempt of this nature has proved unsuccessful; and after all the various changes of times and religions, his gods continue to this day the gods of poetry.

We have extracted most of the preceding remarks from Mr. Pope's preface to his Homer: they not only tend to illustrate the nature of fable in poetry, both as it means the design of a poem, and as it is taken for fiction; but they also show that if this be truly called the "Soul of Poetry," it was first breathed into it by Homer.

To FA'BLE. *v. n.* (from the noun.) 1. To feign; to write not truth but fiction (*Prior*). 2. To tell falsehoods; to lie (*Shakspeare*).

To FA'BLE. *v. a.* To feign; to tell falsely (*Milton*).

FA'BLED. *a.* (from *fable.*) Celebrated in fables (*Tickel*).

FA'BLER. *s.* (from *fable.*) A dealer in fiction; a writer of feigned stories.

FABRIANO (Gentile da), an eminent historical painter, born at Verona in 1332, and died in 1412. The doge and senate of Venice, as a reward for his genius, conferred upon him the title of nobility.

FABRIANO, a town of Italy, in the marquisate of Ancona, famous for its excellent paper. Lat. 42. 10 N. Lon. 12. 32 E.

FA'BRIC. *s.* (*fabrica*, Latin.) 1. A building; an edifice (*Wotton*). 2. Any system or compages of matter (*Prior*).

To FA'BRIC. *v. a.* (from the noun.) To build; to form; to construct (*Philips*).

To FA'BRICATE. *v. a.* (*fabricor*, Latin.) 1. To build; to construct. 2. To forge; to devise falsely.

FABRICA'TION. *s.* (from *fabricate.*) The act of building; construction (*Hale*).

FABRICIA. In botany, a genus of the class icosandria, order monogynia. Calyx five-cleft, half superior; petals five, without claws; stigma capitate; capsule many-celled; seeds winged. Two species; natives of New-Holland.

FABRICIUS (Caius), a famous Roman, who was twice consul, and gained several victories over the Samnites and Lucanians; but his integrity and contempt of riches have done more honour to his memory than his military renown. Being sent ambassador to Pyrrhus, he refused the presents which were offered him, and spurned with virtuous indignation the attempts made to corrupt his fidelity. But not content with proving faithful to his country, he excited Pyrrhus's gratitude as well as admiration, by discovering to him the perfidy of his physician, who had made an offer to the Romans of poisoning his royal master. This brave and virtuous man died in poverty about 250 B. C. and was buried at the public expence. The state also portioned out his two daughters in marriage. (*Watkins.*)

FABRICIUS (George), a learned German, and famous for his Latin poetry, born in Upper Saxony in 1516. In 1550 he published Roma, containing a description of that city, and written on the spot. On his return to his own country he settled as a schoolmaster, and died in 1571. His poems were printed at Basle in 1567, in 2 vols. 8vo. He also wrote some books in prose, as the Annals of Massein, Origines Saxonicæ, &c.

FABRICIUS (Jerome), an Italian physician, usually called Aquapendente, from the place of his birth. He professed anatomy with great reputation at Padua for forty years, and the republic of Venice settled upon him a pension of 1000 golden crowns, besides which they honoured him with a statue and gold chain. He died about 1603. His works in surgery and anatomy have been printed in 2 vols. folio. (*Watkins.*)

FABROT (Charles Hannibal), one of the most celebrated civilians of his time, was born at Aix in 1681; and acquired an extraordinary skill in the civil and canon law, and in the belles lettres. He published the Basilicæ or Constitutions of the Emperors of the East, in Greek and Latin, with learned notes, in seven vols. folio; and editions of Cedrenus, Nicetas, Anastasius, Bibliothecarus, Constantine Manasses, and Cujas, with learned and curious notes.

FA'BULIST. *s.* (*fabuliste*, Fr.) A writer of fables (*Croxal*).

FABULO'SITY. *s.* (*fabulositas*, Latin.) Fulness of feigned stories (*Abbot*).

FA'BULOUS. *a.* (*fabulosus*, Lat.) Feigned; full of fables or invented tales (*Addison*).

FA'BULOUSLY. *ad.* In fiction (*Brown*).

FACE. *s.* (*face*, Fr. from *facies*, Latin.) 1. The visage (*Bacon*). 2. Countenance; cast of the features (*Pope*). 3. The surface of any thing (*Genesis*). 4. The front or fore part of any thing (*Ezekiel*). 5. Visible state of affairs (*Milton*). 6. Appearance; resemblance (*Ben Jonson*). 7. Presence; sight (*Dryden*). 8. Confidence; boldness (*Tillotson*). 9. Distortion of the face (*Shakspeare*).

On some of these acceptations we must enlarge; as below.

FACE. The bones of the face are divided into those of the upper and under jaw. The upper jaw consists of thirteen bones, viz. two superior maxillary, two jugal, two nasal, two lachrymal, two inferior spongy, two palatine, and the vomer. The under jaw is formed of one bone, the inferior maxillary bone. The muscles of the face are those of the eyelids, eyeball, nose, mouth, and lips. See ANATOMY.

The human face is called the image of the soul, as being the seat of the principal organs of sense; and the place where the ideas, emotions, &c. of the soul are chiefly set to view. Pride and disdain are shown in the eye-brows, modesty on the cheeks, majesty in the forehead, &c. It is the face shews the sex, age, temperament, health, or disease, &c. The face, considered as the index of the passions, habits, &c. of the person, makes the subject of physiognomy. See PHYSIOGNOMY.

FACE, among painters and artists, is used to denote a certain dimension of the human body, adopted for determining the proportion which the several parts should bear to one another: thus the different parts of the body are said to consist, in length, of so many faces. See Drawing.

Face, in the military art, a word of command, intimating to turn about: thus, *face to the right*, is to turn upon the left heel a quarter-round to the right; and, *face to the left*, is to turn upon the right heel a quarter-round to the left.

Face, or Façade, in architecture, is used for the front of a building, or the side on which the chief entrance is; also for the side it presents to a street, garden, court, &c. and sometimes for any side opposite to the eye.

Face, Facia, or Fascia, denotes a flat member having a considerable breadth, and but a small projecture, used in architraves and pedestals.

Face, in astrology, the third part of a sign.

Face *to* Face. (An adverbial expression.) 1. When both parties are present (*Acts*). 2. Without the interposition of other bodies; nakedly (*Corinthians*).

To Face. *v. n.* (from the noun.) 1. To carry a false appearance (*Spenser*). 2. To turn the face; to come in front (*Dryden*).

To Face. *v. a.* 1. To meet in front; to oppose with confidence and firmness (*Dryden*). 2. To oppose with impudence (*Hudibras*). 3. To stand opposite to (*Pope*). 4. To cover with an additional superficies (*Addison*).

FA'CELESS. *s.* (from *face.*) Being without a face.

FACEPAI'NTER. *s.* (*face* and *painter.*) A drawer of portraits.

FACEPAI'NTING. *s.* (*face* and *painting.*) The act of drawing portraits (*Dryden*).

FA'CET. *s.* (*facette*, Fr.) A small surface; a superficies cut into several angles (*Bacon*).

FACE'TIOUS. *a.* (*facetieux*, Fr.) Gay; cheerful; lively; witty (*Gov. of the Tongue*).

FACE'TIOUSLY. *ad.* (from *facetious.*) Gayly; cheerfully; wittily; merrily.

FACE'TIOUSNESS. *s.* (from *facetious.*) Cheerful wit; mirth; gayety.

FACIAL NERVE. Nervus facialis. Portio dura of the auditory nerve. These nerves are two in number, and are properly the eighth pair: but are commonly called the seventh, being reckoned with the auditory, which is the portio mollis of the seventh pair. They arise from the fourth ventricle of the brain, pass through the petrous portion of the temporal bone to the face, where they form the pes anserina, which supplies the integuments of the face and forehead.

FACIES, (*facies.*) See Face.

Facies hippocratica. That particular disposition of the features which immediately precedes the stroke of death is so called, because it has been so admirably described by Hippocrates.

FA'CILE. *a.* (*facile*, French.) 1. Easy; not difficult; performable or attainable with little labour (*Milton*). 2. Easily surmountable; easily conquerable. 3. Easy of access or converse; not haughty; not supercilious; not austere (*Ben Jonson*). 4. Pliant; flexible; easily persuaded (*Calamy*).

To FACI'LITATE. *v. a.* (*faciliter*, Fr.) To make easy; to free from difficulty (*Clarendon*).

FACI'LITY. *s.* (*facilité*, French.) 1. Easiness to be performed; freedom from difficulty (*Raleigh*). 2. Readiness in performing; dexterity (*Dryden*). 3. Vitious ductility; easiness to be persuaded; ready compliance (*Bacon*). 4. Easiness of access; affability (*South*).

FACINE'RIOUS. *a.* Wicked; facinorous (*Shakspeare*).

FA'CING. *s.* (from *to face.*) An ornamental covering (*Wotton*).

FACI'NOROUS. *a.* (*facinora*, Latin.) Wicked; atrocious; detestably bad.

FACI'NOROUSNESS. *s.* (from *facinorous.*) Wickedness in a high degree.

FACIO (Bartholomew), a writer of the 15th century, born at Spezzia, in the territory of Genoa, and secretary to Alphonso king of Naples. He died about 1457. His works are, 1. De Bello Venetio Claudiano, seu inter Venetos et Genuenses, circiter anno 1391, 8vo. 1578. 2. De rebus ab Alphonso I. Rege Neapolitano gestis, lib. x. 3. De Humanæ Vitæ Felicitate, ad Alphonsum Neap. Reg. 4. De Viris illustr. sui Temporis.

FACT. *s.* (*factum*, Latin.) 1. A thing done; an effect produced (*South*). 2. Reality; not supposition (*Smalridge*). 3. Action; deed (*Dryden*).

FA'CTION. *s.* (*faction*, French.) 1. A party in a state (*Shakspeare*). 2. Tumult; discord; dissension (*Clarendon*).

Faction, in antiquity, a name given to the different companies of combatants in the circus. They were four, viz. the white, the red, the green, and the blue; to which Domitian added another of purple colour.

FA'CTIONARY. *s.* (*factionaire*, French.) A party man: not in use (*Shakspeare*).

FA'CTIOUS. *s.* (*factieux*, French.) 1. Given to faction; loud and violent in a party; publicly dissentious (*Shakspeare*). 2. Proceeding from public dissensions (*K. Charles*).

FA'CTIOUSLY. *ad.* In a manner criminally dissentious or tumultuous (*K. Charles*).

FA'CTIOUSNESS. *s.* (from *factious.*) Inclination to public dissension.

FACTI'TIOUS. *a.* (*factitius*, Lat.) Made by art, in opposition to what is made by nature (*Boyle*).

Factitious or artificial character. Character factitius. In natural history, a mark or marks distinguishing one genus from another in an artificial arrangement: such as is done by Ray and others in synoptical tables of vegetables.

FACTOR, in commerce, is an agent employed by merchants residing at other places, to buy or sell goods, or negotiate bills, or transact any kind of business on their account; and entitled to a certain allowance for his trouble. A supercargo differs from a factor in this: the business of the former is limited to the care of a particular cargo; he goes along with it, and generally returns when the business is completed: the latter has a fixed residence abroad, and executes business for different merchants. But their duties, and the circumstances for which they are accountable, are the same.

The duty of a factor is to procure the best intelligence of the state of trade at his place of residence; of the course of exchange; of the quantity and quality of goods at market, their present price, and the probability that it may rise or fall; to pay exact obedience to the orders of his employers; to consult their advantage in matters referred to his direction; to execute their business with all the dispatch that circumstances admit; to be early in his intelligence, distinct in his accounts, and punctual in his correspondence. As fidelity and intelligence are required from the factor, so the law requires the like from the principal: if, therefore, a merchant remits counterfeit jewels to his factor, who sells them as true ones, and sustains loss or damage by imprisonment or other punishment, the principal shall not make satisfaction to the factor but to the party who purchased them. Business of this kind is called commission-business; and traders in this way have current as well as commission accounts constantly between them, and draw on, remit to, and send commissions to each other only by the intercourse of letters, which, among men of honour, are as obligatory and authoritative as all the bonds and ties of law.

In case of a factor's insolvency, the owner may reclaim his goods; and if they be sold on trust, the owner, and not the factor's creditors, shall recover payment of the debts.

Factors, in multiplication, a name given to the multiplier and multiplicand; so called because they constitute the product, or factum, as it is sometimes called.

FACTORAGE, called also commission, is the allowance given to factors by the merchant who employs them. A factor's commission in Britain, on most kinds of goods, is 2½ per cent.: on lead, and some other articles, 2 per cent.

FA'CTORY. *s.* (from *factum.*) 1. A house or district inhabited by traders in a distant country. 2. The traders embodied in one place.

FACTO'TUM. *s.* (*fac totum*, Latin.) A servant employed alike in all kinds of business.

FA'CTURE. *s.* (French.) The act or manner of making any thing.

FACULÆ, in astronomy, certain bright and shining parts, which the modern astronomers have, by means of telescopes, observed upon or about the surface of the sun: they are but seldom seen. The word is pure Latin; being a diminutive of *fax*, torch; and supposed to be here applied from their appearing and disappearing by turns. See Sun.

FA'CULTY. *s.* (*faculté*, Fr. *facultas*, Lat.) 1. The power of doing any thing; ability (*Hooker*). 2. Powers of the mind, imagination, reason, memory (*Swift*). 3. Mechanical power (*Wilkins*). 4. (In physic.) A power or ability to perform any action, natural, vital, and animal (*Quincy*). 5. A knack; habitual excellence; dexterity (*Clarendon*). 6. Quality personal; disposition or habit of good or ill (*Shakspeare*). 7. Natural virtue; efficacy (*Milton*). 8. Power; authority (*Shakspeare*). 9. Privilege; right to do any thing (*Hooker*).

Faculty, in law, a privilege granted to a person, by favour and indulgence, of doing what, by law, he ought not to do. For granting these privileges there is a court under the archbishop of Canterbury, called the court of the faculties, the chief officer of which is styled master of the faculties, who has a power of granting dispensations in divers cases: as to marry without the banns being first published; to ordain a deacon under age; for a son to succeed his father in his benefice; a clerk to hold two or more livings, &c.

Faculty, in the schools, a term applied to the different members of an university, divided according to the arts and sciences taught there: thus in most universities there are four faculties, viz. 1. Of arts, which include humanity and philosophy. 2. Of theology. 3. Of physic. And, 4. Of civil law. The degrees in the several faculties in our universities are those of bachelor, master, and doctor.

Faculty of advocates, a term applied to the college or society of advocates in Scotland, who plead in all actions before the court of session. They meet in the beginning of every year, and choose the annual officers of the society, viz. dean, treasurer, clerks, private and public examinators, and a curator of their library. The manner of admission into the faculty of advocates is by a trial of the civil law, and Scotch law: the person desiring to be admitted having, upon petition, obtained a recommendation to the dean of the faculty, he gives a remit to the private examinators, who are nine in number, and who, after their election, having divided the body of the civil law into nine parts, each taking one, appoint a diet for examination: in this diet there must be at least seven present, each of whom examines the candidate; and the question being afterwards put, Qualified, yea or no? they give their opinion by balloting, upon which the candidate is either admitted by signing his petition, or remitted to his studies. After the private trial the dean of the faculty assigns the candidate a title of the civil law, for the subject of a thesis; which being distributed among the advocates, the faculty meet on a day appointed, when three at least of fifteen public examinators dispute against the thesis; and afterwards the faculty give their opinions by balloting, as in the private trial. If the candidate is found qualified, the dean assigns him a law for an harangue before the lords; which harangue being made, he is admitted a member of the faculty, upon paying the fees, taking the oaths to the government, and an oath to be faithful in his office.

FACU'ND. *a.* (*facundus*, Lat.) Eloquent.

To **FA'DDLE.** *v. n.* To trifle; to toy; to play.

To **FADE.** *v. n.* (*fade*, French.) 1. To tend from greater to less vigour; to grow weak; to languish. 2. To tend from a brighter to a weaker colour (*Boyle*). 3. To wither, as a vegetable (*Isaiah*). 4. To die away gradually; to vanish (*Addison*). 5. To be naturally not durable; to be transient (*Locke*).

To FADE. *v. a.* To wear away; to reduce to languor; to deprive of vigour (*Dryden*).

To FADGE. *v. n.* (ᵹeꝼeᵹan, Saxon.) 1. To suit; to fit; to have one part consistent with another (*Shakspeare*). 2. To agree; to live in amity (*Hudibras*). 3. To succeed; to hit (*L'Estrange*).

FÆCES. (from *fæx, fæcis,* Latin. It is doubtful whether this word is derived from *facio,* or from *figo:* it is more generally referred by grammarians to the former, who add that the diphthong *æ* is made use of to distinguish the dative case singular, which would otherwise be *feci,* from *feci* the verb in the preterperfect tense.) Feces. The excrementitious matter of the intestines.

The keen eye and assaying touch of the chemist, which have now ventured into every department and material of nature, have not refrained from an examination of this repressive compound: and we shall give a few of the more general results which have been collected from the research.

The fæces not only vary in their consistence in different animals, but even in the same animal at different times, and this variety is found to pass through all the degrees, from a fluid state nearly to a firm solidity. The colour is equally variable: in man it is more or less yellow; in some quadrupeds, as the horse and cow, it is a dark green; in the pig it is greyish; in the dog it is sometimes white, at other times black; in some kinds it is white like chalk, as in those particularly that live by suction, viz. the woodcock and snipe; in some insects it is red, as the bug and flea, whilst in others it is green.

The odour also is various. It is generally more or less fetid, but in the cat it is extremely so, and more so in carnivorous animals than graminivorous animals; whilst in those of some animals there is scarcely any smell.

Since the fæces are the refuse of the food by which animals are supported, it is natural to suppose that these differences must arise from the nature and properties of the food the animal takes in; and this difference of food will equally have an influence on them when submitted to chemical analysis. With respect to their colour, it generally arises from a portion of bile they contain; and as to their fetid odour, Fourcroy is of opinion it arises from the commencement of putrefaction, which already takes place during their passage through the intestines, although some chemists will not allow of any such putrefaction.

Some of the old alchemists had an idea that the philosopher's stone was concealed in animal fæces, and on this account many experiments have been made, particularly upon the human, and those of quadrupeds; but from the great obscurity that is thrown over their writings nothing satisfactory is to be learned from them The best chemist, according to Macquer, who has investigated the nature of human fæces, is Homberg; and this unpleasant operation he undertook for the satisfaction of a friend, who affirmed, that a white oil, of no unpleasant odour, was to be extracted from them, which possessed the valuable property of fixing quicksilver in such a manner as to be converted into silver. Homberg found the oil, but it had no such effect on quicksilver.

Fresh human fæces, distilled on a water bath, even to dryness, afforded nothing but an aqueous, clear, tasteless fluid, of a disagreeable smell; no volatile alkali, however, appeared, although it had approached to a putrid state, while putrid substances always afford it at the same heat. The dry residue, on increasing the heat by degrees, gave a volatile alkaline spirit and salt, a stinking oil and a carbonaceous portion remained, consequently the same substances as other animal matters.

The same sort of fæces lixiviated with water, filtered and evaporated, afforded an oily nitrated salt, which fused on red hot coals like saltpetre, and heated to a certain point in close vessels, inflamed. Putrid excrements gave an oil without colour or smell. To this it may be added, that the fæcal matter which Homberg analysed was from a person who had been fed on coarse bread, and Champaigne wine. We learn from Haller, that the human fæces contain a small quantity of acid, which is found in great abundance in the ruminating class; and Brugnatelli speaks of an acid existing in the fæces of carnivorous birds; those of the dog, however, contain none of it. Those of ruminating animals, likewise, effervesce with the nitrous acid, which is produced in a much stronger degree with the fæces of the dog, hen, and pigeon. In some countries it is not uncommon to make use of pig's dung instead of soap.

The following is the result of a careful analysis of human fæces according to Berzelius.

Water	73·3
Vegetable and animal remains	7·0
Bile	0·9
Albumen	0·9
Peculiar extractive matter	2·7
Salts	1·2
Slimy matter, consisting of resin of bile, peculiar animal matter, and insoluble residue	14·0
	100·0

The excrementitious matter examined by Thaer and Einhof was that of cattle fed at the stall, chiefly on turnips. It had a yellowish green colour, a smell somewhat similar to that of musk, but little taste. Its specific gravity was 1·045. It did not alter vegetable blues, and of course contained no uncombined acid or alkali.

Sulphuric acid, when mixed with this matter, developes the odour of acetic acid; but Thaer and Einhof have shewn that this acid does not exist in the fæces, but is formed by the action of the sulphuric acid. The pure alkalies, nitric and muriatic acids, produced little change on the fæces of cattle, at least when not assisted by heat.

When 100 parts are dried on a steam bath, they leave 28⅛ of solid matter.

When eight ounces, or 3840 grains, were diffused through water, they let fall a quantity of sand weighing 45 grains.

The watery solution being strained through a linen cloth left 600 grains of a yellowish fibrous matter, which possessed the properties of the fibrous matter of plants.

The liquid, on standing, deposited a slimy substance, which was separated by filtration. It weighed when dry 480 grains. To this matter the fæces owe their peculiar colour and smell. It was insoluble in water and alcohol. When heated it smelled like bile. It burnt like vegetable matter. Alkalies scarcely affected it. Sulphuric acid developed the odour of acetic acid. Oxymuriatic acid rendered it yellow. Thaer and Einhof considered this substance as the remains of the vegetable matter employed as food by the cattle; but it is extremely probable that it might contain also a portion of the resin of bile, as Berzelius detected that substance in a similar matter from the human fæces.

The filtered solution passed through colourless, but on exposure to the air became in a few minutes wine yellow and then brown. When evaporated to dryness it left a brownish matter, of a bitterish taste, and weighing 90 grains. It was soluble in water, insoluble in alcohol, and precipitated from water by that liquid. It was not precipitated by infusion of galls. The solution was found to contain some phosphoric salts. The 90 grains of residue, when heated, burnt like animal matter. They soon ran into putrefaction, exhaling ammonia.

When evaporated to dryness and burnt, this excrementitious matter left behind it an ash, which was found (not reckoning the sand) to consist of the following salts and earths in the proportions stated.

Lime	12
Phosphat of lime	12·5
Magnesia	2
Iron	5
Alumina with some manganese .	14
Silica	52
Muriat and sulphat of pot-ash .	1·2

Thaer and Einhof made numerous experiments on the putrefaction of cow-dung, both in close vessels and in the open air, from which it would appear that the process resembles closely the putrefaction of vegetable matter; the oxygen of the air being abundantly changed into carbonic acid.

To Vauquelin we are indebted for an analysis of the fixed parts of the excrements of fowls, and a comparison of them with the fixed parts of the food; from which some very curious consequences may be deduced.

He found that a hen devoured in ten days 111,11·843 grains troy of oats. These contained

136·509 grains prosphat of lime
219·548 silica

356·057

During these ten days she laid four eggs; the shells of which contained 98·776 grains phosphat of lime, and 453·417 grains carbonat of lime. The excrements emitted during these ten days contained 175·529 grains phosphat of lime, 58·494 grains of carbonat of lime, and 185·266 grains of silica. Consequently the fixed parts thrown out of the system during these ten days amounted to

274·305 grains of phosphat of lime
511·911 carbonat of lime
185·266 silica

Given out 971·482
Taken in 356·057

Surplus 615·425

Consequently the quantity of fixed matter given out of the system in ten days exceeded the quantity taken in by 615·425 grains.

The silica taken in amounted to 219·548 grains
That given out was only 185·266 grains

Remains 34·282

Consequently there disappeared 34·282 grains of silica.

The phosphat of lime taken in was . . . 136·509 grains
That given out was . . 274·305 grains

137·796

Consequently there must have been formed, by digestion in this fowl, no less than 137·796 grains of phosphat of lime, besides 511·911 grains of carbonat. Consequently lime (and perhaps also phosphorus) is not a simple substance, but a compound, and formed of ingredients which exist in oat seed, water, or air, the only substances to which the fowl had access. Silica may enter into its composition, as a part of the silica had disappeared; but if so, it must be combined with a great quantity of some other substance.

These consequences are too important to be admitted without a very rigorous examination. The experiment must be repeated frequently, and we must be absolutely certain that the hen has no access to any calcareous earth, and that she has not diminished in weight; because in that case some of the calcareous earth of which part of her body is composed may have been employed. This rigour is the more necessary, as it seems pretty evident, from experiments made long ago, that some birds at least cannot produce eggs unless they have access to calcareous earth. Dr. Fordyce found that if the canary-bird was not supplied with lime at the time of her laying, she frequently died, from her eggs not coming forward properly. He divided a number of these birds at the time of their laying eggs into two parties: to the one he gave a piece of old mortar, which the little animals swallowed greedily; they laid their eggs as usual, and all of them lived; whereas many of the other party which were supplied with no lime died. Vauquelin also ascertained, according to Fourcroy, that pigeons' dung contains an acid of a peculiar nature, which increases when the matter is diluted with water; but gradually gives place to ammonia, which is at least exhaled in abundance.

The white matter voided by dogs who feed chiefly on bones, was formerly used in medicine under the name of album græcum. It has not been examined by modern chemists; but is supposed to consist in a great measure of the earthy part of the bones used as food.

FÆCULA. (often spelt *fecula*, but without authority from any ancient MSS. though *fetus* from *feo* is perhaps more correct than *fætus*; and *feces* and *fæces* are used indiscriminately, as doubtful whether derived from *facio* or *figo*.) In chemistry, a term generally applied to any fine pulverulent matter extracted from whatever part of a vegetable, simply by breaking down its texture, washing with water, and subsidence for a greater or less time. The fæcula is the substance deposited at the bottom of the water. It is therefore in other words a most minutely divided substance, capable of being for a time suspended but not dissolved in cold water or in the native vegetable juices. Of these the most important is the amylaceous fæcula, or a nutritive insipid substance which is contained most abundantly in all grains, forming the largest and most valuable part of their substance, and when separated, purified, and dried, is the common starch. The preparation of Starch as a manufacture will be described under that article; the chemical properties of pure fæcula belong to the present subject.

Almost every part of vegetables will furnish this fæcula, but it is particularly found in all grains or seeds of whatever kind, is united in them with an extractive and saccharine matter, sometimes with gluten and vegetable albumen, with mucilage or with oil. It is also contained copiously though comparatively in less proportion in most roots, particularly the tuberous and bulbous, in the medullary part of trees and plants, and sometimes nearly equally diffused over the whole plant, as in many of the lichens and plants of a similar genus.

The extraction of the fæcula is a very simple process, but from certain vegetables it can never be obtained free from colour and taste. The root or grain employed must first be thoroughly bruised, rasped, or broken down in any way, and then washed with a quantity of cold water, which becomes immediately turbid, and if the fæcula is white, milky; and simply holds the fæcula suspended in a state of extreme division, but without dissolving any portion of it. This turbid water is then to be immediately separated from the fibrous pulp by a sieve, and allowed to remain at rest for a time, when the fæcula will be found at the bottom, in the form of a very fine close-grained powder, but without any tenacity or cohesion, somewhat of the consistence of very fine wetted sand. It should then be washed repeatedly with abundance of water, till this comes from it quite insipid.

The extraction of fæcula is therefore as simple as possible, consisting in fact only of a single operation, that of washing out with cold water; but it is only from grains and some roots that it can be procured so easily, for this simple method will not succeed in the nut or kernel seeds in which the mixture of oil, fæcula, and mucilage is so intimate, that both dissolve together into a milky emulsion when agitated with water; nor will mere washing easily separate the fæcula from many of the juices, fruits, and soft parts in which it is intimately combined with mucilage, extract, and saline substances.

In all processes for the separation of fæcula from other vegetable matters, it should be constantly kept in mind that only cold water is to be employed, for when hot it dissolves readily.

Pure fæcula (taking starch for an example) is a white powder nearly if not absolutely insipid, somewhat adhering to the tongue, but readily softening down in the mouth into an incohering pulp. When examined with care in a strong light, and especially with the help of a lens, it is seen to be composed of small semi-transparent globules, with a satiny gloss and somewhat of a crystalline arrangement. When in mass and squeezed between the fingers, it breaks with a slight snap and a peculiar short feel not easily described. It is not easily moistened with cold water, on the surface of which it swims till thoroughly wetted.

Pure starch, when heated strongly in the open air, passes from yellow to red and brown, softens, puffs up, exhales a white, pungent, acid-smelling smoke, exactly resembling that of mucilage or sugar, and leaves a spongy and rather bulky coal. The products of its distillation are, a water loaded with pyromucous acid, some drops of red or brown oil, much carbonic acid and hydrocarbonous gasses. The coal when fully calcined leaves slight traces of potash and phosphat of lime.

Starch does not easily alter in the air, but by very long keeping it runs into clots, and gets a sour and rancid smell.

Fæcula rubbed with a little cold water only makes an incoherent mass, which on drying cracks into small pieces. With more water and a moderate warmth the mixture ferments faintly, and turns sour, probably by producing the acetous acid.

Boiling water, however, acts in a very different manner on fæcula, for it speedily and totally dissolves into a thick, tenacious, transparent jelly, as is daily seen in the domestic uses of starch. This jelly becomes thicker and more tenacious by long boiling, and it will unite with boiling water in any proportion. By slow evaporation the jelly shrinks in every direction, and at last dries into a nearly transparent brittle substance, so closely resembling the evaporated solution of mucilage, that scarcely any difference can be found between the two.

The jelly when much diluted and dried on very extended surfaces gives only a kind of varnish and stiffness, for which it is of great use in the starching of linen.

Most of the acids dissolve fæcula readily, especially when hot, and with nearly the same appearances that attend their action on mucilage and sugar. The nitric acid, however, does not produce with fæcula the mucous acid, as it does with gum mucilage.

The alkalies dissolve fæcula with ease, but without appearing to produce any material change in its composition.

On the whole, the resemblance between the amylaceous fæcula and mucilage is so strong, that they may almost be considered as identical when each is brought to a state of solution in water.

Of the green Fæcula of Plants.

A vast number of the green succulent plants when exposed to slight pressure give a very turbid green juice, from which a fecula subsides though extremely slow, but it may be separated more readily by the filter. In this case the filtered liquor is tenacious, but clear and colourless, and a green pulp is left on the filter. Rouelle appears to have been the first who clearly showed the nature of this fæcula, and proved it to be not in the least similar to the amylaceous fæcula, but to be composed of a substance resembling the gluten of wheat, intimately combined with a kind of resin soluble in alcohol, to which the green colour seems to be owing. The clear liquor from which this fæcula has subsided also holds in solution another portion of gluten, or a similar matter.

Fourcroy considers this fæcula rather as albuminous, and the substance contained in the clear liquor to be still more decidedly so; but Proust has pointed out some differences, and the other observations of this excellent chemist on this subject are also important.

When any of the green turbid juice of plants, such as of cabbage, hemlock, cress, and the like, is exposed to heat, it coagulates or becomes ropy, and soon a considerable quantity of a green, tough, glutinous mass separates in flocculi from the liquor which is then left colourless. The clear filtered recent juice of plants also affords flocculi of gluten, which readily separate at a heat as low as 145°; at this temperature the albumen of an egg mixed with water will not coagulate. When the coagulated mass dries, it hardens into an elastic horny substance which will not again unite with water. If this fæcula, either before or after coagulation by heat, be kept under water, in warm weather it becomes offensive in a day's time, and by keeping it grows excessively putrid, with the fetor attending animal matter in a high state of decomposition. It appears to be to this that the excessive putrescency of hemp is owing whilst it is rotting in ditches to prepare it for spinning. The water in which this fæcula has been long kept contains sulphuretted hydrogen, carbonat of ammonia, and some gluten dissolved in the ammonia.

The green fæcula when put into potash partly dissolves therein, the insoluble portion falling to the bottom as a green sediment. The solution has all the characters of animal matters, exhaling ammonia, and blackening silver and many other metallic solutions.

When the entire green fæculous precipitate, formed by heating the recent juice, is treated by alcohol, a portion only dissolves therein, leaving the true gluten untouched, and which amounts to about 80 per cent. of the entire precipitate. The alcoholic solution evaporated to dryness leaves (as Rouelle first observed) a soft green substance resembling a resin. Alcohol also added to the juices gives a precipitate of gluten, and unites with the resin. It has been doubted, however, by Parmentier whether this green resin is properly so called, since it does not deposit any thing on mixture with water, as the tinctures of the true resins do. The oxymuriatic acid in a few days takes away all colour from this green resin, makes it ropy like turpentine, and its solution in alcohol will then grow turbid with water. The entire green fæcula is reduced by oxymuriatic acid to the colour of dead leaves. The above resin gives a clear solution with potash, and this colour will attach itself to silk, but it is not permanent. On the whole, therefore, there is much reason to believe that the green fæcula of plants consists of gluten intimately combined with a substance very nearly resembling a resin, and that it is to the former principle that the tendency to animal putrefaction and the ammoniacal products are owing, and in the latter the green colour seems entirely to reside.

FAENZA (the ancient *Faventia*), a town of Romagna, in Italy, with a bishop's see. It is famous for fine earthenware. Lat. 44. 21 N. Lon. 11. 40 E.

FAERNUS (Gabriel), a Latin poet and writer of the 16th century. He wrote some Latin elegies, and fables in the same language in iambic verse. Bentley has given his notes upon Terence entire, in his edition of that author. He died at Rome in 1561.

FÆX. (*fæx, fæcis, fæces.*) The alvine excretions. See Fæces.

To FAG. *v. a.* (*fatigo*, Latin.) To grow weary; to faint with weariness (*Mackenzie*).

FAGARA. Iron-wood. In botany, a genus of the class tetrandria, order monogynia. Calyx four-cleft; corol four-petalled; capsule two-valved, one-seeded. Twelve species; chiefly natives of the East Indies and South America, shrubby or arboreous. The chief is f. octandra with pinnate leaves, downy each side; the leaflets ovate, toothed; common petiole wing-jointed, flowers eight—male. A tall tree, abounding in a balsamic glutinous juice, racemed flowers, with white calyxes and yellow corols. Its balsam resembles the gum tacamahac, but is not the same; this last being the production of the calophyllum.

FAGE (Raymond de la), an ingenious French artist, who acquired, by his own application, a great skill in drawing with the pen or Indian ink. He generally used to draw in a public house, and paid his reckonings with a sketch. He died in 1690, aged 42.

FAGIUS (Paul), *alias* Buchlin, a learned Protestant minister, born at Rheinzabern in Germany, in 1504. He was a schoolmaster at Isna; but afterwards became a zealous preacher, and wrote many books. The persecution in Germany menacing danger to all who did not profess the Romish doctrines, he and Bucer came over to England in 1549, at the invitation of archbishop Cranmer, to perfect a new translation of the Scriptures. Fagius took the Old Testament, and Bucer the New, for their respective parts; but the design was at that time frustrated by the sudden death of both. Fagius died in 1550, and Bucer did not live above a year after. Their bodies were dug up and burned in the reign of queen Mary.

FAGNANO (Count Julius-Charles de), marquis of Toschi and St. Honorio, was one of the most distinguished Italian mathematicians. We have not been able to collect any authentic particulars relative to his life and person. It is conjectured that he was born about 1690. He attained considerable eminence among the Italian geometers about 1719: for at that period he gave in the Italian journals some very interesting memoirs on geometrical problems and the transcendental analysis. Several curious papers of his, on elliptic arcs, &c. are given in the Leipsic Acts. His works were collected and published by himself under the title Produzzioni mathematiche, del Conte Giulis-Carlo di Fagnano, &c. Pesaro, 1750, 2 vols. 4to. The various objects of these cannot here be detailed. In the first volume there is a general theory of geometrical proportions: in the second a treatise on the properties of plane triangles, containing much very curious matter: among the other pieces in the second volume, are many which relate to the properties and uses of the curve called the lemniscate; a figure of which is engraven on the frontispiece of the book. Here also we find Fagnano's curious theorem from whence may be deduced a new measure of the arcs of the ellipse, hyperbola, and conoid, first published in the Diarium Eruditorium Italiæ, tom. 26. an. 1716; a theorem which furnished part of the topics of dispute between the late Mr. John Landen, and Dr. Henry Clarke. (See Clarke's Supplement to Lorgna on Series, p. 54, &c.) We have not learned the exact period of count Fagnano's death.

Fagnano (John Francis de Tuschis de), archdeacon of Sinigaglia, the son of the above, was an able mathematician who trod in the steps of his father. He has several interesting memoirs in the Leipsic Acts, for 1754, 1762, 1774, 1775, and 1776. Our attempts to obtain any biographical information have here also been equally unsuccessful.

FAGON (Guy Crescent), chief physician to Lous XIV. born at Paris in 1632. He was an early champion for the doctrine of the circulation of the blood, and was a laborious collector of plants to enrich the royal garden, of which he was appointed superintendant. By his recommendation Tournefort was sent to the East for plants. Fagon died in 1718.

FAGONIA, in botany, a genus of the class decandria, order monogynia. Calyx five-leaved; petals five; capsule five-celled, ten-valved; the cells one-seeded. Four species: three natives of the East; and one of Spain: all herbaceous plants.

FAGOPYRUM, or Buck-wheat. See Polygonum.

FA'GOT. *s.* (*fagod*, Welsh; *fagot*, Fr.) 1. A bundle of sticks bound together for the fire (*Fairfax*). 2. A bundle of sticks for any purpose (*Addison*). 3. A soldier numbered in the muster roll, but not really existing.

To Fa'got. *v. a.* (from the noun.) To tie up; to bundle together (*Dryden*).

FAGOTTO. See Bassoon.

FAGRÆA, in botany, a genus of the class pentandria, order monogynia. Corol funnel-form, with a very long tube; stigma peltate; berry two-celled, fleshy; seeds globular. One species only; a shrub of Ceylon; with thick square branches, and large terminal flowers.

FAGUS, in botany, a genus of the class monoecia, order hexandria. Male; calyx campanulate, five-cleft; corolless; stamens from five to twelve. Fem.; calyx four-cleft; corolless; styles two- or three-cleft; seeds two or three, covered with a coriaceous, prickly calyx. Five species.

1. F. castanea. Chesnut-tree. Leaves lanceolate, with pointed serratures, naked underneath; prickles of the fruit compound and entangled together. Indigenous to our own woods.

2. F. pumila. Dwarf chesnut, or chinguapine. Leaves lance-ovate, acutely serrate, downy underneath; aments filiform, knotty. A native of North America.

3. F. sylvatica. Beech-tree. Leaves ovate, obscurely serrate; spines of the fruit simple. Common to our own woods.

4. F. ferruginea. Leaves ovate-oblong, remotely and acutely serrate, pointed, downy underneath. North America.

5. F. cochinchinensis. Leaves ovate, crowded; fruit three-celled, three-valved. A native of Cochinchina.

The beech-tree is a native of Europe, and may be propagated by seeds, or from suckers, but the first way is the most eligible. The season for sowing the seeds is any time from October to February. When the plants come up, they must be constantly kept clean from weeds, and if thick together, the strongest of them must be drawn out in the autumn following, that those left may have room to grow; by which means a seed bed may afford a three year's draught of young plants, which should be planted in a nursery, and at three feet distance, if designed for timber-trees, row from row, and eighteen inches in the rows. But, if designed for hedges, to which the tree is well adapted, the distance need not be so great; two feet, row from row, and one foot in the rows, will be sufficient. In this nursery they may remain two or three years, observing to clear them from weeds; as also to dig up the ground between the roots at least once a year, taking care not to bruise the roots, nor to dig the ground in summer, when the earth is hot, and dry. When this tree is propagated from suckers, it should be planted at once where it is designed to stand. It will grow to a considerable height, and thrives least in a chalky or stony ground.

The common chesnut-tree is more frequently a native of Italy, and the southern parts of Europe; and is propagated by planting the nuts in February in beds of fresh undunged earth. The best nuts for sowing are those brought from Portugal and Spain. This tree, however, ripens its fruit very well in our own country, which is as good for sowing, when the trees are designed either for timber or beauty, as the foreign nuts. They may be raised either in nurseries, or in the places where they are to stand. If in a nursery, the spot should be chosen upon poor ground, and trenches should be opened about the middle of February, four inches deep, and six inches asunder. In these the chesnuts should be planted regularly, one every four inches, with the eye uppermost; and the earth be drawn over them. Half a dozen of these trenches should be made, and then a space left by way of an alley, to get between in order to clean them; then another bed of six rows, thus proceeding till a sufficient quantity be planted. Traps must be laid about the ground for vermin. The plants will appear in two months, and should then be kept clear from weeds, and suffered to stand two years: at the end of this time they should be taken up, and planted at two feet distance, in rows, a yard asunder; the long tap-root is to be cut off, and care taken not to injure the others. The best time for removing them is early in March; when the side shoots must be carefully trimmed off, that they may grow upright and straight. When they have stood four years in this place, they may be removed to the spots where they are designed to be stationary.

The chesnut grows to an enormous size, and is remarkable for its longevity. The largest in the known world grow on the sides of mount Etna: but in our own country at Tortworth, in Gloucestershire, is a tree that measures fifty-two feet in its circumference, is proved to have stood where it now is ever since the year 1150, fixes the boundary of the manor, and is probably near a thousand years old. As an ornament, the chesnut has great beauty, though it yields in elegance to the beech, and in dignity to the oak. As a timber, it is often employed as a substitute for oak; and where no great dependence is to be placed on its strength it answers extremely well. It is chiefly valuable, however, as staves for liquor casks, and as underwood for hop-poles. Its fruit is relished by many animals, and may be employed as a substitute for flour.

The beech is a tree of pre-eminent value, whether regarded as an ornament in our forests and pleasure-grounds, or as a useful timber after it is felled. It makes the stateliest and most magnificent single tree produced in this country; exhibiting a rotundity and elegance which almost may vie with the rude majesty of the oak: its branches are regular; its foliage soft; and its bark smooth and silvery. The chief objection to its use in architecture is that it is peculiarly subject to the worm: but the cabinet-maker and turner employ it more than any other timber; and it is to them what the oak is to the ship-builder, or the ash to the wheel-wright. Its natural soil and situation is a dry, limy height, in which it will grow to a prodigious size and extent of ramification. The seeds yield a good lamp oil, and are eagerly eaten by squirrels, mice, and swine; the oil they contain is expressed in Silesia, and used by the poor people instead of butter.

FAHLUN, a town of Sweden, capital of Dalecarlia, situate in the midst of rocks and hills, between the lakes of Run and Warpen. It contains two churches, and (including the miners) 7000 inhabitants. The copper mine, which gives existence and celebrity to the town, is on its east side. Lat. 60. 34 N. Lon. 16. 42 E.

FAHRENHEIT (Gabriel Daniel), an ingenious experimental philosopher, born at Dantzic in 1686. About 1726 he improved the thermometer, by making use of mercury instead of spirits of wine, and forming a new scale for the instrument, grounded upon the most accurate experiments. The English have generally adopted this scale, while the French prefer Reaumur's, or recently, the centigrade thermometer. Fahrenheit wrote a dissertation on thermometers, and died in 1736.

To FAIL. *v. n.* (*failler*, French.) 1. To be deficient; to cease from former plenty; to fall short (*Locke*). 2. To be extinct; to cease; to be no longer produced (*Psalms*). 3. To cease; to perish; to be lost (*Addison*). 4. To die; to lose life (*Shakspeare*). 5. To sink; to be borne down (*Isaiah*). 6. To decay; to decline; to languish (*Milton*). 7. To miss; not to produce its effect (*Bacon*). 8. To miss; not to succeed in a design (*Shakspeare*). 9. To be deficient in duty (*Wake*).

To Fail. *v. a.* 1. To desert; not to continue to assist or supply; to disappoint (*Locke*). 2. Not to assist; to neglect (*Davies*). 3. To omit; not to perform (*Dryden*). 4. To be wanting to (*Kings*).

Fail. *s.* (from the verb.) 1. Miscarriage; miss; unsuccessfulness. 2. Omission; nonperformance (*Shaksp.*). 3. Deficience; want. 4. Death; extinction (*Shakspeare*).

FAI′LING. *s.* (from *fail.*) Deficiency; imperfection; lapse (*Rogers*).

FAI′LURE. *s.* (from *fail.*) 1. Deficience; cessation (*Woodward*). 2. Omission; nonperformance; slip (*South*). 3. A lapse; a slight fault.

FAIN. *a.* (ꝼeaᵹn, Saxon.) 1. Glad; merry; cheerful; fond (*Spenser*). 2. Forced; obliged; compelled (*Hooker*).

Fain. *ad.* Gladly; very desirously (*Swift*).

To Fain. *v. n.* To wish; to desire fondly (*Spenser*).

To FAINT. *v. n.* (*faner*, French). 1. To decay; to wear or waste away quickly. 2. To lose the animal functions; to sink motionless and senseless (*Guardian*). 3. To grow feeble (*Bacon*). 4. To sink into dejection (*Milton*).

To **Faint.** *v. a.* To deject; to depress; to enfeeble (*Shakspeare*).

Faint. *a.* (*fane*, French.) 1. Languid; weak; feeble (*Temple*). 2. Not bright; not vivid; not striking (*Newton*). 3. Not loud; not piercing (*Boyle*). 4. Feeble of body (*Rambler*). 5. Cowardly; timorous (*Camden*). 6. Dejected; depressed (*Hebrews*). 7. Not vigorous; not active (*Davies*).

Faint-action, in law, a feigned action, or such as, although the words of the writ are true, yet, for certain causes, the plaintiff has no title to recover by.

Faint-pleader, in law, a covinous, false, or collusory manner of pleading, to the deceit of a third person.

FAINTHEA'RTED. *a.* (*faint* and *heart.*) Cowardly; timorous (*Isaiah*).

FAINTHEA'RTEDLY. *ad.* Timorously.

FAINTHEA'RTEDNESS. *s.* Cowardice; timorousness; want of courage.

FA'INTING. *s.* (from *faint.*) Deliquium; temporary loss of animal motion. See Syncope.

FA'INTISHNESS. *s.* (from *faint.*) Weakness in a slight degree; incipient debility (*Arbuthnot*).

FA'INTLING. *s.* (from *faint.*) Timorous; feebleminded (*Arbuthnot*).

FA'INTLY. *ad.* (from *faint.*) 1. Feebly; languidly (*Walsh*). 2. Not in bright colours (*Pope*). 3. Without force of representation (*Shakspeare*). 4. Without strength of body (*Dryden*). 5. Not vigorously; not actively (*Shakspeare*). 6. Timorously; with dejection (*Denham*).

FA'INTNESS. *s.* (from *faint.*) 1. Languor; feebleness; want of strength. 2. Inactivity; want of vigour (*Spenser*). 3. Timorousness; dejection (*Shakspeare*).

FA'INTY. *a.* (from *faint.*) Weak; feeble; languid; debilitated (*Dryden*).

FAIR. *a.* (fæᵹeꞃ, Saxon.) 1. Beautiful; elegant of feature; handsome (*Shakspeare*). 2. Not black; not brown; white in the complexion (*Hale*). 3. Pleasing to the eye (*Shakspeare*). 4. Clear; pure (*Boyle*). 5. Not cloudy; not foul; not tempestuous (*Shaksp.*). 6. Favourable; prosperous (*Prior*): 7. Likely to succeed (*Shakspeare*). 8. Equal; just (*Clarendon*). 9. Not effected by any insidious or unlawful methods; not foul (*Temple*). 10. Not practising any fraudulent or insidious arts (*Pope*). 11. Open; direct (*Dryden*). 12. Gentle; mild; not compulsory (*Spenser*). 13. Mild; not severe (*Milton*). 14. Pleasing; civil (*Shakspeare*). 15. Equitable; not injurious (*Milton*). 16. Commodious; easy (*Shak.*). 17. Liberal; not narrow (*Carew*).

Fair. *ad.* (from the adjective.) 1. Gently; decently; without violence (*Locke*). 2. Civilly; complaisantly (*Dryden*). 3. Happily; successfully (*Shakspeare*). 4. On good terms (*Collier*).

Fair. *s.* 1. A beauty; elliptically a fair woman (*Dryden*). 2. Honesty; just dealing (*Arbuthnot*).

Fair, a greater kind of market, granted to a town, by privilege, for the more speedy and commodious providing of such things as the place stands in need of. The word *fair* is formed from the French *foire*, which signifies the same thing; and *foire* is by some derived from the Latin *forum*, market; by others from the Latin *feriæ*, because anciently fairs were always held in those places where the wakes, or feasts of the dedications of churches, called *feriæ*, were held. It is incident to a fair, that persons should be free from being arrested in it for any other debt or contract than what was contracted in the same; or, at least, promised to be paid there. These fairs are generally kept once or twice a year; and, by statute, they shall not be held longer than they ought, by the lords thereof, on pain of their being seized into the king's hands, &c. Also, proclamation is to be made, how long they are to continue; and no person shall sell any goods after the time of the fair is ended, on forfeit of double the value, one-fourth to the prosecutor and the rest to the king. There is a toll usually paid in fairs on the sale of goods, and for stallage, picage, &c.

Fairs abroad are either free, or charged with toll and impost. The privileges of free fairs consist chiefly, first, in that all traders, &c. whether natives or foreigners, are allowed to enter the kingdom, and are under the royal protection, exempt from duties, impositions, tolls, &c. Secondly, that merchants, in going or returning, cannot be molested or arrested, or their goods stopped. They are established by letters patent from the prince. Fairs, particularly free fairs, make a very considerable article in the commerce of Europe, especially that of the Mediterranean, and inland parts of Germany, &c.

The principal British fairs, are, 1. Sturbridge fair, near Cambridge, formerly the largest in Britain; but lately it has somewhat declined. 2. Bristol has two fairs, very near as great as that of Sturbridge. 3. Exeter. 4. West Chester. 5. Edinburgh. 6. Wheyhill; and, 7. Burford fair; both for sheep. 8. Pancras fair, in Staffordshire, for saddle-horses. 9. Bartholomew-fair, at London, for lean and Welsh black cattle. 10. St. Faith's, in Norfolk, for Scotch runts. 11. Yarmouth and Lowestofft fishing-fairs for herrings, the only fishing-fairs in Great Britain. 12. Ipswich butter-fair. 13. Woodborough-hill, in Dorsetshire, for West country manufactures, as kerseys, druggets, &c. 14. Two cheese-fairs at Chipping Norton: with innumerable other fairs, besides weekly markets, for all sorts of goods, as well our own as of foreign growth.

The principal fairs abroad are at Frankfort, Leipsic, Novi, Riga, Archangel, St. Germain, Lyons, Beaucaire, &c.

Fair-maid-of-Kent, in botany. See Ranunculus.

FAIRBURN WATER. A sulphureous water in the county of Ross, in North Britain.

FAIRFAX (Edward), an English poet. He was the son of sir Thomas Fairfax, of Denton, in Yorkshire, and discovered, when young, a lively taste for poetry: he translated Tasso's poem of Godfrey of Bullogn into English verse, which was greatly admired by king James and Charles I. He died about 1632, at his seat in Yorkshire.

FAIRFORD, a town of Gloucestershire, with a market on Thursday. The church was built for the sake of the glass, taken in a ship going to Rome. It has 28 large windows, curiously painted with scripture histories, in extremely beautiful colours, and designed by the famous Albert Durer. Lat. 51. 40 N. Lon. 1. 44 W.

FAIRING. *s.* A present given at, or brought from, a fair.

FAIR ISLE, an island of the Northern ocean, between Shetland and Orkney, from both which its high towering rocks are visible.

FA'IRLY. *ad.* (from *fair.*) 1. Beautifully. 2. Commodiously; conveniently (*Dryden*). 3. Honestly; justly; without shift (*Bacon*). 4. Ingenuously; plainly; openly (*Pope*). 5. Candidly; without sinistrous interpretations (*Dryden*). 6. Without violence to right reason (*Dryden*). 7. Without blots (*Shakspeare*). 8. Completely; without any deficience (*Spen.*).

FA'IRNESS. *s.* (from *fair.*) 1. Beauty; elegance of form (*Sidney*). 2. Honesty; candour; ingenuity (*Atterbury*).

FA'IRSPOKEN. *a.* (from *fair* and *speak.*) Bland and civil in language and address (*Hooker*).

FAIRY. (Neither Johnson nor any of his predecessors have been able to trace the origin of this term: like the term *genii,* which has also been supposed to be derived from the Latin, it is pure genuine Saracenic; and exists literally both in the Arabic and Persian, nearly in the same sense in which we use it.) In oriental traditions and romances, a sort of deity, or imaginary genius, conversant on the earth, and distinguished by a variety of fantastical actions either good or bad. Among ourselves they are most usually represented as females of an order superior to human nature, yet subject to wants, passions, accidents, and even death; sprightly and benevolent while young and handsome; morose, peevish, and malignant, if ugly, or in the decline of their beauty; fond of appearing in white, whence, by credulous people, they were often called the white ladies.

Fairy circle, or ring, a phænomenon pretty frequent in the fields, &c. supposed by the vulgar to be traced by the fairies in their dances. Their are two kinds of it; one of about seven yards in diameter, containing a round bare path, a foot broad, with green grass in the middle of it. The other is of different extent, encompassed with a circumference of grass. Messrs. Jessop and Walker, in the Philosophical Transactions, ascribe them to lightning; and Mr. Nicholson, in his Journal (vol. i. p. 546.) has related some circumstances observed by himself after a thunder-storm, which show that in some instances these fairy rings are really produced by explosions of lightning. Still, however, it is admitted as incontrovertible, that in many cases the rings are caused by the running of a fungus.

Mr. Gough, Mr. Florian-Jolly, and Dr. Wollaston, have recently written upon this subject. But it is, nevertheless, still shrouded in some obscurity.

Fairy. *a.* 1. Given by fairies. 2. Belonging to fairies (*Shakspeare*).

FA'IRYSTONE. *s.* A stone found in gravel-pits.

FAISANS, an island in the river Bidassoa, which separates France from Spain. It is also called the island of Conference, because Lewis XIV. and Philip IV. here swore to observe the peace of the Pyrenées, in 1660, after 24 conferences between their ministers. Here also the hostages of France and Spain are received and delivered, it being considered as a neutral place. It is situate between Andaye and Fontarabia. Lat. 43. 20 N. Lon. 1. 46 W.

FAISTENBERGER (Anthony), a painter of Inspruck, born in 1678, and died in 1722. His landscapes are pleasing, and the buildings are designed in the Roman taste. The scenes are generally solemn, though enlivened by cascades, rivers, and rocks; the trees are natural, their foliage touched with spirit, and the colouring is real nature. He had a younger brother called Joseph, whose manner so resembles that of Anthony as hardly to be distinguished from it.

FAITH. *s.* (*foi,* French.) 1. Belief of the revealed truths of religion (*Hooker. Hammond*). 2. The system of revealed truths held by the christian church (*Acts*). 3. Trust in God (*Swift*). 4. Tenet held (*Shakspeare*). 5. Trust in the honesty or veracity of another. 6. Fidelity; unshaken adherence (*Milton*). 7. Honour; social confidence (*Dryden*). 8. Sincerity; honesty; veracity (*Shakspeare*). 9. Promise given (*Shakspeare*).

Faith, Fides, in antiquity, as denoting honesty or fidelity was deified by the Romans, and represented with an erect open air, and dressed in a thin robe, so fine that one might see through it. This deity is also represented as very old and grey-headed; and she appears on medals as giving her hand, and sometimes only by two hands joined together.

Faith, in philosophy and theology, that assent which we give to a proposition advanced by another, the truth of which we do not immediately perceive from our own reason or experience; or it is a judgment or assent of the mind, the motive whereof is not any intrinsic evidence, but the authority, or testimony, of some other who reveals or relates it.

Hence, as there are two kinds of authorities and testimonies, the one of God, and the other of man, faith becomes distinguished into divine and human.

Faith (Divine), is that founded on the authority of God; or it is that assent we give to what is revealed by God.

The objects of this faith, therefore, are matters of revelation.

FAITH (Human), is that whereby we believe what is told us by men.

The object hereof is matter of human testimony and evidence.

FAITH, in practical theology, makes the first of the theological virtues or graces.

Faith in God, in this sense, denotes such a conviction of his being, perfections, character, and government, as produces love, trust, worship, obedience, and resignation. Faith in Christ, as it has been loosely defined by some, is a mere assent to the gospel as true; but according to others, it signifies such a persuasion that he is the Messiah, and such a desire and expectation of the blessings which he has promised in his gospel to his sincere disciples, as engage the mind to fix its dependence upon him, and subject itself to him in all the ways of holy obedience; and thus defined it is a very extensive principle, and includes in its nature and inseparable effects the whole of moral virtue. In this sense it has been said, that under the gospel a man is justified by faith. Faith, likewise, in respect to futurity, is a moral principle, implying such a conviction of the reality and importance of a future state as is sufficient to regulate the temper and conduct.

FA'ITHBREACH. *s.* (*faith* and *breach.*) Breach of fidelity; disloyalty; perfidy (*Shakspeare*).

FAI'THED. *a.* (from *faith.*) Honest; sincere: not in use (*Shakspeare*).

FAI'THFUL. *a.* (*faith* and *full.*) 1. Firm in adherence to the truth of religion (*Ephesians*). 2. Of true fidelity; loyal; true to the allegiance or duty professed (*Milton*). 3. Honest; upright; without fraud (*Numbers*). 4. Observant of compact or promise (*Dryden*).

FAI'THFULLY. *ad.* 1. With firm belief in religion. 2. With full confidence in God. 3. With strict adherence to duty (*Shakspeare*). 4. Without failure of performance (*Dryden*). 5. Sincerely; with strong promises (*Bacon*). 6. Honestly; without fraud (*South*). 7. Confidently; steadily (*Shakspeare*).

FAI'THFULNESS. *s.* (from *faithful.*) 1. Honesty; veracity (*Psalms*). 2. Adherence to duty; loyalty (*Dryden*).

FAI'THLESNESS. *s.* (from *faithless.*) 1. Treachery; perfidy. 2. Unbelief as to revealed religion.

FAI'THLESS. *a.* (from *faith.*) 1. Without belief in the revealed truths of religion; unconverted (*Hooker*). 2. Perfidious; disloyal; not true to duty (*Shakspeare*).

FAITHORNE (William), an English painter and engraver. He was a soldier in the royal army during the civil wars, and was taken prisoner by Cromwell. On obtaining his liberty he went to France, where he studied under Champaigne. After his return to England he practised both painting in miniature and engraving, but chiefly the latter. He also published a book in drawing, graving, and etching. He died in 1691, aged about 75. His son, William Faithorne, was a good engraver in mezzotinto.

FA'ITOUR. *s.* (*faitard*, Fr.) A scoundrel; a rascal; a mean fellow: obsolete (*Spen.*).

FAKE. *s.* A coil of rope (*Harris*).

FAKENHAM, a town in Norfolk, with a market on Thursdays. Lat. 52. 53 N. Lon. 0. 58 E.

FAKIRS, Indian monks or friars. They outdo the severity and mortification of the ancient anchorets or solitaries. Some of them make a vow of continuing all their lifetime in one posture, and keep it effectually. Others never lie down; but continue in a standing posture, all their lives, supported only by a stick, or rope under their arm-pits. Some mangle their bodies with scourges and knives. They look upon themselves to have conquered every passion, and triumphed over the world; and accordingly scruple not, as if in a state of innocence, to appear entirely naked in public. The common people of East India are thoroughly persuaded of the virtue and innocence of the fakirs; notwithstanding which they are accused of committing the most enormous crimes in private.

It is more than probable, these Indian friars have some secret art to lull their senses asleep, in order to render themselves in a great measure insensible of the excessive torments they voluntarily undergo. Ovington assures us that, "as he was one day in an assembly of fakirs, he observed that they drank opiates infused in water; the intoxicating virtue whereof was enough to turn their brain."

The garment of the chief fakirs consists of three or four yards of orange-coloured linen, which they tie round them, and a tiger's skin, which hangs over their shoulders. The hair is woven in tresses, and forms a kind of turban. The superior of the fakirs is distinguished from the rest by having a greater number of pieces in his garment, and by a chain of iron, two yards long, tied to his leg. When he designs to rest in any place, a garment is spread upon the ground, on which he sits and gives audience, whilst his disciples publish his virtues. Some persons of quality in India have become fakirs: among others, five great lords belonging to the court of Cha-gehan, mogul of the Indies. It is said, there are about two millions of fakirs in the East Indies.

FALAISE, a town of France, in the department of Calvados, with a castle, and one of the finest towers in France. It is remarkable for being the birth-place of William the Conqueror. It has a good trade in serges, linen, and lace. Lat. 48. 53 N. Lon. 0. 2 W.

FALCA'DE. *s.* (from *falx, falcis,* Latin.) A horse is said to make *falcades*, when he throws himself upon his haunches two or three times as in very quick curvets (*Farrier's Dict.*).

FA'LCATED. *a.* (*falcatus*, Lat.) Hooked; bent like a reaping hook (*Harris*).

FALCA'TION. *s.* Crookedness; form like that of a reaper's hook (*Brown*).

FALCIFORM PROCESS. (*falciformis*; from *falx*, a scythe, and *forma*, resemblance.) The falx. A process of the dura mater, that arises from the grista galli, separates the hemi-

spheres of the brain, and terminates in the tentorium.

FA'LCHION. s. (*faulchion, fauchon,* Fr.) A short, crooked, sword, or scymetar.

FALCO, in zoology, a genus of the class aves, order accipitres. Bill hooked, the base covered with a cere; head covered with close set feathers; tongue bifid.

These, for the most part, are a rapacious tribe, and feed on putrid carcases; yet seldom, and never but when pressed by extreme hunger, attack living animals; they are bold, and fly with great speed when high in the air, but slowly in its lower regions; have an exquisite sense of smell, and are very quick-sighted: not gregarious; generally build in clefts of impending rocks their nests, which are called eyries, a term, however, which merely implies a place of eggs; but a few of them make their nests on the ground: the bill more hooked than in the vulture tribe; nostrils small, oval, placed in the cere; legs and feet scaly; middle and outer toes connected. A hundred and thirty-six species, including the tribes of eagle, falcon, and osprey; some birds improperly termed vultures, kite, hawk, buzzard, ring-tail, merlin, and hobby, scattered over the four continents of the globe; of which twenty-four are found in the interior or on the coasts of our own country. See Nat. Hist. pl. xcv. xcviii. c. cvi. and cxvi.

1. F. ossifragus. Osprey. Cere and legs yellow, the latter somewhat downy; body ferruginous; tail-feathers white on the inner side. Inhabits Europe and North America; size of a turkey; lives chiefly on fishes, upon which it darts down with surprising speed and dexterity when they are near the surface; but is incapable of diving after them. Its muscular strength in the act of flying is very great: the fish it generally darts upon is salmon; yet it has occasionally brought up a seal in its talons: and a curious print is exhibited by Barlow (which he took from having been an eye-witness of the fact itself) of an osprey soaring with a cat in the air, who resisted the capture with great spirit, in consequence of which both animals fell much injured to the ground, and were taken up by the designer himself, and are engraved in the 36th plate of his collection.

2. F. leucocephalus. Bald eagle. Cere and legs yellow; legs somewhat downy; body brown; head and tail white. Inhabits the woods of Europe and America: three feet three inches long; feeds on hogs, lambs, and fishes, which it takes from other birds; nest large; lays two eggs.

3. F. chrysaëtos. Golden eagle. Cere yellow; legs downy, yellowish-rusty; body variegated, brown and rusty; tail black, waved at the base with cinereous. Inhabits Europe and Siberia; flies to a vast height in serene weather, and descends against a storm; three feet long; legs feathered down to the toes; tail white beneath, black at the tip. The general weight is about twelve pounds. There are two instances in Scotland of this bird having flown away with infants to its nest: yet in both the theft was discovered time enough to extricate them without essential damage. Very long-lived, many instances occurring of its existing upwards of a century; whence probably the allusion of the psalmist, "thy youth is renewed like the eagle's." Being capable of enduring abstinence; instances have occurred of its continuing for upwards of twenty days without food of any kind.

4. F. fulcus. Ring-tailed eagle. Cere yellow; legs downy, rusty; back brown; tail with a white band. Another variety, with a white tail with a brown tip. Inhabits Europe, Asia, and America: builds on lofty rocks; is trained by the Tartars to hunt hares, antelopes, and foxes: its quill-feathers are used to mount arrows.

5. F. serpentarius. Secretary vulture. Body black; hind-head crested; tail-feathers white at the tips, the two middle ones longest; legs very long. Inhabits interior Africa, and the Philippine islands; three feet high; feeds on smaller animals.

6. F. harpyja. Crested eagle. Head crested with long feathers; body beneath variegated. Inhabits South America; size of a sheep; is said to be able to cleave a man's skull at a stroke; erects the crest in the form of a coronet.

7. F. barbatus. Bearded eagle. Whitish-fiery red; back brown; a black stripe above and beneath the eyes. Two other varieties from difference or different disposition of colours. Inhabits the Alps; the two last varieties the mountains of Persia: four feet long; builds in holes of inaccessible rocks; preys on alpine quadrupeds; and will attack men when asleep: flies in flocks.

8. F. Gallicus. French eagle. Bill cinereous; legs naked, yellowish; body grey-brown; beneath (in the male) whitish, with reddish brown spots. Inhabits France; two feet long; feeds on rats, mice, and frogs; builds its nest mostly on the ground; lays three grey eggs.

9. F. milvus. Kite. Cere yellow; tail forked; body ferruginous; head whitish.

β. Another variety; crown and throat chesnut.

γ. Cere greenish; body brownish; head, throat, and chin chesnut.

δ. Coverts of the back violet; feathers tipt with a white spot.

Inhabits Europe, Asia, and Africa: about two feet long; feeds on offal and poultry; flies placidly, and foretels storms by it clamour; eggs three, roundish, whitish, with dirty yellow spots; migrates into Europe the beginning of April.

10. F. Austriacus. Austrian kite. Cere and legs yellow; legs somewhat downy; body above chesnut, beneath brickdust colour spotted with brown; tail forked. Inhabits the woods of Austria; size of e. milvus; feeds on birds and bats.

11. F. haliaetos. Bald buzzard. Cere and feet blue; body brown above, white beneath; head white.

β. Another variety. Cere cinereous, legs pale; body above grey, beneath whitish; tail equal.

γ. Tail brown, colour of the body, crown black, or brown variegated with white; belly white.

δ. Body rusty brown; a white line from the upper mandible through the region of the eyes to the hind head, which is also white. Inhabits Europe, America, and Siberia, in marshy places, building among the reeds; nearly two feet long; feeds on ducks and fishes, which it catches by diving for.

12. F. antillarum. Mansfenny. Body brown; belly white; crown black. Inhabits the West Indian islands; eighteen inches long; feeds on birds and reptiles; legs and claws very large and strong.

13. F. orientalis. Oriental hawk. Legs lead colour; above the eyes a ferruginous streak; head and body above dusky brown, beneath rusty brown; tail spotted with white. Inhabits Japan: seventeen inches long.

14. F. butes. Buzzard. Cere and legs yellow; body brown; belly pale with brown spots. Inhabits our own country and Europe at large; twenty inches long; feeds on birds, insects, and smaller animals; varies in its colours.

15. F. æruginosus. Moor buzzard. Cere greenish; body grey; crown, chin, arm-pits, and legs yellow. Inhabits England and Europe generally; twenty-one inches long; builds its nest in marshy places; lives on fishes, aquatic birds and rabbits; varies in colour.

16. F. palumbarius. Goshawk. Cere black, edged with yellow; legs yellow; body brown; tail-feathers with pale bands; eye-brows white. Inhabits England and Europe generally, as also North America; twenty-two inches long; devours poultry; and was formerly much used in falconry.

17. F. communis. Common falcon. Yearly falcon. Aged falcon. Body brown, the feathers edged with rusty; tail with darker transverse bands; bill blueish-ash; cere, irids, and legs yellow.

β. Another variety: inclining to brown.

γ. Back gibbous.

δ. Head, neck, and breast with brown spots.

ε. Entirely white; with scarcely visible yellow spots.

ζ. Uniformly brownish black.

η. Wings spotted.

θ. Body above brown with darker spots; beneath white with brown spots.

ι. Spotted with black and red.

κ. Body beneath reddish tawny.

λ. Breast yellow with rusty spots; wings towards the tips spotted with white. Inhabits Europe and North America: the varieties marked ε. China; η. Hudson's bay; κ. India. Larger than the goshawk; feeds on partridges. Bill dusky or lead colour; body beneath white, with dusky, heart-shaped spots; tail dotted with white; claws black.

18. F. gyrfalco. Brown gyrfalcon. Cere blue; legs yellow; body brown, with cinereous bands beneath; sides of the tail white. Inhabits Europe; preys on herons, cranes, and pigeons.

19. F. lannarius. Lanner. Cere yellow; legs and bill blue; body beneath with black longitudinal spots. Two other varieties, differing in shade or disposition of colour, but not essentially. Inhabits England, Sweden, Tartary, and other parts of Europe; size of a buzzard; migrates; builds its nest in low trees; and is much esteemed in falconry.

20. F. cyaneas. Hen-harrier. Cere white; legs tawny; body hoary-blue; a white arch over the eyes surrounding the chin. Inhabits England, other parts of Europe, and Africa: seventeen inches long.

21. F. tinnunculus. Restril. Cere and legs yellow; back purplish-red, with black spots; breast with brown streaks; tail rounded. Two other varieties, from difference or different dispositions of colour. Inhabits England, Siberia, and other parts of Europe, on the tops of old buildings; migrates into the north early in the spring; preys on mice, small birds and insects; and was formerly trained for catching game.

22. F. nisus. Sparrow-hawk. Cere green; legs yellow; belly white waved with grey; tail with blackish bands. Two other varieties.

β. Back spotted with white.

γ. Body entirely white. Inhabits England and Europe generally, Africa, and Madeira; the male twelve inches long, the female fifteen; very bold; preys on poultry, partridges, pigeons, and small birds; and is taught to catch larks.

23. F. vespertinus. Ingrian falcon. Cere, legs, and eye-lids yellow; vent and thighs rusty. Inhabits Ingria, Russia, and Siberia; builds on the top branches of trees, or takes possession of the magpie's nest; preys on quails, and goes abroad chiefly in the evening and at night; size of a pigeon.

24. F. subbuteo. Hobby. Cere and legs yellow; back brown; nape white; belly palish with oblong brown spots. Another variety from slight difference of colour. Inhabits England, Siberia, and other parts of Europe: twelve inches long; preys on larks, which are so terrified by their appearance as to fly to mankind for protection.

25. F. æsolon. Merlin. Cere and legs yellow; head ferruginous; body above blueish-ash, with rusty spots and stripes; beneath yellowish-white with oblong spots. Inhabits Europe: twelve inches long; and migrates southerly on the approach of winter. Is seen not uncommonly in our own country. There are three other varieties with a trivial variance of colour; inhabiting the West India islands, or New York: about nine inches long.

26. F. pumilius. Tiny falcon. Legs yellow; body brown-ash, beneath whitish with blackish bars; crown whitish. Inhabits Cayenne: the smallest of the entire genus, being hardly six inches long.

The common or yearly falcon is the bird most usually employed in ancient times in the sport or science of falconry. He is superior to all others for courage, docility, gentleness, and nobleness of nature. Several authors take the name *falcon* to have been occasioned by its crooked talons or pounces, which resemble a falx or sickle. Giraldus derives it *à falcando*, because it flies in a curve. The falcon, or falcon gentle, is both for the fist and for the lure. In the choice, take one that has wide nostrils, high and large eye-lids, a large black eye; a round head, somewhat full on the top; barb feathers on the clap of the beaks, which should be short, thick, and of an azure colour; the breast large, round, and fleshy; and the thighs, legs, and feet, large and strong; with the sear of the foot soft and blueish: the pounces should be black, with wings long and crossing the train, which should be short and very pliable. The name falcon is confined to the female: for the male is much smaller, weaker, and less courageous than the female; and therefore is denominated *tassle*, or *tircelet*. The falcon is excellent at the river, brook, and even field; and flies chiefly at the larger game, as wild-goose, kite, crow, heron, crane, pye, shoveler, &c. The custom of carrying a falcon about extended to many countries, and was esteemed a distinction of a man of rank. The Welsh had a saying, that you may know a gentleman by his hawk, horse, and greyhound. In fact, a person of rank seldom went without one on his hand. Harold, afterwards king of England, is painted going upon a most important embassy, with a hawk on his hand and a dog under his arm. Henry VI. is represented at his nuptials attended by a nobleman and his falcon. Even the ladies were not without them in earlier times; for in an ancient sculpture in the church of Milton Abbas, in Dorsetshire, appears the consort of king Athelstan with a falcon on her royal fist tearing a bird.

FALCONER, a person who brings up, tames, and manages birds of prey; as falcons, hawks, &c. (See FALCONRY.) The grand seignor usually keeps 6000 falconers in his service. The French king had a grand falconer, which was an office dismembered from that of great hunt, *grand venur*. Historians take notice of this post as early as the year 1250.

FALCONER (William), a Scotch poet, who published, about 1762, an ingenious poem, called the Shipwreck. He also wrote an ode to the duke of York, which procured him the patronage of that prince. Falconer was a sailor, and compiled a very useful work, entitled, The Marine Dictionary. He went out in 1769 in the Aurora frigate, which was never heard of after sailing from the Cape of Good Hope for the East Indies.

FALCONET. See FAUCONET.

FALCONRY, or FAUCONRY, the art of taming, managing, and tutoring, birds of prey, particularly falcons and hawks; and employing them with advantage in the pursuit of game; called also hawking.

Professor Beckmann shews that so early as the time of Ctesias, hares and foxes were hunted in India by means of rapacious birds. The account of Aristotle, however, is still more to the purpose, and more worthy of notice. "In Thrace (says he) the men go out to catch birds with hawks. The men beat the reeds and bushes which grow in marshy places, in order to raise the small birds, which the hawks pursue and drive to the ground, where the fowlers kill them with poles." The same account is to be found in another book ascribed also to Aristotle; and which appears, at any rate, to be the work of an author not much younger. Respecting Thrace, which is situated above Amphipolis, a wonderful thing is told, which might appear incredible to those who had never heard it before. It is said that boys go out into the fields, and pursue birds by the assistance of hawks. When they have found a place convenient for their purpose, they call the hawks by their names, which immediately appear as soon as they hear their voices, and chase the birds into the bushes, where the boys knock them down with sticks and seize them. What is still more wonderful, when these hawks lay hold of any birds themselves, they throw them to the fowlers; but the boys, in return, give them some share of the prey. *De mirabilibus auscultat*. cap. 128.

Other writers after Aristotle, such as Antigonus, Ælian, Pliny, and Phile, have also given an account of this method of fowling. Ælian, who seldom relates any thing without some alteration or addition, says, that in Thrace nets were used, into which the birds were driven by the hawks; and in this he is followed by the poet Phile. Ælian, also, in another place describes a manner of hunting with hawks in India, which, as we are told by several travellers, is still practised in Persia, where it is well understood, and by other eastern nations.

"The Indians (says he) hunt hares and foxes in the following manner: they do not employ dogs, but eagles, crows, and, above all, kites, which they catch when young, and train for that purpose. They let loose a tame hare or fox, with a piece of flesh fastened to it, and suffer these birds to fly after it, in order to seize the flesh, which they are fond of, and which, on their return, they receive as the reward of their labour. When thus instructed to pursue their prey, they are sent after wild foxes and hares in the mountains; these they follow in hopes of obtaining their usual food, and soon catch them and bring them back to their masters, as we are informed by Ctesias. Instead of the flesh, however, which was fastened to the tame animals, they receive as food the entrails of the wild ones which they have caught."

It seems, therefore, that the Greeks received from India and Thrace the first information respecting the method of fowling with birds of prey; but it does not appear that this practice was introduced among them at a very early period. In Italy, however, it must have been very common, for Martial and Apuleius speak of it as a thing every where known; the former calls a hawk the fowler's servant.

Falconry, however, was practised with far more spirit and universality among the ancient Britons than among any other nation whatever. It commenced at least as early as the middle of the fifth century, and was cultivated as late as to the fifteenth or sixteenth, and seems at length to have fallen a sacrifice to the introduction of gunpowder and the field-sports to which gunpowder gave rise. In its zenith of estimation and practice, a degree of consequence and dignity was attached to the art of falconry, which may well excite our surprise at the present moment. From the household regulations of Howel Dha, prince of Wales, in 942, we learn that the grand falconer ranked fourth in the order of precedency among the twenty-four chief officers of the Welsh court; and was limited to three draughts of strong potation or metheglin at the royal table, lest from intoxication he should neglect his hawks. When this exalted courtier succeeded in his sport, the prince rose to meet him, and sometimes held his stirrup. At an early period of English history a similar degree of distinction appears to have been conferred on the same amusement by the English court. The office of grand falconer of England is still hereditary in the duke of St. Alban's family, as that of master of the game is in the duke of Grafton's. No hawks, however, are now kept; but the salary attached to the office continues, and amounts to 982*l*. 10*s*. per annum; independently of an additional sum of 30*l*. for each lunar month, making together 1372*l*. 10*s*. There are various deductions upon this gross amount: so that the net produce is reduced to about a thousand pounds sterling per annum.

FA'LDAGE. *s.* (*faldagium*, barbarous Lat.) A privilege of setting up folds for sheep in any field within the manor (*Harris*).

FA'LDING. *s.* A kind of coarse cloth.

FA'LDSTOOL. *s.* (*fald* or *fold* and *stool.*) A kind of stool placed at the south side of the altar, at which the kings of England kneel at their coronation.

FALDWORTH, among our old writers, a person of sufficient age to be reckoned of some decennary.

FALERII, in ancient geography, a town of Etruria, on the west or right side of the Tiber: the people of the town and territory were called Falisci. They made an excellent kind of sausage, called by Martial *Venter Faliscus.*

FALEZIN, a town of European Turkey, remarkable for a battle between the Turks and Russians, and for being the place where peace was concluded between those powers, in 1711. Lat. 45. 30 N. Lon. 27. 0 E.

FALKENBERG, a strong town of Upper Saxony, in Germany. Lat. 53. 35 N. Lon. 15. 58 E.

FALKENBURG, a maritime town of Sweden, seventeen miles N. W. of Helmstadt. Lat. 56. 52 N. Lon. 12. 50 E.

FA'LKIA, in botany, a genus of the class hexandria, order digynia. Calx one-leafed; corol one-petalled; campanulate; styles two; seeds four. One species; a Cape plant, with creeping stem; leaves entire, and cut at the base.

FALKINGHAM, a town in Lincolnshire, with a market on Thursdays. Lat. 52. 48 N. Lon. 0. 20 W.

FALKIRK, a handsome town of Stirlingshire, in Scotland, chiefly supported by the great markets for Highland cattle, called trysts, which are held in its neighbourhood thrice a year: 15,000 head of cattle are sometimes sold at one tryst. Lat. 55. 57 N. Lon. 45. 8 W. Here are 8,838 inhabitants.

FALKLAND, a borough of Fifeshire, in Scotland, at the foot of one of the beautiful green hills called the Lomonds. Here are the magnificent ruins of a royal palace, some apartments of which are still inhabited. Lat. 56. 18 N. Lon. 3. 7 W.

FALKLAND ISLANDS, a cluster of islands near the Magellanic Streights. The English took possession of these islands in the name of his Britannic majesty in 1764, but abandoned them in 1774.

To FALL. *v. n.* pret. *I fell;* compound pret. *I have fallen* or *faln.* (feallan, Saxon.) 1. To drop from a higher place (*Shakspeare*). 2. To drop from an erect to a prone posture. 3. To drop; to be held no longer (*Acts*). 4. To move down any descent (*Burnet*). 5. To drop ripe from the tree (*Isaiah*). 6. To pass at the outlet: as a river (*Arbuthnot*). 7. To be determined to some particular direction (*Cheyne*). 8. To apostatize; to depart from faith or goodness (*Milton*). 9. To die by violence (*Milton*). 10. To come to a sudden end (*Davies*). 11. To be degraded from a high station (*Shakspeare*). 12. To decline from power or empire (*Addison*). 13. To enter into any state worse than the former (*Dryden*). 14. To decrease; to be diminished (*Arbuthnot*). 15. To ebb; to grow shallow. 16. To decrease in value; to bear less price. 17. To sink; not to amount to the full (*Bacon*). 18. To be rejected; to become null (*Locke*). 19. To decline from violence to calmness (*Shakspeare*). 20. To enter into any new state of the body or mind (*Knolles*). 21. To sink into an air of discontent or dejection of the look (*Bacon*). 22. To sink below something in comparison. 23. To happen; to befall (*Donne*). 24. To come by chance; to light on (*Shakspeare*). 25. To come in a stated method (*Holder*). 26. To come unexpectedly (*Boyle*). 27. To begin any thing with ardour and vehemence (*Hale*). 28. To handle or treat directly (*Addison*). 29. To come vindictively (*Chronicles*). 30. To come by any mischance to any new possessor (*Knolles*). 31. To drop or pass by carelessness or imprudence (*Swift*). 32. To come forcibly and irresistibly (*Acts*). 33. To become the property of any one by lot, chance, or otherwise (*Denham*). 34. To languish; to grow faint (*Addison*). 35. To be born; to be yeaned (*Mortimer*). 36. *To* FALL *away.* To grow lean (*Arbuthnot*). 37. *To* FALL *away.* To revolt; to change allegiance (*Kings*). 38. *To* FALL *away.* To apostatize (*Luke*). 39. *To* FALL *away.* To perish; to be lost. 40. *To* FALL *away.* To decline gradually; to fade; to languish (*Addison*). 41. *To* FALL *back.* To fail of a promise or purpose (*Taylor*). 42. *To* FALL *back.* To recede; to give way. 43. *To* FALL *down.* To prostrate onesself in adoration (*Psalms*). 44. *To* FALL *down.* To sink; not to stand. 45. *To* FALL *down.* To bend as a suppliant. 46. *To* FALL *from.* To revolt; to depart from adherence (*Hayward*). 47. *To* Fall *in.* To concur; to coincide. 48. *To* Fall *in.* To comply; to yield to. 49. *To* Fall *off.* To separate; to be broken. 50. *To* Fall *off.* To perish; to die away. 51. *To* Fall *off.* To apostatize; to revolt. 52. *To* Fall *on.* To begin eagerly to do any thing (*Dryden*). 53. *To* Fall *on.* To make an assault (*Shakspeare*). 54. *To* Fall *over.* To revolt; to desert from one side to the other (*Shakspeare*). 55. *To* Fall *out.* To quarrel; to jar (*Sidney*). 56. *To* Fall *out.* To happen; to befall (*Hooker*). 57. *To* Fall *to.* To begin eagerly to eat (*Dryden*). 58. *To* Fall *to.* To apply himself to (*Pope*). 59. *To* Fall *under.* To be subject to (*Taylor*). 60. *To* Fall *under.* To be ranged with (*Addison*). 61. *To* Fall *upon.* To attack; to invade. 62. *To* Fall *upon.* To attempt (*Holder*). 63. *To* Fall *upon.* To rush against (*Addison*).

To Fall. *v. a.* 1. To drop; to let fall (*Shakspeare*). 2. To sink; to depress (*Bacon*). 3. To diminish; to let sink (*Locke*). 4. To yean; to bring forth (*Shakspeare*).

Fall. *s.* (from the verb) 1. The act of dropping from on high (*Dryden*). 2. The act of tumbling from an erect posture (*Shakspeare*). 3. The violence suffered in dropping from on high (*Locke*). 4. Death; overthrow; destruction incurred. 5. Ruin; dissolution (*Denham*). 6. Downfal; loss of greatness; declension from eminence; degradation (*Daniel*). 7. Declension of greatness, power, or dominion (*Hooker*). 8. Diminution; decrease of value (*Child*). 9. Declension or diminution of sound; cadence; close to music (*Milton*). 10. Declivity; steep descent (*Bacon*). 11. Cataract; cascade (*Pope*). 12. The outlet of a current into any other water (*Addison*). 13. Autumn; the fall of the leaf (*Dryden*). 14. Any thing that comes down in great quantities (*L'Estrange*). 15. The act of felling or cutting down.

Fall of man, in scripture history, that lamentable event by which sin and death were introduced into the world. The Mosaic account of the fall is detailed in the third chapter of Genesis, and need not be repeated here. This has been the topic of fruitful controversies, into which we are not disposed to enter. We do not see upon what principle any who call themselves Christians can deny the fall of man; since it was this alone which rendered the Christian dispensation necessary: it is this fact which is assumed as the basis, and without which there would be no place for the superstructure of redemption. Christ "came not to call the righteous, but sinners to repentance;" and we know of no hypothesis to account for the introduction of sin, but that laid before us in the Scriptures; where also we are furnished with a cure for this most dismal of all maladies: "for if by one man's offence death reigned by one; much more they which receive abundance of grace, and of the gift of righteousness, shall reign in life by one Jesus Christ. Therefore, as by the offence of one judgment came upon all men to condemnation; even so, by the righteousness of one the free gift came upon all men unto justification of life," &c. Rom. v. 17, 18, 19.

As to the deistical, or, as it is now fashionable to call them, *philosophical* objections to the fall of man, those who are desirous to see it triumphantly proved how unphilosophical they are, may consult Delany's "Revelation examined with Candour," Dissertations 1, 2, and 6.

FALLA'CIOUS. *a.* (*fallacieux*, French.) 1. Producing mistake; sophistical (*South*). 2. Deceitful; mocking expectation (*Milton*).

FALLA'CIOUSLY. *ad.* Sophistically; with purpose to deceive (*Brown*).

FALLA'CIOUSNESS. *s.* Tendency to deceive; inconclusiveness.

FALLA'CY. *s.* (*fallacia*, Latin.) Sophism; logical artifice; deceitful argument (*Sidney*).

FALLIBI'LITY. *s.* (from *fallible.*) Liableness to be deceived; uncertainty (*Watts*).

FA'LLIBLE. *a.* (*fallo*, Latin.) Liable to error; such as may be deceived (*Taylor*).

FA'LLING. *s.* (from *fall.*) Indenting opposed to prominence (*Addison*).

Falling-sickness. See Epilepsia.

Falling-stars. See Meteorology.

FALLOPIAN TUBE. See Tuba Fallopiana.

Fallopian ligament. See Poupart's ligament.

FALLOPIUS (Gabriel), an eminent physician and anatomist of Modena, was born in 1490. He discovered the tubes called thence Fallopian tubes. He was professor of anatomy, first at Pisa, and next at Padua, where he died in 1563. All his works were published in 3 vols. folio, at Venice, 1585 and 1606, and at Frankfort in 1600 and 1606.

FA'LLOW. *a.* (ꝼalepe, Saxon.) 1. Pale red, or pale yellow (*Clarendon.*) 2. Unsowed; left to rest after the years of tillage (*Hayward*). 3. Plowed, but not sowed (*Howel*). 4. Unplowed; uncultivated (*Shakspeare*). 5. Unoccupied; neglected (*Hudibras*).

Fa'llow. *s.* (from the adjective.) 1. Ground plowed in order to be plowed again (*Mortimer*). 2. Ground lying at rest (*Rowe*).

To Fa'llow. *v. n.* To plow in order to a second plowing (*Mortimer*).

Fallow deer; deer bred in parks for the production of venison, as well as for ornament. The male is called a buck; the female, a doe; the offspring of both a fawn: they slightly vary in colour, but are chiefly of a dark dingy brown, inclining to black, or a mottled sandy dun. The buck is furnished with horns, which he sheds yearly: the doe has no such weapons for self-defence.

The buck sheds his horns from the middle of April to the close of May, and for the most part regenerates them by the month of September. The doe generally produces her young in the last week of May, or by the middle of

June. The season for buck venison commences in July, and continues till about Michaelmas; when doe venison comes in, and continues till January. The rutting time, or season of procreation, commences at the latter end of August, and continues during the greater part of September.

Buck-hunting was formerly a much more common sport than at present, and a dwarf kind of stag-hounds, called buck-hounds, was kept for the purpose. The uncertainty, however, and short duration of the chase has nearly destroyed the practice; and there is, in the present day, hardly any such thing in the kingdom as a pack kept solely for the purpose of hunting fallow deer.

Fallow land. Land under no immediate cultivation, ploughed up and laid at rest, to acquire from its exposure to the oxygen of the air additional strength for the production of future crops. Of fallow lands there are two kinds, summer and winter; for which see Husbandry.

FA′LLOWNESS. *s.* (from *fallow.*) Barrenness; an exemption from bearing fruit (*Donne*).

FALMOUTH, a seaport of Cornwall, with a market on Thursday. About two centuries ago, there were not more than two or three houses, but it is now governed by a mayor, four aldermen, and a town-clerk. It has a very noble and extensive harbour, communicating with a number of navigable creeks; and it is a flourishing town of great traffic, which has been much improved by its being the station of the packets to Spain, Portugal, and America. Lat. 50. 8 N. Lon. 4. 58 W.

Falmouth, is also the name of a town in Jamaica, on the N. coast; of one in Virginia; and of a seaport in the state of Massachusets.

FALSE. *a.* (*falsus*, Latin.) 1. Not morally true; expressing that which is not thought (*Shakspeare*). 2. Not physically true; conceiving that which does not exist (*Davies*). 3. Supposititious; succedaneous (*Bacon*). 4. Deceiving expectation (*L'Est.*). 5. Not agreeable to rule, or propriety (*Shak.*). 6. Not honest; not just (*Donne*). 7. Treacherous; perfidious; traitorous (*Shakspeare*). 8. Counterfeit; hypocritical; not real (*Dryden*).

False. *ad.* Not truly; falsely (*Shaksp.*).

False action, if brought against one whereby he is cast into prison, and dies pending the suit, the law gives no remedy in this case, because the truth or falsehood of the matter cannot appear before it is tried: and if the plaintiff is barred, or non-suited at common law, regularly all the punishment is amercement.

False imprisonment is a trespass committed against a person, by arresting and imprisoning him without just cause, contrary to law; or where a man is unlawfully detained without legal process: and it is also used for a writ which is brought for this trespass. If a person be any way unlawfully detained, it is false imprisonment; and considerable damages are recoverable in those actions.

False, when used in music, is applied to such chords as do not contain all the intervals appertaining to them in their perfect state: thus, a false fifth contains only six semitones.

False voice. See Voice.

False-quarter. In the manage, a cleft or chink in the side or quarter of a horse's hoof, running in an oblique or slanting direction with the horny fibres of it, from the coronet to its base, by which the horny substance of the crust is divided, and one part of the hoof is separated from the other, and consequently rendered unable to support the portion or share of weight which the limb should sustain. When the horse sets his foot to the ground, the crack widens, and when he lifts it up again the hardened edges of the divided hoof inclose betwixt them the tender and soft parts, and squeeze them so as frequently to occasion bleeding at the crack; nor is this all, for it often happens that the complaint is attended with inflammation of the parts, a discharge of matter, and consequent lameness. This complaint is occasioned in general by a wound or bruise upon the coronet, by which the continuity of parts is broken, for we always find that when the horny fibres of the hoof are divided at their roots, they seldom, or perhaps never, unite again, but leave a blemish of a greater or less extent, in proportion to the size or depth of the wound or bruise. From this account of the nature of the complaint, it is evident that a radical cure cannot possibly be effected, though we have it in our power so far to palliate it as to render the horse in a measure useful, by adopting a shoe of such a construction as will support the whole weight of the injured limb, without pressing too much upon the injured quarter; for which purpose a round, or what is commonly termed a barred shoe, is undoubtedly the most proper. The surface of the hoof on and near the diseased part should likewise be cut down lower than the surface of the crust upon which the shoe is to rest, or if the hoof will not admit of cutting down, the shoe may be raised up from the weak quarter; either of which methods of proceeding will remove the weight from the diseased part, and consequently the horse will not halt so much as before. Sand and gravel are easily admitted into the chink or crack, and accumulated there till they irritate and inflame the parts, in consequence of which matter forms underneath the hoof, which not unfrequently breaks out at the coronet, and produces the most inveterate ulcers—to heal which it is extremely difficult, on account of the sinus or fistula, commonly called a quittor, branching out in different directions under the hoof.—Horses that have this defect should be carefully attended to; and when the thick hardened parts or edges of the crack grow too high, by which it is rendered so much the deeper, and of consequence lodges a greater portion of sand, or other extraneous matter; these edges should be rasped down, or pared with a crooked knife, till the seam entirely disappears; but where there remains a blackness or appearance of gravel, the part must be traced further, always taking care not to draw blood if it can possibly be avoided. The crack being made smooth and equal, it will not be easy for sand or gravel to lodge in it, but as the parts will be tender, it will be proper to apply an emollient poultice for a few days, till the soreness subsides. If the inflammation had been great, and matter had formed in the crack in consequence thereof, or if the parts have been wounded by the knife, in paring down the hardened edges, fungus may perhaps shoot out and become troublesome. In which case the hard parts of the hoof near it are to be removed, and a digestive poultice applied.

False roots, in arithmetic and algebra, negative and impossible roots of numbers or equations. So the square root of 16 may be reckoned either 4 or —4, the former true, the latter false. The cube root of 1, is either 1, or $-\frac{1+\sqrt{-3}}{2}$, or $-\frac{1-\sqrt{-3}}{2}$, the latter two false or imaginary. Again, if r be the real root of any cube r^3, the two false roots of it will be $-\frac{1+\sqrt{-3}}{2}r$, and $-\frac{1-\sqrt{-3}}{2}r$.

To False. *v. a.* (from the noun.) Out of use. 1. To violate by failure of veracity (*Spenser*). 2. To deceive (*Spenser*). 3. To defeat; to balk; to evade (*Spenser*).

FALSEHE′ARTED. *a.* (*false* and *heart.*) Treacherous; perfidious; deceitful (*Bacon*).

FA′LSEHOOD. *s.* (from *false.*) 1. Want of truth; want of veracity (*South*). 2. Want of honesty; treachery (*Milton*). 3. A lie; a false assertion (*Job*). 4. Counterfeit; imposture (*Milton*).

FA′LSELY. *ad.* (from *false*). 1. Contrarily to truth; not truly (*Government of the Tongue*). 2. Erroneously; by mistake (*Smalridge*). 3. Perfidiously; treacherously; deceitfully.

FA′LSENESS. *s.* (from *false.*) 1. Contrariety to truth. 2. Want of veracity; violation of promise (*Tillotson*). 3. Duplicity; deceit (*Hammond*). 4. Treachery; perfidy; traitorousness (*Rogers*).

FA′LSER. *s.* (from *false*). A deceiver (*Spenser*).

FALSETTO. (Italian.) That species of voice in a man, the compass of which lies above his natural voice, and is produced by artificial straining.

FALSIFI′ABLE. *a.* (from *falsify.*) Liable to be counterfeited or corrupted.

FALSIFICA′TION. *s.* (*falsification*, Fr.) 1. The act of counterfeiting any thing so as to make it appear what it is not (*Bacon*). 2. Confutation (*Broome*).

FA′LSIFIER. *s.* (from *falsify.*) 1. One that counterfeits; one that makes any thing to seem what it is not (*Boyle*). 2. A liar (*L'Estrange*).

To FA′LSIFY. *v. a.* (*falsifier*, French.) 1. To counterfeit; to forge (*Hooker*). 2. To confute; to prove false (*Addison*). 3. To violate; to break by falsehood (*Knolles.*),

To Fa′lsify. *v. n.* To tell lies (*South*).

FA′LSITY. *s.* (*falsitas*, Lat.) 1. Falsehood; contrariety to truth (*Sandys*). 2. A lie; an errour (*Glanville*).

FALSTAFF. See Fastolff.

FALSO BORDONE, a musical term, which denotes that ground bass of an air whose notes move all in consecution.

FALSTER, a little island of Denmark, near the entrance of the Baltic, between the islands of Zealand, Laland, and Mona.

To FA′LTER. *v. n.* (*vaultur*, Islandick.) 1. To hesitate in the utterance of words (*Dryden*). 2. To fail in any act of the body (*Shakspeare*). 3. To fail in any act of the understanding.

To Fa′lter. *v. a.* To cleanse; to sift (*Mortimer*).

FA′LTERINGLY. *ad.* (from *falter.*) With hesitation; with difficulty; with feebleness.

FALX. (*falx.*) In anatomy. The falciform process of the dura mater. See Falciform process.

FAMA CLAMOSA, in the judicial procedure of the church of Scotland, a ground of action before a presbytery against one of its members, independent of any regular complaint by a particular accuser.

FAMAGUSTA (the ancient Arsinoe), an episcopal town of the island of Cyprus, in Asiatic Turkey. Lat. 35. 10 N. Lon. 35. 55 E.

To FA′MBLE. *v. n.* (*fambler*, Danish.) To hesitate in the speech (*Skinner*).

FAME. *s.* (*fama*, Latin.) 1. Celebrity; renown (*Addison*). 2. Report; rumour (*Joshua*).

Fame (*Fama*), a heathen goddess, celebrated chiefly by the poets. She is feigned to be the last of the race of Titans produced by the earth, to have her palace in the air, and to have a vast number of eyes, ears, and tongues.

FA′MED. *a.* (from *fame.*) Renowned; celebrated; much talked of (*Dryden*).

FA′MELESS. *a.* Without fame (*May*).

FAMES CANINA. See Bulimia.

FAMI′LIAR. *a.* (*familiaris*, Latin.) 1. Domestic; relating to a family (*Pope*). 2. Affable; easy in conversation (*Shakspeare*). 3. Unceremonious; free (*Sidney*). 4. Well known (*Watts*). 5. Well acquainted with; accustomed (*Pope*). 6. Common; frequent (*Locke*). 7. Easy; unconstrained (*Addison*). 8. Too nearly acquainted (*Camden*).

Fami′liar. *s.* 1. An intimate; one long acquainted (*Rogers*). 2. A demon supposed to attend at call (*Shakspeare*).

Familiars of the Inquisition, persons who assist in apprehending such as are accused, and carrying them to prison. They are assistants to the inquisitors, and are called familiars because they belong to his family.

FAMILIA′RITY. *s.* (*familiarité*, French.) 1. Easiness of conversation; affability. 2. Acquaintance; habitude (*Atterbury*). 3. Easy intercourse (*Pope*).

To **FAMI′LIARIZE.** *v. a.* (*familiariser*, French.) 1. To make easy by habitude. 2. To bring down from a state of distant superiority (*Addison*).

FAMI′LIARLY. *ad.* (from *familiar.*) 1. Unceremoniously; with freedom (*Bacon*). 2. Commonly; frequently (*Raleigh*). 3. Easily; without formality (*Pope*).

FAMI′LLE. (*en famille*, French.) In a family way; domestically (*Swift*).

FAMILIES, in natural history, any number of individuals, whether animals, vegetables or minerals, that resemble each other in a variety of prominent natural characters. The term is synonymous with tribes.

Families of vegetables. Linnéus (Philos. Bot.) divides the vegetable world into seven families. 1. Fungi. 2. Algæ. 3. Musci, or mosses. 4. Filices, or ferns. 5. Gramina, or grasses. 6. Palmæ, or palms. 7. Plantæ, or plants; including all that are not in the foregoing families. See Gentes.

M. Adanson published a system, under the title of Familles des Plantes. And the Lichfield society have given their translation of Linnéus's Genera Plantarum the same title, in English.

FA′MILY. *s.* (*familia*, Latin.) 1. Those who live in the same house; household (*Swift*). 2. Those that descend from one common progenitor; a race; a generation (*Numbers*). 3. A course of descent; a genealogy (*Pope*). 4. A class; a tribe; a species (*Bacon*).

Family of curves. See Curves.

FA′MINE. *s.* (*famine*, French.) Scarcity of food; dearth (*Hale*).

To **FA′MISH.** *v. a.* (from *fames*, Latin.) 1. To kill with hunger; to starve (*Shakspeare*). 2. To kill by deprivation or denial of any thing necessary to life (*Milton*).

To **Fa′mish.** *v. n.* To die of hunger; to suffer extreme hunger (*Shakspeare*).

FA′MISHMENT. *s.* Want of food (*Hakewill*).

FAMO′SITY. *s.* (from *famous.*) Renown.

FA′MOUS. *a.* (*famosus*, Lat.) Renowned; celebrated; much talked of (*Peacham*).

FA′MOUSLY. *ad.* With celebrity; with great renown (*Shakspeare*).

FA′MOUSNESS. *s.* Celebrity; great fame.

FAN. *s.* (*vannus*, Latin.) 1. An instrument used by ladies to move the air and cool themselves (*Atterbury*). 2. Any thing spread out like a woman's fan (*L'Estrange*). 3. The instrument by which the chaff is blown away when corn is winnowed (*Shakspeare*). 4. Any thing by which the air is moved (*Dryden*). 5. An instrument to raise the fire (*Hooker*).

To **Fan.** *v. a.* 1. To cool or recreate with a fan (*Spectator*). 2. To ventilate; to affect by air put in motion (*Milton*). 3. To separate, as by winnowing (*Bacon*).

Fan, a machine used to raise wind, and cool the air by agitating it. That the use of the fan was known to the ancients is very evident from what Terence says, "Cape hoc flabellum, et ventulum huic sic facito;" and from Ovid. Art. Amand. i. 171. "Profuit et tenues ventos movisse flabello." The fans of the ancients were made of different materials; but the most elegant were composed of peacock's feathers, or perhaps painted so as to represent a peacock's tail.

The custom which now prevails among the ladies of wearing fans was borrowed from the east, where the hot climate renders the use of fans and umbrellas indispensably necessary. The shape and construction of our modern fans are too well known to need any particular description.

Fan is also an instrument to winnow corn. The fan which Virgil calls mystica vannus Iacchi was used in initiations into the mysteries of the ancients: for as the persons who were to be initiated into these mysteries were to be particularly good, this instrument, which separates the corn from the chaff, was a fit emblem of separating the good from the vicious and useless part of mankind. It is figuratively applied in a similar manner in Luke iii. 17.

FANLIGHT, in architecture, a name given to windows of nearly a semicircular form, the panes of which diverge from the centre, in resemblance of an open fan.

FANPALM, in botany. See Chamœrops.

FANA′TICISM. *s.* (from *fanatic.*) Enthusiasm; religious frenzy (*Rogers*).

FANA′TIC. *a.* (*fanaticus*, Latin.) Enthusiastic; struck with a superstitious frenzy (*Milton*).

Fana′tic. *s.* An enthusiast; a man mad with wild notions of religion (*D. of Piety*).

FA′NCIFUL. *a.* (*fancy* and *full.*) 1. Imaginative; rather guided by imagination than reason (*Woodward*). 2. Dictated by the imagination, not the reason; full of wild images (*Hayward*).

FA′NCIFULLY. *ad.* According to the wildness of imagination.

FA′NCIFULNESS. *s.* Addiction to the pleasures of imagination (*Hale*).

FA′NCY. *s.* (*phantasia*, Latin.) 1. Imagination; the power by which the mind forms to itself images and representations of things or persons. (See Imagination.) 2. An opinion bred rather by the imagination than the reason (*Clarendon*). 3. Taste; idea; conception of things (*Addison*). 4. Image; conception; thought (*Shakspeare*). 5. Inclination; liking; fondness (*Collier*). 6. Caprice; humour; whim (*Dryden*). 7. Frolic; idle scheme; vagary (*L'Estrange*). 8. Something that pleases or entertains (*Bacon*).

To **Fa′ncy.** *v. n.* To imagine; to believe without being able to prove (*Locke*).

To **Fa′ncy.** *v. a.* 1. To portray in the mind; to imagine (*Dryden*). 2. To like; to be pleased with (*Raleigh*).

FA′NCYMONGER. *s.* One who deals in tricks of imagination (*Shakspeare*).

FA′NCYSICK. *a.* One whose distemper is in his own mind (*L'Estrange*).

FANDANGO, a dance much practised in Spain, and of which the natives of that country are particularly fond. Its air is lively, and much resembles the English hornpipe. (*Busby*).

FANE. *s.* (*fane*, French; *fanum*, Latin.) A temple; a place consecrated to religion (*Philips*).

FA'NFARON. *s.* (French.) 1. A bully; a hector (*Dryden*). 2. A blusterer; a boaster of more than he can perform (*L'Estrange*).

FANFARONA'DE. *s.* (from *fanfaron*.) A bluster; a tumour of fictitious dignity (*Swift*).

To FANG. *v. a.* (ꝼanȝan, Saxon.) To seize; to gripe; to clutch (*Shakspeare*).

FANG. *s.* (from the verb.) 1. The long tusks of a boar or other animal by which the prey is seized (*Shakspeare*). 2. The nails; the talons. 3. Any shoot or other thing by which hold is taken (*Evelyn*).

FA'NGED. *a.* (from *fang*.) Furnished with fangs or long teeth; furnished with any instruments in imitation of fangs (*Phillips*).

FA'NGLE. *s.* (from ꝼenȝan, Saxon.) Silly attempt; trifling scheme.

FA'NGLED. *a.* (from *fangle*.) Gaudy; ridiculously showy; vainly decorated (*Shakspeare*).

FA'NGLESS. *a.* (from *fang*.) Toothless; without teeth (*Shakspeare*).

FA'NGOT. *s.* A quantity of wares.

FANIONS, in the military art, small flags carried along with the baggage.

FA'NNEL. *s.* (*fanon*, French.) A sort of ornament like a scarf, worn about the left arm of a mass priest when he officiates.

FA'NNER. *s.* One that plays a fan (*Jeremiah*).

FANO, an ancient episcopal town of Urbino, in Italy, 20 miles E. of Urbino. Lat. 43. 46 N. Lon. 13. 5 E.

FA'NTASIED. *a.* (from *fantasy*.) Filled with fancies or imaginations (*Shakspeare*).

FANTA'SM. *s.* See PHANTASM.

FANTA'STICAL, FANTA'STIC. *a.* (*fantastique*, French.) 1. Irrational; bred only in the imagination. 2. Subsisting only in the fancy; imaginary. 3. Unreal; apparent only (*Shakspeare*). 4. Uncertain; unsteady; irregular (*Prior*). 5. Whimsical; fanciful; capricious (*Addison*).

FANTA'STICALLY. *ad.* (from *fantastical*.) 1. By the power of imagination. 2. Capriciously; humorously (*Shakspeare*). 3. Whimsically (*Grew*).

FANTA'STICALNESS. FANTA'STICNESS. *s.* 1. Humorousness; mere compliance with fancy. 2. Whimsicalness; unreasonableness (*Tillotson*). 3. Caprice; unsteadiness.

FA'NTASY. *s.* (from *fantaisie*, French.) 1. Fancy; imagination; the power of imagining (*Newton*). 2. Idea; image of the mind (*Spenser*). 3. Humour; inclination (*Whitgift*).

FANTIN, a small kingdom of Guinea, in Africa, where the English and Dutch have forts. The principal town or village has the same name.

FANUM, a temple, or place consecrated to some deity.

FAP. *a.* Fuddled; drunk (*Shakspeare*).

FAR. *ad.* (ꝼeon, Saxon.) 1. To great extent in length (*Prior*). 2. To a great extent every way (*Prior*). 3. To a great distance progressively (*Shakspeare*). 4. Remotely; at a great distance (*Knolles*). 5. To a distance (*Raleigh*). 6. In a great part (*Judges*). 7. In a great proportion; by many degrees. 8. To a great height; magnificently (*Shakspeare*). 9. To a certain point or degree (*Tillotson*). 10. *Off* is joined with *far*, when *far* noting distance is not followed by a preposition: as *I set the boat* far off, *I set the boat* far from *me*.

FAR-FETCH. *s.* A deep stratagem (*Hudibras*).

FAR-FETCHED. *a.* 1. Brought from places remote (*Milton*). 2. Studiously sought; elaborately strained (*Shakspeare*).

FAR-PIERCING. *a.* Striking or penetrating a great way (*Pope*).

FAR-SHOOTING. *a.* Shooting to a great distance (*Dryden*).

FAR. *a.* 1. Distant; remote (*Dryden*). 2. *From* FAR. From a remote place (*Deut.*).

FAR. *s.* (contracted from *farrow*.) Young pigs (*Tusser*).

To FARCE. *v. a.* (*farcio*, Latin.) 1. To stuff; to fill with mingled ingredients (*Carew*). 2. To extend; to swell out (*Shakspeare*).

FARCE was originally a droll, petty show, or entertainment, exhibited by charletans, or quacks, and their buffoons, in the open street, to gather the crowd together.

The word is French, and signifies literally, *force-meat* or *stuffing*. It was applied on this occasion, without doubt, on account of the variety of jests, jibes, tricks, &c. wherewith the entertainment was interlarded. Some authors derive farce from the Latin *facetia*; others from the Celtic *farce*, mockery; others from the Latin *farcire*, to stuff. At present, farce is removed from the street to the theatre; and instead of being performed by merry-andrews to amuse the rabble, is now acted by our comedians, and become the entertainment of the politest audiences. The poets have reformed the wildness of the primitive farces, and brought them to the taste and manner of comedy. The difference between the two on our stage, is that the latter keeps to nature and probability; and, in order to that, is confined to certain laws, unities, &c. prescribed by the ancient critics. The former disallows of all laws, or rather sets them all aside on occasion. Its end is purely to please, or to make merry; and it sticks at nothing which may contribute thereto, however wild and extravagant. Hence the dialogue is usually low, the persons of inferior rank, and the fable or action trivial or ridiculous; and nature and truth are every where heightened and exaggerated to afford the more palpable ridicule.

FA'RCICAL. *a.* (from *farce*.) Belonging to a farce; appropriated to a farce.

FARCTOUS. (*farcio*, to stuff or cram.) In botany, stuffed, crammed, or full; without any vacuities.—*Farctum folium*; a stuffed leaf, full of pith or pulp; in opposition to *tubulous* and *fistulous*, tubular or hollow like a pipe.—It is applied also to the stem and pericarp.

FARCY. (from *farce*, on account of its intumescence.) In the manage. A disease peculiar to the horse, the ass, and the mule; bearing a striking resemblance to the glanders, only that this latter is for the most part a local affection, or commences as such, and is capable of being produced by inoculation with the purulent matter of the glanders. It is evidently a disease of the lymphatic system, rendering it incapable, in the glands that are affected, of secreting their accustomed and healthy juices, and of propelling the fluids which they have absorbed along their accustomed course. These in consequence stagnate, inflame the vessels in which they are confined, and a variety of tumours, ulcerations, and the discharge of a foul sanies follow.

At the commencement of the disease, a considerable enlargement and rigidity may be perceived in the affected absorbent, accompanied by much pain and inflammation. Glandular tumours are observed to arise, at first extremely sensible, but soon becoming schirrous: small ulcerations (called farcy buds) are soon visible, discharging a foul and corroding sanies; the edges of these buds are thick and hard, and the whole has an unhealthy aspect. If these symptoms are permitted to increase, the discharge becomes absorbed into the circulation; the system, consequently, is speedily and totally tainted, the ulcers spread with considerable rapidity, and few parts of the skin will remain long free from them; the sheath enlarges, as also the extremities; the coat stares, and the skin attaches itself closely to the body. At such a period it will be no easy undertaking to afford permanent relief; but where we have an opportunity of encountering the malady in its primary stages, we have a right to entertain very sanguine hopes of success.

Calomel, or other preparations of mercury, given as alteratives, and continued daily till commotion be excited, or nearly so, appears to afford the best mode of internal treatment: extreme cleanness, emollient lotions, thorough grooming, and the application of digestive ointment to the ulcers, with gentle exercise, is the most adviseable external treatment.

Where the animal is full in flesh, rowels will frequently prove of much advantage; but they can seldom be employed with propriety in lean and debilitated habits.

The disease termed WATER-FARCY, by old farriers, is completely dropsical, and may be owing either to a deficiency in the absorbents, or to an increased action of the secreting vessels; but, we believe, more particularly to the latter. In such cases we can discover no enlargement in the absorbents, nor is there the same appearance of ulceration as in the true farcy. It is usually removed, without much difficulty, by diuretics, or mild purgatives; but in more obstinate instances mercury must here also be had recourse to.

FA'RDEL. *s.* (*fardello*, Italian.) A bundle; a little pack (*Shakspeare*).

FARDING-DEAL, or FARDING-LAND; in our old customs, a rood, or fourth part of an acre.

To FARE. *v. n.* (faran, Saxon.) 1. To go; to pass; to travel (*Fairfax*). 2. To be in a state good or bad (*Waller*). 3. To proceed in any train of consequences good or bad (*Milton*). 4. To happen to any one well or ill (*South*). 5. To feed; to eat (*Brown*).

FARE. *s.* (from the verb.) 1. Price of passage in a vehicle by land or by water (*Dryden*). 2. Food prepared for the table; provisions.

In London the fares of Hackney-coaches, and of boats on the Thames, are established by law: tables of these fares may be found in most large accounts of London, and in several annual pocket-books.

FAREHAM, a town of Hampshire, having a market on Wednesdays, 74 miles W. by S. of London.

FAREWELL (Cape), the most southerly promontory of Greenland, lying at the entrance of Davis's Streight. Lat. 59. 38 N. Lon. 42. 30 W.

The same name is given to a promontory of New Zealand. Lat. 40. 37 S. Long. 172. 41 E.

FAREWE'LL. *ad.* 1. The parting compliment; adieu (*Shaksp*). 2. It is sometimes used only as an expression of separation without kindness (*Waller*).

FAREWE'LL. *s.* Leave; act of departure (*Shakspeare*).

FARFARA, (*farfara*, from *farfarus*, the white poplar, so called because its leaves resemble those of the white poplar). See TUSSILAGO.

FARI'NA. (*farina*, from *far*, corn, of which it is made). Meal or flour. A term given to the pulverulent and glutinous part of wheat and other seeds, which is obtained by grinding and sifting. It is highly nutritious, and consists of gluten, starch, and mucilage. See WHEAT, and POLLEN.

FARINACEOUS. A term given to all articles of food which contain farina. See FARINA.

FARLEW, money paid by the tenant in the west of England, in lieu of a heriot.

FARM, FARIN, or FERM, (*firma*), in law, signifies a little country messuage or district, containing house and land, with other conveniences; hired, or taken by lease, either in writing, or parole under a certain yearly rent. (See LEASE.) This in divers parts is differently termed: in the north it is a tack; in Lancashire, a fermeholt; in Essex, a wike, &c. In the corrupted Latin, *firma* signified a place inclosed or shut in: whence, in some provinces, Menage observes, they call closerie or closure, what in others they call a farm. Add, that we find *locare ad firmam*, to signify, to let to farm; probably on account of the sure hold the tenant here has, in comparison of tenants at will.

Spelman and Skinner, however, choose to derive the word farm from the Saxon *fearme*, or *feorme*, that is, *victus*, provision; because the country people and tenants anciently paid their rents in victuals and other necessaries, which were afterwards converted into the payment of a sum of money. Whence a farm was originally a place that furnished its landlord with provisions. And among the Normans they still distinguish between farms that pay in kind, i. e. provisions, and those which pay in money; calling the former simply *fermes*, and the latter *blanche ferme*, white ferm.

Spelman shows, that the word *firma* anciently signified not only what we now call a farm, but also a feast or entertainment, which the farmer gave the proprietor or landlord for a certain number of days, and at a certain rate for the lands he held of him. Thus *fearme* in the laws of king Canute is rendered by Mr. Lambard *victus:* and thus we read of *reddere firmam unius noctis*, and *reddebat unum diem de firma*; which denote provision for a night and a day, the rents about the time of the conquest being all paid in provisions; which custom is said to have been first altered under king Henry I. We also say to farm duties, imposts, &c.

FARM (Culture of a). See HUSBANDRY.

To FARM. *v. a.* (from the noun.) 1. To let out to tenants, at a certain rent (*Sh.*). 2. To take at a certain rate (*Camden*). 3. To cultivate land.

FA'RMER. *s.* (*fermier*, French.) 1. One who cultivates hired ground (*Shak.*). 2. One who cultivates ground (*Mortimer*).

FARMER (Hugh), a learned divine among the dissenters. He was descended from a respectable family in Merionethshire, and educated under Dr. Doddridge at Northampton. Early in life he settled at Walthamstow as pastor to the dissenting congregation there, and soon after his going to that place he was invited to take up his residence at the house of Mr. Snell, a gentleman of fortune, who delighted in his conversation. Here he continued till his death, which happened Feb. 5, 1787. Mr. Farmer is known by a Dissertation on Miracles, 8vo.; a Treatise on the Worship of Human Spirits in the ancient Heathen Nations, 8vo.; on Christ's Temptation, 8vo.; and on the Demoniacs, 8vo.

FARMER (Richard), a learned English divine and antiquary. He was born at Leicester in 1735, and educated at Emanuel college, Cambridge, where he proceeded to his degree of D.D. In 1775 he was chosen master of his college, and the same year served the office of vice-chancellor. Lord North gave him a prebend in the cathedral of Canterbury, which he resigned on obtaining a residentiaryship of St. Paul's. He had also some other church preferment, and was a fellow of the royal and antiquarian societies. The doctor died in the autumn of 1797.

Though a good classical scholar, Dr. Farmer has been celebrated only for that kind of literature which is connected with the English drama, and having a strong predilection for old English writers, he ranked high among the commentators upon Shakspeare. His essay upon the Learning of Shakspeare, dedicated to Mr. Cradock, the intelligent resident of Gumley-Hall, in Leicestershire, has passed through several editions. This essay was, in fact, the first foundation of his fame, which an unconquerable indolence prevented him from carrying to that height to which the exercise of his literary talents could not have failed to raise it. So great, indeed, was his love of ease, that after having announced for subscriptions a history of Leicestershire, and actually begun to print it, rather than submit to the fatigue of carrying it through the press, he returned the subscriptions, and presented the MSS. and plates to Mr. Nichols, the respectable printer of the Gentleman's Magazine, who has since carried on the history with a degree of spirit, ability, and industry, perhaps unprecedented in this department of literature.

Indolence and the love of ease were indeed the doctor's chief characteristics; and to them may be chiefly attributed a want of propriety in his external appearance, and in the usual forms of behaviour belonging to his station. The prevailing features of his character distinguished themselves by several oddities: there were three things, it was said, which the master of Emanuel loved, viz. old port, old clothes, and old books; and three things which no one could persuade him to perform, viz. to rise in the morning, to go to bed at night, and to settle an account. His accounts with some of his pupils, when tutor of his college, were never settled to the day of his death; and the young gentlemen not unfrequently took advantage of this unconquerable indolence, to borrow of him considerable sums, well knowing that there was little chance of a demand being ever made upon their parents. When in Cambridge, if an old house were pulled down, the master of Emanuel was always there in an old blue great coat, and a rusty hat. When in London, he was sure to be found in the same garb at an old book-stall, or standing at the corner of a dirty lane, poring through his glass at an old play-bill. By his enemies he is admitted to have been a man of generosity. As he obtained money easily, so he parted with it easily. Whilst he was always ready to relieve distress, his bounty was frequently bestowed on the patronage of learned men, and learned publications. He was, accordingly, a favourite with all who knew him. In his own college he was much loved; in the university he had, for many years, more influence than any other individual; and, with all his eccentricities, his death was a loss to that learned body, which, in the opinion of some of its members, has not yet been made up.

FA'RMOST. *a.* (superlative of *far.*) Most distant; remotest (*Dryden*).

FARN ISLANDS, two groups of little islands and rocks, 17 in number, lying opposite to Bamborough castle in Northumberland. At low water, the points of several others are visible, besides those above mentioned. The nearest island to the shore is called the House island, and lies exactly one mile and 68 chains from the coast. The most distant is about seven or eight miles. Their produce is kelp, feathers, and a few seals, which the tenant watches and shoots for the sake of the oil and skins. Some of them yield a little grass, that may serve to feed a cow or two; which the people transport over in their little boats. The largest, or House island, is about one mile in compass, and has a fort and a light-house. It contains about six or seven acres of rich pasture; and the shore abounds with good coals, which are dug at the ebb of tide.

FA'RNESS. *s.* (from *far.*) Distance; remoteness (*Carew*).

FARNHAM, a town of Surrey, having a market on Thursdays, for wheat, oats, and barley. It is 39 miles W.S.W. of London. Lat. 51. 16 N. Lon. 0. 46 W.

FARNOVIANS, in ecclesiastical history, a sect of Socinians, so called from Stanislaus Farnovius, who separated from the other Unitarians in the year 1568, and was followed by several persons eminent for their learning. This sect did not last long; for, having lost their chief, who died in 1615, it was scattered abroad, and reduced to nothing.

FARO, an island of Sweden, near the island of Gothland, about 33 miles in circuit. The chief town has the same name. Lat. 57. 50 N. Lon. 19. 7 E.

FARO, or PHARO. (*faro*, Italian; from φαρος, *pharos*, a *covering*, *mask*, or *integument*; and hence, in a secondary sense, a *lanthorn* or *light-house*, as affording a covering or protection to the lamp, or candle.) A game at cards invented at Venice, and, in its earlier and less complicated state, known by the name of *Bassetta*, or *Basset*; whence Dennis, "Gamesters would no more be known, and lady Dabcheck's *Basset-bank* would be broke." It appears to have been communicated to our own country from France.

This is often written, but erroneously, *Pharaoh*, or *Pharaon*, as though it were derived from the common title of the monarchs of ancient Egypt, instead of from the Greek φαρος (pharos); whence the Italian *faro*; in which last country this game originated, and where the term was formerly used, as among the Greeks, to imply a cloak, covering, veil, or mask.

The reason of this name the reader will perceive as he peruses our account of it, which will embrace the rules of the game; the method of playing it; its peculiar glossary, and scale of odds or chances.

Rules of the game.—The banker turns up the cards from a complete pack, deliberately, one by one, laying them alternately, first to his right for the bank, and then to his left-hand for the punter, till the whole are dealt out.

The punter may, at his option, set any number of stakes, agreeable to the sum limited, upon one or more cards chosen out of his livret, from the ace to the king inclusive, either previous to dealing the cards, or after any number of coups are made, or he may mask his bets, or change his cards whenever he pleases, or finally decline punting, except an event is unsettled when not above eight cards are undealt.

The banker wins when the card equal in points to that on which the stake is set turns up on his right hand, but loses when it is dealt to the left.

The punter loses half the stake when his card comes out twice in the same coup.

The last card neither wins nor loses.

The last card but one is called hocly, and forms part of the banker's gain; but now is frequently given up, and generally so in the last deal.

When by accident or design the pack happens to contain more or less than fifty-two cards, or should the last coup be found deficient, owing to any misdeal, however arising, whether discovered at the end or during the game, the bank must then pay every stake depending at the period when the error is detected, which payment must also be made if the cards are thrown up.

The dealer should hold the cards close in his hand, and always be prepared to inform any punter how many cards remain.

The first card is never valid till the second is dealt.

No person but the dealer or croupier should ever meddle with the cards, unless to cut them.

A paroli, &c. may be purchased by paying a sum equivalent to the stake.

Method of play.—The tailleur and croupier sit opposite each other, at a large oval table covered with a green cloth, on which is a line marked by coloured tape, or a wooden rim about an inch high, and eight from the edge of the table, for the purpose of separating those cards punted on from the others. Money is placed either loose in a well, or done up in rouleaus. The tailleur is to deal; while the croupier pays and receives, guards against errors, and shuffles another pack of cards.

The game may be played by any number of persons, each punter being furnished with a livret, from which having chosen a card, or cards, and placed the same on the table, just within the line, putting the stake either thereon, or upon other cards placed face downwards at the head of those betted on. The stakes are answered by the banker, who usually limits the sums according to his capital; and at public tables has generally two or more croupiers. Then the dealer having previously counted and shuffled the cards, and had them cut by a punter, should hold the pack tight in his hand, and shew the bottom card as a caution to avoid punting on it near the conclusion of the game, and to prevent mistakes, a similar card, with the corners cut off, is usually laid in the middle of the table; next he says play, and proceeds to deal slowly, first to the right, afterwards to the left, mentioning every one as he goes on, and stopping between each two cards, while the croup settles the event.

When a punter gains, he may either take his money or paroli; if he wins again, he may play sept & le va; should he then prove successful, he can paroli for quinze & le va; afterwards for trente & le va; and finally for soixante & le va; which is the highest chance in the game. Should the punter not like to venture so boldly, he may make a paix or pont; afterwards a double or treble paix, &c. or a single, double, or treble paix-paroli.

When doublets are dealt, the punter may either pay or make a pli.

A reckoning may be kept of the number of times each card is dealt, by properly placing a livret and bending the corners of similar cards, one way for the punter, another way for the dealer.

Glossary.—Banker; the person who keeps the table.

Cocking. See paroli.

Couche or *enjeu*; the stake.

Coup; a stroke or pull. Any two cards dealt alternately to the right and left.

Croupier; croup. An assistant to the dealer.

Doublet. Is when the punter's card is turned up twice in the same coup, then the bank wins half the stake. A single paroli must be taken down, but if there are several, only one retires.

Hocly; a certainty. Signifies the last card but one, the chance of which the banker claims, and may refuse to let any punter withdraw a card when eight or less remain to be dealt

Livret; a small book. A suit of thirteen cards, with four others called *figures*, viz. one, named the little figure, has a blue cross on each side, and represents ace, duce, trey; another, yellow on both sides, styled the yellow figure, signifies, four, five, six; a third, with a black lozenge in the centre, named the black figure, stands for seven, eight, nine, ten; and a red card, called the great or red figure, for knave, queen, king: these figures are useful for those who punt on several cards at once.

L'une pour l'autre; one for the other. Means a drawn game, and is said when two of the punter's cards are dealt in the same coup.

Mask. Signifies turning a card, or placing another face downwards, during any number of coups, on that whereon the punter has staked, and which he afterwards may display at pleasure.

Oppose; the opposite game. Is reversing the game, and having the cards on the right for the punter, and those on the left for the dealer.

Paix; peace. Equivalent to double or quits; is, when the punter, having won, does not choose to paroli and risque his stake, but bends or makes a bridge of his card, signifying that he ventures his gains only A double paix is, when the punter having won twice, bends two cards one over the other. Treble paix, thrice, &c. A paix may follow a sept, quinze, or trente, &c.

Paix-paroli. Is when a punter has gained a paroli, wishes then to play double or quits, and save his original stake, which he signifies by doubling a card after making his first paroli; double paix-paroli succeeds to winning a paix-paroli; treble paix-paroli follows double, &c.

Paroli or *parolet*; double. Sometimes called cocking, is when a punter, being fortunate, chooses to venture both his stake and gains, which he intimates by bending a corner of his card upwards.

Pli; bending. Is used when a punter, having lost half his stake by a doublet, bends a card in the middle, and setting it up with the points and foot towards the dealer, signifies thereby a desire either of recovering the moiety, or of losing all.

Pont; a bridge, The same as paix.

Ponte or *punt*; a point. The punter or player.

Quinze et le va; fifteen and it goes. Is when the punter having won a sept, &c. bends the third corner of the card, and ventures for 15 times his stake.

Sept et le va; seven, &c. Succeeds the gaining of a paroli, by which the punter being entitled to thrice his stake, risks the whole again, and bending his card a second time, tries to win seven-fold.

Soixante et le va; sixty-three, &c. Is when the player having obtained a trente, ventures all once more, which is signified by making a fifth paroli, either on another card, if he has parolied on one only before, or by breaking the side of that one which contains four, to pursue his luck in the next deal.

Tailleur; the dealer. Generally the banker.

Trente et le va; one and thirty. Follows a quinze, &c. when the punter again tries his luck, and makes a fourth paroli.

Odds or chances at the game.—The chances of doublets vary according to the number of similar cards remaining among those undealt.

The odds against the punter increase with every coup that is dealt.

When twenty cards remain in hand, and the punter's card but once in it, the banker's gain is 5 per cent.

When the punter's card is twice in twenty, the banker's gain is about the 34th part of the stake.

When the punter's card is thrice in twenty, the banker's gain is about 4 per cent.

When the punter's card is four times in twenty, the banker's gain is nearly the 18th part of the stake.

When only eight cards remain, it is 5 to 3 in favour of the bank; but when but six are left, it is 2 to 1; and when no more than four, it is 3 to 1.

Table exhibiting the odds against winning any number of events successively, equally applicable to Hazard, Billiards, Faro, Rouge and Noir, or other games of chance.

That the punter wins or loses the first time is an even bet. That he does not win twice together, is 3 to 1; three successive times, 7 to 1; four successive times, 15 to 1; five successive times, 31 to 1; six successive times, 63 to 1; seven successive times, 127 to 1; eight successive times, 255 to 1; nine successive times, 511 to 1; ten successive times, 1023 to 1; and so on to any number, doubling every time the last odds, and adding one for the stake.

N. B. A punter plays on the square by placing a stake, referring to both at the head of two cards that have been dealt thrice each, and neither of which is the bottom one.

Table disclosing, at the first view, the several advantages of the Banker, in whatever circumstances he may be placed.

Number of Cards in the Stock.	The Number of Times the Punter's Card is contained in the Stock.			
	1	2	3	4
52	**	**	**	50

10	10	14	12	8
8	8	11	9	6

Application of the table.—I. To find the gain of the banker when there are thirty cards remaining in the stock, and the punter's card twice in it. In the first column seek for the number answering to 30, the number of cards remaining in the stock: over against it, and under 2, at the head of the table, you will find 54, which shows that the banker's gain is the 54th part of the stake.

II. To find the gain of the banker when but ten cards are remaining in the stock, and the punter's card thrice in it. Against 10, the number of cards in the first column, and under number 3, you will find 12, which denotes that the banker's gain is the 12th part of the stake.

III. To find the banker's profit when the punter's cards remain twice in twenty-two In the first column find 22, the number of cards, over against it under figure 2, at the head of the table, you find 38, which shows that the gain is one 38th part of the stake.

IV. To find the banker's gain when eight cards remain, and the punter's card thrice among them. In the first column seek for 8, on a line with which, under the 3, stands the figure of 9, denoting the profits to be 1-9th, or 2s. 4d. in the guinea.

Corollary 1.—From the table it appears, that the fewer cards there are in the stock, the greater is the gain of the banker.

Corollary 2.—The least gain of the banker under the same circumstance, is when the punter's card is but twice in hand, the next greater when three times, still greater when but once, and the greatest of all when four times. The banker's profit is 3 per cent. upon all the sums adventured, supposing the punter's to stop when only six cards remain; but with hocly, it is full 5 per cent.

Faro di Messina, a promontory of Sicily, at the entrance of the strait between Italy and Sicily. It had formerly a light-house for the direction of mariners.

Faro, an episcopal town of Algarve, in Portugal. It was taken by Alphonso, king of Portugal, from the Moors, in 1429. Lat. 37. 14. N. Long. 7. 48. W.

Faro, Farro, or Feroe Islands, a cluster of small islands, in the Northern Ocean, between 5 and 8° W. long. and 61 and 63° N. lat. They are subject to Denmark. Seventeen are habitable, each of which is a lofty mountain, divided from the others by deep and rapid currents. Some of them are deeply indented with secure harbours, all of them steep, and most of them faced with tremendous precipices. The surface consists of a shallow soil of remarkable fertility; producing plenty of barley, and fine grass for sheep. No trees above the size of a juniper, or stunted willow, will grow here; nor are any quadrupeds to be seen, except sheep, and rats and mice, originally escaped from ships. Vast quantities of sea-fowls frequent the rocks, and the taking of them furnishes a perilous employment for the inhabitants. See Bird-catching.

FARQUHAR (George), a celebrated comic poet, born at Londonderry in Ireland, in 1678, and educated at Trinity college, Dublin, which he soon quitted to join a company of comedians. Not succeeding in Ireland, he went to London, and soon after received from the earl of Orrery a lieutenancy in his lordship's own regiment. In 1698, appeared his first dramatic piece, entitled, Love in a Bottle, which was well received. In 1700 he brought out his Constant Couple, or Trip to the Jubilee; and at the end of the same year he was in Holland, of which country he has given a humorous description in two of his letters. In 1701 appeared his comedy called Sir Harry Wildair, or the sequel to the Trip to the Jbuilee; and the year following his Miscellanies, or Collection of Poems, Letters, and Essays. In 1703 he brought out the Inconstant, or the Way to win him.

His next piece was the popular play of the Recruiting Officer, dedicated to all friends round the Wrekin, a famous hill near Shrewsbury. His last performance was the Beaux Stratagem, which had a great run. The author died in the midst of its success, in 1707. He left two daughters in very poor circumstances, but they were kindly provided for by Wilks the actor.

FARRA'GINOUS. *a.* (from *farrago*, Lat.) Formed of different materials (*Brown*).

FARRA'GO. *s.* (Latin.) A mass formed confusedly of several ingredients; a medley.

FARREATION, in antiquity. See Confarreation.

FARRIER, or Ferrier. (*ferrarius*, from ferrum, *iron*, Latin, the metal he works upon). One who forges horse-shoes, and fixes them on. In most villages, from his association with horses, he is styled the horse-doctor; but the diseases of this noble animal, and indeed of domestic quadrupeds in general, having been lately studied scientifically in Europe, under the appellation of veterinary medicine, we shall here regard the farrier as the mere mechanic or horse-shoe-maker, and refer the reader for whatever else relates to farriery to the article Veterinary medicine.

To Fa'rrier. *v. n.* (from the noun.) To practice surgery and give medicine to horses.

FARRIERY, the art of curing, palliating, or preventing the diseases of horses, called of late years, and since the subject has employed the attention of scientific persons, the veterinary art. See VETERINARY MEDICINE, and VETERINARY COLLEGE.

FARRINGDON, a town in Berks, with a market on Tuesdays. Lat. 51. 44 N. Lon. 1. 27 W.

FA'RROW. *s.* (ꝼeaꞃh, Saxon.) A litter of pigs (*Shakspeare*).

To FA'RROW. *v. a.* To bring pigs (*Tusser*).

FARS, or FARSISTAN, one of the most fertile provinces of Persia, in Asia. It is bounded by Kerman on the E. by Irac-Agemi on the N. by Chusistan on the W. and by the Gulph of Bussorah on the S. In this province are the ruins of the famous Persepolis.

FART. *s.* (ꝼeꞃꞇ, Saxon.) Wind from behind (*Suckling*).

To FART. *v. a.* (from the noun.) To break wind behind (*Swift*).

FARTACK, a town of Arabia Fœlix, in Asia. It is the capital of a kingdom of the same name. Lat. 15. 20 N. Lon. 51. 25 E.

FA'RTHER. *ad.* (We ought to write *further* and *furthest*, ꝼoꞃðeꞃ, ꝼuꞃðeꞃ, Saxon.) At a greater distance; to a greater distance; more remotely; beyond; moreover (*Locke*).

FA'RTHER. *a.* (supposed from *far*, more probably from *forth*, and to be written *further*.) 1. More remote (*Dryden*). 2. Longer; tending to greater distance (*Dryden*).

To FA'RTHER. *v. a.* (more proper *to further*.) To promote; to facilitate; to advance (*Dryd.*).

FA'RTHERANCE *s.* (more properly *furtherance*.) Encouragement; promotion (*Asc.*).

FARTHERMO'RE. *ad.* (more properly *furthermore*.) Besides; moreover (*Raleigh*).

FA'RTHEST. *ad.* (more properly *furthest*.) At the greatest distance; to the greatest distance.

FA'RTHEST. *a.* Most distant; remotest.

FA'RTHING. *s.* (ꝼeoꞃðlinᵹ, Saxon.) 1. The fourth of a penny (*Cocker*). 2. Copper money (*Gay*). 3. It is used sometimes in a sense hyperbolical; as it is not worth a *farthing*; or proverbial.

FARTHING OF GOLD, denotes in ancient books, ¼th of a noble.

FA'RTHINGALE. *s.* A hoop, used to spread the petticoat (*Swift*).

FA'RTHINGSWORTH. *s.* As much as is sold for a farthing (*Arbuthnot*).

FASCES, in antiquity, axes tied up together with rods or staves, and borne before the Roman magistrates, as a badge of their office and authority. In funeral processions it was customary to carry the fasces reversed, as a token of grief.

FA'SCIA. (*fascia*, from *fascis*, a bundle; because by means of a band materials are collected into a bundle.) In anatomy. A bandage, fillet, or roller: hence the aponeurotic expansions of muscles, which bind parts together, are termed fasciæ.

FASCIA, in antiquity, a thin sash, which the Roman women wrapped round their bodies, next to their skin, in order to make them slender.

FASCIA, in architecture. See FACE.

FASCIA, in astronomy. See BELTS.

FASCIA LATA, in anatomy, a thick and strong tendinous expansion sent off from the back, and from the tendons of the glutei and adjacent muscles, to surround the muscles of the thigh. It is thickest on the outside of the thigh and leg, but towards the inside of both becomes gradually thinner. A little below the trochanter major, it is firmly fixed to the linea aspera; and farther down, to that part of the head of the tibia that is next the fibula, where it sends off the tendinous expansion along the outside of the leg. It serves to strengthen the action of the muscles, by keeping them firm in their proper places when in action, particularly the tendons that pass over the joints where this membrane is thickest.

FASCIALIS. In anatomy. (*fascialis, musculus*.) See TENSOR VAGINÆ FEMORIS.

FA'SCIATED. *a.* (from *fascia*, Latin.) Bound with fillets; tied with a bandage.

FASCIA'TION. *s.* (*fascia*, Latin.) Bandage; the act of binding diseased parts (*Wiseman*).

FA'SCICLE. (*fasciculus*.) A small volume, or bundle; a livret.

FA'SCICLE. (*fasciculus*, from *fascis*, a bundle.) In botany. A species of inflorescence, or manner of flowering, in which several upright, parallel, fastigiate, approximating flowers are collected together: as in dianthus barbatus. Colligit flores erectos, parallelos, fastigiatos, approximatos. Hence

Fascicular root. A species of the tuberous, with the knobs collected in bundles as in pæonia.

Fasciculate leaves. Fascicled leaves. In botany. Growing in bundles or bunches from the same point, as in larix.

To FA'SCINATE. *v. a.* (*fascino*, Latin.) To bewitch; to enchant; to influence in some wicked and secret manner (*Decay of Piety*).

FASCINA'TION. *s.* (from *fascinate*.) The power or act of bewitching; enchantment; unseen inexplicable influence (*South*).

FASCINA'TION. (*fascinatio*, Latin; *βασκανια*, Greek; *quasi*, *φασκανια—παρα το φαεσι καινειν*, *oculis, aspectu, occidere*.) Incantation; witchcraft; an occult power possessed, or supposed to be possessed, by one animal operating upon another to its injury or destruction.

This is a subject which has never been thoroughly investigated; and a full examination of which would lead us far beyond the limits to which we are necessarily confined. We can only advert to a few particulars, which we should like to see comprehensively and rationally discussed; and we must for the present offer them without advancing any opinion of our own.

In all ages, and amidst all nations, animals of various kinds have been supposed to possess, either naturally, or by acquirement, a secret or occult control over other animals, sometimes communicated imperceptibly, sometimes through the medium of the eyes, which is the precise meaning of the term fascination; and sometimes through that of spells or sounds, which is the proper meaning of incantation, which has hitherto, though incorrectly, been regarded as its synonym.

Man has been supposed in all ages, and in almost all countries, to have at times possessed such a controul over his fellow man. Hence, the magicians of ancient Egypt; the inchanters of Persia and Arabia; the necromancers and sorcerers, the φαρμακοι and venefici of Greece and Rome; the witches, wizards, and weirds of the northern tribes. The idea is encouraged in the sacred scriptures; and distinct allusions are made, both in the Old and New Testaments, to a possession of this preternatural control.

We shall next observe, that a similar control appears to be exercised still, and to have been exercised from time immemorial, by man in a certain state of endowment, over other animals; and we now chiefly allude to the fascinating power of the ancient psylli of Egypt, and to various tribes of African barbarians over the entire race of serpents, the most poisonous of which they are capable of handling, and even of eating up alive, from foot to head, without sustaining the smallest injury whatever; the reptile, in every instance, appearing to sicken and to become deprived of power from the first moment it is seized, and implicitly resigning itself to the will of the fascinator. This assertion of ancient and modern historians has indeed been ridiculed by M. Denon, and his philosophic associates, but without any kind of authority whatever, and merely because it is a power, which, when in Egypt, they were not able either to comprehend or unravel. The concurrent testimony of the most honest and best informed travellers of all ages prove the existence of the fact. Bruce was an eye-witness to it in a variety of cases, and once or twice submitted to a preparation, which he was told by the tribes who were thus naturally gifted, would afford him an equal power, though only for a short period of time; but his heart in every instance misgave him after he had been prepared, and he was afraid to make the trial.

But it is not man only, who is from age to age reported to possess this occult control over his own and various other genera; but other animals are equally reported to possess a similar control.

Among the Roman philosophers and historians, the lion was believed to be in this manner charmed and deprived of all energy, by some occult power lodged in the game cock. Pliny makes particular mention of this fact, and ascribes it to the influence of the cock's comb. Nat. Hist. viii. 18. Lucretius, who, though a poet, was less apt to depend upon unauthenticated reports, alludes to the same fact, as a circumstance generally known and ascertained; but instead of ascribing the effect to the cock's comb, refers it, more plausibly at least, to the penetrative power of his eye.

Quem etiam gallum, noctem explodentibus alis,
Auroram clarâ consuetum voce vocare,
Nenec queunt rapidei constare leones,
Inque tueri? ita continuo meminere fugaï.
De Rer. Nat. iv. 714.

The lion, thus, the cock's indignant eye
Flies, nor can e'er encounter, loud of wing
Who drives the shadows, and the lazy dawn
Wakes with shrill clarion, iterated oft.

There are various other instances of fascination said to be exercised by one animal over another, to which we might advert if we had space; but we must limit ourselves to the very extraordinary power of this kind, generally admitted to belong to the serpent race, and more especially to the rattle-snake; and which, though chiefly exercised upon birds and the smaller quadrupeds, is affirmed by some writers, yet without sufficient authority, to have been extended to the horse, and even to man himself.

We will first advert to the observations of M. Vaillant, in his travels into the interior parts of Africa. On the confines of the European colony, at a place called Swortland, he tells us that he saw a shrike on the branch of a tree tremble as if in convulsions, whilst it uttered the most piercing cries of distress. Closer attention led him to discover upon the next branch of the same tree a large serpent, that, with stretched-out neck, and fiery eyes, though perfectly still, was gazing on the poor animal. He shot the serpent; but in the mean time the bird had died. Having measured the distance between the place where the shrike was seen in convulsions, and that occupied by the serpent when it was shot, he found it to be three feet and a half; which convinced him and his attendants, that the bird had not died either from the bite or the poison of its enemy. Indeed he stripped it before the whole company, and made them observe that it was untouched, and had not received the slightest wound. In another district of Africa, during the course of the same travels, he saw a small mense die in convulsions, occasioned by the fascinating power of a serpent, at the distance of two yards from it; and when he consulted his Hottentots upon this incident, he assures us, that they expressed no sort of astonishment, but asserted that the serpent has the faculty of attracting and fascinating such animals as it wishes to devour. He produces one instance of similar fascination upon a human subject, a captain in the Dutch service; who, after assuring our traveller that it is an event which happens very frequently, proceeded thus: "My testimony ought to have the more weight, as I had once nearly become myself a victim to this fascination. While in garrison at Ceylon, and amusing myself, like you, in hunting in a marsh, I was, in the course of my sport, suddenly seized with a convulsive and involuntary trembling, different from any thing I had ever experienced, and at the same time was strongly attracted, and in spite of myself, to a particular spot of the marsh. Directing my eyes to this spot, I beheld, with feelings of horror, a serpent of an enormous size, whose look instantly pierced me. Having, however, not yet lost all power of motion, I embraced the opportunity before it was too late, and saluted the reptile with the contents of my fusee. The report was a talisman that broke the charm. All at once, as if by a miracle, my convulsion ceased; I felt myself able to fly; and the only inconvenience of this extraordinary adventure was a cold sweat, which was doubtless the effect of my fear, and of the violent agitation my senses had undergone."

We have read of various cases of human fascination by the same means, but they have uniformly been accompanied with either a sudden or a steady view of the fascinating animal. We do not think that any of them are sufficiently supported for belief; but we should certainly be much more tempted to believe such cases than the case before us, in which the fascination preceded the view.

Of all the serpent tribe, however, the rattle-snake is said to possess this extraordinary faculty in the highest degree; and hence the fascination has been conjectured by some writers to reside in the rattle itself, instead of in the eyes. One of the first who started this idea was Dr. Mead; and his opinion has been of late years supported by a similar belief, on the part of professor Blumenbach of Gottingen. "With respect to the use of the rattle," says Dr. Mead, "a vulgar error has obtained even among the learned. It is commonly said that it is a kind of contrivance of Providence, to give warning to passengers, by the noise which this part makes when the creature moves, to keep out of the way of its mischief. Now, this is a mistake. It is beyond all dispute, that wisdom and goodness shine forth in the works of the Creator: but the contrivance here is of another kind than is imagined. All the parts of animals are made either for the preservation of the individual, or for the propagation of its species. This before us is for the service of the individual. This snake lives chiefly upon squirrels and birds, which a reptile can never catch, without the advantage of some management to bring them within its reach. The way is this: The snake creeps to the foot of a tree, and by shaking his rattle, awakens the little creatures which are lodged in it. They are so frighted at the sight of their enemy, who fixes his lively, piercing eyes upon one or other of them, that they have no power to get away, but leap about from bough to bough till they are quite tired, and at last, falling to the ground, they are snapped into his mouth! This is by the people of the country called *charming* the squirrels and birds."

But, if various serpents, that have no rattle, be possessed, as they appear to be, of the same power, then the argument no longer holds good. On this account, a third hypothesis has been offered, which consists in ascribing the fascinating influence to a vapour or miasm which issues from the body of the serpent, and produces so extraordinary an effect: while a fourth opinion has been started still later, which consists in denying the existence of any fascinating power whatever.

The most strenuous supporter of this last opinion is professor Barton of Philadelphia, who wrote a memoir upon this subject, in 1796, in which he stated his objections at full length, admitting indeed the fact, but controverting the mode of accounting for it upon any occult or recondite principle. "The snake," says he, "whatever its species may be, lying at the bottom of the tree or bush upon which the bird or squirrel sits, fixes its eyes upon the animal it designs to fascinate or enchant. No sooner is this done, than the unhappy animal is unable to make its escape. It now begins to utter a most piteous cry, which is well known by those who hear it and understand the whole machinery of the business, to be the cry of a creature enchanted. If it is a squirrel, it runs up the tree for a short distance, comes down again, then runs up, and lastly, comes lower down. The snake still continues at the foot of the tree, with its eyes fixed on the squirrel, with which its attention is so entirely taken up, that a person accidentally approaching may make a considerable noise, without the snake's so much as turning about. The squirrel, as before mentioned, comes always lower, and at last leaps down to the snake, whose mouth is already wide open for its reception. The poor little animal then, with a piteous cry, runs into the snake's jaws and is swallowed at once, if it be not too big; but if its size will not allow it to be swallowed at once, the snake licks it several times with its tongue, and smoothens it, and by that means makes it fit for swallowing."

Having thus stated the fact, the writer next enters into the question of a fascinating influence, and the various modes we have already adverted to, by which it is accounted for, and each of which he determines to be equally nugatory. With respect to the theory of an emitted vapour, "I know," says he, "that in some of the larger species of serpents, inhabiting South America and other countries, there is evolved in the stomach, during the long and tedious process of digestion in these animals, a vapour or a gas, whose odour is intensely fetid. I have not, however, found that this is the case with the rattle-snake and other North American serpents that I have examined. But my own observations on this head have not been very minute. I have made inquiry of some persons (whose prejudices against the serpent tribe are not so powerful as my own), who are not afraid to put the heads and necks of the black snake, and other serpents that are destitute of venomous fangs, into their mouths, and have been informed, that they never perceived any disagreeable smell to proceed from the breath of these animals. I have been present at the opening of a box which contained a number of living serpents; and although the box had been so close as to admit but a very small quantity of fresh air, although the observation was made in a small warm room, I did not perceive any peculiarly disagreeable effluvium to arise from the bodies of these animals. I am, moreover, informed by a member of this society, who has, for a considerable time, had a rattle-snake under his immediate care, that he had not observed that any disagreeable vapour proceeds from this reptile. On the other hand, however, it is asserted by some creditable persons of my acquaintance, that a most offensive odour, similar to that of flesh in the last stage of putrefaction, is continually emanating from every part of the rattle-snake, and some other species of serpents. This odour extends, under certain circumstances, to a considerable distance from the body of the animal. Mr. William Bartram assures me, that he has observed 'horses to be sensible of, and greatly agitated by it, at the distance of forty or fifty yards from the snake. They shewed (he says) their abhorrence by snorting, winnowing, and starting from the road, endeavouring to throw their riders, in order to make their escape.' This fact, related by a man of rigid veracity, is extremely curious; and in an especial manner deserves the attention of those writers who imagine that this fetid emanation from serpents is capable of affecting birds, at small distances, with a kind of asphyxy."

The professor concludes with observing, that "the result of not a little attention to the subject, has taught me that there is but one wonder in the business;—the wonder that the story should ever have been believed by a man of understanding and of observation." Fascination, adds he, is chiefly limited to birds that build low, and "in almost every instance, I found that the supposed fascinating faculty of the serpent was exerted upon the birds at the particular season of their laying their eggs, of their hatching, or of their rearing their young, still tender and defenceless. I now began to suspect, that the cries and fears of birds, supposed to be fascinated, originated in an endeavour to protect their nest or young. My inquiries have convinced me that this is the case." He imagines that the old birds are merely caught by a courageous advancing, rather than by a fearful and retreating fluttering—a fluttering intended to frighten away the serpent itself; and that in exercising this sleight, it advances too far, and falls a prey to its own temerity.

We cannot say that we are convinced by this reasoning; and still less are we satisfied with the argument adduced to prove that the fascinating power may not exist in a vapour or effluvium thrown forth from the body of the serpent, because, in such case, it would be generally discoverable by a specific odour. What odour accompanies the vapour, that, issuing from the surface of the electric eel, exhausts the muscular power of the hand that attempts to grasp it? It is in like manner, perhaps, an effluvium equally specific that agitates the nervous system of various persons, who are peculiarly affected, and may be said to be fascinated by the presence of a cat. The writer of this article has witnessed such agitations and under circumstances in which the cat was not seen or known to be present; and where the agitation took place on the moment of the cat's introduction into the room; and yet in no such cases is the effect attended with a sense of any kind of odour, either to the person affected, or to by-standers, who are free from such affection. In reality, the finest vapours and the purest gasses we are acquainted with have neither odour nor any other sensible quality by which we can distinguish them, and are only to be ascertained by their effects. Miasms and contagions have seldom, perhaps never, any odour, unless combined with other materials; light, caloric, and oxygen are equally destitute. We do not, then, contend that the efflux of vapour from the surface of serpents is the cause of fascination, but only that the argument has not been fairly met and rebutted by the present objection.

We cannot conclude this article better than in the words of Mr. Pennant: "Of the fascinating power of the rattle-snake, it is difficult to speak. Authors of credit describe the effects. Birds have been seen to drop into its mouth; squirrels descend from their trees, and leverets run into its jaws. Terror and amazement seem to lay hold on these little animals: they make violent efforts to get away, still keeping their eyes fixed on those of the snake; at length, wearied with their movements, and frightened out of all capacity of knowing the course they ought to take, they become the prey of the expecting devourer, probably in their last convulsive motion."

FASCINES, in fortification, faggots of small wood of about a foot diameter, and six feet long, bound in the middle and at both ends. They are used in raising batteries, making chandeliers, in filling up the moat to facilitate the passage to the wall, in binding the ramparts where the earth is bad, and in making parapets of trenches to screen the men.

FA'SCINOUS. *a.* (*fascinum*, Lat.) Caused or acting by witchcraft: not in use (*Harvey*).

FASCIOLA. Gourdworm. Flake. In zoology, a genus of the class vermes, order intestina. Body flattish, with an aperture, or pore at the head, and generally another at a distance beneath, seldom a single aperture. These are hermaphrodite, oviparous, and are generally found in the stomach, intestines, or liver; the intestines are flexuous and the ovaries lateral. Forty-six species.

A. Infesting Mammals.
B. ——— Birds.
C. ——— Reptiles.
D. ——— Fishes.
E. ——— Worms.

The tribe A. of different species is found in man, the fox, polecat, badger, long-eared bat, sheep, swine, deer, horse, and stag. B. in the eagle, buzzard, kite, duck, crane, goose, bittern. C. salamander, frog. D. eel, whiting, haddock, blenny, father-lasher, plaise, perch, salmon, trout, pike, and bream. E. cuttle-fish.

The most common species is F. hepatica, or liver-flake, with body ovate and sharper before, with a white line down the middle, and spot in the centre; inhabiting the liver of sheep, which often vomits it up in brooks; generally found fixed by a pore at the extremity and another in the middle of the abdomen, and occasions or is produced by, dropsy and the disorder called the rot.

Body about an inch long; broader on the fore part, and terminated by a tube; the back marked with about eight longitudinal furrows in two series. See the article ROT.

FA'SHION. *s.* (*façon*, French.) 1. Form; make; state of any thing with regard to outward appearance (*Luke*). 2. The make or cut of clothes (*Shakspeare*). 3. Manner; sort; way (*Hayward*). 4. Custom operating upon dress, or any domestic ornaments (*Shakspeare*). 5. Custom; general practice (*Tillotson*). 6. Manner imitated from another; way established by precedent (*Shakspeare*). 7. General approbation; mode (*Pope*). 8. Rank; condition above the vulgar (*Raleigh*). 9. Any thing worn (*Shakspeare*). 10. The farcy, a distemper in horses (*Shakspeare*).

To FA'SHION. *v. a.* (*façonner*, French.) 1. To form; to mould; to figure (*Raleigh*). 2. To fit; to adapt; to accommodate (*Spenser*). 3. To counterfeit; not used (*Shakspeare*). 4. To make according to the rule prescribed by custom (*Locke*).

FASHION PIECES, in the sea language, the aftmost or hindmost timbers of a ship, which terminate the breadth, and form the shape of the stern. They are united to the stern-post, and to the extremity of the wing transom, by a rabbit, and a number of strong nails or spikes driven from without.

FA'SHIONABLE. *a.* (from *fashion.*) 1. Approved by custom; established by custom; modish (*Rogers*). 2. Made according to the mode (*Dryden*). 3. Observant of the mode (*Shakspeare*). 4. Having rank above the vulgar, and below nobility.

FA'SHIONABLENESS. *s.* (from *fashionable.*) Modish elegance (*Locke*).

FA'SHIONABLY. *ad.* (from *fashionable.*) In a manner conformable to custom; with modish elegance (*South*).

FA'SHIONIST. *s.* (from *fashion.*) A follower of the mode; a sop; a coxcomb.

FAST, in general, denotes an abstinence from food, but is more particularly used for such abstinence on a religious account.

Religious fasting has been practised by most nations from the remotest antiquity. Some divines even assign its origin to the earthly paradise, where our first parents were forbidden to eat of the tree of knowledge. But though this seems carrying the matter too far, it is certain that the Jewish church has observed fasts ever since its first institution. Nor were the neighbouring heathens, viz. the Egyptians, Phœnicians, and Assyrians, without their fasts. The Egyptians, according to Herodotus, sacrificed a cow to Isis, after having prepared themselves by fasting and prayer: a custom which he likewise ascribes to the women of Cyrene. Porphyry affirms, that the Egyptians, before their stated sacrifices, always fasted a great many days, sometimes for six weeks; and that the least behoved to be for seven days; during all which time the priests and devotees not only abstained from flesh, fish, wine, and oil, but even from bread, and some kinds of pulse. These austerities were communicated by them to the Greeks, who observed their fasts much in the same manner. The Athenians had the Eleusinian and Thesmophorian fasts, the observation of which was very rigorous, especially among the women, who spent one whole day sitting on the ground in a mournful dress, without taking any nourishment. In the island of Crete, the priests of Jupiter were obliged to abstain all their lives from fish, flesh, and baked meats. Apuleius informs us, that whoever had a mind to be initiated in the mysteries of Cybele, were obliged to prepare themselves by fasting ten days; and, in short, all the pagan deities, whether male or female, required this duty of those that desired to be initiated into their mysteries of their priests and priestesses that gave the oracles, and of those that came to consult them.

Though fasting is not positively enjoined by Christ or his apostles, a custom prevailed among the first Christians of joining abstinence with their prayers, especially when they were engaged in affairs of extraordinary importance. But in the most ancient times we find no mention of any public and solemn fasts, except upon the anniversary of Christ's crucifixion. However, in process of time, days of fasting were gradually introduced, first by custom, and afterwards by positive appointment; though it is not certain what those days were, nor whether they were observed in the first century. Mr. Mosheim acknowledges, that those who affirm, that in the time of the apostles, or soon after, the fourth and sixth days of the week were observed as fasts, are not destitute of specious arguments in favour of their opinion. Eccles. Hist. vol. i. p. 106. 8vo.

To FAST. *v. n.* (*fastan*, Goth. ꝼæꞅꞇan, Saxon.) 1. To abstain from food (*Bacon*). 2. To mortify the body by religious abstinence (*Matthew*).

FAST. *a.* (ꝼæꞅꞇ, Saxon.) 1. Firm; immovable (*Milton*). 2. Strong; impregnable (*Spenser*). 3. Fixed; adhering (*Temple*). 4. Deep; sound (*Shakspeare*). 5. Firm in adherence (*Ascham*). 6. (from *ffest*, Welch.) Speedy; quick; swift (*Davies*). 7. FAST *and loose.* Uncertain; variable: inconstant; deceitful (*Sidney*).

FAST. *ad.* 1. Firmly; immovably (*Shakspeare*). 2. Closely; nearly (*Knolles*). 3. Swiftly; nimbly (*Daniel*). 4. Frequently (*Hammond*).

FAST-DAYS, are those appointed by public authority to be observed by fasting and humiliation. The Church of England enjoins 16 vigils or fasts before holidays, 40 fasts in lent, 12 ember days, 3 rogation days, 4 solemn days, and all Fridays in the year. Besides which there is generally an annual fast in time of war.

To FA'STEN. *v. a.* (from *fast.*) 1. To make fast; to make firm (*Dryden*). 2. To hold together; to cement; to link. 3. To affix; to conjoin (*Swift*). 4. To stamp; to impress; to fix (*Shakspeare*). 5. To unite inseparably (*Decay of Piety*). 6. To lay on with strength (*Dryden*).

To FA'STEN. *v. n.* To fix one's self (*Brown*).

FA'STENER. *s.* (from *fasten.*) One that makes fast or firm.

FA'STER. *s.* (from *fast.*) He who abstains from food.

FASTERMANS, or FASTING-MEN, in our old customs, denoted men in repute and substance, who were responsible for each other's behaviour.

FA'STHANDED. *a* (*fast* and *hand.*) Avaricious; closehanded; covetous (*Bacon.*)

FASTI, in Roman antiquity, the kalendar wherein were expressed the several days of the year, with their feasts, games, and other ceremonies. There were two sorts of fasti, the greater, or *fasti magistrales*, and the less, or *fasti kalendares*. The fasti magistrales contained, besides the several feasts, &c. the birth-days and other circumstances relating to the magistrates and emperors. The fasti kalendares were also of two kinds, urbani and rustici; the former contained an account of the feasts and ceremonies observed in the city; the latter, of those observed in the country, which were fewer, as too much time taken up in this way would interfere with the cultivation of the earth.

FASTI was also a chronicle of time, wherein noted events were registered according to the years of the respective consuls.

FASTI, or DIES FASTI, likewise denoted court-days.

FASTIDIO'SITY. *s.* (from *fastidious.*) Disdainfulness; contemptuousness (*Swift*).

FASTI'DIOUS. *a.* (*fastidiosus*, Lat.) Disdainful; squeamish; insolently nice (*South*).

FASTI'DIOUSLY. *ad.* Disdainfully; contemptuously; squeamishly (*Government of the Tongue*).

FASTIGIATE. (*fastigium*, the pointed top, or roof of a building.) In botany, applied to various parts of a plant. A fastigiate stem, having branches of an equal height. Peduncles are fastigiate, when they elevate the fructifications in a bunch, so that they are all of an equal height, as if they had been shorn off horizontally, or when they are so proportioned, as to form an even surface at top, like a flat roof: as in dianthus and silene. A fastigiate umbel, an umbel rising gradually. This is a different idea from the former; and in Philos, Botan. the umbellate flower is thus described: est aggregate ex flosculis pluribus insidentibus receptaculo in pedunculos fastigiatos, omnes ex eodem puncto productos. Here we are probably to understand *fastigiatos* in the former sense of level-topped: but it is doubtful how Linnéus came to annex this idea to *fastigium* and its derivatives; since roofs are not flat in northern countries; and although they be so in the east, and in some parts of Italy, yet *fastigiatus* seems rather applied to lofty and pointed buildings. Thus Solinus, speaking of the pyramids—turres sunt in Ægypto fastigiatæ, ultra celsitudinem omnem, quæ fieri manu possit.

FASTIGIUM, in architecture. See PEDIMENT.

FASTING, the abstaining from food. Many extraordinary stories have been related of long continued fasting. Sir William Hamilton gives an account of two fattened hogs, that lay buried under a heap of ruins in Soriano, and were taken out alive the 42d day. And, in the shipwreck of the Juno off the coast of Aracan, in the year 1795, those persons who survived the wreck lived 23 days without any other sustenance than what was derived from the sea-water which they sucked out of their garments.

FA'STINGDAY. *s.* (*fast* and *day*.) Day of mortification by religious abstinence (*Taylor*).

FA'STNESS. *s.* (from *fast*.) 1. State of being fast. 2. Firmness; firm adherence (*Bacon*). 3. Strength; security (*Davies*). 4. A strong place; a place not easily forced. 5. Closeness; conciseness: not used (*Ascham*).

FASTOLFF (sir John), a famous general, born at Yarmouth in Norfolk, in 1377. He served with great glory in France, where he obtained several high posts while the English held their possessions in that kingdom. In 1440 he returned home covered with laurels, and his conduct afterwards showed that he deserved them; for he was bountiful to the poor, and a liberal encourager of learning. He left a considerable legacy for building the schools of philosophy and civil law at Cambridge, and was a great benefactor to Magdalen college, Oxford. He died in 1459. Shakspeare has been censured for abusing this excellent man, under the ludicrous character of sir John Falstaff; but it is probable that the poet had no thoughts of ridiculing Fastolff, and that the coincidence is merely accidental.

FA'STUOUS. *a.* (*fastuosus*, Latin.) Proud; haughty.

FAT. *a.* (fæt, Saxon.) 1. Full-fed; plump; fleshy (*Arbuthnot*). 2. Coarse; gross; dull (*Dryden*). 3. Wealthy; rich (*Milton*).

FAT. (*adeps.*) A concrete oily matter contained in the cellular membrane of animals, of a white or yellowish colour, with little or no smell or taste. It differs in all animals in solidity, colour, taste, &c. and likewise in the same animal at different ages. In infancy it is white, insipid, and not very solid; in the adult it is firm and yellowish, and in animals of an advanced age, its colour is deeper, its consistence various, and its taste in general stronger.

It is collected in particular follicles of the cellular membrane, accumulated in the groin, epiploon, around the kidnies and blood-vessels; and is secreted on the surface of the skin by a set of minute glands, on this account called sebacic, where it sometimes concretes, chiefly, though not always, from want of cleanliness, and exhibits the appearance of small worms: it is accumulated from diminished perspiration; from the nature of the aliments fed on; and from idiosyncrasy. It forms sometimes steatomatous humours, and, by the possession of a small quantity of oxygen, contains the sebacic acid, which acts readily on vessels of lead, copper, and iron, in which it is often deposited for culinary purposes.

Fats and oils are commonly divided into spermaceti, fat properly so called, fish or thran-oil, and empyreumatic oil, extracted by distillation from many vegetable and animal substances. Chemically analysed it is found to possess five parts out of six of carbon, and one of hydrogen, with a very small portion, as already observed, of oxygen. Fat meat is nourishing to those that have strong digestive powers. It is used externally as a softening remedy, and enters into the composition of ointments and plaisters.

To FAT. *v. n.* To grow fat; to grow full-fleshed (*L'Estrange*).

To FAT. *v. a.* (from the noun.) To make fat; to fatten; to make fleshy (*Abbot.*).

FATA MORGANA, by the French denominated *mirages*, a very remarkable phenomenon, which is sometimes observed from the harbour of Messina and adjacent places, at a certain height in the atmosphere. The name which signifies the *Fairy Morgana* is derived from an opinion of the superstitious Sicilians, that the whole spectacle is produced by fairies, or such like visionary invisible beings. The populace are delighted whenever it appears; and run about the streets shouting for joy, calling every body out to partake of the glorious sight.

This singular meteor has been described by various authors; but the first who mentioned it with any degree of precision was father Angelucci, who observed it in 1643. His account does not differ very materially from that given by P. Minasi in his Dissertation on this phænomenon, published in 1773. But as the latter is more minute, we present part of it to our readers: "When the rising sun shines from that point whence its incident ray forms an angle of about 45° on the sea of Reggio, and the bright surface of the water in the bay is not disturbed either by the wind or the current, the spectator being placed on an eminence of the city, with his back to the sun and his face to the sea, on a sudden there appear in the water, as in a catoptric theatre, various multiplied objects, that is to say, numberless series of pilasters, arches, castles well delineated, regular columns, lofty towers, superb palaces, with balconies and windows, extended alleys of trees, delightful plains with herds and flocks, armies of men on foot and horseback, and many strange images in their natural colours and proper actions, passing rapidly in succession along the surface of the sea during the whole of the short period of time while the above-mentioned causes remain. But if, in addition to the circumstances before described, the atmosphere be highly impregnated with vapour, and dense exhalations not previously dispersed by the action of the wind or waves, or rarefied by the sun, it then happens that in this vapour, as in a curtain, extended along the channel to the height of about 30 palms, and nearly down to the sea, the observer will behold the scene of the same objects not only reflected from the surface of the sea, but likewise in the air, though not so distinct or well defined as the former objects from the sea. Lastly, if the air be slightly hazy and opake, and at the same time dewy, and adapted to form the iris, then the above-mentioned objects will appear only at the surface of the sea, as in the first case, but all vividly coloured or fringed, with red, green, blue, and other prismatic colours."

Minasi, therefore, distinguishes three sorts of Fata Morgana: that is to say, the first at the surface of the sea, which he calls the Marine Morgana; the second in the air, called the Aërial Morgana; and the third only at the surface of the sea, which he calls the Morgana fringed with prismatic colours.

Different accounts have been given of this singular appearance: M. Houel attributes it to a bitumen that issues from certain rocks at the bottom of the sea, and which is often seen to cover a part of its surface in the canal of Messina. The subtle parts of this bitumen being attenuated, combined, and exhaled with the aqueous globules that are raised by the air, and formed into bodies of vapour, give to this condensed vapour more consistence; and contribute, by their smooth and polished particles, to the formation of a kind of aërial crystal, which receives the light, reflects it to the eye, and transmits to it all the luminous points which colour the objects exhibited in this phenomenon, and render them visible.

A curious print, exhibiting the Fata Morgana, may be seen in Nicholson's Journal, vol. 1. 4to. Some further particulars respecting this singular phenomenon may also be seen in No. 52 of Tilloch's Philosophical Magazine.

By Mr. Good it is very plausibly resolved into *striæ* or strata of different densities in the atmosphere. See his translation of Lucretius, note to vol. ii. p. 25.

FA'TAL. *a.* (*fatalis*, Latin.) 1. Deadly; mortal; destructive (*Dryden*). 2. Proceeding by destiny; inevitable; necessary (*Tillotson*). 3. Appointed by destiny (*Bacon*).

FA'TALIST. *s.* (from *fate.*) One who maintains that all things happen by invincible necessity (*Watts*).

FATA'LITY. *s.* (*fatalité*, French.) 1. Predestination; predetermined order or series of things and events (*South*). 2. Decree of fate (*King Charles*). 3. Tendency to danger (*Brown*).

FA'TALLY. *ad.* (from *fatal.*) 1. Mortally; destructively, even to death (*Dryden*). the decree of fate (*Bentley*).

FA'TALNESS. *s.* (from *fatal.*) Invincible necessity.

FATE, FATUM, denotes an inevitable necessity, depending upon a superior cause. The word is formed *a fando*, from speaking: and primarily implies the same with *effatum*, viz. a word or decree pronounced by God; or a fixed sentence, whereby the Deity has prescribed the order of things, and allotted to every person what shall befall him. The Greeks called it ειμαρμενη, as it were a chain or necessary series of things indissolubly linked together. It is also used to express a certain unavoidable designation of things, by which all agents, both necessary and voluntary, are swayed and directed to their ends. See NECESSITY. In this last sense, fate is distinguished into, 1. Astrological fate, arising from the influence and position of the heavenly bodies; which (it is supposed) gave laws both to the elements and mixed bodies, and to the will of men. 2. Stoical fate, defined by Cicero an order or series of causes, wherein cause being linked to cause, each produces another, and thus all things flow from one prime cause. To this fate the Stoics subject even the gods.

FA'TED. *a.* (from *fate.*) 1. Decreed by fate (*Dryden*). 2. Modelled in any matter by fate (*Prior*). 3. Endued with any quality by fate (*Dryden*).

FATES, in mythology. See PARCÆ.

FATHEMITES, or FATEMITES, the descendants of Mahomet by Fathema or Fatema his daughter.

FA'THER. *s.* (ꝼaðeꞃ, Saxon.) 1. He by whom the son or daughter is begotten (*Bacon*). 2. The first ancestor (*Romans*). 3. The appellation of an old man (*Camden*). 4. The title of any man reverend for age, learning, and piety (*Shakspeare*). 3. One who has given original to any thing good or bad (*Genesis*). 6. The ecclesiastical writers of the first six or eight centuries (*Stillingfleet*). 7. One who acts with paternal care and tenderness (*Job*). 8. The title of a popish confessor (*Addison*). 9. The title of a senator of old Rome (*Dryden*). 10. The appellation of the first person of the adorable Trinity (*Taylor*). 11. The compellation of God as Creator (*C. Prayer*). 12. A title given to prelates, and other church dignitaries.

FATHER-IN-LAW. *s.* (from *father.*) The father of one's husband or wife (*Addison*).

FATHER (Natural), he who has illegitimate children.

FATHER (Adoptive), he who takes the children of some other, and achnowledges them as his own.

FATHER (Putative), the reputed or supposed father.

FATHER-LASHER, in ichthyology. See COTTUS.

FATHER-LONG-LEGS, in entomology. See TIPULA.

To FATHER. *v. a.* 1. To take; to adopt as a son or daughter (*Shakspeare*). 2. To supply with a father (*Shakspeare*). 3. To adopt a composition (*Swift*). 4. To ascribe to any one as his offspring, or production (*Hooker*).

FA'THERHOOD. *s.* (from *father.*) The character or authority of a father (*Hall*).

FA'THERLESS. *a.* (from *father.*) Wanting a father; destitute of a father (*Addison*).

FA'THERLINESS. *s.* (from *father.*) The tenderness of a father; parental kindness.

FA'THERLY. *a.* (from *father.*) Paternal; like a father; tender; protecting (*Shakspeare*).

FA'THERLY. *ad.* In the manner of a father (*Milton*).

FA'THOM. *s.* (ꝼæðm, Saxon.) 1. A measure of length containing six feet; the space to which a man can extend both arms (*Holder*). 2. Reach; penetration; depth of contrivance; compass of thought (*Shakspeare*).

To FA'THOM. *v. a.* (from the noun.) 1. To encompass with the arms extended or encircling. 2. To reach; to master (*Dryden*). 3. To sound; to try with respect to the depth (*Felton*). 4. To penetrate into; to find the bottom; as, *I cannot* fathom *his design.*

FA'THOMLESS. *a.* (from *fathom.*) 1. That of which no bottom can be found. 2. That of which the circumference cannot be embraced (*Shakspeare*).

FATI'DICAL. *a.* (*fatidicus*, Latin.) Prophetic; having the power to foretell (*Howel*).

FA'TIFEROUS. *a.* (*fatifer*, Lat.) Deadly; mortal; destructive.

FA'TIGABLE. *a.* (*fatigo*, Latin.) Easily wearied; susceptible of weariness.

To FA'TIGATE. *v. a.* (*fatigo*, Latin.) To weary; to fatigue: not in use (*Shakspeare*).

FATI'GUE. *s.* (*fatigue*, Fr.) 1. Weariness; lassitude. The cause of weariness; labour; toil (*Dryden*).

To FATIGUE. *v. a.* (*fatiguer*, French.) To tire; to weary; to harass with toil (*Prior*).

FATKI'DNEYED. *a.* (*fat* and *kidney.*) Fat: by way of reproach or contempt (*Shakspeare*).

FA'TLING. *s.* (from *fat.*) A young animal fed fat for the slaughter (*Isaiah*).

FA'TNER. *s.* (from *fat.*) That which gives fatness (*Arbuthnot*).

FA'TNESS. *s.* (from *fat.*) 1. The quality of being fat or plump. 2. Fat; grease; fulness of flesh (*Spenser*). 3. Unctuous or greasy matter (*Bacon*). 4. Oleaginousness; sliminess (*Arbuthnot*). 5. Fertility; fruitfulness (*Gen.*). 6. That which causes fertility (*Philips*).

To FA'TTEN. *v. a.* (from *fat.*) 1. To feed up; to make fleshy (*Arbuthnot*). 2. To make fruitful (*Dryden*). 3. To feed grossly; to increase (*Dryden*).

To FA'TTEN. *v. n.* (from *fat.*) To grow fat; to be pampered (*Otway*).

FA'TTY. *a.* (from *fat.*) Unctuous; oleaginous; greasy (*Bacon*).

FATUARII, in antiquity, persons who appeared inspired, and foretold things to come.

FATUITAS. (*fatuitas*; from *fatuus*, silly.) Foolishness. A synonym of amentia.

FATU'ITY. *s.* (*fatuité*, Fr.) Foolishness; weakness of mind (*K. Charles*).

FA'TUOUS. *a.* (*fatuus*, Lat.) 1. Stupid; foolish; feeble of mind (*Glanville*). 2. Impotent; without force (*Denham*).

FA'TWITTED. *a.* (*fat* and *wit.*) Heavy; dull; stupid (*Shakspeare*).

FAUCES. (*faux*, *fauces.*) A cavity behind the tongue, palatine arch, uvula, and tonsils; from which the pharynx and larynx proceed.

FA'UCET. *s.* (*fausset*, French.) The pipe inserted into a vessel to give vent to the liquor, and stopped up by a peg or spigot (*Swift*).

FAUCHEUR (Michael le), a French protestant divine, greatly admired for his eloquence. The marquis de la Force said, after hearing him preach against duelling, "If a challenge were to be sent to me, I would refuse it." He died at Paris in 1667. His works are; 1. A Treatise on oratorical Action. 2. Sermons, in 8vo. 3. Christian Prayers and Meditations. 4. A Treatise on the Eucharist, against cardinal Perron.

FAUCHION. (See FALCHION.) A crooked sword.

FAUCON, or FALCON, a name formerly given to a small piece of canon, whose diameter was 2¾ inches; weight 750 pounds; length 7 feet; load 2¼ pound; shot 2½ inches diameter, and 2½ pound weight. See CANNON.

FAUCONET, or FALCONET, a very small piece of ordnance, whose diameter at the bore was 2¼ inches; weight 400 pounds; length 6 feet; load 1¼ pound; shot something more than two inches diameter, and 1⅛ pound weight.

FA'UFEL. *s.* (French.) The fruit of a species of the palm-tree.

FAVI'LLOUS. *a.* (*favilla*, Latin.) Consisting of ashes (*Brown*).

FAVISSÆ, in antiquity. 1. Cisterns to keep water in. 2. Subterraneous reservoirs in which were laid old statues, and other things formerly used in the temple.

FA'ULCON. *s.* See FALCON.

FAULT. *s.* (*faute*, French.) 1. Offence; slight crime; somewhat liable to censure or objection (*Hooker*). 2. Defect; want; absence (*Shakspeare*). 3. Puzzle; difficulty.

To FAULT. *v. n.* (from the noun.) To be wrong; to fail (*Spenser*).

To FAULT. *v. a.* To charge with a fault; to accuse.

FA'ULTER. *s.* (from *fault.*) An offender; one who commits a fault (*Fairfax*).

FA'ULTFINDER. *s.* (*fault* and *find.*) A censurer; an objector.

FA'ULTILY. *ad.* (from *faulty.*) Not rightly; improperly; defectively; erroneously.

FA'ULTINESS. *s.* (from *faulty.*) 1. Badness; viciousness (*Sidney*). 2. Delinquency; actual offences (*Hooker*).

FA'ULTLESS. *a.* (from *fault.*) Exempt from fault; perfect (*Fairfax*).

FA'ULTY. *a.* (*fautif*, French.) 1. Guilty of a fault; blameable; criminal; not innocent (*Milton*). 2. Wrong; erroneous (*Hooker*). 3. Defective; bad in any respect (*Bacon*).

FAUNALIA, in antiquity, Roman feasts celebrated in honour of the god Faunus, who was the same among the Romans with the Pan of the Greeks. The Faunalia were held on the day of the nones of December; i. e. on the fifth day of that month. The principal sacrifice was a roe-buck, or rather, according to Horace, a kid, attended with libations of wine and burning of incense. See Ode 18. lib. iii.

FAUNS, Fauni, among the ancients, were a species of demi-gods inhabiting the forests; called also Sylvans (*Sylvani*), and little differing from the Satyrs. They delighted more particularly in vineyards; and they generally appear as attendants of Bacchus, in the representations of Bacchanal feasts and processions. They were represented as half men, half goats, having the horns, ears, feet, and tail of a goat, a very flat nose, and the rest human. Though the Fauns were held as demi-gods, yet they were supposed to die after a long life. Arnobius shows that their father or chief, Faunus himself, only lived 120 years.

FAUNUS, in fabulous history, a son of Picus, who reigned in Italy about 1300 years before the Augustan age. His bravery, as well as wisdom, have given rise to the tradition that he was the son of Mars. His great popularity, and his fondness for agriculture, made his subjects revere him as one of their country deities after death. He was represented with all the equipage of the satyrs, and was consulted to give oracles.

FAVONIUS, among the Romans, the wind which blew directly from the west.

FAVORITO, an epithet given to such parts of a musical composition as are performed to the greatest advantage, by the best voices or instruments.

To FA'VOUR. *v. a.* (*faveo*, Latin.) 1. To support; to regard with kindness; to countenance (*Bacon*). 2. To assist with advantages or conveniencies (*Addison*). 3. To resemble in feature (*Spectator*). 4. To conduce to; to contribute.

Fa'vour. *s.* (*favor*, Latin.) 1. Kindness; kind reward (*Shakspeare*). 2. Support; defence; vindication (*Rogers*). 3. Kindness granted (*Sidney*). 4. Lenity; mildness; mitigation of punishment (*Swift*). 5. Leave; good-will; pardon (*Psalms*). 6. Object of favour (*Milton*). 7. Something given by a lady to be worn (*Shakspeare*). 8. Any thing worn openly as a token (*Shakspeare*). 9. Feature; countenance (*South*).

FA'VOURABLE. *a.* (*favorable*, French.) 1. Kind; propitious; affectionate (*Shaksp.*). 2. Palliative; tender; averse from censure. 3. Conducive to; contributing to (*Temple*). 4. Accommodate; convenient (*Clarendon*). 5. Beautiful; well-favoured: obsolete (*Spenser*).

FA'VOURABLENESS. *s.* (from *favourable.*) Kindness; benignity.

FA'VOURABLY. *ad.* (from *favourable.*) Kindly; with favour (*Rogers*).

FA'VOURED. *particip. a.* 1. Regarded with kindness (*Pope*). 2. Featured: with *well* or *ill* (*Spenser*).

FA'VOUREDLY. *ad.* With *well* or *ill.* In a fair or foul manner.

FA'VOURER. *s.* (from *favour.*) One who favours; one who regards with kindness or tenderness; a wellwisher; a friend (*Daniel*).

FA'VOURITE. *s.* (*favorite*, French.) 1. A person or thing beloved; one regarded with favour (*Pope*). 2. One chosen as a companion by his superior (*Clarendon*).

FA'VOURLESS. *a.* (from *favour.*) 1. Unfavoured; not regarded with kindness. 2. Unfavouring; unpropitious (*Spenser*).

FA'VOUS RECEPTACLE, in botany, a honey-combed receptacle. See Alveolate.

FAUQUEMONT, or Valkenburg, a town of the Dutch Netherlands, seven miles E. of Maestricht. Lat. 50. 52 N. Lon. 5. 50 E.

FAUSEL-NUT, in botany. See Areca.

FA'USEN. *s.* A large sort of eel (*Chapman*).

FA'USSEBRAYE. *s.* A small mount of earth, four fathom wide, erected on the level round the foot of the rampart (*Harris*).

FA'UTOR. *s.* (Latin, *fauteur*, French.) Favourer; countenancer (*Ben Jonson*).

FA'UTRESS. *s.* (*fautrice*, Fr.) A woman that favours or countenances (*Chapman*).

FAUX, in botany, the jaws, chaps, throat, or opening of the tube of the corol; or, between the segments of the corol, where the tube ends. As in the class didynamia and the asperifoliæ in class pentandria. Hiatus inter lacinias corollæ ubi tubus terminatur. The whole upper part of the tube is called the neck, *collum*: and the opening is sometimes termed the mouth, *os.*

FAWKES (Francis), an English poet and divine. He was born in Yorkshire about 1725, and educated at Jesus college, Cambridge, where he took his degrees in arts. On entering into orders he settled at Bromham in his native county, but afterwards he obtained the vicarage of Orpington in Kent, which he exchanged in 1774 for the rectory of Hayes. He died in 1777. Mr. Fawkes is known by many ingenious poems of his own, but more so by his translations of Anacreon, Sappho, Bion, and Moschus, published in 1760 in 12mo. and the Idylliums of Theocritus, 1767, 8vo.

FAWN. The young of the buck and doe, so called during its first year. The fawn is secreted by the dam in fern, or long grass, with great care, during the first weeks, and seldom accompanies the mother but by night. In royal parks and chaces, a certain number are annually killed when about three months old, to prevent the district from being overstocked; this is generally done by coursing with greyhounds, which is often accounted excellent sport, the greyhounds being frequently beaten.

To Fawn. *v. n.* (of uncertain original.) 1. To court by frisking before one, as a dog (*Sidney*). 2. To court by any means (*South*). 3. To court servilely (*Milton*).

Fawn. *s.* A servile cringe; low flattery (*Shakspeare*).

FA'WNER. *s.* (from *fawn.*) One that fawns; one that pays servile courtship (*Spectator*).

FA'WNINGLY. *ad.* (from *fawn.*) In a cringing servile way.

FA'XED. *a.* (from ꝼæx, Saxon.) Hairy (*Cumden*).

FAY. *s.* (*fée*, French.) 1. A fairy; an elf (*Milton*). 2. (*foi*, French.) Faith: obsolete (*Spenser*).

FAYAL, one of the Azores, or Western Islands, which suffered greatly by an earthquake in 1764. Its capital is Villa do Horta.

FAYETTE, a county of Kentucky, bounded on the N. by the Ohio, on the E. by Bourbon county, and on the S. W. by the river Kentucky. Lexington is the capital.

Fayette, a county of Pennsylvania, 37 miles long, and 33 broad. In 1790, it contained 13,325 inhabitants. Union is the capital.

FAYETTEVILLE, a town of N. Carolina, on the N. W. branch of Cape Fear river, 90 miles N. W. of Wilmington, to which that river is navigable for boats.

FE, Fo, or Fohi, the name of the chief god of the Chinese, whom they adore as the sovereign of heaven. They represent him shining all in light, with his hands hid under his robes, to show that his power does all things invisibly.

Fe (Santa), a rich and regular built city, the capital of New Mexico, and the see of a bishop. It is situate near the source of the Rio del Nort. Lat. 36. 50 N. Lon. 108. 48 W.

Fe (Santa), a town of Paraguay, situate at the confluence of the Salade with the Plata, 450 miles S. W. of Assumption. Lat. 30. 45 S. Lon. 60. 40 W.

FEABERRY. *s.* A gooseberry.

FEAL, was anciently used for faithful. It is now a provincial term for turf.

Feal-dikes, cheap fencing used in Scotland, by means of the turf dug from the surface of ditches.

FEALTY, in law, an oath taken on the admittance of any tenant, to be true to the lord of whom he holds his land; by this oath the tenant holds in the freest manner, on account that all who have fee hold per fidem et fiduciam, that is, by fealty at the least. This fealty, at the first creation of it, bound the tenant to fidelity, the breach of which was the loss of his fee. It has been divided into general and special; general, that which is to be performed by every subject to his prince; and special, required only of such as, in respest of their fee, are tied by oath to their lords. To all manner of tenures, except tenantcy at will and frankalmoign, fealty is incident, though it chiefly belongs to copyhold estates, held in fee and for life. The form of this oath by stat. 17 Ed. II. is to run as follows: "I A.B. will be to you my lord D. true and faithful, and bear to you faith for the lands and tenements which I hold of you, and I will truly do and perform the customs and services that I ought to do to you. So help me God."

Fealty, is sometimes used to denote fidelity to a master.

FEAR. *s.* (ꝼeaꞃan, Saxon.) 1. Dread; terrour; painful apprehension of danger (*Locke*). 2. Awe; dejection of mind at the presence of any person or thing (*Genesis*). 3. Anxiety; solicitude (*Maccabees*). 4. That which causes fear (*Shakspeare*). 5. The object of fear (*Genesis*). 6. Something hung up to scare deer (*Isaiah*).

Fear, when considered philosophically, may be described as a painful sensation produced by the immediate apprehension of some impending evil. This evil may consist in being deprived of what we at present enjoy, in being disappointed in what we expect, or in the infliction of a positive misery.

The passion of fear is still more painful than that of sorrow, which, notwithstanding its severity, has, when calmed into an affection, something soothing in its nature. Fear produces an agony and anxiety about the heart not to be described; and it may be said to paralyze the soul in such a manner, that it becomes insensible to every thing but to its own misery. Inertness and torpor pervade the whole system, united with a constriction of the integuments of the body, and also a certain sense of being fettered, or of being rendered incapable of motion. The eyes are pallid, wild, and sunk in their sockets; the countenance is contracted and wan; the hair stands erect, or at least excites the sensation, which every child experiences as often as he is terrified by stories of ghosts, witches, &c.; the bowels are strongly affected, the heart palpitates, respiration labours, the lips tremble, the tongue falters, the limbs are unable to obey the will, or support the frame. Dreadful shrieks denote the inward anguish: these are often succeeded by syncopies; which, while they manifest that the sufferings are greater than nature can sustain, afford a temporary relief.

Such are the external signs which indicate the wretched state of mind under this horrid passion. Since torpor, debility, and painful constrictions frequently accompany fear more than any other passion, the emotions will, in such instances, be less vivid. Instead of violent transports, a deep depression and numbness, as it were, both of body and mind, characterise the passion; though these may be visible to the spectators, and are not less expressive of inward anguish.

When the effects of fear operate powerfully, without any mixture of hope, these passive impressions are predominant: but where there is a possibility of escape, the mind reacts with wonderful energy. Abject depression is changed into violent agitations; collected force takes place of debility; and tremendous exertions succeed to the torpid and inert state. When a personal attack is apprehended, momentary and trembling strength is thrown into the muscles; the body instinctively places itself in the attitude of defence; a mixture of fierceness and wild horror is expressed in the countenance, well adapted to alarm and terrify the enemy. If escape be attempted, an unusual energy is thrown into the limbs, enabling the sufferer to precipitate his flight, by exertions that would have been impracticable, in a more composed state of mind. (*Cogan on the Passions.*)

Fear. *s.* (ꝼeoꞃa, Saxon.) A companion: obsolete (*Spenser*).

To **Fear.** *v. a.* (ꝼeaꞃan, Saxon.) 1. To dread; to consider with apprehensions of terrour; to be afraid of (*Dryden*). 2. To fright; to make afraid (*Donne*).

To **Fear.** *v. n.* 1. To live in terrour; to be afraid (*Shakspeare*). 2. To be anxious (*Dryden*).

FE'ARFUL. *a.* (*fear* and *full.*) 1. Timorous; easily made afraid (*Shakspeare*). 2. Afraid (*Davies*). 3. Awful; to be reverenced (*Exodus*). 4. Terrible; dreadful; frightful (*Tillotson*).

FE'ARFULLY. *ad.* (from *fearful.*) 1. Timorously; in fear (*Shakspeare*). 2. Terribly; dreadfully (*Shakspeare*).

FE'ARFULNESS. *s.* (from *fearful.*) 1. Timorousness; habitual timidity. 2. State of being afraid; awe; dread (*South*).

FE'ARLESSLY. *ad.* (from *fearless.*) Without terrour; intrepidly (*Decay of Piety*).

FE'ARLESSNESS. *s.* (from *fearless.*) Exemption from fear; intrepidity (*Clarendon*).

FE'ARLESS. *a.* (from *fear.*) Free from fear; intrepid; courageous; bold (*Temple*)

FEASIBI'LITY. *s.* (from *feasible.*) 1. Practicability. 2. A thing practicable (*Brown*).

FE'ASIBLE. *a.* (*faisible*, French.) Practicable; that may be effected or done (*Glanville*).

FE'ASIBLY. *ad.* (from *feasible.*) Practicably.

FEAST. *s.* (*feste*, French, or *festum*, Lat.) 1. An entertainment of the table; a sumptuous treat of great numbers (*Genesis*). 2. An anniversary day of rejoicing (*Shakspeare*). 3. Something delicious to the palate (*Locke*).

Feasting seems to have been the chief delight of the Germans, Gauls, Britons, and all the other Celtic nations; in which they indulged themselves to the utmost, as often as they had an opportunity. Among these nations (says an author who had carefully studied their manners) there is no public assembly, either for civil or religious purposes, duly held; no birthday, marriage, or funeral properly celebrated; no treaty of peace or alliance rightly cemented, without a great feast. It was by frequent entertainments of this kind that the great men or chieftains gained the affections and rewarded the services of their followers; and those who made the greatest feasts were sure to be most popular, and to have the greatest retinue. These feasts (in which plenty was more regarded than elegance) lasted commonly several days, and the guests seldom retired until they had consumed all the provisions and exhausted all the liquors.

It has been often observed by authors, that there is no nation in the world comes near the English in the magnificence of their feasts. Those made at our coronations, installments, consecrations, &c. transcend the belief of all foreigners; and yet it is doubted whether those now in use are comparable to the feasts of our forefathers.

Feasts (Religious), and the ceremonies thereof, have been observed amongst almost all nations and sects; witness the Greeks, Romans, Hebrews, Christians, and Mahometans.

Feasts among us are either immoveable or moveable. Immoveable feasts are those constantly celebrated on the same day of the year; the principal of these are Christmas-day or the Nativity, the Circumcision, Epiphany, Candlemas or the Purification; Lady-day or the Annunciation, called also the Incarnation and Conception; All Saints, and All Souls; besides the days of the several apostles, St. Thomas, St. Paul, &c. Moveable feasts are those which are not confined to the same day of the year. Of these the principal is Easter, which gives law to all the rest, all of them following, and keeping their proper distances from it; such are Palm-Sunday, Good-Friday, Ash-Wednesday, &c. The four feasts which the English laws take especial notice of are, the Annunciation of the blessed Virgin Mary, or Lady-day, the 25th of March; the nativity of St. John the Baptist, held on the 24th of June; the Feast of St. Michael the Archangel, on the 29th of September; and that of St. Thomas the Apostle, on the 21st of December; on which quarterly days rent on leases is usually reserved to be paid.

Beside these feasts which are general, and enjoined by the church, there are others local and occasional, enjoined by the magistrate, or voluntarily set on foot by the people; such are the days of thanksgiving for delivery from wars, plagues, &c. Such also are the vigils or wakes in commemoration of the dedications of particular churches. The prodigious increase of feast-days in the Christian church commenced towards the close of the fourth century, and was occasioned by the discovery that was then made of the remains of martyrs and other holy men, for the commemoration of whom they were established. These, instead of being set apart for pious exercises, were abused in indolence, voluptuousness, and criminal practices. Many of them were instituted on a pagan model, and perverted to similar purposes.

Feast of death, or **Feast of souls**, a solemn religious ceremony in use among the savages of America; some of whom thus testify their respect for the deceased every eight years; and others, as the Hurons and Iroquois, every ten years.

The day of this ceremony is appointed by public order; and nothing is omitted, that it may be celebrated with the utmost pomp and magnificence. The neighbouring tribes are invited to be present, and to join in the solemnity. At this time all who have died since the last solemn occasion are taken out of their graves: those who have been interred at the greatest distance from the villages are diligently sought for, and brought to this great rendezvous of carcases. The savages take the bodies into their respective cottages, where they prepare feasts in honour of them, and present them offerings. The custom is supposed to have arisen from a rude notion of the immortality of the soul.

To Feast. *v. n.* To eat sumptuously (*Shak.*).

To Feast. *v. a.* 1. To entertain sumptuously (*Hayward*). 2. To delight; to pamper (*Dryden*).

FE'ASTER. *s.* (from *feast.*) One that fares deliciously (*Taylor*). 2. One that entertains magnificently.

FE'ASTFUL. *a.* (*feast* and *full.*) 1. Festive; joyful (*Milton*). 2. Luxurious; riotous (*Pope*).

FE'ASTRITE. *s.* (*feast* and *rite.*) Custom observed in entertainments (*Philips*).

FEAT. *s.* (*fait*, French). 1. Act; deed; action; exploit (*Spenser*). 2. A trick; a ludicrous performance (*Bacon*).

Feat. *a.* (*fait*, French.) 1. Ready; skilful; ingenious (*Shakspeare*). 2. Nice; neat (*Shakspeare*).

FE'ATEOUS. *a.* Neat; dexterous: obsolete.

FE'ATEOUSLY. *ad.* Neatly; dexterously (*Spenser*).

FE'ATHER. *s.* (ƿeðeꞃ, Saxon.) 1. The plume of birds (*Newton*). 2. Kind; nature; species (*Shakspeare*). 3. An ornament; an empty title.

Feather, in physiology, a general name for the covering of birds: it being common to all the animals of this class to have their whole body, or at least the greatest part of it, covered with feathers or plumage.

There are swo sorts of feathers belonging to birds, viz. the strong and hard kind, called quills, found in the wings and tail; and the other plumage, or soft feathers, serving for the defence and ornament of the whole body. All birds, so far as yet known, moult the feathers of their whole body yearly. Feathers make a considerable article of commerce, particularly those of the ostrich, heron, swan, peacock, goose, &c. for plumes, ornaments of the head, filling of beds, writing-pens, &c. Geese are plucked in some parts of Great Britain, five times in the year; and in cold seasons many of them die by this barbarous custom. Those feathers that are brought from Somersetshire are esteemed the best, and those from Ireland the worst.

Eider down is imported from Denmark; the ducks that supply it being inhabitants of Hudson's-bay, Greenland, Iceland, and Norway. All the islands west of Scotland breed numbers of these birds, which turn out a profitable branch of trade to the poor inhabitants. Hudson's-bay also furnishes very fine feathers, supposed to be of the goose kind. The down of the swan is brought from Dantzic. The same place also sends us great quantities of the feathers of the cock and hen. The London poulterers sell a great quantity of the feathers of those birds, and of ducks and turkeys; those of ducks, being a weaker feather, are inferior to those of the goose; and turkeys' feathers are the worst of any. The best method of curing feathers is to lay them in a room, exposed to the air and sun; and when dried, to put them in bags, and beat them well with poles to get off the dirt.

By chemical analysis, feathers appear to consist of little more than inspissated albumen, mixed with a very minute portion of gelatin; so minute, however, that quill or feather, freed from adhering oil, may be boiled for many days in water without any apparent alteration, the liquor having no sensitive properties, giving no precipitate with tar, and a very small one with nitro-muriat of tin. In its general properties, therefore, feather resembles hair, nail, cuticle, and cuticular shell. Like these substances also, feathers, according to Delaval, owe their colour to thin layers of coloured matter, covering the white substance of which they are principally formed. He scraped off the superficial colour from such parts of vividly coloured feathers as were solid enough to admit of that operation, and by this means separated the coloured layers from the white ground on which they had been naturally spread. The surfaces of the lateral fibres of feathers cannot be thus separated on account of their minuteness. But as they appear, when viewed with a microscope, nearly to resemble in their form the feathers themselves, it seems probable that their colours arise from a similar matter and conformation in the smaller fibres, as in the grosser parts of the feathers.

Feather, in the manage, a sort of natural frizzling of the hair, found in many parts of the horse's body, but more commonly between the eyes. Many are of opinion, that, when the feather is lower than the eyes, it is a sign of a weak eye-sight; but this is mere conjecture. A Roman feather, or the French epée Romain, is situated upon a horse's neck: being a row of hair turned back and raised, forming a mark like a feather or sword-blade along the mane.

Feather (Princes), in botany. See Amaranthus.

To Fe'ather. *v. a.* (from the noun.) 1. To dress in feathers. 2. To fit with feathers. 3. To tread as a cock (*Dryden*). 4. To enrich; to adorn; to exalt (*Bacon*). 5. *To* Feather *one's nest.* To get riches together.

FE'ATHERBED. *s.* (*feather* and *bed.*) A bed stuffed with feathers (*Donne*).

FE'ATHERDRIVER. *s.* (*feather* and *drive.*) One that cleanses feathers (*Derham*).

FE'ATHERED. *a.* (from *feather.*) 1. Clothed with feathers (*Dryden*). 2. Fitted with feathers; carrying feathers.

Feathered columbine, in botany. See Thalictrum.

FE'ATHEREDGE. *s.* Boards or planks that have one edge thinner than another, are called *featheredge* stuff (*Moxon*).

FE'ATHEREDGED. *a.* (*feather* and *edge.*) Belonging to a featheredge (*Mortimer*).

FE'ATHERFEW. *s.* A plant.

FE'ATHERLESS. *a.* (from *feather.*) Being without feather (*Howel*).

FE'ATHERLY. *a.* (from *feather.*) Resembling feathers (*Brown*).

FE'ATHERSELLER. *s.* (*feather* and *seller.*) One who sells feathers for beds.

Feather weight, in the sporting vocabulary, signifies the lightest weight that can be put upon the back of a horse, in whatever match he may be engaged, and totally depends upon the will of the owner; who is not under the necessity of bringing his rider to the scale either before or after the race, in an engagement where feather weight is particularly expressed. On the contrary, when a horse runs for any plate, match, sweepstakes, or subscription, at a fixed weight, according to his age, height, or qualification, his rider must be publicly weighed upon the course previous to starting; and at the termination of every heat, if the rider dismount before his horse is led up to the scales (generally affixed to the starting-post), or when there, if he do not weigh his proper weight, the horse is deemed distanced, and can start no more for the prize in question.

FE'ATHERY. *a.* (from *feather.*) Clothed with feathers (*Milton*).

FE'ATLY. *ad.* (from *feat.*) Neatly; nimbly; dexterously (*Dryden*).

FE'ATNESS. *s.* (from *feat.*) Neatness; nicety; dexterity.

FE'ATURE. *s.* (*faiture*, old French.) 1. The cast or make of the face (*Shakspeare*). 2. Any lineament or single part of the face.

To Fe'ature. *v. a.* To resemble in countenance; to favour (*Shakspeare*).

To FEAZE. *v. a.* (*faisez*, French.) 1. To untwist the end of a rope, and reduce it again to its first stamina. 2. To beat; to whip with rods (*Ainsworth*).

FEBRES. (*febris.*) An order in the class pyrexiæ of Cullen, characterized by the presence of pyrexia, without primary or local affection.

FEBRI'CITATE. *v. a.* (*febricitor*, Latin.) To be in a fever.

FEBRICULA. (*febricula*, of *febris*, a fever.) A term employed to express a slight degree of symptomatic fever.

FEBRI'CULOSE. *a.* (*febriculosus*, Latin.) Troubled with a fever.

FEBRIFU'GE. *a.* Having the power to cure fevers (*Arbuthnot*).

Febrifu'ge. (*febrifuga*, from *febris*, a fever, and *fugo*, to drive away.) A medicine that possesses the property of abating the violence of any fever.

FEBRIS. A fever. Of this there are various genera. The following are the chief: They all belong to the class pyrexiæ and order phlegmasia of Cullen.

F. continua. A continued fever. It has no intermission, but exacerbations come on twice in one day. The species of continued fever are three: 1. *Synocha*, or inflammatory fever, known by increased heat; pulse frequent, strong, and hard; urine high-coloured; senses not much impaired. 2. *Typhus*, or putrid-tending fever, which is contagious, and is characterized by moderate heat; quick, weak, and small pulse; senses much impaired, and great prostration of strength. Typhus has four varieties, viz.

α *Typhus petechialis*, typhus with petechiæ.
β *Typhus mitior*, the nervous fever.
γ *Typhus gravior*, the putrid fever.
δ *Typhus icterodes*, the yellow fever.

3. *Synochus*. Mixed fever; being a compound of the two preceding, commencing like the first, and terminating with the symptoms of the second.

F. erysipelatosa. Erysipelatous fever; St. Anthony's Fire. See Erysipelas.

F. hectica. Hectic fever. It is known by exacerbations at noon, but chiefly in the evening, with slight remissions in the morning, after nocturnal sweats; the urine depositing a furfuraceo-lateritious sediment; appetite good; thirst moderate. Hectic fever is symptomatic of chlorosis, scrofula, phthisis, diseased viscera, &c.

F. inflammatoria. See Febris continua.

F. intermittens. Intermittent fever or ague. It is known by cold, hot, and sweating stages in succession, attending each paroxysm, and followed by an intermission or remission. There are three species of this disease, viz. 1. *Intermittens quotidiana.* A quotidian ague. The paroxysms return in the morning at an interval of about twenty-four hours. 2. *Intermittens tertiana.* A tertian ague. The paroxysms commonly come on at mid-day, at an interval of about forty-eight hours. 3. *Intermittens quartana*. A quartan ague. The paroxysms come on in the afternoon, with an interval of about seventy-two hours.

F. nervosa. Febris lenta nervosa. Nervous fever. A variety of typhus mitior of Cullen, but by many considered as a distinct disease. It mostly begins with loss of appetite, increased heat and vertigo; to which succeed nausea, vomiting, great langour, and pain in the head, which is variously described, by some like cold water pouring over the top, by others a sense of weight. The pulse, before little increased, now becomes quick, feeble, and tremulous; the tongue is covered with a white crust, and there is great anxiety about the præcordia. Towards the seventh or eighth day, the vertigo is increased, and tinnitus aurium, cophosis, delirium, and a dry tremulous tongue, take place. The disease mostly terminates about the fourteenth or twentieth day.'

F. putrida. See Febris continua.

F. vesiculosa. Bladdery fever. See Erysipelas and Pemphigus.

FE'BRILE. *a.* (*febrilis*, Latin.) Constituting a fever; caused by a fever (*Harvey*).

FEBRUA, in antiquity, a feast held by the Romans in the month of February, in behalf of the manes of the deceased.

FEBRUARY, the second month of the year, containing 28 days for three years, and every fourth year 29 days. The name is derived either from the god Februus, or from Juno, surnamed Februa.

FECAMP, an ancient seaport of France, in the department of Lower Seine. It had lately a famous Benedictine abbey. Lat. 49. 37 N. Lon. 0. 23 E.

FECES. See Fæces.

The human fæces, according to the experiments of Berzelius, were found to contain,

Water	73·3
Vegetable and animal remains	7·0
Bile	0·9
Albumen	0·9
Peculiar extractive matter	2·7
Salts	1·2
Slimy matter, consisting of resin of bile, peculiar animal matter and insoluble residue	14·0
	100·0

FECIALES, or Fæciales, an order of priests or officers, consisting of twenty persons, among the ancient Romans, appointed to proclaim war, negociate peace, &c.

FECULA. See Fæcula.

FE'CULENCE. Fe'culency. *s.* (*fæculentia*, Latin.) 1. Muddiness; quality of abounding with lees or sediment. 2. Lees; fæces; sediment; dregs (*Boyle*).

FE'CULENT. *a.* (*fæculentus*, Latin.) Foul; dreggy; excrementitious (*Glanville*).

FECU'ND. *a.* (*fœcundus*, Latin.) Fruitful; prolifick (*Graunt*).

FECUNDA'TION. *s.* (*fœcundo*, Latin.) The act of making prolifick (*Brown*).

To FECU'NDIFY. *v. a.* To make fruitful.

FECU'NDITY. *s.* (*fécondité*, French.) 1. Fruitfulness; quality of producing or bringing forth in great abundance (*Woodward*). 2. Power of producing or bringing forth (*Ray*).

FED. The preterit and participle pass. of *feed*.

FE'DARY. *s.* A confederate, a partner, or a dependant (*Shakspeare*).

FE'DERAL. *a.* (from *fœdus*, Latin.) Relating to a league or contract (*Hammond*).

FE'DERARY. *s.* (from *fœdus*, Latin.) A confederate; an accomplice (*Shakspeare*).

FE'DERATE. *a.* (*fœderatus*, Latin.) Leagued.

FEE. *s.* (ꝼeoh, Saxon.) 1. All lands and tenements that are held by any acknowledgment of superiority to a higher lord (*Cowell*). 2. Property; peculiar (*Shakspeare*). 3. Reward; gratification; recompense (*Shakspeare*). 4. Payments occasionally claimed by persons in office (*Shakspeare*). 5. Reward paid to physicians or lawyers (*Addison*).

Fee, Feud, Feudum, Feodum, or Fief, an estate, land, tenement, lordship, or the like, held of a superior lord, on condition of fealty, homage, or other acknowledgment

The word is derived by some authors from *fœdus*, as arising from a treaty or alliance made with the lord; but the opinion of Selden seems the best authorised, who brings it from the Saxon, *feoh*, stipendium.

The term fee is properly applied to lands and tenements, which we hold in perpetual right, on condition of an acknowledgment of superiority in a higher lord. See Tenure.

The writers on this subject divide all lands and tenements wherein a man has a perpetual estate to him and his heirs into allodium and feudum.

Allodium is defined to be a man's own land, which he possesses merely in his own right, without acknowledgment of any service or payment of any rent to another; and this is property in the highest degree.

Feudum is that which we hold by the benefit of another, and for which we do service or pay rent, or both, to the chief lord.

All our land here in England (the crown-lands being in the king's own hands, in right of his crown, excepted) is in the nature of feudum or fee; for though many have land by descent from their ancestors, and others have clearly purchased land with their money, yet is the land of such a nature, that it cannot come to any, either by descent or purchase, but with the burthen that was laid upon him who had novel fee, or first of all received it as a benefit from his lord to him, and to all such to whom it might descend, or any way be conveyed from him; so that in truth, no man has directum dominium, the very property or demesne, in any land, but only the prince in right of his crown. Cam. Brit. 93. See Feodal system.

Fee simple, is an estate of inheritance whereby a person is seised of lands, tenements, or hereditaments, to hold to him and his heirs for ever, generally, absolutely, and entirely, without mentioning what heirs, but referring that to his own pleasure, or the disposition of the law. It is the most perfect tenure of any, when unincumbered; but although the greatest interest which by our law a subject can possess, yet it may be forfeited for treason or felony. To constitute an estate in fee, or of inheritance, the word heir is necessary in the grant or donation. Co. Lit. 1. Plowd. 498. 2 Black. 48.

Fee qualified, is such a freehold estate, as has a qualification subjoined to it, and which therefore must determine whenever the qualification is at an end. Co. Lit. 27.

Fee conditional. This estate was, at

the common law, a fee restrained to some particular heirs, exclusive of others; as to the heirs of a man's body, or to the heirs male of his body: in which cases it was held, that as soon as the grantee had issue born, the estate was thereby converted into fee simple, at least so far as to enable him to sell it, to forfeit it by treason, or to charge it with incumbrances. But the statute de donis having enacted, that such estates so given, to a man and the heirs of his body, should at all events go to the issue, if there were any, or, if none, should revert to the donor, this was by the judges denominated an estate in tail. Plowd. 251. See Estate.

Fee-farm, a kind of tenure without homage, fealty, or other service, except that mentioned in the feoffment; which is usually the full rent, or at least a fourth part of it. The nature of this tenure is, that if the rent be behind, and unpaid for two years, then the feoffor and his heirs may have an action for the recovery of the lands.

To **Fee.** *v. a.* (from the noun.) 1. To reward; to pay (*South*). 2. To bribe; to hire (*Shakspeare*). 3. To keep in hire (*Shakspeare*).

FE'EBLE. *a.* (*foible*, French.) Weak; debilitated; sickly; infirm (*Smith*).

To **Fe'eble.** *v. a.* (from the noun.) To weaken; to enfeeble: not in use (*Shakspeare*).

FEEBLEMI'NDED. *a.* (*feeble* and *mind.*) Weak of mind (*Thessalonians*).

FE'EBLENESS. *s.* (from *feeble.*) Weakness; imbecility; infirmity (*South*).

FE'EBLY. *ad.* (from *feeble.*) Weakly; without strength (*Drayton*).

To **FEED.** *v. a.* (*fodan*, Gothic; ꝼeðan, Saxon.) 1. To supply with food (*Arbuthnot*). 2. To supply; to furnish (*Addison*). 3. To graze; to consume by cattle (*Mortimer*). 4. To nourish; to cherish (*Prior*). 5. To keep in hope or expectation (*Knolles*). 6. To delight; to entertain (*Bacon*). 7. To make fat.

To **Feed.** *v. n.* 1. To take food (*Shakspeare*). 2. To prey; to live by eating (*Temple*). 3. To pasture; to place cattle to feed (*Exodus*). 4. To grow fat or plump.

Feed. *s.* (from the verb.) 1. Food; that which is eaten (*Sidney*). 2. Pasture (*Shakspeare*). 3. Meal; act of eating (*Milton*).

FE'EDER. *s.* (from *feed.*) 1. One that gives food (*Denham*). 2. An exciter; an encourager (*Shakspeare*). 3. One that eats (*Brown*).

Feeder, among huntsmen, the person who has the management of the hounds in kennel; and who fills a station subordinate to the huntsman.

He should be young, indefatigable, and alert, fond of his employment, humane and good-tempered, as much of the comfort of the animals intrusted to his care depends upon him. It is his particular business to keep the kennel sweet and clean, and to execute this part of his trust at stated and regular periods; to prepare, boil, and mix the different kinds of provision for the hounds, according to the regulations of the establishment to which he belongs. When disengaged from the concerns of the kennel he is expected to assist in the stables; as well as to exercise and dress the spare horses of the huntsman and whipper-in, on hunting days, during their absence.

To **FEEL.** *v. n.* pret. *felt*; part. pass. *felt*. (ꝼelan, Saxon.) 1. To have perception of things by the touch. 2. To search by feeling (*Acts*). 3. To have a quick sensibility of good or evil, right or wrong (*Pope*). 4. To appear to the touch (*Sharp*).

To **Feel.** *v. a.* 1. To perceive by the touch (*Judges*). 2. To try; to sound (*Shakspeare*). 3. To have sense of external pain or pleasure (*Creech*). 4. To be affected by; to perceive mentally. 5. To know; to be acquainted with (*Shakspeare*).

Feel. *s.* (from the verb.) The sense of feeling; the touch (*Sharp*).

FE'ELER. *s.* (from *feel.*) One that feels (*Shakspeare*).

FEELERS, in entomology, organs affixed to the mouth of insects, generally less than the antennas, and often jointed.

FE'ELING. *particip. a.* (from *feel.*) 1. Expressive of great sensibility (*Sidney*). 2. Power of action on sensibility (*Bacon*). 3. Perception; sensibility (*Watts*).

Feeling, one of the five external senses, by which we obtain the ideas of solid, hard, soft, rough, hot, cold, wet, dry, and other tangible qualities. This sense is the coarsest, but, at the same time, the surest of all others; it is, besides, the most universal. We see and hear with small portions of our body, but we feel with all. The God of nature has bestowed that general sensation wherever there are nerves, and they are every where where there is life. Were it otherwise, the parts divested of it might be destroyed without our knowledge. It seems that, upon this account, the Deity has provided that this sensation should not require a particular organization. The structure of the nervous papillæ is not absolutely necessary to it. The lips of a fresh wound, the periosteum, and the tendons, when uncovered, are extremely sensible without them. These nervous extremities serve only to the perfection of feeling, and to diversify sensation. Feeling is the basis of all other sensations.

FE'ELINGLY. *ad.* (from *feeling.*) 1. With expression of great sensibility (*Sidney*). 2. So as to be sensibly felt (*Raleigh*).

FEET. *s.* The plural of foot.

Feet-bearer, the name of an officer in the courts of the ancient Anglo-Saxon and Welch kings. He was a young gentleman whose duty it was to sit on the floor, with his back towards the fire, and hold the king's feet in his bosom all the time he sat at table, to keep them warm and comfortable: a piece of state and luxury happily unknown in modern times.

Feet of horses. These in the manage are an object of great and deserved attention and regulation, in order to prevent the multiplicity of evils to which they are liable. These consist chiefly of cracks in the heels, scratches or lacerations, stubs and bruises of the outer sole, or upon the verge of the coronet, between hair and hoof, corns, sand-cracks, thrushes, canker, quitor, ringbone, and foot-founder; exclusive of the frequent injuries produced by improper shoeing.

Most of these will be found treated of under their separate heads, or in the article VETERINARY MEDICINE.

The feet of different horses vary exceedingly in what may be termed the texture or property of the hoof; and this is, in general, regulated by the colour of the legs and feet. There are few horses with white heels but what have white hoofs also, and these are always more susceptible of defects and weakness than those of an opposite description. The sound, firm, dark-coloured hoof of the bay, brown, or black horse, is seldom defective; no other colours are to be equally depended upon, most of them exhibiting weak, thin soles, with a prominence on each side the frog, occasioned by a too feeble and inadequate resistance to the force of the membraneous mass within; feet of this description are also frequently found to have a brittle hoof, the edges of which are incessantly splitting, and threatening sand-cracks, or thrushes, or some other ill state of the frog.

To preserve the feet of a horse perfectly sound, and free from the ills to which they are subject, cleanliness is the leading step. After exercise or use, as soon as the body is drest, the dirt or gravel should be carefully taken from under the shoes with a picker, the feet well washed, the legs and heels rubbed dry, the bottom stopped with cow-dung, and the hoofs oiled with a brush moistened with spermaceti oil. Horses left with wet legs and heels, after a severe chase, or long journey, particularly in sharp easterly winds, or during frost and snow, will have cracks or scratches to a certainty.

The state of the shoes should be constantly attended to. Permitted to continue too long upon the feet, the growth of the hoof brings the shoe forward, and consequently renders it too short at the heel; where it begins to indent, and sinking upon the foot, soon presses upon the outer sole, producing pain or disquietude in some horses, and laying a foundation for corns in others. Horses, in moderate work, require new shoes once a month upon an average. The penurious plan of removing shoes half worn never renders a service adequate to the expense, and only tends to a quicker destruction of the hoof.

FE'ETLESS. *a.* (from *feet.*) Being without feet (*Camden*).

To FEIGN. *v. a.* (*feindre*, French.) 1. To invent (*Ben Jonson*). 2. To make a show of (*Spenser*). 3. To do upon some false pretence (*Pope*). 4. To dissemble; to conceal: obsolete (*Spenser*).

To FEIGN. *v. n.* To relate falsely; to image from the invention (*Shakspeare*).

FE'IGNEDLY. *ad.* (from *feign.*) In fiction; not truly (*Bacon*).

FE'IGNER. *s.* (from *feign.*) Inventer; contriver of a fiction (*Ben Jonson*).

FEINT. *participial a.* (for *feigned;* or *feint*, French.) Counterfeit; seeming (*Locke*).

FEINT, in fencing, a show of making a thrust at one part, in order to deceive the enemy, that you may really strike him in another. A simple feint is a mere motion of the wrist, without stirring the foot.

FEINT, in music. See DIESIS.

FEITHIUS (Everard), a learned man of Elburg, in Germany. He quitted his own country on the invasion of it by the Spaniards under Spinola, and went to Rochelle. As he was one day walking in the street with his servant, a person standing at a door invited him in, and from that time he was never seen more. He was then young, but he had given the most promising testimonies of his talents. In 1677 appeared at Leyden a piece of his, entitled, Antiquitatum Homericarum Libri quatuor, 12mo. There are also some other books of his in print.

FEL. (*fel, fellis.*) See BILE.

FEL-WORT. So called from its bitter taste like bile. See GENTIANA.

FELANDERS. *s.* Worms in hawks.

FELAPTON, in logic, one of the six first moods of the third figure of syllogisms, wherein the first proposition is an universal negative, the second an universal affirmative, and the third a particular negative.

FELDSPATUM. Felspar. In mineralogy, a genus of the class earths, order siliceous; consisting for the most part of silica, some alumine and potash, and a very small quantity of lime and oxyd of iron; hard, lightish, shining, lamellar, breaking into fragments which present four faces mouldering into argil, parasytical; not effervescing with nitric acid, easily melting without ebullition into a pellucid glass. Six species.

1. F. cubicum. Cubic felspar: Petrilite. Reddish-brown; of a glassy lustre, and somewhat splintery fracture; breaking into cubic fragments which are not specular; falling spontaneously into crustose fragments. Found, though rarely, in Saxony, of a common, indefinite form, diaphanous, or somewhat opake; fragments cubic, or so inclining, the faces of which are not polished; very brittle; and at 160 degrees of heat whitening and concreting without any farther sign of fusion: specific gravity 3,081.

2. F. vulgare. Common felspar. Of a glassy lustre and foliated texture, breaking into rhomboidal fragments with four specular faces. Of this there are four varieties:

α Of a common, indefinite form.
β Opake.
γ Transparent.
δ In the form of crystals.

The figures of these crystals again are very different in different species: prismatic, parallelopiped, unequal, eight-sided right angles, four-sided oblique angles, six-sided ob-

lique angles. Found every where in primitive mountains, forming a part of granite, porphyry and gneiss rocks, compact, solid and incorporated with other substances; generally moulders into a kind of porcelain clay; are commonly flesh-colour, blueish-gray, yellowish-white, milk-white, or brownish-yellow; rarely blue, or olive-green, very rarely black; texture in straight shining foliations; cross fracture uneven; when heated the crystalline tribes often decrepitate; it is less hard than quartz, but strikes fire with steel; specific gravity from 2,272 to 2,594: and contains

silica	62,83
alumine	17,02
potash	16,00
lime	3,00
oxyd of iron	1,00
water, &c.	,15
	100,00

3. F. variabile. Labradore spar. Labradore stone. Of a vivacious lustre, reflecting various colours in certain positions of light, of a foliated texture, breaking into rhomboidal fragments with four specular faces. Found on the Labradore coast, the island St. Paul's, and in various parts of America, and Europe, in round masses and detached, and often containing schorl, mica of pyrites; colour dark or light grey, diaphanous or semipellucid, receiving a high polish, and reflecting various tints of blue, purple, red, green, &c. in certain positions, in spots or stripes; specific gravity from 2,6700 to 2,6925.

4. F. lunare. Moon-stone. Pure felspar. Pellucid, white, of a high lustre, and straight lamellar texture, breaking into rhomboidal fragments. Found in Ceylon and Switzerland, Bohemia and Saxony, in solid masses, and also crystallized; the crystals rhomboidal, of irregular, angular, broad six-sided columns terminating in pyramids, and in rectangular four-sided plates; colour white with sometimes a shade of yellow, green, or red, the surface often reflecting iridescent colours; the fragments often appear striated. Specific gravity 2,559.

5. F. fibrosum. Fibrous felspar. Fibrous, with the fibres parallel, and in distinct layers. Found scatteringly in Bohemia, with frequently the vestiges of quartz or mica; colour usually brown; shining internally like nacre or mother-of-pearl, breaking into indeterminate fragments; and is harder than rock-crystal.

6. F. oculus catus. Cat's-eye. Diaphanous; of an imperfectly foliated texture, exhibiting parallel fibres internally, breaking into somewhat irregular fragments. Found in Ceylon and Siberia, of a nearly square figure, with sharp edges, and considerable brilliancy; colour grey, with a tinge of green, yellow, or white; in certain positions reflecting a splendid white like the eye of a cat, sometimes brown with a yellow or red tinge; its texture is so compact that the foliations are scarcely discernible, and it is hard enough to strike fire with steel: specific gravity 2,625 to 2,660.

FELICITAS, Felicity, a heathen divinity. She was the daughter of Hercules, as Euripides and Pausanias say, and deserved divine honours, because she sacrificed herself for the Athenians against the Lacedemonians, according to the answer of the oracle.

Public Felicity had many altars and temples at Rome, as appears from Roman historians, and was called Faustitas, especially in relation to private felicity. In this sense Horace speaks of her, when he says,

> Tutus bos etiam rura perambulat,
> Nutrit rura Ceres, almaque Faustitas.

St. Austin speaks of this goddess in the 4th Book de Civitate Dei, c. 18. and shews that Felicity is the same with good Fortune, and that the Romans acknowledged themselves that Felicity, Virtue, and Victory were neither gods nor goddesses, but only gifts of God, seeing that they demanded them of Jupiter. Wherefore if we consider what they meant by adoring Felicity, Virtue, and Victory, like divinities, it is nothing else than the adoring the supreme Divinity, as the dispenser of these great favours.

Felicity was represented like a divinity sitting on a throne, holding with her right hand Mercury's wand, and with the left a horn of plenty, with this motto, Felicitas Publica, as we see in a medal of the empress Julia Mammea. Lucullus built her a temple at Rome, and Julius Cæsar began another, which Lepidus finished.

To FELI'CITATE. *v. a.* (*feliciter*, Fr.) 1. To make happy (*Watts*). 2. To congratulate (*Brown*).

FELICITA'TION. *s.* (French; from *felicitate.*) Congratulation.

FELI'CITOUS. *a.* (*felix*, Latin.) Happy.

FELI'CITY. *s.* (*felicitas*, Latin.) Happiness; prosperity; blissfulness (*Arbuthnot*).

FE'LINE. *a.* (*felinus*, Latin.) Like a cat; pertaining to a cat (*Grew*).

FELIS. In zoology, a genus of the class mammalia, order feræ. Fore-teeth intermediate ones equal; grinders three; tongue prickly backwards; claws retractile.

A tribe temperate in its habits; that easily climbs trees; swift; sees best by night; when falling from a height alights on the feet; the glans penis muricate backwards; suddenly springs on its prey; sucks the blood and then devours it; waves the tail when in sight of the prey; refuses vegetables except from necessity: females bring many young: teats eight; four pectoral, four abdominal. Twenty-three species: of which the following are chief. See Nat. Hist. Pl. CXI. CXII. CXIII. CXIV.

1. F. leo. Lion. Body pale tawny. Head large, rounded; forehead square, eyes very large; lips pendulous, heart large; male a fourth part larger than the female; sometimes eight feet long; chest shaggy; sides of the head and neck with a yellowish brown mane about two feet long; tail bushy at the extremity.

Inhabits Africa: more rarely the deserts of Persia, India, Japan; mild; preys on horses and other larger quadrupeds, and, when pressed by severe hunger, on man: afraid of flame; restrained by dogs; urines backwards; when young is easily tamed; roars terribly; sleeps in the sun; eats every third day; lazy; slow; leaps upon its prey; breath fetid; smell weak. Its flesh is eaten by the Africans.

The strength of the lion is prodigious; he is said to be able to break the back of a horse by a single stroke of his paw; to carry off with ease a middle-sized ox or a buffalo; and to break the bones with his teeth with perfect ease and swallow them with the flesh. His duration is uncertain: Buffon calculates it under thirty years; but we have had lions in a state of confinement in the Tower who have lived sixty and even seventy years.

2. F. tigris. Tiger. Body with dark, long streaks, generally transverse and black with pale yellow between; length from twelve to fifteen feet. Inhabits the warmer parts of Asia, China, Japan and India: lives in woods and thickets near rivers; cunning, cruel, strong, of vast swiftness; infesting, and desolating man, especially in India. Even when tamed from the birth, will exercise his ferocity as soon as liberated; the male destroys his own progeny; will at times attack the lion; bounds from ambush upon its prey; like the lion has fetid breath; the most beautiful of all wild beasts. Is prodigiously powerful; and will carry off a buffalo without being apparently burdened by its weight. Is less terrified by flame than the lion, and has been known to carry off one out of a large party who were surrounding an immense fire made for the purpose of frightening wild beasts away.

3. F. pardus. Panther. Body upper parts marked with circular spots, lower with stripes; body colour bright tawny; spots black; streaks dusky: length seven feet. Inhabits Africa and the hot parts of Asia; does not attack man unless provoked; enters houses by nights and destroys cats; in other habits resembles the tiger.

4. F. uncia. Ounce. Body whitish, with irregular black spots. Inhabits the north of Africa, Persia, and Hyrcania; less and milder than the former; may be tamed and trained to the chase: length about three and a half feet.

5. F. leopardus. Leopard. Body yellow with black spots nearly contiguous. Inhabits Africa; scarcely larger than the former, and similar in habits.

6. F. onca. Brasilian tiger. Body yellowish, with black, roundish, angular spots, yellow in the middle. Inhabits the whole of South America; in cruelty, but not in courage, resembles the tiger, leaping from ambush with three bounds upon its prey; fastens upon the shoulders of the horse, and carries away animals three times its own size: having tasted human blood, ever afterwards prefers it; eats even fishes, and devours crocodiles: is driven away by fire.

7. F. pardalis. Mexican cat. Ocelot. Body upper part striped; lower spotted; above brown; beneath whitish; length, four feet; height two and a half. Inhabits South America and New Spain; runs up trees at the sight of dogs or men; ferocious, untameable; deceives monkeys by laying as if dead and then seizing them abruptly.

8. F. catus. Cat. Tail annulate. Varieties as follow:

α Wild cat. Tail annulate with brown; body with blackish stripes; three dorsal ones longitudinal, lateral ones spiral.
β Domestic cat. Less: hair shorter, thicker.
γ Angora cat. Hair longer, silvery, silky, longest on the neck.
δ Tortoise-shell cat. Variegated with black, white and orange.
ε Blue cat. Hair blue grey.
ζ Red cat. A red stripe from the head down the back.
η Chinese cat. Ears pendulous; hair shining, variegated with black and yellow.
θ Yellow cat. Reddish yellow; head long; snout sharp; legs short; claws weak; ears round, flat.
ι Madagascar cat. Tail twisted.

Inhabits the woods of Europe and Asia; domesticated every where; when tranquil purs, moving the tail: when irritated is very active, climbs, spits, emits a fetid odour; eyes shine at night; the pupil in the daylight forming a perpendicular line; walks with its claws drawn in; drinks sparingly; urine of the male corrosive; breath fetid; buries its excrements; makes a horrible mewling or caterwauling in its amours; mews after and plays with its kittens; wags its tail when looking after prey; the lion of mice, birds and the smaller quadrupeds; peaceful among its tribe; eats flesh and fishes; refuses hot and salted meats; washes behind its ears before a storm; back electric in the dark; when thrown up falls on its feet; is not infested with fleas; gravid sixty-three days; brings from three to nine young, which are blind for nine days after birth; delights in the aroma of marum, cat's mint and valerian.

9. F. chaus. Caspian lynx. Tail annulate near the tip, which is black; body brownish; yellow ears brown outwards, bearded and black at the tip. Inhabits woods and marshes of the Caspian Sea: ferocious; resembles the wild cat in its habits; forsakes cultivated places; seldom climbs trees; wanders by night among swamps and fields; preying on fishes, mice and birds.

10. F. caracal. Persian lynx. Body palish red-brown; ears black outwards, tips black bearded. Inhabits Barbary, Persia, and India; preys by night; tamed for hunting. The Bengal and the Lybian lynx differ only in order of colours.

11. F. lynx. Common lynx. Tail obscurely annulate, black at the tip; head and body whitish-tan, spotted with black; ears bearded at the top.

β Another variety, white with dark spots.
γ Upper parts whitish yellow; beneath white.
δ Yellowish-white with dusky spots: size of a fox: inhabits Europe, Asia, America, and Japan, among the thickest woods; preys

FELL. *a.* (ꝼelle, Saxon.) 1. Cruel; barbarous; inhuman (*Fairfax*). 2. Savage; ravenous; bloody (*Pope*).

Fell. *s.* (ꝼelle, Saxon.) The skin; the hide (*Shakspeare*).

To **Fell.** *v. a.* (*fellen*, German.) 1. To knock down; to bring to the ground. 2. To hew down; to cut down (*Dryden*).

Fell. The preterit of fall.

FE′LLER. *s.* (from *fell.*) One that hews down (*Isaiah*).

FELLETIN, a town of France, in the department of Creuse, noted for its manufactory of tapestry. Lat. 45. 53. N. Lon. 2. 6 W.

FELLI′FLUOUS. *a.* (*fel* and *fluo*, Lat.) Flowing with gall.

FELLING OF TIMBER. Many circumstances are well known and constantly observed in the felling of timber for building, which, though to a hasty observer they might appear trifling, yet prove, on experience, to be of the utmost consequence. One thing observed by M. Buffon, which very greatly increases the solidity and strength of timber, is, that the trees intended to be felled for service should be first stripped round of their bark, and suffered to stand and die upon the spot before the cutting. The sappy part, or blea of the oak, becomes by this means as hard and firm as the heart, and the real strength and density of the wood has been proved, by many experiments, to be greatly increased by it; nor is this a practice of any detriment to the proprietor, since the remaining stumps of these trees send up their young shoots as vigorously as if they had been cut down in their natural condition. When any tree is to be cut down for timber, the first thing to be taken care of is a skilful disbranching such limbs as may endanger it in its fall; many trees are utterly spoiled for want of a previous care of this kind. In arms of timber that are very great, it is always necessary to chop or sink in them close to the bole, and then, meeting it with downright strokes, it will be severed from the tree without splitting. In felling the tree, take care always to cut as close to the ground as possible, unless it is intended to be grubbed up; and the doing this is of advantage both to the timber and to the wood; for timber is never so much valued, if it be known to grow out of old stocks.

FE′LLMONGER. *s.* (from *fell.*) A dealer in hides.

FE′LLNESS. *s.* (from *fell.*) Cruelty; savageness; fury; rage (*Spenser*).

FE′LLOE. *s.* (*felge*, Danish.) The circumference of a wheel (*Shakspeare*).

FE′LLOW. *s.* (ꝼe, *faith*, and laȝ, *bound.*) 1. A companion; one with whom we consort (*Ascham*). 2. An associate; one united in the same affair (*Dryden*). 3. One of the same kind (*Waller*). 4. Equal; peer (*Fairfax*). 5. One thing suited to another; one of a pair (*Addison*). 6. One like another: as, this knave hath not his *fellow*. 7. A familiar appellation used sometimes with fondness; sometimes with contempt: as, *an honest or sorry* fellow. 8. Mean wretch; sorry rascal (*Swift*). 9. A member of a college, or any incorporated society (*Bacon*).

To **Fe′llow.** *v. a.* To suit with; to pair with; to match (*Shakspeare*).

Fellow-co′mmoner. *s.* One who has the same right of common. 2. A commoner at Cambridge of the higher order, who dines with the fellows.

Fellow-cre′ature. *s.* One that has the same Creator (*Watts*).

Fellow-heir. *s.* Coheir (*Ephesians*).

Fellow-he′lper. *s.* Coadjutor (*John*).

Fellow-la′bourer. *s.* One who labours in the same design (*Dryden*).

Fellow-se′rvant. *s.* One that has the same master (*Milton*).

Fellow-so′ldier. *s.* One who fights under the same commander (*Shakspeare*).

Fellow-stu′dent. *s.* One who studies in company with another (*Watts*).

Fellow-su′fferer. *s.* One who shares in the same evils (*Addison*).

Fellow-fe′eling. *s.* (*fellow* and *feeling.*) 1. Sympathy (*L'Estrange*). 2. Combination; joint interest (*Arbuthnot*).

FE′LLOWLIKE. Fe′llowly. *a.* (*fellow* and *like.*) Like a companion; on equal terms; companionable (*Carew*).

FE′LLOWSHIP. *s.* (from *fellow.*) 1. Companionship; consort; society (*Calamy*). 2. Association; confederacy (*Knolles*). 3. Equality. 4. Partnership; joint interest (*Dryden*). 5. Company; state of being together (*Shaks.*). 6. Frequency of intercourse; solid pleasure (*Bacon*). 7. Fitness and fondness for festal entertainments, with *good* prefixed (*Clarend.*). 8. An establishment in the college, with share in its revenues (*Swift*).

Fellowship, Company, or **Partnership**, is a rule in arithmetic, of great use in balancing accounts among merchants, and partners in trade, teaching how to assign to every one of them his due share of the gain or loss, in proportion to the stock he has contributed, and the time it has been employed, or according to any other conditions. Or, more generally, it is a method of dividing a given number, or quantity, into any number of parts, that shall have any assigned ratios to one another. And hence comes this general rule: Having added into one sum the several numbers that express the proportions of the parts, it will be,

As that sum of the proportional numbers :
Is to the given quantity that is to be divided : :
So is each proportional number :
To the corresponding share of the given quantity.

This rule is usually distinguished into two cases, one in which time is concerned, or in which the stocks of partners are continued for different times; and the other in which time is not considered; this latter being called single fellowship, and the former double fellowship, in which the proportional numbers vary with the products of the stocks and their respective times. Double fellowship may be divided into several cases, some of which are difficult to a beginner: the best rules for their solution are given at p. 61, Keith's Arith.

FE'LLY. *ad.* (from *fell.*) Cruelly; inhumanly; savagely; barbarously (*Spenser*).

FELO DE SE, a felon of himself, is a person who, being of sound mind, and of the age of discretion, voluntarily kills himself: for if a person is insane at the time, it is no crime. But this ought not to be extended so far as the coroner's juries sometimes carry it, who suppose that the very act of self-murder is an evidence of insanity, as if every man who acts contrary to reason had no reason at all; for the same argument would prove every other criminal non compos, as well as the self-murderer. 3 Inst. 54.

All inquisitions of the offence, being in the nature of indictments, ought particularly and certainly to set forth the circumstances of the fact; as the particular manner of the wound, and that it was mortal, &c. and in conclusion add, that the party in such manner murdered himself. 1 Salk. 377.

A felo de se forfeits all chattels real and personal, which he has in his own right; and also all such chattels real whereof he is possessed, either jointly with his wife, or in her right; and also all bonds and other personal things in action, belonging solely to himself; and also all personal things in action, and entire chattels in possession, to which he was entitled jointly with another, on any account except that of merchandize; but it is said that he shall forfeit a moiety only of such joint chattels as may be severed, and nothing at all of what he was possessed of as executor or administrator. Standf. P. C. 188, 189. Plow. 243, 262. 3 Inst. 55.

The further punishment of a felo de se is, to be buried in the highway, and a stake run through the body.

FE'LON. *s.* (*felon*, French.) 1. One who has committed a capital crime. 2. A whitlow; a tumour formed between the bone and its investing membrane. See Paronichia.

Fe'lon. *a.* Cruel; traitorous; inhuman (*Pope*).

FE'LONIOUS. *a.* (from *felon.*) Wicked; traitorous; villainous; malignant (*Wotton*).

FELO'NIOUSLY. *ad.* In a felonious way.

FE'LONIOUS. *a.* Wicked: not used (*Spenser*).

FELONY, in the general acceptation of law, comprises every species of crime which occasioned at common law the forfeiture of lands or goods. This most frequently happens in those for which a capital punishment either was or is liable to be inflicted; for those felonies which are called clergyble, or to which the benefit of clergy extends, were anciently punished with death in lay or unlearned offenders; though now, by the statute law, that punishment is for the first offence universally remitted.

Felony is always accompanied with an evil intention, and therefore shall not be imputed to a mere mistake or misanimadversion; as where persons break open a door to execute a warrant, which will not justify such a proceeding. But the bare intention to commit a felony is so very criminal, that at the common law it was punishable as felony, where it missed its effect through some accident, which no way lessened the guilt of the offender; but it seems agreed at this day, that felony shall not be imputed to a bare intention to commit it, yet it is certain that the party may be very severely fined for such an intention. 1 Haw. 65.

The punishment of a person for felony, by our ancient books, is, 1st, to lose his life; 2dly, to lose his blood, as to his ancestry, and so to have neither heir nor posterity; 3dly, to lose his goods; 4thly, to lose his lands, and the king shall have year, day, and waste, to the intent that his wife and children be cast out of the house, his house pulled down, and all that he had for his comfort and delight destroyed. 4 Rep. 124. A felony by statute incidentally implies, that the offender shall be subject to the like attainder and forfeiture, &c. as is incident to a felon at common law. 3 Inst. 47. See Burglary, Forgery, Homicide, Petit treason, Rape, Robbery, &c.

The word felony, or felonia, is of undoubted feodal original, being frequently to be met with in books of feuds, &c. but the derivation of it has much puzzled the juridical lexicographers, Pratæus, Calvinus, and the rest; some deriving it from the Greek φηλως, "an impostor or deceiver;" others from the Latin *fallo fefelli*, to countenance which they would have it called *fellonia*. Sir Edward Coke, as his manner is, has given us a still stranger etymology; that it is, *crimen animo felleo perpetratum*, "with a bitter or gallish inclination." But all of them agree in the description, that it is such a crime as works a forfeiture of all the offender's lands or goods. And this gives great probability to sir Henry Spelman's Teutonic or German derivation of it: in which language indeed, as the word is clearly of feodal original, we ought rather to look for its signification, than among the Greeks and Romans. *Fe-lon* then, according to him, is derived from two northern words: fee, which signifies (we well know) the fief, feud, or beneficiary estate; and lon, which signifies price or value. Felony is therefore the same as "pretium feudi," the consideration for which a man gives up his fief; as we say, in common speech, such an act is as much as your life, or estate, is worth. In this sense it will clearly signify the feodal forfeiture, or act by which an estate is forfeited, or escheats, to the lord.

To confirm this, we may observe, that it is in this sense, of forfeiture to the lord, that the feodal writers constantly use it. For all those acts, whether of a criminal nature or not, which at this day are generally forfeitures of copyhold estates, are styled *feloniæ* in the feodal law: "scilicet, per quas feudum amittitur." As "si domino deservire noluerit; si per annum et diem cessaverit in petenda investitura; si dominum ejuravit, i. e. negavit se a domino feudum habere; si a domino in jus eum vocante, ter citatus non comparuerit;" all these, with many others, are still causes of forfeiture in our copyhold estates, and were denominated felonies by the feodal constitutions. So likewise injuries of a more substantial or criminal nature were denominated felonies, that is, forfeitures: as assaulting or beating the lord; vitiating his wife or daughter, "si dominum cucurbitaverit, i. e. cum uxore ejus concubuerit;" all these are esteemed felonies, and the latter is expressly so denominated, "si fecerit feloniam, dominum forte cucurbitando." And as these contempts, or smaller offences, were felonies or acts of forfeiture, of course greater crimes, as murder and robbery, fell under the same denomination. On the other hand, the lord might be guilty of felony, or forfeit his seignory to the vassal, by the same act as the vassal would have forfeited his feud to the lord. "Si dominus commisit feloniam, per quam vasallus amitteret feudum si eam commiserit in dominum, feudi proprietatem etiam dominus perdere debet." One instance given of this sort of felony in the lord is beating the servant of his vassal, so as that he loses his service; which seems merely in the nature of a civil injury, so far as it respects the vassal. And all these felonies were to be determined, per "juramentum sive judicium parium suorum," in the lord's court; as with us forfeitures of copyhold lands are presentable by the homage in the court baron.

Felony, and the act of forfeiture to the lord, being thus synonymous terms in the feodal law, we may easily trace the reason why, upon the introduction of that law into England, those crimes which induced such forfeiture or escheat of lands (and, by a small deflexion from the original sense, such as induced the forfeiture of goods also) were denominated felonies. Thus it was that suicide, robbery, and rape, were felonies; that is, the consequence of such crimes was forfeiture; till by long use we began to signify by the term of felony the actual crime committed, and not the penal consequence. And upon this system only can we account for the cause, why treason in ancient times was held to be a species of felony; viz. because it induced a forfeiture.

Hence it follows, that capital punishment does by no means enter into the true idea and definition of felony. Felony may be without inflicting capital punishment, as in the cases instanced of self-murder, excusable homicide, and petit larceny: and it is possible that capital punishments may be inflicted, and yet the offence be no felony; as in the case of heresy by the common law, which, though capital, never worked any forfeiture of lands or goods, an inseparable incident to felony. And of the same nature was the punishment of standing mute, without pleading to an indictment; which at the common law was capital, but without any forfeiture, therefore such standing mute was no felony. In short, the true criterion of felony is forfeiture: for, as sir Edward Coke justly observes, in all felonies which are punishable with death, the offender loses all his lands in fee-simple, and also his goods and chattels; in such as are not punishable, his goods and chattels only.

The idea of felony is indeed so generally connected with that of capital punishment, that we find it hard to separate them; and to this usage the interpretations of the law do now conform. And therefore, if a statute makes any new offence felony, the law implies that it shall be punished with death, viz. by hanging, as well as with forfeiture: unless the offender prays the benefit of clergy; which all felons are entitled once to have, unless the same is expressly taken away by statute.

Felonies by statute are very numerous; and as this work will not admit of a proper enumeration, we must refer to the Table of the quarto edition of the Statutes, where they are set forth in alphabetical order.

FELT. The preterit of *feel.*

Felt. *s.* (ꝼelt, Saxon.) 1. Cloth made of wool united without weaving (*Shakspeare*). 2. A hide or skin (*Mortimer*).

To Felt. *v. a.* (from the noun.) To unite without weaving (*Hale*).

Felt-spar. See Feldspatum.

FELTING. The process by which hair, wool, or silk is worked into a compact texture, without spinning or weaving; chiefly employed in the manufacture of hats.

If any species of hair, wool, or even silk be inspected cursorily, it appears polished, yet if rubbed between the fingers, held by the point, and drawn to the root, the resistance is more considerable than in the contrary direction; the motion is likewise tremulous, and there is a chirping noise. Likewise, if a hair be held between the finger and thumb, and rubbed by alternately moving them in the direction of its length, a progressive motion will be produced, which is always with the root end foremost. The same structure may be shown by tying two hairs together, and then giving the knot a few blows between the palms of the hands, for the knot will either untie itself or draw closer, according as the asperities of the surfaces are placed in tying. From this mechanism, which is common to wool, and every other kind of hair, which, according to Monge, have their surface composed either of scales like those of fish, or imbricated cones, like the horns of animals, may be deduced the harsh feel of woollens against the skin, compared with linens, and their irritating effect upon wounds. It is this disposition to progressive motion endways, which causes hair to entangle and felt itself when pressed by the hatter between two pieces of linen, to which they do not unite from its fibres being smooth. Cut hair is better than such as is plucked, because the bulbous roots prevent the progressive motion. The fibres of wool being crooked, must naturally move in curves; but those of the hare, rabbit, and beaver, being straight, cannot be used alone in felting, until after a previous operation, which consists in rubbing them with a nitrous solution of mercury, by means of a brush, before they are separated from the skin. The solution acting only on one side of the hairs renders them crooked.

The straight hairs are used for felting hats, in which operation the action must be continued for a determinate time only, otherwise they would pass through and come out on the opposite side. The disposition of wool to felt itself, is an impediment to the carding and spinning processes; hence oil is used, which diminishes the power of the hairs to act on each other; but at the fulling-mill, soap and marle are used, which carry off the oil, and restore the wool to its former state, in consequence of which, the fulling process takes place, and the cloths are rendered narrower, shorter, closer, stronger, and thicker. The balls of hair in the stomach of certain animals which lick each other, are felted by the action of the stomach. To which may be added, that a similar cause is the chief reason why beds of cock and hen feathers are inferior to those of goose feathers; the latter being much straighter, do not form the hard flat balls which abound in the former. This work, which is entirely mechanical, forms the felt, which is a kind of soft spungy stuff, of greater or less thickness, and in its first state of a loose and imperfect texture. Its fibres would soon disunite from their weak connection; hence to give it requisite density and consistence, it undergoes the operation of fulling.

This, which is in a certain respect the completion of felting, has for its object the intimate connection of the fibres, and a more perfect and durable cohesion of the whole mass. For this purpose, the mere mechanical act of pressure is insufficient; the result would be a formless mass without consistence. For the fulling, it is necessary to make use of a bath of water heated nearly to ebullition, into which are put, in France, ten or fifteen pounds of lees of wine, for every hundred pounds of water. The heat is kept up the whole time of working, and every three or four hours a new quantity of lees is added. Into this bath the workmen plunge their felt, and begin their second process. The felt is dipped in, and immediately taken out again and squeezed, bent and rolled, by pressure in different directions, sometimes with the hand defended by leather, and sometimes by a roller, or other similar instrument. This is repeated until the stuff is well condensed, and has acquired the requisite solidity; hence the lees added must be considered as a chemical solvent, acting directly on the substance of the hair, and producing, either by softening or swelling it, an alteration necessary to insure the cohesion of the different fibres of the stuff.

The editor of the French Encyclop. Method. affirms, that it is the alkali or potash of the lees which determines the fulling. Chaussier has, however, found the assertion of the editor to be erroneous: to prove which, nothing more is necessary than to dip a piece of blue paper in the bath, which instantly becomes red, and if after several hours work the state of the bath be examined again, it is found that the acting part, which is the acidulous tartrite of potash, is partly exhausted, and the workmen soon perceive the want of a new portion; and if we consider the sparing solubility of the acidulous tartrite in cold water, it will appear why the water must be kept nearly boiling. Hence it is evident, that it must act by the portion of acidule it contains. It was this first observation that induced Chaussier to substitute the sulphuric acid instead of the lees, which although unknown to this chemist, had been used as a great secret in foreign manufactures. He found twelve drachms of this acid sufficient for one hundred pounds of water, and that this method was much preferable to that of wine lees, as being not only more convenient and economical, but the health of the workmen was not impaired by the excess and duration of the heat, the thick vapours, and the disgusting odour which exhales from the bath, particularly when the lees had been putrid and mouldy. A boiling heat is not necessary as formerly; ninety or one hundred degrees of Fahrenheit being sufficient for good fulling. It also saves fuel; cauldrons of lead may be substituted for those of copper, and the felt produced is of superior quality.

With respect to this process, it is only necessary to mention, that hats felted in the new manner take the dye better than in the old way, and that oak bark is substituted to nut-gall with advantage.

This process, called preparation, consists in lining the inner surface of the crown, as well as of the brim of the hats, with a glutinous substance, which, by drying, gives firmness to the work and preserves its form. This chemist found a solution of glue in a decoction loaded with the mucilage of linseed oil the best; whilst Margueron recommends the mucilage extracted from the leaves of the horse-chesnut when its foliage is in full vigour. A strong decoction of these leaves, which contains a great portion of mucous and adhesive matter, is used with the glue. These are better than gum arabic and other friable gums which become brittle.

To FE'LTRE. *v. a.* (from *felt.*) To clot together like felt (*Fairfax*)

FE'LUCCA. *s.* (*feleu*, French.) A small open boat with six oars.

FE'MALE. *s.* (*femelle*, French.) A she; one of the sex which brings young (*Shakspeare*).

Fe'male. *a.* Not male; not masculine; belonging to a she (*Milton*).

Female plant. Which has female flowers only. Female flower; which has pistils or stigmas, without stamens, or at least anthers.

Female screw. See Screws.

FEME COVERT. *s.* (French.) A married woman.

Feme sole. *s.* (French.) A single woman.

FEMINA'LITY. *s.* (from *fœmina*, Lat.) Female nature (*Brown*).

FE'MININE. *a.* (*fœmininus*, Latin.) 1. Of the sex that brings young; female. 2. Soft; tender; delicate (*Milton*). 3. Effeminate; emasculated (*Raleigh*).

Fe'minine. *s.* A she; one of the sex that brings young; a female (*Milton*).

Feminine, in grammar, one of the genders of nouns. See Gender. The feminine gender is that which denotes the noun or name to belong to a female. In the Latin, the feminine gender is formed of the masculine, by altering its termination; particularly by changing *us* into *a*. Thus, of the masculine *bonus equus*, "a good horse," is formed the feminine *bona equa*, "a good mare;" so, of *parvus homo*, "a little man," is formed *parva fœminā*, "a little woman," &c. In French, the feminine gender is expressed, not by a different termination, but by a different article: thus, *le* is joined to a male, and *la* to a female. In English, we are generally more strict, and express the difference of sex not by different terminations, nor by different particles, but different words; as boar and sow, boy and girl, brother and sister, &c. though sometimes the feminine is formed by varying the termination of the male into *ess*; as in abbot, abbess, &c.

FE'MORAL. *a.* (*femoralis*, Lat.) Belonging to the thigh.

FE'MORIS OS. See Femur.

FEMUR. (*femur.*) In anatomy. *Os femoris.* The thigh bone. A long cylindrical bone, situated between the pelvis and tibia. Its upper extremity affords three considerable processes; these are, the head, the trochanter major, and trochanter minor.—The head, which forms about two-thirds of a sphere, is turned inwards, and is received into the acetabulum of the os innominatum, with which it is articulated by enarthrosis. It is covered by a cartilage which is thick in its middle part, and thin at its edges, but which is wanting in its lower internal part, where a round spongy fossa is observable, to which the strong ligament, usually, though improperly, called the round one, is attached. This ligament is about an inch in length, flattish, and of a triangular shape, having its narrow extremity attached to the fossa just described, while its broader end is fixed obliquely to the rough surface near the inner and anterior edge of the acetabulum of the os innominatum, so that it appears shorter internally and anteriorly than it does externally and posteriorly.

The head of the os femoris is supported obliquely, with respect to the rest of the bone, by a smaller part, called the cervex or neck, which, in the generality of subjects, is about an inch in length. At its basis we observe two oblique ridges, which extend from the trochanter major to the trochanter minor. Of these ridges, the posterior one is the most prominent. Around this neck is attached the capsular ligament of the joint, which likewise adheres to the edge of the cotyloid cavity, and is strengthened anteriorly by many strong ligamentous fibres, which begin from the lower and anterior part of the ilium, and spreading broader as they descend, adhere to the capsular ligament, and are attached to the anterior oblique ridge at the bottom of the neck of the femur. Posteriorly and externally, from the basis of the neck of the bone a large unequal protuberance stands out, which is the trochanter major. The upper edge of this process is sharp and pointed posteriorly, but is more obtuse anteriorly. A part of it is rough and unequal, for the insertion of the muscles; the rest is smooth, and covered with a thin cartilaginous crust, between which and the tendon of the glutæus maximus, that slides over it, a large bursa mucosa is interposed. Anteriorly, at the root of this process, and immediately below the bottom of the neck, is a small process called trochanter minor. Its basis is nearly triangular, having its two upper angles turned towards the head of the femur and the great trochanter, while its lower angle is placed towards the body of the bone. Its summit is rough and rounded. These two processes have gotten the name of trochanters, from the muscles that are inserted into them being the principal instruments of the rotatory motion of the thigh. Immediately below these two processes the body of the bone may be said to begin. It is smooth and convex before, but it is made hollow behind by the action of the muscles. In the middle of this posterior concave surface is observed a rough ridge, called *linea aspera*, which seems to originate from the trochantes, and extending downwards, divides at length into two branches, which terminates in the tuberosities near the condyles.—At the upper part of it, blood-vessels pass to the internal substance of the bone, by a hole that runs obliquely upwards.

The lower extremity of the os femoris is larger than the upper one, and somewhat flattened, so as to form two surfaces, of which the anterior one is broad and convex, and the posterior one narrower and slightly concave. This end of the bone terminates in two large protuberances, called *condyles*, which are united before so as to form a pulley, but are separated behind by a considerable cavity, in which the crural vessels and nerves are placed secure from the compression to which they would otherwise be exposed in the action of bending the leg. Of these two condyles, the external one is the largest; and when the bone is separated from the rest of the skeleton, and placed perpendicularly, the internal condyle projects less forwards, and descends nearly three-tenths of an inch lower than the external one: but in its natural situation, the bone is placed obliquely, so that both condyles are then nearly on a level with each other. At the side of each condyle, externally there is a tuberosity, the situation of which is similar to that of the condyles of the os humeri. The two branches of the linea aspera terminate in these tuberosities, which are rough, and serve for the attachment of ligaments and muscles.

FEN, a general name for boggy or marshy land, subject to be overflowed with water.

Several statutes have been made for the draining of fens, chiefly in Kent, Cambridgeshire, Huntingdonshire, and Lincolnshire: in consequence of which these lands are generally kept in such a state, as to produce good crops of oats and other corn in favourable seasons. Indeed the fens in Lincolnshire, &c. bring many advantages to their inhabitants: particularly in the prodigious quantities of fish and fowls which they produce; and in the excellent pasturage for cattle. The fens abound in a sort of herbage that is very nourishing to sheep, oxen, and horses. The duck, mallard, teal, &c. are in such plenty, as scarcely to be conceived. Great advantage is derived from the geese that abound here, beside the food which they afford; that is, from their feathers and quills; and the produce of these is so great, that the custom-house books in the town of Boston shew, that there are frequently sent away in one year three hundred bags of feathers, each bag containing a hundred and a half weight. It may be thought strange by persons unacquainted with these things, but it is a certain truth, that the owners pluck these geese five times a year for the feathers, and once for their quills. Each plucking affords about a pound; and many people have a thousand geese at a time, or more. They are kept at no charge, except in deep snowy weather, when it is necessary to feed them with corn.

FE'NBERRY. *s.* (*fen* and *berry.*) A kind of blackberry (*Skinner*).

FENCE. *s.* (from *defence.*) 1. Guard; security; outwork; defence. 2. Enclosure; mound; hedge (*Dryden*). 3. The art of fencing; defence (*Shakspeare*). 4. Skill in defence (*Shakspeare*).

FENCE, in botany, a term used by Dr. Withering, and some other writers, for the involucre.

To FENCE. *v. a.* 1. To enclose; to secure by an enclosure or hedge (*Fairfax*). 2. To guard; to fortify (*Milton*).

To FENCE. *v. n.* 1. To practise the arts of manual defence; to practise the use of weapons (*Locke*). 2. To guard against; to act on the defensive (*Locke*). 3. To fight according to art (*Dryden*).

FE'NCELESS. *a.* (from *fence.*) Without enclosure; open (*Rowe*).

FE'NCER. *s.* (from *fence.*) One who teaches or practises the use of weapons (*Herbert*).

FE'NCIBLE. *a.* (from *fence.*) Capable of defence (*Addison*).

FENCE-MONTH, the month wherein deer begin to fawn, during which it is unlawful to hunt in the forest. It commences 15 days before Midsummer, and ends 15 days after it. This month, by ancient foresters, is called defence-month.

FENCING, the art of making a proper use of the sword, as well for attacking an enemy as for defending one's self. This art is acquired by practising with foils, called in Latin *rudes;* whence fencing is also denominated *gladiatura rudiaria.* It is one of the exercises learnt in academies; and is an accomplishment both agreeable and useful: agreeable, as it affords gentlemen a noble and distinguished amusement: useful, as it forms the body; and furnishes the faculty of defence, whether it be of their honour or their life, when the one or the other is attacked by those turbulent and dangerous persons whose correction is of service to society in general.

Pyrard assures us, that the art of fencing is so highly esteemed in the East Indies, that none but princes and noblemen are allowed to teach it. They wear a badge or cognizance on their right arms, called in their language *esaru;* which is put on with great ceremony, like the badges of our orders of knighthood, by the kings themselves.

Fencing is divided into two parts, simple and compound. Simple fencing is that performed directly and nimbly on the same line; and is either offensive or defensive. The principal object of the first is whatever may be attempted, in pushing or making passes, from this or that point, to the most uncovered part of the enemy. The second consists in parrying and repelling the thrusts aimed by the enemy. Compound fencing includes all the possible arts and inventions to deceive the enemy, and make him leave that part we have a design on bare and unguarded, upon finding we cannot come at it by force, nor by the agility of the simple play. The principal means hereof are, on the offensive side, feints, appeals, clashings, and entanglings of swords, half-thrusts, &c., and, on the defensive, to push in parrying. Of all which a detail would be here useless, as they are only to be understood and acquired from personal instructions conjoined with practice.

FE'NCINGMASTER. *s.* (*fence* and *master.*) One who teaches the use of weapons.

FE'NCINGSCHOOL. *s.* A place in which the use of weapons is taught.

To FEND. *v. a.* (from *defend.*) To keep off; to shut out (*Dryden*)

To FEND. *v. n.* To dispute; to shift off a charge (*Locke*).

FE'NDER. *s.* (from *fend.*) 1. An iron plate laid before the fire to hinder coals that fall from rolling forward to the floor. 2. Any thing laid or hung at the side of a ship to keep off violence.

FENELON (Francis de Salignac de la Motte), archbishop of Cambray, was born of an illustrious family, at the castle of Fenelon, in the province of Perigord, in 1651. He completed his studies at the university of Paris, where, while young, he distinguished himself as an elegant preacher. In 1686 he was employed as one of the missionaries sent along the coast of Saintonge to convert the protestants. In 1689 he was made tutor to the dukes of Burgundy, Anjou, and Berri, and in 1693 chosen member of the French academy. The improvement which his pupils made under him gave so much satisfaction, that the king presented him with the abbey of St. Valery, and shortly after preferred him to the archbishopric of Cambray. About this time he fell into considerable trouble, occasioned by his book, intituled, an Explication of the Maxims of the Saints, which abounded with mystical sentiments. Bossuet, bishop of Meux, who was a violent enemy to madame Guyon, the celebrated mystic, soon discovered a similarity between her notions and those of the archbishop of Cambray. Several conferences took place between these two prelates on this subject, and at last the cause was referred to the pope, who condemned Fenelon's book. The good archbishop submitted quietly to this sentence, and even read it publicly himself in his cathedral of Cambray. He wrote many other books. The work that gained him the greatest reputation, and which will render his memory immortal, is his Adventures of Telemachus; the style of which is natural, the fictions well contrived, the moral sublime, and the political maxims tending all to the happiness of mankind. Hence it is thought, as the printing of this work was stopped at Paris, that the prelate's heresy was in politics instead of religion; and though his disgrace was prior to this work, he had, while he was tutor to the young princes, taught them the principles asserted and exemplified in Telemachus. He spent the remainder of his days in his diocese, beloved by all who knew him, and universally admired. In the last war of Louis XIV. with the allies, the duke of Marlborough had so profound a regard for him, that he gave express orders to his army not to injure the lands of the archbishop. He died in 1715. Besides the above works, we must mention, as peculiarly excellent, his Dialogues of the Dead, in 2 vols.; Dialogues on Eloquence in general, and that of the Pulpit in particular; a Treatise on the Education of Daughters; a Demonstration of the Existence of God; Spiritual Works; and Directions for the Conscience of a King.

FENERA'TION. *s.* (*feneratio*, Latin.) Usury; the gain of interest (*Brown*).

FENESTRATE, in entomology, a term applied to the hyaline spots on the wings of butterflies.

FENESTRELLE, a town and fort of Piedmont, in the valley of Vaudois. Lat. 85. 10 N. Lon. 7. 21 E.

FENESTRA OVALIS. (from *fenestra*, a window, or φαίνω, to shine.) In anatomy, an oblong or elliptical foramen, between the cavity of the tympanum and the vestibulum of the ear. It is shut by the stapes.

FENESTRA ROTUNDA, a round foramen, leading from the tympanum to the cochlea of the ear. It is covered by a membrane in the fresh subject.

FENGELD, in our ancient writers, is used for a tax or imposition raised for repelling of enemies.

FENNEL. See FÆNICULUM, and ANETHUM.

FENNEL-HOGS. See PEUCEDANUM.

FENNEL-FLOWER, in botany. See NIGELLA.

FENNEL (Giant), in botany. See FERULA.

FENNEL (Sea), in botany. See CRITHUSUM.

FE'NNY. *a.* (from *fen.*) 1. Marshy; boggy; moorish. 2. Inhabiting the marsh.

FENNY STRATFORD, a town of Buckinghamshire, having a market on Mondays. It is 45 miles N.W. of London.

FE'NNYSTONES. *s.* A plant.

FE'NSUCKED. *a.* (*fen* and *sucked.*) Sucked out of marshes (*Shakspeare*).

FENUGREEK. See FÆNUGRECUM, and TRIGONELLA.

FENTON (Elijah), descended from an ancient family, was born at Shelton, near Newcastle, but in what year is uncertain. He was the youngest of 12 children, and was intended for the ministry; but embracing principles contrary to the government, while at Cambridge, he became disqualified for entering into holy orders. After he quitted the university, he was secretary to the earl of Orrery; but he seems to have spent the most of his life amongst his friends and relations, and used to pay an annual visit to his elder brother, who enjoyed an estate of 1000*l.* a-year. He was a man of great tenderness and humanity enjoyed the fairest reputation, and was much esteemed by Mr. Pope, who, when he died in 1730, paid him the tribute of a very elegant epitaph. He published a volume of poems in the year 1717; and in 1723 was acted his tragedy of Mariamne, built upon the story collected from Josephus in the third volume of the Spectator.

FEOD, or FEUD, a right which a vassal hath in lands or some immoveable thing of his lord's, to use the same, and take the profits thereof hereditarily, rendering unto the lord such feodal duties and services as belong to military tenure, &c. and the property of the soil always remaining to the lord.

FEODAL, of or belonging to a feud or fee.

FEODAL SYSTEM, the constitution of fiefs or feuds. It is about 12 centuries ago, since this system was so universally received in Europe, that sir Henry Spelman calls it the law of nations in our western world. Hence it deserves our attention in a particular manner; a knowledge of feuds being indispensably requisite for a proper understanding either of the civil government of our own country, or the laws by which its landed property is regulated.

The military policy of the Celtic or northern nations, known by the names of Goths, Vandals, Franks, Huns, and Lombards, furnished the original constitution or system of feuds. These people pouring out into vast multitudes from the same *officina gentium*, or store-house of nations, overran all the European countries on the declension of the Roman empire. They brought the feudal system along with them from the countries out of which they emigrated; and, supposing it to be the most proper method of securing their new conquests, they introduced it into their more southerly colonies.

According to this system, the victorious general allotted considerable tracts of land to his principal officers; while they, in like manner, divide their possessions among the inferior officers, and even those common soldiers who were thought to be the most deserving. Allotments of this kind were named feoda, fiefs, fees, or feuds, from a combination of words, in the language of these barbarians, signifying a reward or stipend bestowed on certain conditions. The condition upon which these rewards were given was, that the possessors should faithfully serve the person from whom they were received, both at home and abroad, in the military way. To this they engaged themselves, by a *juramentum fidelitatis*, or oath of fealty; in the event of a breach of which, either by not performing the service agreed upon, by deserting their lord in time of battle, &c. the lands were to return to their original possessor.

Thus the possessors of feodal allotments became interested in the defence of them; and not only the receivers, but those who gave them, were equally and mutually bound to defend their possessions, none of them being able to pretend any right but that of conquest. For this purpose, government and subordination were absolutely necessary; it being impossible to conduct any system of defence where every thing was tumultuous and irregular. Every person, therefore, who was a feudatory, i. e. who had received lands, was bound to do every thing in his power to defend the lord of his fee; while, on the other hand, the latter was no less subordinate to his immediate superior; and so on to the prince himself. In like manner a reciprocal bond of defence existed down from the prince to the lowest feodists.

Such were the foundations on which the feodal system was established; and the natural consequence was, a military subjection throughout the whole community. The prince could always collect an army of feudatories ready to defend not only the kingdom in general, but the particular possessions of each person; and the propriety of this constitution was soon apparent in the strength which these newly-erected kingdoms acquired, and the valour with which their conquests were defended.

Besides these feodal grants, however, which were held only on the terms of military service above-mentioned, there were others called *allodial*, which were given upon more enlarged principles. To these every free man had a title; and could not only claim his territory as well as the rest, but dispose of it at his pleasure; and this freedom was denominated *allodiality*. These allodials, however, were not exempted from military service. A part of their freedom consisted in liberty to go to the wars; for this, in the barbarous times we speak of, was the only way to acquire any degree of renown. Only the slaves were destined to follow the arts of peace; while every free person was not only at liberty to defend his country, but under an obligation to do it in case of any urgent necessity.

Thus there was a feodal and a national militia. The free people only were allowed to possess property; the feudal vassals constituted the army, properly so called; while the national militia was composed of the allodial proprietors. This allodiality was not confined to landed property, but included likewise moveable estates or money; so that proprietors of the latter kind were obliged also in times of danger to bear arms and appear in the field. Between the feodal and allodial proprietors, however, there was this farther difference, that the latter had no concern with any private quarrels which might take place among the lords themselves; so that they were never obliged to appear in the field, unless when called forth by the sovereign against the enemies of the nation at large. This circumstance we might suppose to be an advantage, but it ultimately operated otherwise, becoming the means of changing the allodial right into a feodal tenure. For some time the holders of fiefs had an eminent advantage over the allodial proprietors, owing to the imperfection of government in those days; so that the nobles had it in their power to revenge their own quarrels, while the weak were equally exposed to the insults of both parties. The lord and his vassals, therefore, were always formidable; but the allodial proprietors had scarce any means of defending themselves. The reason of this was, in the first place, that the law did not allow them to commit any hostilities; and in the next, they were too distant and unconnected to form any proper league for mutual defence; and hence proceeded the necessity of converting allodial property into feudal tenure. This was indeed owing in a great measure to the absurdity and violence of the times, by which gifts of property, burthened with service, and which might return to the person who granted them, were rendered superior in value to the absolute and unconditional possession of a subject. Other considerations, however, besides that just mentioned, contributed to produce the same effect. As in those dark ages no right existed but what had its origin in conquest, it thence followed, that the greatest conqueror or warrior was the most honourable. The king, therefore, in whom the whole exploits of the community centred, as being their head, was the most honourable person; all others derived from him that portion of honour which they enjoyed, and which was most nicely adjusted in proportion as they approached him. Allodial proprietors having no pretensions of this kind, were treated with contempt as a kind of poltroons. From this disagreeable situation they wished to free themselves, by converting their allodial property into feudal tenures; while the princes, supposing it their interest to extend those tenures as much as possible, discouraged the allodial possessions. As the feodalists supported the importance of the nation and dignity of the monarch, it was not thought proper to allow the allodial proprietors any greater compensations than what were given to vassals in similar cases. Thus they were exposed to continual mortifications in the courts of justice; they were neglected by the king; denied sufficient protection from the laws; exposed not only to continual insults, but to have their property on all occasions destroyed by the great; so that they were without resource except from the feodal tenures, and were obliged even to solicit the privileges which were bestowed in other cases on vassals. In these unhappy circumstances, they were glad to yield up their lands to any superior whom they thought most agreeable, and to receive them back from them as a feudal gift. Thus the landed property was every where changed into feudal tenures, and fiefs became universal.

There have been several doubts and difficulties among the learned respecting the period at which the feudal laws were introduced into England: the generally received opinion, however, is, that they were introduced by William the conqueror. That monarch, at the head of victorious troops, having to do with two nations at enmity with each other, lying under a reciprocal check, and equally subdued, by a sense of their unfortunate resistance, found himself in the most favourable circumstances for becoming absolute; and his laws, being promulgated, as it were, in the midst of thunder and lightning, imposed the yoke of despotism both on the victors and the vanquished. He divided England into 60,215 military fiefs, all held of the crown; the possessors of which were, on pain of forfeiture, to take up arms, and repair to his standard on the first signal. And the feodal system, being thus suddenly and violently introduced, took a more rigorous form than in other countries; the barons as well as the common people were subjected under it; and the whole was pressed together by the immense weight of the regal authority.

From the first institution of military service, a fine had been accepted instead of actual appearance in the field. In the times of barbarity, however, when men accounted rapine and bloodshed their only glory, there were but few who made an offer of this compensation; but as wealth and luxury increased, and the manners of people became softer, a general unwillingness of following the army into the field became also prevalent. A new tenure, called escuage, was therefore introduced; by which the vassal was only obliged to pay his superior a sum of money annually instead of attending him into the field. Hence originated taxes and their misapplication; for as the king was lord paramount of the whole kingdom, it thence happened that the whole escuage money collected throughout the nation centred in him. The princes then, instead of recruiting their armies, frequently filled their coffers with the money, or dissipated it otherwise, hiring mercenaries to defend their territories when threatened with any danger. These being composed of the dregs of the people, and disbanded at the end of every campaign, filled all Europe with a disorderly banditti, who frequently proved very dangerous to society. To avoid such inconveniencies, standing armies were introduced, and taxations began to be raised in every European kingdom. New inconveniencies arose. The sovereigns in most of these kingdoms, having acquired the right of taxation, as well as the command of the military power, became completely despotic: but in England the sovereign was deprived of this right by Magna Charta, which was extorted from him, as related in our English histories; so that, though allowed to command his armies, he could only pay them by the voluntary contributions of the people, or their submitting to such taxations as were virtually imposed by themselves.

FE'ODARY. *s.* (from *feodum*, Latin.) One who holds his estate under the tenure of suit and service to a superior lord (*Hanmer*).

To FEOFF. *v. a.* (*feoffare*, low Lat.) To put in possession; to invest with right.

FEOFFE'E. *s.* (*feoffatus*, Lat. *fiefé*, Fr.) One put in possession (*Spenser*).

FE'OFFER. *s.* (*feoffator*, low Latin.) One who gives possession of any thing.

FEOFFMENT, in law, (from the verb *feoffare* or *infeudare*, to give one a feud); the gift or grant of any corporeal hereditament to another. He that so gives, or enfeoffs, is called the feoffer; and the person enfeoffed is denominated the feoffee. This is plainly derived from, or is indeed itself the very mode of the ancient feodal donation; for though it may be performed by the word enfeoff, or grant, yet the aptest word of feoffment is *do* or *dedi*. And it is still directed and governed by the same feodal rules; insomuch that the principal rule relating to the extent and effect of the feodal grant, *tenor est qui legem dat feudo*, is in other words become the maxim of our law with relation to feoffments, *modus legem dat donationi*. And therefore, as in pure feodal donations, the lord from whom the feud moved must expressly limit and declare the continuance or quantity of estate which he meant to confer, *ne quis plus donasse præsumatur, quam in donatione expresserit*; so, if one grants by feoffment lands or tenements to another, and limits or expresses no estate, the grantee (due ceremonies of law being performed) hath barely an estate for life. For, as the personal abilities of the feoffee were originally presumed to be the immediate or principal inducements to the feoffment, the feoffee's estate ought to be confined to his person, and subsist only for his life; unless the feoffer, by express provision in the creation and constitution of the estate, hath given in a longer continuance. These express provisions are indeed generally made; for this was for ages the only conveyance, whereby our ancestors were wont to create an estate in fee-simple, by giving the land to the feoffee, to hold to him and his heirs for ever; though it serves equally well to convey any other estate of freehold. But by the mere words of the deed the feoffment is by no means perfected: there remains a very material ceremony to be performed, called livery of seisin; without which the feoffee has but a mere estate at will. See Seisin.

FERABAD, a town of Persia, capital of the province of Mazanderan, seated among the mountains which bound the Caspian Sea to the S. and 12 miles from it. Shah-Abbas often spent his winters here. It is 139 miles W. of Astrabad. Lon. 52. 21 E. Lat. 37. 14 N.

FERA'CITY. *s.* (*feracitas,* Lat.) Fruitfulness; fertility.

FERÆ, in zoology, an order of the class mammalia; thus originally characterised: Foreteeth conic, usually six in each jaw; tusks longer than the other teeth; grinders with conic projections; feet with claws; claws subulate; food carcases, and other animals attacked while alive.

FE'RAL. *a.* (*feralis,*Lat.) Funereal; deadly.

FERALIA, in antiquity, the same as Febrica. It continued for 11 days, during which time presents were carried to the graves of the deceased, marriages were forbidden, and the temples of the gods were shut.

FER DE FOURCHETTE, in heraldry, a cross having at each end a forked iron, like that formerly used by soldiers to rest their musquets on. It differs from the cross fourché, the ends of which turn forked, whereas this has that sort of fork fixed upon the square end.

FERE, a town of France, in the department of Aisne, famous for its powder-mill, and school of artillery. Near this town is the castle of St. Gobin, famous for its manufactures of fine plate-glass. Lat. 49. 29. N. Lon. 5. 25 E.

FERENTARII, in Roman antiquity, auxiliary troops, lightly armed.

FERENTINUM, in ancient geography, a town of the Hernici in Latium, which the Romans, after subduing that nation, allowed to be governed by its own laws. Now Ferentino, an episcopal city in the Campania of Rome. Lon. 14. 5 E. Lat. 41. 45 N.

FERENTUM, or Forentum, in ancient geography, a town of Apulia, in Italy. Now Forenza, in the Basilicata of Naples.

FERETRUM, among the Romans, the bier used in carrying out the bodies of the dead.

FERG, or Fergire (Francis Paul), an eminent landscape painter, born at Vienna in 1689. He studied under Hans Graaf and Grient, and possessing a fine taste he soon acquired an excellence in his art, which was also greatly improved by travelling. From Germany he came to London, where his talents were greatly admired, but an imprudent marriage rendered him incapable of profiting sufficiently by them. It is said that he was found dead at the door of his lodging, exhausted by cold, want, and wretchedness, in 1740. He adorned his landscapes with ruins executed in a grand taste. He also painted conversation-pieces admirably well. (*Watkins*).

FERGUSON (James), an ingenious experimental philosopher and mechanic, was born in Bamffshire, in Scotland, in 1710, and when young was placed out as a servant to a shepherd, in which situation he acquired an exact knowledge of the stars, and discovered so promising a genius, that some gentlemen of the neighbourhood kindly assisted him, and enabled him to follow his favourite studies. He made a wooden clock, and afterwards a watch, only by examining one of each. He also acquired a knowledge of drawing, and maintained himself and family by painting portraits, which profession he followed both in Scotland and England. About 1744 he went to London, where his uncommon abilities procured him many friends, and the honour of being admitted a fellow of the Royal Society. His present majesty, on his accession, settled upon him a pension of 50*l.* a year, and used often to converse with him upon philosophical and mechanical subjects. This ingenious man died in 1776. He invented several useful instruments, and published some excellent books; as, 1. Select Mechanical Exercises, 8vo.; 2. Introduction to Electricity, 8vo.; 3. Introduction to Astronomy, 8vo.; 4. Astronomy explained ons Sir Isaac Newton's Principles, 8vo.; 5. Lectures on Mechanics, Hydrostatics, Hydraulics, Pneumatics, and Optics, 8vo.; 6. A Treatise on Perspective, 8vo. New editions of the Select Lectures and the Astronomy, have been lately published by Dr. David Brewster, with many valuable additions.

To what a degree of consideration Mr. Ferguson mounted by the strength of his natural genius, almost every one knows. He was by many considered as at the head of practical mechanics in this nation of philosophers. And he might justly be styled self-taught, or rather heaven-taught; for in his whole life he had not above half a year's instruction at school. He was a man of the clearest judgment, and the most unwearied application to study; benevolent, meek, and innocent in his manners as a child; humble, courteous, and communicative. Instead of pedantry, philosophy seemed to produce in him only diffidence and urbanity, a love for mankind and for his Maker. His whole life was an example of resignation and Christian piety. He might be said to be an enthusiast in his love of God, if religion, founded on such substantial and enlightened grounds as his was, could be styled enthusiasm.

FERIA, in the Roman breviary, is applied to the several days of the week; thus, Monday is the feria secunda; Tuesday the feria tertia; though these days are not working days, but holidays.

FERIÆ LATINÆ, festivals at Rome, instituted by Tarquin the Proud. The feriæ among the Romans were certain days set apart to celebrate festivals, and during that time it was unlawful for any person to work. They were either public or private. The public were of four different kinds, and were called stativæ, or immoveable; conceptivæ, or moveable; latinæ, compitaliæ, imperativæ, appointed only by the consul, dictator, &c. Nundinæ and privatæ. (For a minute description of the several kinds of feriæ, the student is referred to Kennet's Antiquities.) The days on which the feriæ were observed were called by the Romans festi dies, because dedicated to mirth, relaxation, and festivity.

FERIA'TIO. *s.* (*feriatio*, Latin.) The act of keeping holiday.

FERINE. (*ferinus*, *morbus*, savage or brutal.) A term occasionally applied to any malignant or noxious disease.

FERI'NENESS. *s.* (from *ferine*.) Barbarity; savageness; wildness (*Hale*).

FE'RITY. *s.* (*feritas*, Latin.) Barbarity; cruelty; wildness; savageness (*Woodward*).

FERLINGATA TERRÆ, in our old writers, according to Du Cange, 40 perches of land.

FERMAT (Peter), counsellor of the parliament of Toulouse, in France, who flourished in the 17th century, and died in 1663. He was a general scholar, and a universal genius, cultivating jurisprudence, poetry, and mathematics, but especially the latter, for his amusement. He was contemporary and intimately connected with Mersenne, Torricelli, Des Cartes, Pascal, Roberval, Huygens, Frenicle, and Carcavi, and several others the most celebrated philosophers of their time. He was a first-rate mathematician, and possessed the finest taste for pure and genuine geometry, which he contributed greatly to improve, as well as algebra.

Fermat was author of, 1. A Method for the Quadrature of all Sorts of Parabolas. 2. Another on Maximums: which serves not only for the determination of plane and solid problems; but for drawing tangents to curve lines, finding the centres of gravity in solids, and the solution of questions concerning numbers: in short, a method very similar to the Fluxions of Newton. 3. An Introduction to Geometric Loci, plane and solid. 4. A Treatise on Spherical Tangencies: where he demontrates in the solids the same things as Vieta demonstrated in planes. 5. A Restoration of Apollonius's two books on Plane Loci. 6. A General Method for the Dimension of Curve Lines. Besides a number of other smaller pieces, and many letters to learned men; several of which are to be found in his Opera Varia Mathematica, printed at Toulouse, in folio, 1679. (*Hutton's Dict.*)

FERME, in the manage, implies an exercise on the same spot, without quitting or deviating from it.

FERMENAGH, or FERMANAGH, a county of Ireland, in the province of Ulster, 38 miles long and 23 broad. It is bounded by Donegal, Tyrone, Monaghan, Cavan, and Leitrim; it contains 19 parishes, and before the union sent four members to parliament. Inniskilling is the capital.

To FERME'NT. *v. a.* (*fermento*, Latin.) To exalt or rarify by intestine motion of parts (*Pope*).

To FERME'NT. *v. n.* To have the parts put into intestine motion.

FERME'NT. *s.* (*ferment*, Fr. *fermentum*, Latin.) 1. That which causes intestine motion (*Floy.*). 2. Intestine motion; tumult (*Rogers*).

FERME'NTABLE. *a.* (from *ferment.*) Capable of fermentation.

FERME'NTAL. *a.* (from *ferment.*) Having the power to cause fermentation (*Brown*).

FERMENTATION (*fermentalio*, Latin; εκϐρασμος, Greek.) An intestine motion, excited by the assistance of proper heat and fluidity between the integrant and constituent parts of farinaceous, saccharine, and a few other substances, from which new combinations of their respective principles result.

The usual heat requisite for fermentation is about 70 deg. of Fahrenheit; and the usual substances employed for the purpose are sugar and farinaceous materials; the latter as possessing a considerable portion of the saccharine principle; this portion, however, is seldom sufficient in the farinaceous materials to enable them to ferment without some previous preparation. The preparation consists in wetting and in exposing the grain to a degree of warmth to excite the process of vegetation; but no new saccharine principle is added: it is merely more completely developed. Sugar must be employed in every fermentation; but it requires about four times its weight of water. With the sugar, mucilage is also requisite; an ingredient which the coarse sugar usually contains. But it is singular, that a vegetable acid must also be previously contained in the substance to be fermented (Annales de Chimie, xxxvi. 20.); and this we shall find to be supplied, in beer, by the barm or yeast, and is contained naturally in all the fruits.

When these ingredients are in due proportion, and the temperature raised to nearly 70°, an intestine motion commences; the liquor becomes thick and muddy; an additional degree of heat is excited in proportion to the rapidity of the process, which sometimes rises so high as 95°, and carbonic acid gass arises. In this process the sugar disappears, and the fluid becomes clear, as well as of a less specific gravity; and, as it is styled, of a vinous taste, owing to the formation of alcohol. The other ingredients seem merely to have assisted the process, and to remain unchanged; for we still find the mucilage both in wine and beer, and the vegetable acid in the former; though the small portion employed as a ferment in the latter seems to have escaped with the carbonic acid gass. Thus the sugar appears to be in part decomposed, and to have separated in the form of carbonic acid gass; and the other part, with a large excess of hydrogen, forms the alcohol, combined with the colouring matter, and the vegetable acid. The superfluous extractive matter, which the vinous liquor cannot dissolve, rises to the top, or sinks to the bottom, in proportion to the quantity of air entangled with it. In this process a portion of malic acid is formed, perhaps from the tartarous; and some oxygen is seemingly evolved. It was supposed that the latter was derived from the open air; but Fabroni has informed us, that fermentation proceeds with equal rapidity and success in close and in open vessels. Annales de Chimie, xxxi. 302.

After this active process of fermentation is at an end, it still proceeds in a more slow, often in an imperceptible, way. If wine or beer be kept in a heat, from 70 to 90 degrees, it gradually thickens, grows hot with a gently hissing noise, and filaments are observed to move in it, though previously fine. The heat and noise lessen; the filaments subside, and the liquor is again clear; but it is no longer vinous; it is acid. The result of the acetous fermentation seems not to be connected with the alcohol. Yet if the assertions of some of the older chemists, that the strongest wines, when rendered acid, afford the strongest vinegars, be true, alcohol may probably have some effect. These vinegars have not, however, been examined; and we strongly suspect that they would appear to have been impregnated with acetous ether. The extractive matter seems to be the substance which first experiences the change; for when it is carefully separated, wine will not become sour, though found by Chaptal to become acid, when vine leaves were added. (Annales de Chimie, xxxvi. 245.) It is said also, with some truth, that fermented liquors do not become acid, unless they are exposed to the atmosphere, from whence the oxygen, essential to the acidity, is absorbed. There seem, however, to be some cases in which this exposure to the atmosphere is not necessary; for wine will not become sour in well-corked bottles. In general, however, no cork is sufficiently tight to prevent, after some time, the escape of alcohol; and the atmospheric air finds access by the same course: in bottles which contain acid wine, some space will always be found empty, and the acidity is in proportion to this space. The flakes are owing to the extractive matter which commenced the process; but some portion of this still remains, and the malic acid is the last to experience the change.

The first signs of fermentation are a gentle intestine motion, the rising of small bubbles to the top of the liquor, and a whitish turbid appearance. This is soon followed by the collection of a froth or head, consisting of an infinite number of air bubbles entangled in the liquor, which, as the process advances, rise slowly to a considerable height, forming a white dense permanent froth. A very large portion of the gass also escapes, which has always a strong, agreeable, penetrating vinous smell. The temperature of the liquor at the same time increases several degrees above the external air; and continues so during the whole of the process. Sooner or later these appearances gradually subside; the head of foam settles into a dense froth, and on turning it aside, the liquor beneath appears much clearer, and nearly at rest, having deposited a copious sediment, and from being clammy and saccharine to the taste, it is now vinous and intoxicating, thinner and of less specific gravity.

The process, however, does not stop suddenly, but goes off very gradually, the liquor continuing to work or throw up foam, to clarify, to attenuate, to increase in intoxicating power, and more completely to lose all its sugar, which at last can now no longer be discerned by the taste, or detected by chemical analysis. The vinous liquor when complete, if of sufficient strength, and well fermented, will now keep for an indefinite time in vessels secured from air, and undergoes comparatively little further alteration, except in becoming more perfectly limpid by the deposition of an additional quantity of sediment.

The nature of the gass of fermenting liquors has long been known to consist for the most part of carbonic acid; and therefore it will extinguish candles, destroy animal life, convert alkalies into alkaline carbonats, and the like. But it is not simply carbonic acid that is given off, for it has been found by Scheele to hold in solution a sensible portion of alcohol, and by Proust to contain a quantity of azot. Mr. Collier has also found that the gass contains all the materials requisite for vinous fermentation. For this, he passed the whole gass from a ninety-gallon fermenting tun through a cask of water, and divided the water, thus impregnated, into three parts, the first of which was immediately distilled, and gave a small quantity of spirit; to the second was added some yeast, by which a new fermentation was excited, and the subsequent product of distilled spirit was almost doubled; and the third, being suffered to remain longer, produced some vinegar.

The attenuation of liquors by fermentation, or the diminution of their specific gravity, is very striking. This is commonly seen by the hydrometer, which swims much deeper in fermented liquor than in the same materials before fermentation. Most of this attenuation is doubtless owing both to the destruction of the sugar, which dissolved in water adds to its density, and to the consequent production of alcohol, which, on the contrary, by mixture with water, lessens its density. The extract or mucilage also appears to be in some degree destroyed by fermentation, for the gelatinous consistence of thick liquors is much lessened thereby, though this quality, as far as it depends on mucilaginous extract, is not so completely lost as the saccharine material: many of the full-bodied ales, for example, retaining much of their original clamminess and gelatinous density.

It has been doubted whether alcohol exists ready formed in vinous liquors, or whether it is not then in some intermediate state, and is brought to a perfect spirit by the boiling heat required for distillation. It is not easy to devise any unexceptionable mode of determining this question. Fabbroni argues in favour of alcohol being a product, and not an educt from wine; that wine cannot be again formed by adding the distilled alcohol to the residue; and also that if a small portion of alcohol is added to wine, it may be separated again almost entirely by carbonat of potash (with which alcohol will not unite), but this salt will not separate any alcohol from wine in its natural state. This last fact, however, only shews, that the union of the alcoholic with the other part of the wine is too strong to be broken by simple affinity without the assistance of heat; and as to the former, it is highly probable that the boiling heat operates some change on the other constituents of wine, the effect of which can never be done away by the mere return of the spirit which has been driven off. This opinion, therefore, though by no means improbable, wants further confirmation.

Alcohol is not immediately formed in fermenting liquors, as it does not appear till the fermentation is complete, for the liquor distilled in the early stage of the process will not yield a drop of spirit. The external air seems to have no chemical effect whatever in the process of vinous fermentation, as it may be conducted full as well in close as in open vessels, always allowing room for the great expansion of the materials, and the vast production of gass. Mr. Collier has also found, by direct experiment, that more spirit is produced by close than by open fermentation. In three separate experiments, in each of which equal quantities of wort and yeast were fermented, under circumstances precisely similar, with the single exception, that in one the vessel was open and in the other it was closed (having no exit but through a tube dipping in water) he found, that on distilling each fermented liquor, and obtaining the same quantity of spirit from each, that belonging to the close fermenting vessels was constantly of a less specific gravity, and consequently contained more alcohol than the other. Where the spirit from the open vessel was 74 degrees below proof, that from the closed vessel was 56: where the former was 83, the latter was 65; and where 103, the other was 93.

The theory of vinous fermentation is still involved in extreme difficulty, on account of the very compound nature of all the substances employed in it, and their great tendency to decomposition in a variety of methods.

The results of the experiments of Lavoisier should not pass unnoticed, though it is obvious that much too great simplicity is attempted in the explanation of a process, which every circumstance shows to be very complicated. It is some advantage, however, that the action of the external air, so necessary to be considered in most decompositions of vegetable matter, may here be entirely put out of the question. The simple point to which Lavoisier's experiments tend, is (setting aside all other agents) to explain how sugar becomes converted into carbonic acid and alcohol, which, after all, is the great phenomenon of vinous fermentation. The entire products of sugar, yeast, and water, fermented in close vessels, are stated to be carbonic acid, alcohol, and water, chiefly, together with a small quantity of acetous acid and part of the materials undecomposed. We shall not enumerate the exact composition given by this eminent chemist of all the ingredients and products of fermentation, nor enlarge on the many sources of inaccuracy which may be pointed out, but the theory suggested by the author from these experiments is the following: Sugar is a compound of about 8 of hydrogen, 64 of oxygen, and 28 of carbon, and the process of fermentation effects a change, merely in the arrangement of the constituent parts of the sugar, converting one portion into carbonic acid, and the other into alcohol: and hence, as the carbonic acid contains only carbon with a large proportion of oxygen, the portion which is left must contain all the hydrogen, now concentrated into a much smaller compass, part of the carbon, and only the small remaining portion of oxygen. Or, in other words, by this new arrangement of the ingredients of the sugar, one portion (namely, the carbonic acid) is totally deprived of hydrogen, and overloaded with oxygen; and consequently the other portion (which is the alcohol) abounds in hydrogen, and is deficient in oxygen. The carbon is nearly equally divided between the two products relatively to their quantity.

Perhaps no more plausible theory has yet been offered of the general phenomenon of vinous fermentation, though it is so extremely defective in essential parts, and even not corresponding with the alleged composition of alcohol, given by the same chemist in another part of his inquiries, that it can only be regarded as an ingenious and happy conjecture. The great question still remains for future inquirers to determine: what is it that causes sugar to ferment? for it has been proved, that sugar will not of itself begin this spontaneous change into carbonic acid and alcohol, though when once begun, probably the process will go on without further assistance. It has been already mentioned, that both extractive matter and an acid are present in every known instance of vinous fermentation, and for any thing that appears to the contrary, both of them are necessary, though the requisite quantity of each is very small, compared to the sugar; therefore, the strength or body of the fermented liquor is in direct proportion to the quantity of sugar alone (the fermentation having been complete), and there is strong reason to suppose, that the extractive matter and the acid are only accessary ingredients, but still essential, or those without which the vinous decomposition of sugar cannot be effected.

It has been supposed, that it is the vegeto-animal extract, as it has been called, which exists in the fermentable juices of vegetables, that causes the first change in the sugar. The precise nature of this vegeto-animal matter is not very well known; it may be supposed to be similar to the gluten of wheat, but most intimately combined with the vegetable saccharine mucilage, and hence extremely susceptible of spontaneous change. The chief, if not the only proof of its existence, in many of these combinations, is the production of a quantity of ammonia when decomposed by heat; which alkali is almost uniformly formed by the action of fire, and indicates, in the recent vegetable, the existence of azot. It may, therefore, be more properly termed the azotic than the vegeto-animal ingredient, and as mentioned under the article **Bread**, it seems to be peculiarly requisite to the panary fermentation, and to perform the most important part in this process.

Some of the commonest fermenting materials, such as wort of malt, or the infusion of the soluble part of barley, rendered saccharine by previous decomposition, it is well known will hardly enter into fermentation without yeast; and hence, chemists have sought in this substance for the principle which gives the first impulse to the fermentation of sugar. The analysis of yeast presents a vast variety of ingredients, the chief of which are the carbonic, acetic, and malic acids, mucilage, sugar, and gluten. Of these, the latter is in the largest proportion, which would seem to give much weight to the opinion of the great share which the azotic ingredient has in inducing fermentation.

Yet Mr. Henry found, by a series of very interesting experiments, that malt infusion might be made to enter into complete fermentation, simply by impregnating it with carbonic acid from chalk and sulphuric acid; and the liquor, thus fermented, gave a yeast, which made perfect bread, gave alcohol by distillation, and vinegar by further keeping. Undoubtedly the wort itself contained all the ingredients of yeast, since this substance was produced during the fermentation; but the experiment is decisive to prove, that no addition of azotic extract is required to begin fermentation in materials naturally fermentable; though, when once begun, the yeast, as fast as it was produced, must have assisted in the fermentation then going on. The evidence for the necessity of an acid to begin fermentation is therefore more decisive; but it is still doubtful what particular acid is required, or whether several will answer the purpose.

In Mr. Henry's experiments, the acid was the carbonic, and, from the arrangement of the apparatus, probably a small portion of the sulphuric was also carried in along with it. But in grape juice no evidence can be given of the existence of the carbonic acid ready formed, though the tartaric and malic, and other vegetable acids, contain within themselves the two ingredients of carbonic acid; and it is well known, that they are chiefly and ultimately resolvable into the carbonic. Yeast will even induce fermentation after it is pressed and dried into solid cakes (a practice not uncommon, as it will keep a great length of time in this form), but after this operation, it can hardly contain an atom of carbonic acid ready formed, though with abundant tendency to produce it by the first mutual action of its other constituent parts. Many interesting inquiries, therefore, remain to be carried on, before we can have a full and satisfactory theory of this most important process of vinous fermentation.

Fermentation in the living animal. In a certain sense of the term fermentation, it may be said to take place in the stomach during digestion, and even amongst the circulating fluids. We meet at least with an assimilating process, by which, when a poisonous matter is introduced into the system, it is increased in quantity, a part of the healthy fluids being apparently converted into the nature of the morbid substance, and rendered capable of propagating the same poison, with an equal increment, by being introduced, no matter in how small a quantity, into the healthy fluids of another person.

To this extent the doctrine of a fermentative assimilation must be admitted by every medical practitioner. But the older schools of medicine appear to have carried the doctrine too far, when they contemplated the process which takes place in the living subject, as precisely the same as takes place by chemical agency between inanimate materials. In this last case, the whole mass exposed to the fermenting process is equally and alike converted into a third substance; but in the living body, we hear of no instance in which all the fluids, or even the whole of any particular description of fluids, are transformed into a new compound. There is, nevertheless, a degree of mystery still existing in this subject that we cannot develop; and that calls for much diffidence and modesty in our mode of treating it. The doctrine of the old schools has certainly been favoured in no inconsiderable degree by the discoveries of modern chemists.

Fermentation is a term which has also been lately applied to mineral as well as to animal and vegetable matter: for it is by a process, which he denominates fermentation, that Mr. Parkinson endeavours to account for the conversion of vegetable materials into turfa and bitumen, especially into coal. *Organic Remains of a former World.*

FERME'NTATIVE. *a.* (from *ferment.*) Causing fermentation (*Arbuthnot*).

FERMO, an ancient town of the March of Ancona, in Italy. It belongs to the pope, and is the see of an archbishop. Lat. 43. 7 N. Lon. 13. 50 E.

FERN-MALE. See Filix.

Fern-female. See Filix fœmina.

FERNS. See Filices.

FERNANDES. See Juan Fernandes.

FE'RNY. *a.* (from *fern.*) Overgrown with fern (*Dryden*).

FERO'CIOUS. *a.* (*ferox*, Lat. *feroce*, Fr.) 1. Savage; fierce (*Pope*). 2. Ravenous; rapacious (*Brown*).

FERO'CITY. *s.* (*ferocitas*, Lat. *férocité*, Fr.) Savageness; wildness; fierceness (*Addison*).

FERONIA, the pagan goddess of woods and orchards. This deity took her name from the town Feronia, situated at the foot of mount Soracte in Italy, where were a wood and temple consecrated to her. That town and wood are mentioned by Virgil, in the catalogue of Turnus's forces. Strabo relates, that those who sacrificed to this goddess walked barefoot upon burning coals, without being hurt. She was the guardian of freed-men, who received their cap of liberty in her temple.

Fero'nia. Elephant apple-tree. In botany, a genus of the class decandria; order monogynia. Calyx five-parted; petals five; berry globular, covered with a hard, rough, woody shell; one-celled; seeds numerous. One species; an East-India tree with a few irregular branches and single thorns; flowers panicled; fruit large, juicy, and pleasant to the taste.

FERRARA, (the ancient *Forum alieni*), a city of Italy, capital of a duchy of the same name, with a bishop's see, and an university. It was formerly a fine and flourishing place; but the present inhabitants are few in proportion to its extent, and bear every mark of poverty. They retain, however, an old privilege of wearing swords by their sides, which extends to the lowest mechanics; and fencing is the only science in a flourishing condition in this town, which furnishes all Italy with skilful fencing-masters. Formerly here was a noted manufactory of sword-blades. In the Benedictine church, Ariosto the poet is interred. Lat. 44. 54 N. Lon. 11. 41 E.

Ferrara, or the **Ferrarese**, a province of Italy, in the territory of the church; bounded on the N. by the Polesino di Rovigno, on the W. by the duchy of Mantua, on the S. by the Bolognese and Romagna, and on the E. by the gulf of Venice. It had its own dukes till 1597, when pope Clement VIII. united it to the apostolic chamber.

FERRARI (Octavian), an Italian writer of the 16th century, born of a noble family at Milan, in 1518. He became professor first at Padua, and afterwards at Milan, where he taught philosophy till his death, in 1586. He wrote, 1. De Sermonibus Exotericis, Venice, 1575; 2. De Origine Romanorum, 1607. He also translated Athenæus into Latin.

FERRA'RIA, in botany, a genus of the class monadelphia; order triandria. Spathe two-leaved; calyxless; petals six, the three outer ones broader; style one; capsule three-celled, inferior. Four species: natives of the Cape; Mexico; Australasia. It is a curious circumstance in one or two of these plants, that their roots vegetate only once every two or three years; appearing in the intermediate space to be torpid or somnolent.

FERRE'OLA, in botany, a genus of the class diœcia; order pentandria. Calyx three-cleft; corol three-cleft. Male: filaments inserted into a semi-globular receptacle. Fem.; style one; germ oval; berry two-seeded. One species; a Coromandel tree, the trunk of which is covered with a ferruginous bark; leaves oval, entire.

FE′RREOUS. *a.* (*ferreus*, Lat.) Irony; partaking of iron (*Brown*).

FERRET, in mastiology. See MUSTELA.

To **FE′RRET.** *v. a.* (from the noun.) To drive out of lurking places (*Heylin*).

FE′RRETER. *s.* (from *ferret.*) One that hunts another in his privacies.

FERRETS, among glass-makers, the iron with which the workmen try the melted metal, to see if it be fit to work.

FERRI CARBONAS, Carbonate of Iron, the name introduced into the new pharmacopœia of the London College, to supply the late name of RUBIGO FERRI, which see.

FERRI LI′MATU′RA PURIFICA′TA. Steel filings possess tonic, astringent, and deobstruent virtues, and are calculated to relieve chlorosis and other diseases in which steel is indicated, where crudity in the primæ viæ abounds.

FERRI RUBI′GO. See RUBIGO FERRI.

FERRI SULPHAS. The name of the FERRUM VITRIOLATUM of the new pharmacopœia. See FERRUM VITRIOLATUM.

FERRI (Ciro), a skilful painter, born of a good family at Rome, in 1634. He was bred under Peter Cortona; and the works of the scholar are often mistaken for those of the master. The great duke of Tuscany nominated him chief of the Florentine school; and he was as good an architect as a painter. He died in 1689.

FE′RRIAGE. *s.* (from *ferry.*) The fare paid at a ferry.

FERRO, or HIERO, one of the Canary isles, remarkable for this circumstance, that several geographers have reckoned their first meridian from its westernmost extremity. It is a dry and barren spot, affording no water except what is supplied in a surprising manner, by the fountain-tree, which grows in this island, and distils water from its leaves, in such plenty as to answer all the purposes of its inhabitants. According to the requisite tables, the latitude is 27. 47. 20 N. and lon. 17. 45. 50 W. of Greenwich.

FERROL, a town of Spain, in Galicia, with a famous harbour, not only one of the best in Spain, but, as many assert, of all Europe. Here the vessels lie safe from all winds. Lat. 43. 30 N. Lon. 8. 4 W.

FERRU′GINOUS. *a.* (*ferrugineus*, Latin.) Partaking of the particles and qualities of iron (*Ray*).

FERRUGO, rust or oxide of iron. See OXIDE.

FE′RRULA. Fennel-giant. In botany, a genus of the class pentandria; order digynia. Fruit oval, flat-compressed, with three raised lines on both sides. Twelve species; all herbaceous perennials, rising about ten feet high, generally with yellow flowers; for the most part natives of the South of Europe and the Levant. The only one worth noticing is F. asa fetida, a native of Persia, with alternately sinuate and obtuse leaflets; the concrete juice of which is the asa fetida of the shops.

FE′RRULE. *s.* (from *ferrum*, iron, Latin.) An iron ring put round any thing to keep it from cracking (*Ray*).

FERRUM. Iron; for the medical properties of which, see IRON. In mineralogy, a genus of the class metals. Blueish-grey, easily rusting in the air, very hard, tenacious and elastic, sonorous, exceedingly malleable, ductile, attracted by the magnet, and itself convertible into a magnetic substance: specific gravity 7,778; becoming white in the fire, then emitting brilliant sparks, and at last melting; forming a red oxyd, when its filings are kept red hot in an open vessel and stirred; soluble in all acids, giving them an astringent taste; and yielding a black colour when mixed with vegetable astringents; precipitating a green powder, when dissolved in sulphuric acid, and mixed with potass; with the Prussic acid forming a rich azure blue.

This most useful of all metals, the continual attendant on man in all his states of social existence, which gives tools to the labourer and mechanic, arms to the soldier, to the sailor his compass, to the scholar his penknife and his ink, so easily unites with other substances, and dissolves in menstrua of almost every description, that it is rarely if ever found in an uncombined and native state; yet as it has occasionally been so discovered, although it is uncertain whether such specimens may not more properly belong to the meteoric kind, as they all contain nickel, we have added native iron to the other species of this metal, which will then afford us thirty-four: of which the chief are as follow:

1. F. nativum. Native iron. Uncombined, malleable. Found in masses in America; but possibly meteoric: yet Kirwan thinks it has unquestionably been detected in an original state at Ebenstork, in Sweden, and in the mountain of Grand-Gilbert in Dauphiny.

2. F. meteoricum. Meteoric iron. Amorphous; of a granular texture; externally covered with a black scoriaceous crust, internally ashy-grey, mixed with minute shining particles; falling from the atmosphere. Found at Wold Cottage in Yorkshire, in Scotland, various parts of continental Europe, especially Siberia, in Asia and America, where the masses have been deposited by the bursting of meteors. These masses when they first fall from the atmosphere are said to be hot, and their descent is affirmed to be accompanied with a loud explosion or hissing noise. They are found of various magnitudes, from a few ounces to several tons in weight: the outer surface is rough and indented, and covered with a thin black crust, as if it were burnt; internally they are of a fine granular texture, which may be easily crumbled to pieces by the nail; of an ashy-grey colour, intermixed with small shining yellow particles, and discovering an earthy smell: they are slightly magnetic, and sometimes exhibit fine veins of iron: spe-

cific gravity from 3,352 to 4,281. A piece of the Yorkshire stone in 150 parts contained

Silica - - - - -	75
Magnesia - - - -	37
Oxyd of iron - - -	48
Oxyd of nickel - -	2
	162

the excess of 12 proceeding from the absorption of oxygen during the process of analysation.

The production of these meteoric stones, as they are commonly called, in the upper regions, has been variously conjectured: but we are to this hour totally ignorant upon the subject. All that has hitherto been offered being conjecture, and nothing more. Their descent from the skies was at one time denied; but the frequency of such descent in all parts of the world, as well as in all ages, as high as to the æras of Aristotle and Anaxagoras, both of whom have characteristically described them, has subverted all incredulity in the present day; and left us to account for their formation in the best manner we are able. M. M. Humboldt, Parkin, and Izarn suppose them to consist of the elementary particles either of the substances that feed volcanoes, or of all bodies whatever volatilized and reduced to extreme division, by the medium of hydrogenous gass, inflaming in the upper regions of the atmosphere, and hereby re-uniting their primary corpuscles, and thus acquiring an increased magnitude of weight, which produces their descent. The greater number of the French philosophers, however, conceive that these bodies are thrown from some enormous volcanoes in the moon, by the common law of projectiles—and M. La Place has entered into a regular series of calculations, to prove that such volcanoes as we apprehend to exist in the lunar sphere may possess a projectile force capable of producing such effect. While M. Chladni conjectures again, that these bodies are dependent for their formation neither upon the earth nor the moon, but are formed from substances exterior to the atmospheres of both, substances which have never incorporated with them, and are found loose in the vast ocean of space, consistently with the epicurean theory. For a more particular but compressed account of the different theories and reasonings upon this subject we refer the reader to the notes on GOOD's translation of Lucretius, vol. I. p. 194, and 414. See also our article AEROLITHS.

3. F. chalybeum. Attracted by the magnet, reducible to grains, black, with a black streak, of a compact texture, and common form, found at the base of the mountain Urdjumski, in Siberia, and in the mines of Sweden: strikes fire with steel, and is malleable after fusion: contains from 50 to 60 per cent. of good iron, which is convertible into the best kind of steel, and a little sulphur.

4. F. selectum. Common iron ore: magnetic iron ore. Attracted by the magnet, reducible to grains, black, with a black streak, of a very fine granular texture, and common form. Found in most of the iron mines of Europe and America, and yields a considerable proportion of good iron.

5. F. commune. This is also called common iron ore. Attracted by the magnet, reducible to grains, black, with a black streak, of a coarser granular texture than the last, and of common form. There are five other varieties:

ϐ mixed with arenaceous particles.
γ mixed particles of steatite interspersed.
δ mixed calcareous particles.
ε interspersed with red micaceous spots.
ζ mixed with particles of pyrite.

Found in most countries containing mines of iron; and is subject to many varieties; contains a large quantity of ore, and some sulphur.

6. F. crystallinum. Magnetic iron stone; octahedral iron ore. Attracted by the magnet, black, with a black streak, in the form of crystals. Found in various parts of Great Britain, Norway, Sweden, Germany, Corsica, generally strongly attached to their matrix.

7. F. glareosum. Magnetic sand. Attracted by the magnet, black, with a black streak, in the form of sand. Found in Italy, at the base of volcanic mountains, in the rivers, and on the shores of Great Britain, Siberia, Greenland, Bohemia, Jamaica and India; and probably the fragments of other ores washed down and comminuted by torrents and the waves of the sea.

8. F. magnes. Magnet: loadstone. Magnetic, compact, of a common form. Found in the mines of Denmark, Sweden, Norway, Lapland, Siberia, Bohemia, and Peru, in masses, plates, grains, or eight-sided crystals; and often contains above 70 per cent. of iron.

9. F. basalticum. Columnar iron ore, Magnetic, brownish-red, formed of slender columns adhering to each other, and which are generally incurved. Found in Bohemia, Franconia, &c. generally in large strata: slightly stains the fingers, sounds hollow when struck.

10. F. micaceum. Micaceous iron ore: brown, scaly, iron ore: foliated oxyd of iron. Not magnetic, iron-grey, shining, of a lamellar texture. Found in Wales, Scotland, Cornwall, &c. in Siberia, Lapland, Sweden, Hungary, and other parts of Europe; massive, or disseminated, variously grouped, or crystallized, in small six-sided tables.

11. F. speculare. Specular iron ore: crystallized oxyd of iron. Not magnetic, compact, of a steel-grey colour, and lustre, with a red streak, internally specular. Four varieties, and found in the mines of Lancashire, in the isle of Elba, Germany, France, Russia, massive, disseminated or crystallized, the surface often tarnished, and exhibiting various iridescent colours.

12. F. rubricosum. Red scaly iron ore: red iron glimmer: ochraceous iron. Not magnetic, red lamellar, shining internally, very soft, greasy to the touch, and staining the fingers: of a common form. Found in Wales, Sweden, Saxony, Hungary, most frequently incumbent upon other ores and minerals.

13. F. hæmatites: not magnetic, fibrous, hardish, opake, with a red or yellow streak. Four varieties:

α Black iron ore.
β Brown hæmatite; or muriated oxyd of iron.
γ Blood-stone; red hæmatite.
δ Yellow hæmatite.

Found in various parts of England and Scotland, particularly in Lancashire; in Russia, Siberia, and other parts of the continent; massive, disseminated, nodular, botryoidal, tabular, cellular, tubular, or stalactitical.

14. F. compactum. Solid hæmatite. Compact red iron ore. Not magnetic, compact, opake, with a red or yellow streak. Found in Lancashire, Siberia, Saxony, Bohemia.

15. F. spatosum. Pearl-spar. Sparry iron ore. Not magnetic, lamellar, effervescing with acids, crackling and blackening before the blow-pipe, breaking into rhomboidal fragments. Found in various parts of Great Britain and the European continent; massive or disseminated, or in small crystals.

16. F. siliceum. Sinople. Not magnetic, striking fire with steel. Found in the mines of Hungary and the Harz, and sometimes contains, with hornstone, quartz and jasper, a small portion of gold.

17. F. argillaceum. Argillaceous iron ore. Soft, opake, without lustre, dry. Found in various parts of Great Britain, in Italy, Saxony, Germany, Bohemia; in detached lumps, or forming strata, fistular, cellular, or variously imitative.

18. F. ochra. Iron ochre; red ochre; red crayon. Not magnetic, without lustre, opake, friable. Found in every country abounding in iron ore; sometimes in water impregnated with iron: streak red or yellow; it adheres to the tongue, stains strongly, and is principally employed in drawing or writing.

19. F. cœruleum. Blue iron earth; azure iron ore. Not magnetic, friable, earthy, without lustre, becoming blue by exposure to the air, and brownish in the fire, changing its colours in a solution of soda. Found in many parts of England and Scotland, Siberia, Sweden, Norway, Poland, Germany, &c.; in marshy grounds, at various depths, generally in an earthy state, and without any regular shape, adhering to the stones and pebbles which surround it. By Klaproth it is considered as a phosphat of iron.

20. F. subaquosum. Lowland iron ore: bog iron ore. Not magnetic, without lustre, opake, of a dull colour, humid. Found in Great Britain, and various parts of Europe, in low swampy situations, stagnant lakes or brooks, &c.; sometimes massive, but commonly in detached lumps of various shapes, as placentiform, flat, rounded, granular, or pisiform, generally perforated, fistular or spongy: when globular or kidney-shaped it is called *Eagle stone*.

21. F. viride. Green iron earth: green martial earth. Of a green colour, shining, dissolving in acids, with difficulty friable. Found at Schneeburg in a matrix of quartz and clay, compact, solid, or like a corroded stone, oftener inverting or incumbent, and seldom indurated.

22. F. arsenicale. Arseniat of iron: arseniated iron ore. Grey or greenish, not magnetic, emitting arsenical vapours, when thrown on red hot coals. Found in the copper mines of Cornwall, and in Spain, in small pieces, or generally crystallised in cubes.

23. F. sulphuratum. Sulphuret of iron: iron pyrite. Opake, emitting sulphureous flames and vapours, when thrown on hot coals. This species must again be brought forward, under the article SULPHUR, which see.

24. F. phlogisticum. Bituminous iron ore. Opake, of a dusky colour, inflammable. Found in Hungary and Sweden; in external appearance resembling a piece of coal; texture rather friable, or rather firm or fixed. It quickly kindles, and burns with a light flame, losing something of its weight.

FERRUM AMMONIACA'TUM. In the late pharmacopœia, F. ammoniacale. Flores martiales. Flores salis ammoniaci martiales. Ens martis. Ens veneris Boylei. Murias ammoniacæ ferratus. Sal mortis muriaticum sublimatum. Sal ammoniacum martiale. This preparation is the true ammoniacal muriat of iron, and therefore termed murias ferri ammoniacalis in the new chemical nomenclature. It is exhibited in chlorosis, asthenia, menorrhagia, intermittent fevers, and most cases of debility.

FERRUM TARTARISA'TUM. Tartarus chalybeatus. Mars solubilis. Ferrum potabile. This preparation of iron is called tartaris potasse acidulus ferratus in the new chemical nomenclature. Its virtues are astringent and tonic, and it forms in solution an excellent tonic fomentation to contusions, lacerations, distortions, &c.

FERRUM VITRIOLA'TUM. Vitriolum martis. Vitriolum ferri. Vitriolum viride. Sal martis. Green vitriol. This is an excellent preparation of iron, and is exhibited in many diseases as a styptic, tonic, astringent, and antihelmentic. In the new chemical nomenclature it is called sulphas ferri, it being a sulphate of iron.

To FE'RRY. *v. a.* (ꝼiꞃan, to pass, Saxon.) To carry over in a boat (*Spenser*).

To FE'RRY. *v. n.* To pass over water in a vessel of carriage (*Milton*).

FE'RRY, FERRYBOAT. *s.* (from the verb, and *boat*.) 1. A vessel of carriage (*Shakspeare*). 2. The passage over which the ferryboat passes.

FE'RRYMAN. *s.* (*ferry* and *man*.) One who keeps a ferry; one who for hire transports goods and passengers over the water (*Shakspeare*).

FERTE-ALAIS, a town of France, in the department of Seine and Oise, 18 miles S. of Paris. Lon. 2. 27 E. Lat. 48. 30 N.

FERTE-BERNARD, a town of France, in the department of Sarte, seated on the Huisne, 20 miles N. E. of Mans. Lon. 0. 39 E. Lat. 48. 8 N.

FERTH, or FORTH. Common terminations, are the same as in English an army; coming from the Saxon word ꝼẏꞃð (*Gibson*).

FE'RTILE. *a.* (*fertile*, Fr. *fertilis*, Lat.) Fruitful; abundant; plenteous (*Dryden*).

FE′RTILENESS. *s.* Fruitfulness; fecundity.

To FERTI′LITATE. *v. a.* (from *fertile.*) To fecundate; to fertilize: not in use (*Brown*).

FERTI′LITY. *s.* (*fertilitas*, Latin.) Fecundity; abundance; fruitfulness (*Raleigh*).

To FE′RTILIZE. *v. a.* (*fertiliser*, French.) To make fruitful; to make plenteous; to make productive; to fecundate (*Woodward*).

FE′RTILY. *ad.* (from *fertile.*) Fruitfully; plenteously; abundantly.

FE′RVENCY. *s.* (*fervens*, Latin.) 1. Heat of mind; ardour; eagerness (*Shak.*). 2. Pious ardour; zeal (*Hooker*).

FE′RVENT. *a.* (*fervens*, Latin.) 1. Hot; boiling (*Wotton*). 2. Hot in temper; vehement (*Hooker*). 3. Ardent in piety; warm in zeal (*Acts*).

FE′RVENTLY. *ad.* (from *fervent.*) 1. Eagerly; vehemently (*Spenser*). 2. With pious ardour (*Colossians*).

FE′RVID. *a.* (*fervidus*, Latin.) 1. Hot; burning; boiling. 2. Vehement; eager; zealous.

FERVI′DITY. *s.* (from *fervid.*) 1. Heat. 2. Zeal; passion; ardour.

FE′RVIDNESS. *s.* (from *fervid.*) Ardour of mind; zeal; passion (*Bentley*).

FERULA, in the ancient Eastern church, signified a place separated from the church, wherein the audientes were kept, as not being allowed to enter the church; whence the name of the place, the persons therein being under penance or discipline. This word was sometimes used to denote the prelate's crosier or staff.

Ferula, a little wooden pallet or slice, reputed the schoolmaster's sceptre, wherewith he chastises the boys, by striking them on the palm of the hand. The word is Latin, and has been also used to denote the prelate's crosier and staff. It is supposed to be formed of the Latin *ferire*, to strike. Under the eastern empire, the ferula was the emperor's sceptre, as is seen on divers medals; it consists of a long stem or shank, and a flat square head.

Ferula, in botany. See Ferrula.

Fe′rula assa fœtida. The systematic name of the assafœtida plant. See Assafœtida.

To FE′RULE. *v. a.* To chastise with a ferula.

FE′RVOUR. *s.* (*fervor*, Lat. *ferveur*, Fr.) 1. Heat; warmth (*Waller*). 2. Heat of mind; zeal (*Hooker*). 3. Ardour of piety (*Addison*).

FESCENNINA, the name given to the first nuptial songs, because they originated with the people of Fescennia, a city of Etruria.

FE′SCUE. *s.* (*festu*, French.) A small wire by which those who teach to read point out the letters (*Holder*).

FE′SELS. *s.* A kind of base grain (*May*).

FESSE. *s.* (In heraldry.) The fesse is so called of the Latin word fascia, a band or girdle, possessing the third part of the escutcheon over the middle (*Peacham*).

To FE′STER. *v. n.* To rankle; to corrupt to grow virulent (*Sidney*).

FESTI DIES. See Feriæ latinæ.

FE′STINATE. *a.* (*festinatus*, Latin.) Hasty; hurried: not in use (*Shakspeare*).

FE′STINATELY. *ad.* Hastily (*Shakspeare*).

FESTINA′TION. *s.* (*festinatio*, Latin.) Haste.

FE′STIVAL. *a.* (*festivus*, Lat.) Pertaining to feasts; joyous (*Atterbury*).

Fe′stival. *s.* Time of feast; anniversary day of civil or religious joy (*Sandys*).

FE′STIVE. *a.* (*festivus*, Latin.) Joyous; gay; befitting a feast (*Thomson*).

FESTI′VITY. *s.* (*festivitas*, Latin.) 1. Festival; time of rejoicing (*South*). 2. Gaiety; joyfulness (*Taylor*).

FESTOON, in architecture and sculpture, &c. an ornament in form of a garland of flowers, fruits and leaves, intermixed or twisted together. It is a kind of string or collar, much the widest in the middle, where it falls down in an arch; being extended by the two ends, the extremities of which hang down perpendicularly.

FESTU′CA. Fescue-grass. In botany, a genus of the class triandria; order digynia. Calyx two-valved; spiklet oblong, rounded, with pointed glumes. Twenty-seven species. Some few with an equal panicle, the rest with a panicle pointing one way. The species are largely scattered over the globe; and about twelve of them are common to the pastures, woods, mountains, or old walls of our own country.

FESTUCINE, in mineralogy, of a shivery or splintery fracture.

Festu′cine. *a.* (*festuca*, Latin.) Straw-colour; between green and yellow (*Brown*).

FESTU′COUS. *a.* (*festuca*, Latin.) Formed of straw (*Brown*).

To FET. *v. a.* To fetch: not in use (*Spenser*).

Fet. *s.* A piece: not in use (*Drayton*).

To FETCH. *v. a.* pret. fetched. (ꝼeccan, Sax.) 1. To go and bring (*Waller*). 2. To derive; to draw (*Shakspeare*). 3. To strike at a distance (*Bacon*). 4. To bring to any state by some powerful operation (*Addison*). 5. To draw within any confinement or prohibition (*Sanderson*). 6. To produce by some kind of force (*Add.*). 7. To perform any excursion (*Knolles*). 8. To perform with suddenness or violence (*Addison*). 9. To reach; to arrive at (*Chapman*). 10. To obtain as its price (*Locke*).

To Fetch. *v. n.* To move with a quick return (*Shakspeare*).

Fetch. *s.* (from the verb.) A stratagem by which any thing is indirectly performed; a trick; an artifice (*Hudibras*).

FE′TCHER. *s.* (from *to fetch.*) One that fetches any thing.

FETHARD, a borough of Ireland, in the county of Tipperary, eight miles S.E. of Cashel, and 86 S.S.W. of Dublin.

Fethard, a town of Ireland, in the county of Wexford, on the coast, 81 miles S. of Dublin. Lon. 7. 3 W. Lat. 52. 10 N.

FE'TID. *a.* (*fœtidus*, Latin.) Stinking; having a smell strong and offensive (*Arbuthnot*).

FE'TIDNESS. *s.* The quality of stinking.

FET-LOCK. (q. d. *feet-lock.*) The lock or tuft of hair that grows behind the pastern-joint of a horse: whence the joint itself is called the fetlock joint, as well as the pastern-joint. Horses of a low size have scarcely any such tuft; but some species of draft horses have very large fetlocks, and so much hair, that if care be not taken to keep them clean, they will soon become subject to grease and other ulcers. See GREASE.

FE'TOR. *s.* (*fœtor*, Latin.) A stink; a stench; a strong and offensive smell (*Arbuthnot*).

FE'TTER. *s.* It is commonly used in the plural, fetters. (from feet; ꝼeꞇꞇeꞃe, Saxon.) Chains for the feet (*Raleigh*).

To FE'TTER. *v. n.* (from the noun.) To enchain; to shackle; to tie (*Bramhall*).

FETTI (Domenico), an eminent painter in the style of Julio Romano, was born at Rome in 1589, and educated under Ludovico Civoli in Florence. He painted but little for churches, but excelled in history; his pictures are much sought after, and are scarce. He abandoned himself to disorderly courses; and put an end to his life, by excesses, in the 35th year of his age.

To FE'TTLE. *v. n.* To do trifling business.

FETUS. See FŒTUS.

FEUD, in our ancient customs, a capital quarrel or enmity, not to be satisfied but with the death of the enemy; and thence called *deadly feud.*

FEUD, *feoda*, the same with Fief, or Fee. See FEODAL SYSTEM.

FEUDATORY, or FEODATORY, a tenant who formerly held by feodal service.

FEVER, in medicine. See FEBRIS.

FEVER-FEW, in botany. See MATRICARIA.

To FE'VER. *v. a.* (from the noun.) To put into a fever (*Shakspeare*).

FE'VERET. *s.* (from *fever.*) A slight fever; febricula (*Ayliffe*).

FE'VERISH. *a.* (from *fever.*) 1. Diseased with a fever (*Creech*). 2. Tending to a fever (*Swift*). 3. Uncertain; inconstant; now hot, now cold (*Dryden*). 4. Hot; burning (*Dryden*).

FE'VERISHNESS. *s.* (from *feverish.*) A slight disorder of the feverish kind.

FE'VEROUS. *s.* (*fievérieux-se*, French.) 1. Troubled with a fever or ague (*Shaks.*). 2. Having the nature of a fever (*Milton*). 3. Having a tendency to produce fevers (*Bacon*).

FEVERSHAM, a seaport in Kent, on a creek of the Medway, much frequented by small vessels. It is a member of the port of Dover, and is governed by a mayor. Here are markets on Wednesdays and Saturdays. In the neighbourhood are several gunpowder-mills. Here also are the remains of a stately abbey built by king Stephen, who was interred in it with his queen and son. Lat. 51. 22 N. Lon. 0 55 E.

FE'VERY. *a.* (from *fever.*) Diseased with a fever (*Ben Jonson*).

FE'UILLAGE. *s.* (French.) A bunch or row of leaves (*Jervas*).

FE'UILLEMORT. *s.* (French.) The colour of a faded leaf, corrupted commonly to philemot.

FEUILLEE (Louis), a French naturalist, born in Provence, in 1660. Louis XIV. sent him into various countries, and at his return granted him a pension. He died in 1732. He wrote a Journal of Observations, physical, mathematical, and botanical, made on the Coasts of South America and New Spain, 3 vols. 4to.

FEUI'LLIA. In botany, a genus of the class diœcia, order pentandria. Calyx five-cleft; corol five-cleft; nectary five convergent filaments. Fem.: styles three, porne hard. Three-celled, covered with a bark. Two species: one of the East and the other of the West Indies; both herbaceous and scandent.

FEVRE (Claude), a French painter, who excelled in painting portraits, though he did also flowers and historical subjects very well. He died in London in 1675, aged 42.

FEVRE (Nicholas le), or Faber, a learned man, born at Paris in 1544. While a student he met with a strange misfortune; for as he was cutting a pen, a piece of the quill flew into his eye, and gave him such intolerable pain, that in a fit of agony he thrust the knife into his eye and cut it out. In 1587 he published Seneca with notes. Henry IV. appointed him preceptor to the prince of Condé, and after the death of that monarch, he became tutor to Lewis XIII. He died in 1611. His works, which are not numerous, were printed at Paris in 1614, 4to. (*Watkins*).

FEVRE (Roland le) a painter, commonly called le Fevre of Venice, but born in Anjou. He painted portraits and naked figures, and had a curious method of staining marble. He died in England in 1677.

FEVRE (Tannegui le), or Tanaquil Faber, father of Madame Dacier, was born at Caen in Normandy, in 1615. His reputation for learning, even in his youth, was so great, that Cardinal Richelieu settled upon him a pension of 2000 livres, to inspect the books that were printed at the Louvre. On the death of the cardinal his salary was stopped. Some years afterwards he removed to Saumur, and became a professor there, having embraced the reformed religion. Here he had a great number of scholars, who afterwards proved ornaments to the world of letters. He died in 1672. His son, who was a protestant minister, but afterwards turned Roman catholic, published a tract, intituled, De futilitate Poeticis, 1697. T. le Fevre published; 1. Luciani de morte Peregrini libellus, cum notis, 1653, 4to. 2. Diatribe, Flavii Josephi de Jesu Christo Testimonium suppositum esse, 1655, 8vo. 3. Epistolarum. 4. Several French translations from the ancients. 5. A Method of Education, &c.

FE'UTERER. *s.* A dog-keeper.

FEW. *a.* (feo, Saxon.) 1. Not many; not numerous (*Berkley*). 2. *In few.* In not many words (*Hooker*).

FE'WEL. *s.* (*feu*, Fr.) Combustible matter; as firewood, coal (*Bentley*).

To Fe'wel. *v. n.* (from the noun.) To feed with fewel (*Cowley*).

FE'WNESS. *s.* (from *few.*) 1. Paucity; smallness of number (*Dryden*). 2. Paucity of words; brevity (*Shakspeare*).

To FEY. *v. a.* (*veghen*, Dutch.) To cleanse a ditch of mud (*Tusser*).

FEZ, a kingdom of Barbary, 125 miles in length and breadth; bounded on the W. by the Atlantic Ocean, on the N. by the Mediterranean Sea, on the E. by Algiers, and on the S. by Morocco and Tafilet. The air is temperate and wholesome, and the country full of mountains, particularly to the W. and S. where Mount Atlas lies; but it is populous and fertile, producing citrons, lemons, oranges, dates, almonds, olives, figs, raisins, sugar, honey, flax, cotton, pitch, and corn in abundance. The inhabitants breed camels, beeves, sheep, and the finest horses in Barbary.

Fez, the capital of the kingdom of Fez, is not only ancient, but one of the largest and most handsome cities in Africa. It is composed of three towns, called Beleyde, Old Fez, and New Fez. Old Fez is the most considerable, and contains about 80,000 inhabitants. The palaces are magnificent, and there are 700 mosques, 50 of which are very considerable, adorned with marble pillars and other ornaments. The houses are built of brick or stone, and adorned with Mosaic work: those of brick are ornamented with glazing and colours, like Dutch tiles, and the wood-work and ceilings are carved, painted, and gilt. There is a court to every house, in which are square marble basons. The roofs are flat, and they sleep thereon in the summer. Here are two colleges for students, finely built of marble and adorned with paintings; one of those has 100 rooms, and the sides are adorned with marble pillars of various colours, whose capitals are gilt, and the roof glitters with gold, azure, and purple. Here are many hospitals, and above 100 public baths, many of which are stately structures. All the trades live in a separate part of the city, and the exchange, full of all sorts of rich merchandise, is itself as large as a small town. The gardens are beautiful, and full of all kinds of fragrant flowers and shrubs, so that the city in general is a sort of terrestrial paradise. The inhabitants are clothed like the Turks, and the ladies dress very expensively in the winter; but in the summer, they wear nothing but a shift. It is the centre of the trade of this empire, and hence caravans go to Mecca, carrying with them ready-made garments, Cordovan leather, indigo, cochineal, and ostrich feathers, for which they bring in return, silks, muslins, and drugs. Other caravans go to Tombuctoo, and the river Niger; one of which consists of 20,000 men. They travel over such dry barren deserts, that every other camel carries water. Their commodities are salt, cowries, wrought silk, British cloth, and the woollen manufactures of Barbary. Here are a great number of Jews, who have handsome synagogues; but the bulk of the inhabitants are Moors, of a tawny complexion; there are also a great number of blacks. Lat. 33. 40 N. Lon. 5. 5 W.

FEZZAN, a country of Africa, situate to the south of Tripoli, and sixty days journey west from Cairo. It contains, according to the report of travellers, 28 towns and 100 villages. The chief productions are dates and senna. The natives are of a deep swarthy complexion, with short, curly, black hair, thick lips, flat noses, &c.; though on the whole tall and well-shaped. Their dress is similar to that of the Moors of Barbary. In their common intercourse, all distinctions of rank seem forgotten. The Fezzaner is generous and hospitable, and whether his fare be scanty or abundant, he is desirous that others should partake of it. Gold dust constitutes their chief medium of payment, and value in that medium is always expressed by weight. In religion they are rigid, but not intolerant Mahometans. The government is monarchical, and its powers are administered with such regard to the happiness and welfare of the people, that they are ardently attached to their sovereign, and indeed to one another. Mourzook is the capital.

FIASCONE, an episcopal town of Italy, in the territory of the church. It is noted for fine Muscadine wine. Lat. 42. 34 N. Lon. 12. 13 E.

FIAT, in law, is used for a short order or warrant of some judge for making out and allowing certain processes. Thus, if a certiorari be taken out in vacation, and tested of the precedent term, the fiat for it must be signed by a judge of the court, some time before the essoign day of the subsequent term, otherwise it will be irregular. There is no need for the judge to sign the certiorari itself, but only where it is required by statute.

Fiat justitia, is an order granted on a petition to the king for his warrant to bring a writ of error in parliament, in which case he writes on the top of the petition fiat justitia, Let justice be done; and then the writ of error is made out, &c.

FIATOLA, in ichthyology. See Stromateus.

FIB. *s.* A lie; a falsehood (*Pope*).

To Fib. *v. n.* To lie; to tell lies (*Arbuthnot*).

FI'BBER. *s.* A teller of fibs.

FIBER. (*fiber*, from *fiber*, extreme, because it resides in the extremities of lakes and rivers.) The beaver. The female beaver. *Castor fiber* of Linnéus. It has two excretory follicles near the anus, filled with an unctuous substance called castor. See Castoreum.

FIBRE ANIMAL. Muscular fibre or flesh; a compound substance, the base of which is fibrin, a material peculiar to this kind of organic structure, but which is always more or less united with other substances.

A variety of chemical experiments have

lately been made to investigate the general nature of flesh or animal fibre, and to ascertain the relative proportions of the various materials that compose it. The best experiments are those of Reaumur, Geoffrey, Thouvenel, Fourcroy and Hatchett. The experiments of the two last are mostly entitled to attention, and especially those of Mr. Hatchett; who has not only availed himself of every antecedent fact of importance, but has very largely contributed to the general number of facts.

Mr. Hatchett's researches have been chiefly directed to the muscular fibre of beef; in prosecuting which, with a view of separating the liquid albuminous part in lymph, as much as possible, a quantity of lean muscle of fat beef was cut into small thin pieces, then macerated during fifteen days in cold water, and afterward subjected to pressure during each day, when the water was changed. The weather was very cold, and the maceration continued to the end of the fifteenth day, without any sign of putrescency. The shreds of muscle (amounting to about three pounds) were then boiled with about six quarts of water, during five hours; and the water being changed, the same was repeated every day during the course of three weeks; at the end of which, the water afforded only slight signs of gelatin, when infusion of oak bark, or nitro muriat of tin, was added. After this, the fibrous part was well pressed and dried by the heat of a water-bath.

Some of the muscular fibre thus prepared was steeped in nitric acid, diluted with three measures of water during fifteen days. The acid acquired a yellow tinge, and possessed all the properties of the nitric solutions of albumen.

The fibre, which had been thus steeped in the acid, was (when washed) dissolved by boiling water, and by evaporation became a gelatinous mass; which being again dissolved in boiling water, was precipitated by infusion of oak bark, and more slowly by nitro muriat of tin, like albuminous substances, when treated in a similar manner. When the fibre, which had been steeped in the acid, was immersed in ammonia, it was not completely dissolved, and afforded a residuum. The greater part, however, was dissolved, and formed a deep orange or yellowish brown solution, similar in properties to that of albumen. When boiled with lixivium of caustic potash, this muscular fibre was completely dissolved, ammonia was discharged, and animal soap formed, which being diluted with water, and saturated with muriatic acid, yielded a precipitate similar to that obtained from animal soap, except that it sooner becomes hard and soapy when exposed to the air.

Muscular fibre, when prepared by long maceration, and subsequent boiling with frequent change of water, so as to be nearly deprived of all its gelatinous part, is not easily brought into a putrid state. A small quantity was kept moistened with water during April, in the course of which time it acquired a musty, but not a putrid smell, neither were the fibres reduced to a pulpy mass; a portion of it was kept two months under water, but it neither became putrid, nor was converted into that fatty substance obtained from recent muscle. Hence Mr. Hatchett is of opinion, that the readiness with which muscle becomes putrid is principally owing to the gelatin, which is mixed with it in large proportion, and which, with the natural quantity of moisture, is requisite to give the fibre a proper degree of toughness and flexibility.

The residuum afforded by muscular fibre, which had been long steeped in dilute nitric acid, and afterward immersed in ammonia, consisted principally of fat, mixed with a small portion of the fibre which had not been sufficiently acted upon by the acid, and little or no earthy matter was thus obtained. But when the prepared muscular fibre was dissolved in boiling nitric acid, a complete solution, resembling that of albumen in its general properties, was formed, and some fat floated in drops at the top of the liquor. Ammonia was then added, so as to supersaturate the acid, and produced the same effects as on the nitric solutions of albumen, excepting that a copious white precipitate was obtained. This precipitate, while moist, was agitated with a quantity of acetous acid, which dissolved, and separated a small portion of phosphat of lime; but the remainder and by much the greatest part of this precipitate was scarcely attacked, even when the acid was boiled.

When exposed to a red heat, it becomes dark grey, and then nearly white; after which it was in the state of carbonat of lime.

Another part was dissolved in nitric acid, and lime was precipitated by carbonat of soda. The slight excess of the latter was then saturated by acetous acid, and the whole was boiled to expel the carbonic acid; after which the liquor from its effects on solutions of lime, barytes, &c. evidently contained oxalic acid in solution; the precipitate was therefore oxalat of lime mixed with a very small quantity of phosphat of lime; 200 grains of the dry muscular fibre dissolved and boiled with a nitric acid, afforded 17 grains of this precipitate.

Although it is known that the gelatinous liquor obtained from muscle by boiling water contains phosphats of soda and of lime, yet Hatchett did not imagine the greater part of the latter could be so completely separated. He therefore, in some measure, repeated the experiment on the muscle of veal, and found phosphats of soda and of lime in the liquor. But when the muscle was afterwards dissolved in boiling nitric acid, and the solution saturated with ammonia, he was surprised to find, although the same change in colour was produced as in all the former experiments, the liquor remained transparent, and even after several days, only a few scattered particles appeared at the bottom of the vessel.

Another experiment was made on the recent muscle of mutton, but this was immediately dissolved in nitric acid, without being previously boiled in water. The fat being separated, the solution was as before saturated with ammonia, and as usual became of a deep orange colour, or yellowish-brown; in a few hours also, a small quantity of white precipitate subsided. This precipitate, however, was completely and readily soluble in acetous acid, and in every respect proved to be phosphat of lime.

This chemist observes, that the liquor from which the above precipitate was separated, as well as those afforded by the muscle of veal, by the prepared muscle of beef (as well as by the solutions of tortoiseshell and albumen) in boiling nitric acid, subsequently saturated with ammonia, all contained a considerable portion of uncombined oxalic acid, which was separated by the acetite of lime and of lead. But he did not find oxalic acid in the solutions formed by immersing the bodies, for a long time, in cold and dilute nitric acid; neither did he find oxalic acid in solutions made by dissolving the substances in boiling muriatic acid. It is evident, therefore, that the oxalic acid, observed in the above experiments, was a product of the operations, and not an educt of the substances.

Hatchett concludes, from the experiments upon the above muscular substances, that they contain lime in various proportions, and in two different states, viz. carbonat and phosphat, and that the greater part of the latter is gradually separated, in conjunction with the gelatin, by means of boiling water. Not that the phosphat of lime is an essential ingredient in gelatinous substances, on the contrary, isinglass, which is a perfectly gelatinous body, affords but a mere visible trace of it. The muscular fibre of beef appears to have been nearly deprived of its phosphat of lime, by the long continued and repeated boiling in water to which it had been subjected; but still so large a quantity of lime remained, that when oxalic acid was formed by the action of the boiling nitric acid, it combined with lime and formed an oxalat amounting to 19 grains from 200 grains of the dry muscular fibre, dissolved in nitric acid, and precipitated by ammonia. He does not know what quantity of lime was separated with the gelatin; but from the quantity of lime remaining, and which afterwards combined with oxalic acid, the muscle of beef must contain a considerable portion of earthy matter; and as by the experiment on the muscle of veal, scarcely any precipitate was obtained after it had been boiled, and as but a small portion of phosphat of lime was present in the gelatinous liquid, it appears, that in this muscle the whole of the small portion of lime it contained was in the state of phosphat; and this being nearly separated, there did not remain any part of uncombined lime or carbonat of lime, which by uniting with the oxalic acid (subsequently produced) would form an oxalat; and as lime in the states of phosphat and carbonat is so much more abundant in the muscle of beef than in that of veal, it may be inferred that the earthy matter is more abundant in the coarse and rigid fibre of adult and aged animals, than in the tender fibre of young ones; and this seems to be corroborated by the tendency to morbid ossification, so frequently observed in aged individuals of the human species. Five hundred grains of the dry prepared muscular fibre of beef, when distilled, left 108 grains of coal, which, by incineration, afforded 25,60 grains of earthy residuum; the coal may therefore be estimated at 82,40 grains. The greatest part of these 25,60 grains was carbonat of lime mixed with some pure lime and a small portion of phosphat; and there can be no doubt but that the latter would have been more abundant, had it not been for the repeated boilings to which the muscular fibre had been subjected. The recent muscles of veal and mutton were, with great difficulty, reduced to ashes; for toward the end of the process, the ashes and remaining coal became coated and glazed with saline matter, which appeared to be soda, partly in the state of phosphat.

It appears, therefore, from the experiments already mentioned, that muscle or flesh consists of albumen, gelatin, fibrin, the phosphats of soda and of lime, muriat of soda, the zoonic acid, and iron; but a more exact analysis is necessary to ascertain its component parts with precision and certainty.

Fibre (Vegetable). Wood. Almost all plants contain a fibrous matter which is distinguished by its comparative insolubility in all chemical agents, indestructibility by spontaneous change, and by a certain toughness and elasticity produced by the strong intertexture of its minute threads. These fibres are sometimes highly flexible and firm; as the stringy stalk of the hemp plant, the aloe, the bark of the birch, and other trees that afford all the variety of matting. They exist with greater hardness and brittleness in the cane, but are still highly flexible and elastic: and with yet greater density and diminished flexibility they form the ligneous fibre or wood of the larger trees. The chemical analysis of vegetable fibre we shall give under the article Wood.

Fibre of a root, in botany, a thread or longitudinal canal, imbibing moisture from the earth. These fibres properly constitute the roots of vegetables: the main body, whence they usually proceed, is the descending trunk; and will, in many plants, become a trunk, if the plant be turned upside down.

A branch or subdivision of a fibre is called a fibril. Fibrilla.

FIBRIN, in chemistry, the fibrous matter of animals or vegetables: or rather the matter which chiefly constitutes such fibres, and upon which the peculiar power of such fibres depends.

This when pure is of a white colour and without smell or taste: it is very tenacious, and hence capable of elongation. It contains no iron on analysis; and as gelatine is more abundant in young animals, this is found more abundantly in old. The other three chief bases of animal matter are Albumen, Gelatin, and Osseous earth, which see under their respective heads.

It was till of late conceived that plants, though they possessed a fibrous structure, did not possess the peculiar matter of fibrin. In the juice of the papaw tree, however, that contains a very large portion of albuminous matter, fibrin has been fully detected by Vauquelin, which may hence rank as a vegetable as well as an animal matter.

When the juice of the papaw tree is treated with water the greater part dissolves; but there remains a substance insoluble, which has a greasy appearance. It softens in the air and becomes vivid, brown, and semi-transparent. When thrown on burning coals it melts, lets drops of grease exude, emits the noise of meat roasting, and produces a smoke which has the odour of fat volatilized. It leaves behind it no residue. This substance is fibrin. The resemblance between the juice of the papaw tree and animal matter is so close that one would be tempted to suspect some imposition, were not the evidence that it is really a vegetable juice quite unexceptionable.

The properties of fibrin are the following:

1. It is tasteless, fibrous, elastic, and resembles gluten.
2. It is indissoluble in water and in alcohol.
3. It is not dissolved by diluted alkalies.
4. It is dissolved without difficulty by acids.
5. With nitric acid it gives out much azotic gass.
6. In distillation it yields much carbonat of ammonia and oil.
7. It soon putrifies when kept moist, becomes green, but does not acquire any resemblance to cheese. See Fibre.

FIBROLITE, a species of the topaz family, first observed by Bournon in the matrix of the imperfect corundum. Colour white, or dirty grey; hardness rather greater than that of quartz; specific gravity 3.214; texture fibrous; cross fracture compact; internal lustre glossy; infusible by the blow-pipe; usually in shapeless fragments. Bournon observed one specimen crystallized, in a rhomboidal prism; the angles of whose faces were 80° and 100°. It is composed, according to Chenevix, of 52·25 alumina, 38·00 silica, and 3·75 a trace of iron and loss.

FI'BRIL. *s.* (*fibrille*, French.) A small fibre or string (*Cheyne*).

FI'BROUS. *a.* (*fibreux*, French.) Composed of fibres or stamina (*Bacon*).

FIBULA. (*fibula, quasi figulula,* from *figo,* to fasten. So named because it joints together the tibia and the muscles.) A long bone of the leg, situated on the outer side of the tibia, and which forms, at its lower end, the outer ankle. Its upper extremity is formed into an irregular head, on the inside of which is a slightly concave articulating surface, which, in the recent subject, is covered with cartilage, and receives the circular flat surface described under the edge of the external cavity of the tibia. This articulation is surrounded by a capsular ligament, which is farther strengthened by other strong ligamentous fibres, so as to allow only a small motion backwards and forwards. Externally, the head of the fibula is rough and protuberant, serving for the attachment of ligaments, and for the insertion of the biceps, cruris muscle. Immediately below it, on its inner side, is a tubercle, from which a part of the gastrocnemus internus has its origin. Immediately below this head the body of the bone begins. It is of a triangular shape, and appears as if it were slightly twisted at each end in a different direction. It is likewise a little curved inwards and forwards. This curvature is in part owing to the action of muscles; and in part perhaps to the carelessness of nurses. Of the three angles of the bone, that which is turned towards the tibia is the most prominent, and serves for the attachment of the interosseous ligament, which, in its structure and uses, resembles that of the fore-arm, and, like that, is a little interrupted above and below. The three surfaces of the bone are variously impressed by different muscles. About the middle of the posterior surface is observed a passage for the medullary vessels, slanting downwards. The lower end of the fibula is formed into a spongy, oblong head, externally rough and convex, internally smooth, and covered with a thin cartilage, where it is received by the external triangular depression at the lower end of the tibia. This articulation, which resembles that of its upper extremity, is furnished with a capsular ligament, and farther strengthened by ligamentous fibres, which are stronger and more considerable than those we described above. They extend from the tibia to the fibula, in an oblique direction, and are more easily discernible before than behind. Below this the fibula is lengthened out, so as to form a considerahle process, called malleolus externus, or the outer ankle. It is smooth, and covered with cartilage on the inside, where it is contiguous to the astragalus, or first bone of the foot. At the lower and inner part of this process there is a spongy cavity, filled with fat; and a little beyond this, posteriorly, is a cartilaginous groove, for the tendons of the peroneus longus and peroneus brevis, which are here bound down by the ligamentous fibres that are extended over them.

The principal uses of this bone seem to be, to afford origin and insertion to muscles, and to contribute to the articulation of the leg with the foot.

Fibulæ, buckles, clasps. This Latin word, generally taken, signifies all sorts of work that joints two things together.

Fibula architectonica, that which in architecture we call a nail, peg, key, and ring, and all that is made use of to join beams together, and other parts of buildings. In this sense Cæsar makes use of this word, in the description he has made of the bridge that he built over the river Rhine: Binis utrinque fibulis ab extremâ parte distinebantur.

Fibula, in relation to clothes, means buckles and clasps, that keep close, or tie up some part of our clothes. The Greeks and Romans made use of them, and often adorned them with precious stones. Men and women wore them upon their clothes and shoes, and used them to keep up their hair, aliqua fibula comam diffluentem colligans.

Fibula gymnastica, or Citharædica, used only by musicians and comedians, to keep close the prepuce of children, lest they should keep women company, and lose their voice, as we learn of Celsus. The same thing was used to players upon the stage, to preserve their voice, as it is reported by Martial.

Menophili penem tam grandis fibula vestis.

FICA'RIA. (*ficaria*; from *ficus*, a fig, so called from its likeness.) The herb fig-wort.

FICHARD (John), an eminent lawyer of Frankfort-on-the-Maine, who died in 1581, aged 69. He wrote, 1. Virorum, qui superiori nostroque sæcula eruditiono et doctrina illustres atquæ memorabiles fuerunt, Viiæ, 4to. 2. Vitæ jurisconsultorum. 3. Onomasticon Philosophica Medica synonymem. 4. De Cautelis. 5. Consilium Marimoniale.

FICINUS (Marsilius), a famous Italian, born at Florence in 1453, and brought up at the expense of Lorenzo de Medicis, with whom he became a particular favourite. He was the first who restored the platonic philosophy in the west, to facilitate which he rendered the works of Plato and Plotinus into Latin. He died at Corregio in 1499. His writings are very numerous, and were collected and printed in 2 vols. folio, at Basil, in 1561 and 1576.

FI'CKLE. *a.* (ꝼicol, Saxon.) 1. Changeable; inconstant; irresolute; wavering; unsteady (*Dryden*). 2. Not fixed; subject to vicissitude (*Milton*).

FI'CKLENESS. *s.* (from *fickle.*) Inconstancy; uncertainty; unsteadiness (*Sidney*).

FI'CKLY. *ad.* (from *fickle.*) Without certainty or stability (*Southern*).

FI'CO. *s.* (Ital.) An act of contempt done with the fingers (*Carew*).

FICOIDES, in botany. See MESEMBRYANTHEMUM.

FI'CTILE. *a.* (*fictilis*, Latin.) Manufactured by the potter (*Bacon*).

FI'CTION. *s.* (*fictio*, Latin.) 1. The act of feigning or inventing (*Stillingfleet*). 2. The thing feigned or invented (*Raleigh*). 3. A falsehood; a lie.

FI'CTIOUS. *a.* Fictitious; imaginary (*Prior*).

FICTI'TIOUS. *a.* (*fictitius*, Latin.) 1. Counterfeit; false; not genuine (*Dryden*). 2. Feigned; imaginary (*Pope*). 3. Not real; not true; allegorical (*Addison*).

FICTI'TIOUSLY. *ad.* (from *fictitious.*) Falsely; counterfeitly (*Brown*).

FICUS. Fig-tree. In botany, a genus of the class polygamia; order triœcia; receptacle, common, turbinate, fleshy, connivent, covering and concealing the fructification in the same or a distinct plant. Male: calyx three-parted; corolless; stamens three. Female: calyx five-parted; corolless; pistil one; seed one, compressed. Fifty-six species. India; West Indies; South America; and Australasia. The most celebrated are as follow:

1. Ficus India. Banyan-tree, or Indian-fig. Leaves oblong, rounded at the base, smooth, entire, somewhat glaucus underneath, with impressed dots above: fruits nearly globular. This tree is the glory of the Bramins, and is well entitled to their highest boastings. From the munificent display of its fruit, its astonishing longevity, or rather superiority to all decay, and its overspreading arms, they regard it as the best emblem of the deity, generally erect their pagodas in its vicinity, and pass their lives under its enormous shade.

2. F. sycomorus. Sycomore, or Sycamore, Leaves heart-shaped, roundish, very entire, downy underneath: fruit sessile. A large tree, fifty feet high, frequent in Lower Egypt: it buds in the end of March, and the fruit ripens in the beginning of June. It is cultivated in our own country.

3. F. carica. Common fig-tree. Leaves palmate, in about three lobes, rough underneath; fruit glabrous, pear-shaped, umbilicate. It rises about fifteen or twenty feet, with an upright branching stem. The varieties are numerous, and for the most part produce ripe fruit in July or August. The chief varieties are, the large, oblong, dark, purplish-blue fig; the brown or chesnut; the green Ischia; brown Ischia; the Malta; the round brown Naples fig. The genus is a native of the south of Europe, and many of its varieties are cultivated in our own gardens. The maturation of the fruit is often accelerated by a very peculiar process called CAPRIFICATION, which we have already described under that term, and to which therefore we refer the reader.

All the branches of the banyan, when they have reached a certain height, incurve, and when they have in this manner bent down to the surface of the earth, pierce it with their tendrils, which from stem-branches immediately become radicles or root-branches; in consequence of which the original tree is possessed at length of a vast multitude of enormous trunks, each increasing in diameter, and rivaling, or nearly so, the trunk from which they sprang. All these trunks are continually sending forth new branches, which are again converted into new trunks, sporting alike with time and space, for the trunks never die spontaneously, nor is there any limit to their spontaneous extent. The largest banyan known to Europeans is on an island in the river Nerbedda in the Guzzerat, distinguished, in honour of a bramin of high reputation, by the name of Cubbeer Burr. High floods have destroyed much of the extent of this tree; yet it measures round the principal stems two thousand feet in circumference; its largest trunks, each exceeding our noblest oaks, amount to three hundred and fifty; the smaller are more than three thousand; and it is said that seven thousand persons find ample room to repose under its shade. It is loaded in its season with an abundance of fruit, and is able to supply the same number of persons from the enormous quantity it produces.

FICUS. (*ficus.*) A fleshy excrescence about the anus, in figure resembling a fig.

FICUS CARICA, the systematic name of the fig-tree. See CARICA.

FID. *s.* (*fitta*, Italian.) A pointed iron with which seamen untwist their cords (*Skinner*).

FI'DDLE. *s.* (ꝼiꝺele, Sax.) A stringed instrument of music; a violin (*Stillingfleet*).

To FI'DDLE. *v. n.* (from the noun.) 1. To play upon a fiddle (*Bacon*). 2. To trifle; to shift the hands often, and do nothing (*Arbuthnot*).

FI′DDLEFADDLE. *s.* (A cant word.) Trifles.

Fi′ddlefaddle. *a.* Trifling; giving needless trouble (*Arbuthnot*).

FI′DDLER. *s.* (from *fiddle.*) A musician; one that plays upon the fiddle (*Ben Jonson*).

FIDDLESHAPED, in botany. See Panduræform,

FI′DDLESTICK. *s.* (*fiddle* and *stick.*) The bow and hair which a fiddler draws over the strings of a fiddle (*Hudibras*).

FI′DDLESTRING. *s.* (*fiddle* and *string.*) The string of a fiddle. See Violin.

FIDE-JUSSOR, in the civil law, is a surety, or one that obliges himself in the same contract with a principal, for the greater security of the creditor or stipulator.

FIDEI-COMMISSUM, in Roman antiquity, an estate left in trust with any person, for the use of another. See Trustee.

FIDE′LITY. *s.* (*fidelitas*, Lat.) 1. Honesty; veracity (*Hooker*). 2. Faithful adherence (*Clarke*).

FIDES, Faith or Fidelity, one of the virtues deified by the Pagans. She had a temple near the capitol, founded by Numa Pompilius; but no animals were offered, or blood spilt, in her sacrifices. During the performance of her rites, her priests appeared in white vestments, with their heads and hands covered with linen, to shew that fidelity ought to be sacred.

To FIDGE. *To* Fi′dget. *v. n.* (A cant word.) To move nimbly and irregularly.

FIDICINALIS. (*fidicinalis, musculus.*) See Lumbricalis.

FIDICULÆ, in antiquity, the cords with which criminals were tied on the equuleus.

FIDU′CIAL. *a.* (*fiducia*, Lat.) Confident; undoubting (*Hammond*).

FIDU′CIARY. *s.* (*fiduciarius*, Latin.) 1. One who holds any thing in trust. 2. One who depends upon faith without works (*Hammond*).

Fidu′ciary. *a.* 1. Confident; steady; undoubting (*Wake*). 2. Not to be doubted (*Howel*).

FIEF, the same with feud.

FIELD, in antiquity. See Campus and Elysium.

Field. *s.* (ꝼelꝺ, Saxon.) 1. Ground not inhabited; nor built on (*Raleigh*). 2. Ground not enclosed (*Mortimer*). 3. Cultivated tract of ground (*Pope*). 4. The open country (*Shakspeare*). 5. The ground of battle (*Milton*). 6. A battle; campaign; the act of any army while it keeps the field (*Shakspeare*). 7. A wide expanse (*Dryden*). 8. Space; compass; extent (*Smallridge*). 9. The ground or blank spot on which figures are drawn (*Dry.*). 10. (In heraldry.) The surface of a shield.

Field-bed. *s.* (*field* and *bed.*) A bed contrived to be set up easily in the field (*Shakspeare*).

Field-book, in surveying, a book used for setting down angles, distances, and other things remarkable in taking surveys.

The field-book is ruled into three columns. In the middle one are set down the distances on the chain line, at which any mark, offset, or other observation is made; and in the right and left hand columns are entered the offsets, angles, and observations made on the right and left hand respectively of the chain line.

It is of great advantage, both for brevity and perspicuity, in large surveys, to begin at the bottom of the leaf and write upwards; denoting the crossing of fences, by lines drawn across the middle column, or only a part of such a line on the right and left opposite the figures to avoid confusion, and the corners of fields, and other remarkable turns in the fences where offsets are taken to, by lines joining in the manner the fences do.

Field-colours, in war, are small flags of about a foot and a half square, which are carried along with the quarter-master general, for marking out the ground for the squadrons and battalions to encamp on.

Field-fare, in ornithology. See Turdus.

Field-officer, in the art of war. See Officer.

Field of view, or of vision, is the whole space or extent within which objects can be seen through an optical machine, or at one view of the eye without turning it.

The precise limits of this space are not easily ascertained, for the natural view of the eye. In looking at a small distance, we have an imperfect glimpse of objects through almost the extent of a hemisphere, or at least for above 60 degrees each way from the optic axis; but towards the extremity of this space, objects are very imperfectly seen; and the diameter of the field of distinct vision does not subtend an angle of more than 5 degrees at most, so that the diameter of a distinct image on the retina is less than $\frac{6}{180}$ of an inch; but it is probably much less.

Field-pieces, small cannons, from three to twelve pounders, carried along with an army in the field.

Field-staff, a weapon carried by artillery men, about the length of a halbert, with a spear at the end; having on each side ears screwed on, like the cock of a match-lock, where the gunners fix in lighted matches when they are upon command; and then the field-staffs are said to be armed.

Field-works, in fortification, are those thrown up by an army in besieging a fortress, or by the besieged to defend the place. Such are the fortifications of camps, highways, &c.

FI′ELDED. *a.* (from *field.*) Being in a field of battle (*Shakspeare*).

FIELDING (Henry), a well-known writer of the present age, son of lieutenant-general Fielding, who served under the duke of Marlborough, was born in 1707. He had four sisters; of whom Sarah is well known as the writer of The Adventures of David Simple. On the death of his mother, his father married again: and sir John Fielding, who succeeded him in the commission of the peace for Middlesex, was his brother by this marriage. Henry was sent to study at Leyden; but a failure in his remittances obliged him to return in two years, when his own propensity to gaiety and profusion drove him to write for the stage at 20 years of age. His first dramatic piece, Love in several Masques, which was well received, appeared in 1727; and all his plays and farces, to the amount of 18, were written before the year 1737; and many of them are still acted with applause. While he was thus employed, he married a young lady with 1500*l.* fortune, and inherited an estate of 200*l.* a year from his mother: all which, though on the plan of retiring into the country, he contrived to dissipate in three years; and then applied himself to the study of the law for a maintenance. In losing his fortune, he acquired the gout; which rendering it impossible for him to attend the bar, he with a shattered constitution had recourse to many extempore applications of his pen for immediate supplies; until, soon after the late rebellion, he accepted the office of acting justice for Middlesex, an employment much more profitable than honourable in the public esteem. Reduced at length by the fatigues of this office, and by a complication of disorders, he by the advice of his physicians went to Lisbon, where he died in 1754. He wrote a great number of fugitive pamphlets and periodical essays; but is chiefly distinguished by his Adventures of Joseph Andrews, and History of Tom Jones, of which, the immoral tendency of the latter cannot pass without reprobation. His works have been collected and published, with his life prefixed, by Mr. Murphy.

FIEND. *s.* (ꝼienꝺ, Saxon.) 1. An enemy; the great enemy of mankind; the devil (*Shakspeare*). 2. An infernal being (*Ben Jonson*).

FIENUS (Thomas), a learned physician, born at Antwerp in 1566. After travelling through Italy he came to Louvain, where he was chosen professor of physic. He died there in 1631. His works are; 1. De viribus Imaginationis. 2. De Formatione et Animatione fœtus. 3. Apologia pro eodem. 4. De Cauteriis. 5. Libri Chirurgici.

FIERCE. *a.* (*fier*, French.) 1. Savage; ravenous; easily enraged (*Job*). 2. Vehement in rage; eager of mischief (*Pope*). 3. Violent; outrageous (*Genesis*). 4. Passionate; angry; furious (*Shakspeare*). 5. Strong; forcible (*James*).

FI′ERCELY. *ad.* Violently; furiously (*Kn.*).

FI′ERCENESS. *s.* (from *fierce.*) 1. Ferocity; savageness (*Swift*). 2. Eagerness for blood; fury (*Sidney*). 3. Quickness to attack; keenness in anger and resentment (*Shaksp.*). 4. Violence; outrageous passion (*Dryden*).

FIERIFA′CIAS. *s.* (In law.) A judicial writ for him that has recovered in an action of debt or damages, to the sheriff, to command him to levy the debt or damages (*Cowell*).

FI′ERINESS. *s.* (from *fiery.*) 1. Hot qualities; heat; acrimony (*Boyle*). 2. Heat of temper; intellectual ardour (*Addison*).

FI′ERY. *a.* (from *fire.*) 1. Consisting of fire (*Spenser*). 2. Hot like fire (*Shakspeare*). 3. Vehement; ardent; active (*Shakspeare*). 4. Passionate; outrageous; easily provoked (*Sh.*). 5. Unrestrained; fierce (*Dryden*). 6. Heated by fire (*Pope*).

FIERENZUOLO, a town of Parma, in Italy, 10 miles S. E. of Placentia. Lat. 44. 59 N. Lon. 9. 44 E.

FIEZOLI, an ancient episcopal town of the Florentino, in Italy, 5 miles N. E. of Florence. Lat. 43. 49 N. Lon. 11. 11 E.

FIFE, or Fiffario, a shrill wind instrument of the martial kind, consisting of a short, narrow tube, with holes disposed along the side for the regulation of its tones. It is not blown at the end, but at the side, like a German flute. (*Busby*).

Fife-rails, in a ship, are those that are placed on banisters, on each side of the top of the poop, and so along with hauncers or falls. They reach down to the quarter-deck and to the stair of the gang-way.

FIFESHIRE, a county of Scotland, bounded on the N. by the frith of Tay; on the E. by the British ocean; on the S. by the frith of Forth; and on the W. by the counties of Kinrose, Perth, and Clackmannan. It is about 50 miles long; its greatest breadth 16. "This county," says Mr. Pennant, "is so populous, that excepting the environs of London, scarce one in S. Britain can vie with it; fertile in soil, abundant in cattle; happy in collieries, in iron, in lime, and freestone; blessed in manufactures; the property remarkably well divided; none insultingly powerful to distress, and often depopulate a country; most of the fortunes of a useful mediocrity. The number of towns is almost unparalleled in an equal tract of coast; for the whole shore, from Crail to Culross, about 40 miles, is one continued chain of towns and villages." This county contains 101,272 inhabitants.

FI′FTEEN. *a.* (ꝼyꝼtyne, Saxon.) Five and ten.

FI′FTEENTH. *a.* (ꝼyꝼteoða, Saxon.) The ordinal of fifteen; the fifth after the tenth.

Fifteenth, *Decima quinta*, or *Quinzieme*, an ancient tribute, or imposition of money, laid upon any city, borough, or other town, through the realm; not by the poll, or upon this or that man, but in general upon the whole city, or town.

Fifteenth, a musical interval equal to two octaves.

Fifteenth stop. See Stop fifteenth.

FIFTH, in music, one of the harmonical intervals or concords; being the second in order, and expressed by the ratio 3 : 2. In the natural scale it comes in the fifth place from the fundamental, being distant from it seven semitones. The ancients called it diapente. The imperfect fifth, or semi-diapente, is less than the fifth by a minor semitone.

Fifth. *a.* (ꝼyꝼta, Saxon.) 1. The ordinal of five; the next to the fourth. 2. All the ordinals are taken elliptically for the part which they express: a *fifth*, a *fifth* part; a *third*, a *third* part (*Swift*).

FI′FTHLY. *ad.* (from *fifth.*) In the fifth place.

FI′FTIETH. *a.* (ꝼiꝼteoᵹopa, Saxon.) The ordinal of fifty.

FI′FTY. *a.* (ꝼiꝼtiᵹ, Saxon.) Five tens.

FIG, or Fig-tree. See Ficus.

Fig (Indian), or Cochineal. See Cactus.

Fig (Marigold). See Mesembryanthemum.

Fig-eater, in ornithology. See Motacilla.

Fig-wort, in botany. See Scrophularia.

To Fig. *v. a.* (See Fico.) 1. To insult with ficoes or contemptuous motions of the fingers (*Shakspeare*). 2. To put something useless into one's head (*L'Estrange*).

FIGGING, in horse-dealing, denotes the introducing a piece of ginger (previously bitten) within the sphincter of the anus, where, by its painful stimulus, it so irritates the animal, that he seems, by the cocking of his tail, the erection of his ears, and the deceptive spirit he displays in action, to be a horse of superior value.

To FIGHT. *v. n.* preter. *fought*; part. pass. *fought.* (feohtan, Saxon.) 1. To contend in battle; to war; to make war; to battle; to contend in arms (*Swift*). 2. To combat; to duel; to contend in single fight (*Esdras*). 3. To act as a soldier in any case (*Dryden*). 4. To contend (*Sandys*).

To Fight. *v. a.* To war against; to combat against (*Dryden*).

Fight. *s.* (from the verb.) 1. Battle (*Milton*). 2. Combat; duel (*Dryden*). 3. Something to screen the combatants in ships (*Dry.*).

FI'GHTER. *s.* (from *fight.*) Warriour; duelist (*Shakspeare*).

FI'GHTING. *participial a.* (from *fight.*) 1. Qualified for war; fit for battle (*Chronicles*). 2. Occupied by war (*Pope*).

Fighting (Cock). See Cockfighting.

FI'GMENT. *s.* (*figamentum*, Lat.) An invention; a fiction; the idea feigned (*Brown*).

FI'GPECKER. *s.* (*fig* and *peck.*) A bird.

FIGUERO-DOS-VINHOS, a town of Portugal, in Estremadura, famous for excellent wine. It is seated among mountains near the river Zizere. Lat. 39. 49 N. Lon. 7. 45 W.

FIGUERAS, or St. Fernando-de-Figueras, a strong and important fortress of Spain, in Catalonia. Lat. 42. 18 N. Lon. 2. 46 E.

FI'GULATE. *a.* (from *figulus*, Lat.) Made of potters' clay.

FI'GURABLE. *a.* (from *figuro*, Latin.) Capable of being brought to certain form, and retained in it. Thus lead is *figurable*, but not water (*Bacon*).

FIGURABI'LITY. *s.* (from *figurable*). The quality of being capable of a certain and stable form.

FI'GURAL. *a.* (from *figure.*) Represented by delineation (*Brown*).

FI'GURATE. *a.* (*figuratus*, Latin.) 1. Of a certain and determinate form (*Bacon*). 2. Resembling any thing of a determinate form: as, *figurate* stones retaining the forms of shells in which they were formed by the deluge.

Figurate, or figural numbers, certain ranks of numbers found by adding together first a rank of units, which is the first order, which gives the 2d order; then these added give the 3d order; and so on. Hence the several orders of figurate numbers are as follow:

First order	-	1 .	1 .	1 .	1 .	1 .	&c.
2d order	-	1 .	2 .	3 .	4 .	5 .	&c.
3d order	-	1 .	3 .	6 .	10 .	15.	&c.
4th order	-	1 .	4 .	10 .	20 .	35.	&c.
5th order	-	1 .	5 .	15 .	35 .	70.	&c.

The first order consists all of equals, and the 2d order of the natural arithmetical progression; the 3d order is also called triangular numbers, the 4th pyramidals, the 5th second pyramidals, &c. If the common difference of the first progression were 2, the successive sums would be the series of square numbers, 1, 4. 9, 16, &c. If if it were 3, the series would be pentagonal numbers, 1, 5, 12, 22, &c. If it were 4, the series would be hexagonal numbers, 1, 6, 15, 28, &c. And the reason of the names, triangles, squares, pentagons, &c. is that such numbers may be placed in the form of those regular figures. See Maclaurin's Fluxions, Malcolm's Arithmetic, and Simpson's Algebra.

FIGURA'TION. *s.* (*figuratio*, Latin.) 1. Determination to a certain form (*Bacon*). 2. The act of giving a certain form (*Bacon*).

FI'GURATIVE. *a.* (*figuratif*, French.) 1. Representing something else; typical; representative (*Hooker*). 2. Not literal (*Stillingfleet*). 3. Full of figures; full of rhetorical exornations (*Dryden*).

Figurative (Counterpoise and Descant). See Counterpoise and Descant.

FI'GURATIVELY. *ad.* By a figure; in a sense different from that which words originally imply; not literally (*Hammond*).

FI'GURE. *s.* (*figura*, Latin.) 1. The form of any thing as terminated by the outline (*Boyle*). 2. Shape; form; resemblance (*Sh.*). 3. Person; external form; appearance mean or grand (*Clarissa*). 4. Distinguished appearance; eminence; remarkable character (*Addison*). 5. Magnificence; splendour (*Law*). 6. A statue; an image; something formed in resemblance of somewhat else (*Addison*). 7. Representation in painting (*Dryden*). 8. Arrangement; disposition; modification (*Watts*).

For other meanings, see the succeeding articles.

Figures, in arithmetic, are the numeral characters; or the characters whereby numbers are expressed, or written. Thus the number four hundred and fifty is written, or expressed, by three figures, 450.

These figures in arithmetic are the nine digits; 1, 2, 3, 4, 5, 6, 7, 8, 9, and 0.

These figures were first brought into Europe by the Moors of Spain; and into England, as Dr. Wallis apprehends, about 1130. See Arithmetic and Character.

Figure, among divines. See Type.

Figure, in astrology. See Horoscope.

Figure, in conic sections, according to Apollonius, is the rectangle contained under the latus-rectum and the transverse axis, in the ellipse and hyperbola.

Figure, in geometry, denotes a surface inclosed or circumscribed with one or more lines.

Such are triangles, squares, polygons, circles, ellipses, &c.

Wolfius defines figure a continuum terminated by a perimeter. In which sense, figure is applicable both to superficies and solids. In the former case the perimeter is of lines; in the second of surfaces.

Figure, in grammar, is an expression that deviates from the common and natural rules of grammar; either for the sake of elegance or brevity.

The best grammarians only reckon four figures, the ellipsis, pleonasm, syllepsis, and hyperbaton. Others add two more; viz. antiptosis, and enallage.

Figure, in heraldry, a bearing in a shield.

Figure, in logic, denotes a certain disposition of the terms of a syllogism; particularly of the medium, with regard to the extremes.

Hence it follows, that there are as many figures of syllogisms, as there are different connexions of the extremes with the medium; so that, though the schoolmen ordinarily only reckon three, yet a fourth might be admitted.

In the first figure the medium or middle term is the subject of the major proposition, and the predicate of the minor. This contains four moods, and applies to the proof of all sorts of questions, whether universal or particular, affirmative or negative. In the second figure the middle term is the predicate of both the premises, and this contains four moods, admitting only of negative conclusions.

The third figure requires that the middle term be the subject of both the premises, and has six moods admitting only of particular conclusions. The special rules of these three figures are the following: in the first, the major proposition must always be universal, and the minor affirmative; in the second also the major must be universal, and one of the premises, together with the conclusion, must be negative; in the third figure the minor must be affirmative, and the conclusion always particular.

In the fourth figure, called by the Peripatetics the indirect, and by others, the galenical figure, as varying too much from the natural form, the middle term is predicated in the major proposition, and subjected in the minor. Some logicians will allow this to be nothing else but a mere inversion of the first figure. It has five moods. Watts's Logic, part iii. chap. 2. § 3.

Figure, in ancient music, is used for the different dispositions of the notes in a consonance.

Figure (Apparent), in optics, that figure, or shape, under which an object appears, when viewed at a distance. This is often very different from the true figure; for a straight line viewed at a distance may appear but as a point; a surface as a line; a solid as a surface; and a crooked figure as a straight one. Also, each of these may appear of different magnitudes, and some of them of different shapes, according to their situation with regard to the eye. Thus an arch of a circle may appear a straight line; a square or parallelogram, a trapezium, or even a triangle; a circle, an ellipsis; angular magnitudes, round; a sphere, a circle, &c.

Figure, in rhetoric, any mode of speaking in which words are detorted from their literal and primitive sense. In strict acceptation, the change of a word is a trope, and any affection of a sentence a figure; but they are confounded even by the exactest writers.

A **Figure**, which, among related objects, extends the properties of one to another. This figure is not dignified with a proper name, because it has been overlooked by writers. Giddy brink, jovial wine, daring wound, are examples of this figure. Here are adjectives that cannot be made to signify any quality of the substantives to which they are joined: a brink, for example, cannot be termed giddy in a sense, either proper or figurative, that can signify any of its qualities or attributes. When we examine attentively the expression, we discover, that a brink is termed giddy, from producing that effect in those who stand on it: in the same manner, a wound is said to be daring, not with respect to itself, but with respect to the boldness of the person who inflicts it: and wine is said to be jovial, as inspiring mirth and jollity. Thus the attributes of one subject are extended to another with which it is connected; and the expression of such a thought must be considered as a figure, because the attribute is not applicable to the subject in any proper sense. In the expression bold dead, or *audax facinus*, we extend to the effect what properly belongs to the cause. But to give a complete idea of the subject, we insert the following view of the different relations that may give occasion to this figure. And here it will be observed, that the figure can never have any grace but where the relations are of the most intimate kind.

1. An attribute of the cause expressed as an attribute of the effect.

An impious mortal gave the *daring* wound.
——————To my *advent'rous* song,
That with no middle flight intends to soar.
Paradise Lost.

2. An attribute of the effect expressed as an attribute of the cause.

Quos periisse ambos *misero* censebam in mari.
Plautus.
No wonder, fallen such a *pernicious* height.
Paradise Lost.

3. An effect expressed as an attribute of the cause.

Casting a dim *religious* light. Milton, *Comus.*
And the *merry* bells ring round,
And the *jocund* rebecks sound. Milton, *Allegro.*

4. An attribute of a subject bestowed upon one of its parts or members.

Longing arms.
It was the nightingale, and not the lark,
That pierc'd the *fearful* hollow of thine ear.
Romeo and Juliet, act 3. sc. 7.

5. A quality of the agent given to the instrument with which it operates.

Why peep your *coward* swords half out their shells?

6. An attribute of the agent given to the subject upon which it operates.

High-climbing hill. Milton.

7. A quality of one subject given to another.

Then, nothing loth, th'enamour'd fair he led,
And sunk transported on the *conscious* bed.
Odyssey, viii. 337.
A *stupid* moment motionless she stood.
Thomson's Summer, l. 1336.

8. A circumstance connected with a subject, expressed as a quality of the subject.

> 'Tis ours the chance of *fighting* fields to try.
> ILIAD, i. 301.
> Oh! had I dy'd before that *well-fought* wall.
> ODYSSEY, v. 395.

From this account it appears, that the adorning a cause with an attribute of the effect is not so agreeable as the opposite expression. The progress from cause to effect is natural and easy: the opposite progress resembles retrograde motion; and therefore *panting height, astonish'd thought*, are strained and uncouth expressions, which a writer of taste will avoid.

Another rule regards this figure, that the property of one subject ought not to be bestowed upon another with which that property is incongruous.

> *K. Rich.*——How dare thy joints forget
> To pay their *awful* duty to our presence?
> RICHARD II. act 3. sc. 6.

The connection between an awful superior and his submissive dependent is so intimate, that an attribute may readily be transferred from the one to the other: but awfulness cannot be so transferred, because it is inconsistent with submission.

FIGURE of speech, as peculiarly distinguished from the above, and from those first referred to, is defined, "The using a word in a sense different from what is proper to it; and the new or uncommon sense of the word is termed the figurative sense. The figurative sense must have a relation to that which is proper; and the more intimate the relation is, the figure is the more happy. How ornamental this figure is to language will not be readily imagined by any one who hath not given it peculiar attention; and therefore we shall endeavour to unfold its capital beauties and advantages. In the first place, a word used figuratively, or in a new sense, suggests at the same time the sense it commonly bears; and thus it has the effect to present two objects; one signified by the figurative sense, which may be termed *the principal object*; and one signified by the proper sense, which may be termed *accessory*: the principal makes a part of the thought; the accessory is merely ornamental. In this respect, a figure of speech is precisely similar to concordant sounds in music, which, without contributing to the melody, make it harmonious.

To explain the matter by examples. Youth, by a figure of speech, is termed *the morning of life.* This expression signifies youth, the principal object which enters into the thought; it suggests at the same time, the proper sense of morning; and this accessory object, being in itself beautiful, and connected by resemblance to the principal object, is not a little ornamental. *Imperious ocean* is an example of a different kind, where an attribute is expressed figuratively: together with *stormy*, the figurative meaning of the epithet *imperious*, there is suggested its proper meaning, viz. the stern authority of a despotic prince; and these two are strongly connected by resemblance.

In the next place, this figure possesses a signal power of aggrandizing an object, by the following means. Words, which have no original beauty but what arises from their sound, acquire an adventitious beauty from their meaning: a word signifying any thing that is agreeable, becomes by that means agreeable; for the agreeableness of the object is communicated to its name. This acquired beauty, by the force of custom, adheres to the word even when used figuratively; and the beauty received from the thing it properly signifies, is communicated to the thing which it is made to signify figuratively. Consider the foregoing expression *imperious ocean*, how much more elevated it is than *stormy ocean.*

Thirdly, this figure hath a happy effect by preventing the familiarity of proper names. The familiarity of a proper name is communicated to the thing it signifies by means of their intimate connection; and the thing is thereby brought down in our feeling. This bad effect is prevented by using a figurative word instead of one that is proper; as, for example, when we express the sky, by terming it *the blue vault of heaven*; for, though no work of art can compare with the sky in grandeur, the expression, however, is relished, because it prevents the object from being brought down by the familiarity of its proper name.

Lastly, by this figure, language is enriched and rendered more copious; in which respect, were there no other, a figure of speech is a happy invention.

The beauties we have mentioned belong to every figure of speech. Several other beauties peculiar to one or other sort we shall have occasion to remark elsewhere. See METAPHOR.

Not only subjects, but qualities, actions, effects, may be expressed figuratively. Thus, as to subjects, *gates of breath* for the lips, *the watery kingdom* for the ocean. As to qualities, *fierce* for stormy, in the expression *fierce winter*; *altus* for profundus, *altus puteus, altum mare*; *breathing* for perspiring, *breathing plants.* Again, as to actions, The sea *rages*, Time will *melt* her frozen thoughts, Time *kills* grief. An effect is put for the cause, as *lux* for the sun; and a cause for the effect, as *bonum labores* for corn. The relation of resemblance is one plentiful source of figures of speech; and nothing is more common than to apply to one object the name of another that resembles it in any respect. Height, size, and worldly greatness, resemble not each other; but the emotions they produce resemble each other, and, prompted by this resemblance, we naturally express worldly greatness by height or size: one feels a certain uneasiness in seeing a great depth; and hence depth is made to express any thing disagreeable by excess, as depth of grief, depth of despair: again, height of place, and time long past, produce similar feelings; and hence the expression *Ut altius repetam!* Distance in past time, producing a strong feeling, is put for any strong feeling; *Nihil mihi antiquius nostra amicitia*: Shortness with relation to space, for shortness with relation to time; *Brevis esse laboro, obscurus fio*: Suffering a punishment resembles paying a debt; hence *pendere pœnas.* In the same manner, light may be put for glory, sunshine for prosperity, and weight for importance.

Many words, originally figurative, having by long and constant use lost their figurative power, are degraded to the inferior rank of proper terms. Thus the words that express the operation of the mind have in all languages been originally figurative: the reason holds in all, that when these operations came first under consideration, there was no other way of describing them but by what they resembled: it was not practicable to give them proper names, as may be done to objects that can be ascertained by the sight and touch.

A soft nature, jarring tempers, weight of woe, pompous phrase, beget compassion, assuage grief, break a vow, bend the eye downward, shower down curses, drown'd in tears, wrapt in joy, warm'd with eloquence, loaded with spoils, and a thousand other expressions of the like nature, have lost their figurative sense. Some terms there are that cannot be said to be altogether figurative, or altogether proper: originally figurative, they are tending to simplicity, without having lost altogether their figurative power. Virgil's *regina saucia cura* is perhaps one of these expressions: with ordinary readers, *saucia* will be considered as expressing simply the effect of grief; but one of a lively imagination will exalt the phrase into a figure.

For epitomising this subject, and at the same time for giving a clear view of it, lord Kames gives a list of the several relations upon which figures of speech are commonly founded. This list he divides into two tables; one of subjects expressed figuratively, and one of attributes. See *Elements of Criticism*, vol. ii. p. 305.

Lastly, though figures of speech have a charming effect when accurately constructed and properly introduced, they ought, however, to be scattered with a sparing hand; nothing is more luscious, and nothing consequently more satiating, than redundant ornaments of any kind.

Figure of the Sines, Cosines, Versed-sines, Tangents, or Secants, &c. are figures made by conceiving the circumference of a circle extended out in a right line, upon every point of which are erected perpendicular ordinates equal to the sines, cosines, &c. of the corresponding arcs; and then drawing the curve line through the extremity of all these ordinates; which is then the figure of the sines, cosines, &c. See figs. 1, 2, 3, 4, 5, 6, 7, 8. pl. 68.

Construction of the Figures of Sines, Cosines, &c.

Let ADB, &c. (fig. 1.) be the circle, AD an arc, DE its sine, CE its cosine, AE the versed sine, AF the tangent, GH the cotangent, CF the secant, and CH the cosecant. Draw a right line *aa* equal to the whole circumference ADGBA of the circle, upon which lay off also the lengths of several arcs, as the arcs at every 10°, from 0 at *a*, to 360° at the other end at *a*; upon these points raise perpendicular ordinates, upwards or downwards, according as the sine, cosine, &c. is affirmative or negative in that part of the circle; lastly, upon these ordinates set off the length of the sines, cosines, &c. corresponding to the arcs at those points of the line or circumference *aa*, drawing a curve line through the extremities of all these ordinates; which will be the figure of the sines, cosines, versed sines, tangents, cotangents, secants, and cosecants, as in the figures. Where it may be observed, that the following curves are the same, viz. those of the sines and cosines, those of the tangents and cotangents, and those of the secants and cosecants; only some of their parts a little differently placed.

It may be known when any of these lines, viz. the sines, cosines, &c. are affirmative or negative, i. e. to be set upwards or downwards, by observing the following general rules for those lines in the 1st, 2d, 3d, and 4th quadrants of the circle.

The sines	in the 1st and 2d are	affirmative,
	in the 3d and 4th	negative:
The cosines	in the 1st and 4th are	affirmative,
	in the 2d and 3d	negative:
The tangents	in the 1st and 3d are	affirmative,
	in the 2d and 4th	negative:
The cotangents	in the 1st and 3d are	affirmative,
	in the 2d and 4th	negative:
The secants	in the 1st and 4th are	affirmative,
	in the 2d and 3d	negative:
The cosecants	in the 1st and 2d are	affirmative,
	in the 3d and 4th	negative:

And all the versed sines are affirmative.

To find the Equation and Area, &c. to each of these Curves.

Draw any ordinate *de*; putting $r=$ the radius AC of the given circle, $x=ad$ or AD any absciss or arc, and $y=de$ its ordinate, which will be either the sine $DE=s$, cosine $CE=c$, versed sine $AE=v$, tangent $AF=t$, cotangent $GH=\tau$, secant $CF=f$, or cosecant $CH=\sigma$, according to the nature of the particular construction. Now, from the nature of the circle, are obtained these following general equations, expressing the relations between the fluxions of a circular arc and its sine, or cosine, &c.

$$\dot{x}=\frac{r\dot{s}}{\sqrt{r^2-s^2}}=\frac{-r\dot{c}}{\sqrt{r^2-c^2}}=\frac{r\dot{v}}{\sqrt{2rv-vv}}=\frac{r^2\dot{t}}{r^2+t^2}=$$
$$\frac{-r^2\dot{\tau}}{r^2+\tau^2}=\frac{r^2\dot{f}}{f\sqrt{f^2-r^2}}=\frac{-r^2\dot{\sigma}}{\sigma\sqrt{\sigma^2-r^2}}.$$

And these also express the relation between the absciss and ordinate of the curves in question, each in the order in which it stands; where x is the common absciss to all of them, and the respective ordinates are s, c, v, t, τ, f, and σ. And hence the area, &c. of each of these curves has been found as follows:

1. In the figure of the sines, when the fluxion of the area is found, its correct fluent gives $r^2\mp r\sqrt{r^2-s^2}=r^2-rc=rv$, the rectangle of radius and versed sine, i. e. $-$ or $+$, as s is increasing or decreasing; which is a general expression for the area. When $s=o$, as at a or b, this expression becomes o, or $2r^2$; so that when *ad* becomes a quadrant, *af*, r^2 is the area of *afg*.

The length of the line or figure of sines is equal to half the perimeter of an ellipse, whose axes are to one another, as $\sqrt{2}$ to 1, and whose conjugate axis is equal to the diameter of the circle, from which the line of sines is conceived to be generated; as is ingeniously demonstrated by Mr. Wallace, R. M. C. at p. 187. No. 8, Leybourn's Repository.

2. In the figure of cosines, we have rs, the rectangle of the radius and sine for the general area *adec*; and when *af* is equal to a quadrant, the area becomes $=r^2$.

3. In the figure of the versed sines, we have $r\times AD-DE$ for the area. When AD or *ad* is a quadrant, this becomes $\frac{3{\cdot}1416}{2}r^2-r^2=$ the area *afg*. And when AD or *ad* is a semicircle, it becomes $3{\cdot}1416r^2=$ the area *abg* in this figure.

4. In the figure of tangents, we have $r^2\times$ hyp. log. of $\frac{f}{r}$, for the area *ade*. When *ad* becomes a quadrant, the area *afg* becomes infinite. The same for the figure of cotangents, beginning at f instead of a.

Mutlow Sc. Russell Ct.

Published by G. Kearsley, Fleet Street, Dec.r 1.st 1809.

5. For the figure of the secants, we have $r^2 \times$ hyp. log. of $\frac{s+\sqrt{s^2-r^2}}{r}$, for the area *ade*, which expression is infinite when *ad* becomes the quadrant. The same might be remarked respecting the figure of cosecants, beginning at *f* instead of *a*.

From hence the meridional parts in Mercator's chart may be calculated for any latitude AD or *ad*: For the merid. parts are to the arc of latitude AD : : as the sum of the secants to the sum of as many radii, or : : as the area *ade* : to *ad* × radius *bc* or AD × AC in the 1st figure. See Emerson's Miscellanies, p. 232, &c.

To Fi'gure. *v. a.* (*figuro*, Latin.) 1. To form into any determinate shape (*Dryden*). 2. To show by a corporeal resemblance (*Spen.*). 3. To cover or adorn with figures (*Shakspeare*). 4. To diversify; to variegate with adventitious forms or matter (*Shakspeare*). 5. To represent by a typical or figurative resemblance (*Hooker. Donne*). 6. To image in the mind (*Temple*). 7. To prefigure; to foreshow (*Shakspeare*). 8. To form figuratively; to use in a sense not literal (*Locke*). 9. To note by characters (*Dryden*).

Fi'gure-flinger. *s.* (*figure* and *fling*.) A pretender to astrology (*Collier*).

FILA'CEOUS. *a.* (from *filum*, Latin.) Consisting of threads (*Bacon*).

FI'LACER. *s.* (*filazarius*, low Lat. *filum*.) An officer in the Common Pleas, so called because he files those writs whereon he makes process (*Harris*).

FI'LAGO. Cotton-weed. In botany, a genus of the class syngenesia, order polygamia necessaria. Receptacle chaffy; downless; calyx imbricate; florets of the margin seated among the scales of the calyx. One species only; a white woolly plant of the south of Europe, with sessile and nearly stemless flowers.

FILAMENT, in botany, filamentum, (*filum*, a thread). The thread-like part of the stamen, supporting the anther, and connecting it with the flower. Pars elevans adnectensque antheram.

Filaments, in the same flower, are: 1. Equal, or all of the same length. 2. Unequal, or of different lengths. 3. Connate, or united. 4. Alternate. Most filaments are simple; some few are bifid; and others tricuspidate, or broad and trifid at the end.

FILANDERS, in falconry, a disease in hawks, &c. consisting of filaments of coagulated blood; occasioned by the rupture of some vein, by which the blood is extravasated, and hardens into cords, which inflame and become painful.

Filanders, in the same science, are also worms as small as thread, and about an inch long, that lie wrapt up in a thin skin or net, near the reins of a hawk, apart from either gut or gorge. This malady is known by the hawk's poverty; by ruffling her tail; by her straining the fist, or perch, with her pounces; and, lastly, by croaking in the night, when the filanders prick her. The disease usually proceeds from bad food; and may be remedied by giving the hawk a clove of garlic.

FILARIA, in zoology, a genus of the class vermes, order intestina. Body round, filiform, equal, and quite smooth; mouth dilated, with a roundish lip. Eighteen species:

A. Infesting mammals.
B. ——— birds.
C. ——— insects when perfect.
D. ——— insect larves.

The division A. found in different varieties in man, the cellular membrane of the horse, in the lion, the martin, and the hare.

B. In hawks, owls, crows, storks, and poultry. C. In the scarabæus fimetarius; silpha obscura, carabas, and gryllus. D. In the papilio articæ; p. betulæ; p. quercus; sphinx Euphorbiæ; phalæna caja; ph. quercus; ph. pellionella; found under the skin of the larves, and very destructive to them; sometimes solitary, and from four to seven inches long. The species chiefly worthy of notice is

F. medinensis, of the division A, is the dracunculus or Guinea-worm. Body entirely pale yellowish. It inhabits both the Indies, and is frequent in the morning dew, whence it enters the naked feet of the slaves, and creates the most troublesome itchings, generally accompanied with inflammation and fever. It must be cautiously drawn out by means of a piece of silk tied round its head: for if, by being too much strained, the animal should break, the part remaining under the skin grows with redoubled vigour, and often occasions a fatal inflammation. It is frequently twelve feet long, and not larger than a horse-hair.

FILBERT, or Filbert-tree. See Corylus.

To FILCH. *v. n.* To steal; to take by theft; to pilfer. Usually spoken of petty thefts (*Gay*).

FI'LCHER. *s.* (from *filch*.) A thief; a petty robber.

FILE. *s.* (*file*, Fr.; *filum*, a thread, Lat.) 1. A thread: not used (*Wotton*). 2. A line on which papers are strung to keep them in order (*Bacon*). 3. A catalogue; roll; series (*Shakspeare*). 4. A line of soldiers ranged one behind another. 5. (ꝼeol, Saxon.) An instrument to rub down prominences (*Moxon*).

Files (Manufactory of). Many useful tools have been invented for performing mechanical operations, which consist of a number of wedges or teeth, which may be conceived to stand upon, or rise out of a flat or curved metallic surface. When these teeth are formed upon the edge of a plate, the instrument is called a saw; but when they are formed upon a broad surface, it constitutes what is known by the name of a file. The comb-makers and others use a tool of this description, called a quonet, having coarse single teeth, to the number of about seven or eight in an inch. Fine tools of the same kind, namely, with single teeth, are called floats. When the teeth are crossed they are called files; and when instead of the notches standing in a right line, a number of single individual teeth are raised all over the surface, it is called a rasp. As the art of making files is nearly the same in its practice with regard to all the great variety of forms in which they are made, we shall confine our description to that of the flat file.

Very little need be said in explanation of the method of forging these articles. They are usually made of steel, or more rarely of iron, case-hardened. The forged files are brought to a flat surface on the grindstone, and are then ready for the file cutter. This artist is provided with a great number of chisels, consisting each of a piece of steel of moderate thickness, having a straight edge, of greater length than the height of the chisel, the back of which terminates in a blunt angle or point in the middle of its length, upon which the blows are struck with a hammer of about five or six pounds weight, for middling sized files, having its head all on one side of the stem, so as to resemble the capital letter L, in order that it may by its own weight naturally dispose itself with the face downwards. The file is placed upon a plate of lead on a small low anvil, close to which the workman sits, and on the left side of the block of the anvil are fastened the two ends of a leather strap, which he brings over the file, and by putting his right foot into the loop, holds it steadily in its place. In this situation, taking the chisel between his left finger and thumb, he applies its edge across the file, where the cuts are to begin at the point, and gives it a blow; the direction of the cut being inclined towards the tang, or that end of the file which is to go into the handle. Immediately after this commencing operation, he lifts the chisel, places its edge behind the other cut, and slides it forward till he feels it bear against the bur or protuberancy of the former cut, at which instant he gives the second blow; a third is repeated in like manner, and by a continuance of the same proceeding, the whole surface at length becomes covered with single strokes or notches, each of which presents an elevated sharp edge. The distance between stroke and stroke, or which is the same thing, the coarseness of the file, depends entirely upon the violence of the blow, by which the bur is raised to a greater or a less height; but it is not difficult with so weighty a hammer, after a very little practice, to give the strokes with great uniformity of impulse, and to repeat them with such frequency as to perform this apparently delicate work with great speed and precision. The coarsest files have about ten or twelve cuts in the inch of length, and the very finest have upwards of two hundred.

As soon as the whole surface of the file has been thus cut, the workman files the bur off with a small file, so as to leave very little more of the stroke than what has entered below the original surface; and then proceeds to give the second or cross cut, forming an angle of about sixty degrees, with the first range of strokes. The intention to be answered by filing off the first edges to afford a more even surface for cutting the second, which is done exactly in the same manner as the first range, and likewise to give a suitable figure to the small teeth or lozenge-shaped prominences, which stand up upon the face of the file after the cutting is completed. If this filing off were to be omitted, the teeth would be pointed and irregular; whereas the useful and durable figure is that of a small rounded chisel or gouge.

It may be remarked, upon examining a file, that the first cut is always made more slantwise than the second. If this were not done, the small teeth would all lie behind one another, in rows in the direction of the length of the file, which would make corresponding grooves in the face of any piece of work, that might be to be filed, instead of leaving the workman at liberty to vary his strokes, as is necessary when a flat surface is to be produced.

When the file is cut and finished on both sides, and on one or both edges, as may be required, it is ready for hardening, which is a chemical operation of some skill and ingenuity. The heat is given in a furnace, where the work can be regularly disposed, and for fine work a muffle is used. The file is first exposed to a low degree of ignition, which burns off any greasy or other matter that might adhere to its surface. It is then dipped, cold, in the grounds or thick sediment of beer, and while wet into a powder made of burned or parched horn, or leather, or other coally-animal matter, and of common salt, and in this state speedily dried by exposure to heat. Any other mucilage which could be afforded at a moderate price would probably answer the same purpose as the beer grounds. The file being then put into the ignited muffle, smokes and soon becomes red-hot, being not only defended from oxydation, by the covering of fused salt, and animal coal, which envelopes it on all sides, but being even rendered more steely upon its surface by the absorption of carbon. As soon as it has acquired the low red heat called cherry-red, it is taken out and plunged into pure cold water, which instantly cools it, and renders it very hard.

There are several variations adopted in the hardening process by different workmen, by means of which they differ in their success. Some file-makers, as well as gunsmiths and locksmiths, produce the intended effect so completely, that the whole surface of their work has a beautiful dull-grey aspect, every where alike; whereas, other operations produce coally spots, which are obliged to be cleaned off. The files, when quite dry and clean, are slightly oiled and kept in oiled paper.

The simple operation of file-cutting seems to be of such easy performance, that it is not at all to be wondered at that machines for this purpose should have been very early invented. Mathurin Jousse, in La Fidelle Ouverture de l'Art de Serrurier, published at La Fleche, in Anjou, in 1627, gives a drawing and description of one, in which the file is drawn along by shifts by wheel-work, and the blow is given by a hammer, which is tripped by the machinery. There are several in the Machines approuvées par l'Academie Royale de Paris;

and one in the American Philosophical Transactions, described also in the 2d volume of Gregory's Mechanics. Mr. William Nicholson took out a patent in August, 1802, for improved machinery in the manufacture of files, the specification of which is published in the Repertory of Arts, &c. vol. 2. N. S.

The principal requisites in a machine for file-cutting are, that the file should be steadily supported, and the chisel adapted to the face without any unequal bearing. Files are, however, for the most part, cut by hand; and the chief reasons are, 1. The cut by hand is, from its very nature, exactly of the depth the bur demands; whereas, in a machine, if the stroke be not nicely adapted to the shift, the file may be either shallow-cut, or its bur may be thrown too close by an over heavy stroke; and, 2. In machine-cut files, there must always be a piece left at the beginning, at each corner, which requires to be cut off before hardening. This may be remedied in the machinery, but it has not yet been done. (*British Encyclo.*)

To File. *v. n.* (from *filum.*) A thread. 1. To string upon a thread or wire (*Arbuthnot*). 2. (from feolan, Saxon.) To cut with a file (*Ray*). 3. To smooth; to polish (*Shaksp.*). 4. (from fylan, Saxon.) To foul; to sully (*Shakspeare*).

To File. *v. n.* To march in a file, not abreast, but one behind another (*Blackmore*).

File-fish, in ichthyology. See Balistes.

FI'LECUTTER. *s.* (*file* and *cutter.*) A maker of files (*Moxon*).

FI'LEMOT. *s.* (from *feuille morte*, a dead leaf, French.) A brown or yellow-brown colour (*Swift*).

FI'LER. *s.* (from *file.*) One who files; one who uses the file in cutting metals.

FI'LIAL. *a.* (*filial*, Fr. *filius*, Latin.) 1. Pertaining to a son; befitting a son (*Sidney*). 2. Bearing the character or relation of a son (*Milton*).

FILIA'TION. *s.* (from *filius*, Latin.) The relation of a son to a father; correlative to paternity (*Hale*).

FILIBEG. See Philibeg.

FILICES. Ferns. The fourth family; and the sixth great tribe or nation, in Linnéus's general distribution of vegetables. The first order of the class cryptogamia in his artificial system. The sixty-fourth order in his fragments of a natural method: and the fifty-fifth of his natural orders, at the end of gen. plant.

FILIFORM. (*filiformis.*) In botany, thread-shaped. Of equal thickness from top to bottom, like a thread. Applied to peduncle, filament, style, and receptacle. It seems more elegant to use filament and filiform, than to translate them by thread, and thread-shaped.

FI'LINGS. *s.* (from *file.*) Fragments rubbed off by the action of the file.

FILIPENDULA. (*filipendula*, from *filum*, a thread, and *pendeo*, to hang, so named because the numerous bulbs of its root hang as it were by small threads). Saxifraga rubra. Dropwort. The root of this plant, spiræa filipendula; foliis pennatis, foliolis uniformibus serratis, caule herbaceo, floribus corymbosis of Linnéus, possesses adstringent, and it is said lithontriptic virtues. It is seldom used in the practice of the present day. See Spiræa.

FILIX. (*filix.*) Male polypody, or fern. Polypodium filix mas of Linnéus. The root of this plant has lately been greatly celebrated for its effects upon the tænia solium or broad tape-worm. Madame Noufer acquired great celebrity by employing it as a specific. This secret was thought of such importance by some of the principal physicians at Paris, who were deputed to make a complete trial of its efficacy, that it was purchased by the French king, and afterwards published by his order. The method of cure is the following: After the patient has been prepared by an emollient clyster, and a supper of panada, with butter and salt, he is directed to take in the morning, while in bed, a dose of two or three drachms of the powdered root of the male fern. The powder must be washed down with a draught of water, and two hours after a strong cathartic, composed of calomel and scammony, is to be given, proportioned to the strength of the patient. If this do not operate in due time, it is to be followed by a dose of purging salts, and if the worm be not expelled in a few hours, this process is to be repeated at proper intervals. Of the success of this, or a similar mode of treatment, in cases of tænia, there can be no doubt, as many proofs of it in this country afford sufficient testimony; but whether the fern-root or the strong cathartic be the principal agent in the destruction of the worm may admit of a question.

Filix fœmina. The female fern. The plant which is thus called in the pharmacopœias is not the polypodium filix fœmina, but the pteris aquilina; frondibus supradecompositis, foliolis pinnatis pinnis lanceolatis, infimis pinnatifidis, superioribus minoribus of Linnéus.

The root is esteemed as an anthelmintic, and is supposed to be as efficacious in the destroying the tape-worm as the root of the male-fern.

Filix mas. See Filix.

To FILL. *v. a.* (fyllan, Saxon.) 1. To store till no more can be admitted (*John*). 2. To store abundantly (*Milton*). 3. To satisfy; to content (*Cheyne*). 4. To glut; to surfeit (*Shakspeare*). 5. *To* Fill *out.* To pour out liquor for drink. 6. *To* Fill *out.* To extend by something contained (*Dryden*). 7. *To* Fill *up.* To make full (*Pope*). 8. *To* Fill *up.* To supply (*Addison*). 9. *To* Fill *up.* To occupy by bulk (*Burnet*). 10. *To* Fill *up.* To engage; to employ (*Shakspeare*).

To Fill. *v. n.* 1. To give to drink (*Shakspeare*). 2. To grow full. 3. To glut; to satiate (*Bacon*). 4. *To* Fill *up.* To grow full (*Woodward*).

Fill. *s.* (from the verb.) 1. As much as may produce complete satisfaction (*Fairfax*). 2. The place between the shafts of a carriage; the thill (*Mortimer*).

FILLAGREE, Filigree, or Filigrane, work, a kind of enrichment on gold or silver, wrought delicately, in manner of little threads or grains, or both intermixed. The word is compounded of *fil* or *filum*, thread, and *granum*, grain. In Latin it is called *filatim elaboratum opus, argentum, aurum.*

There is no manufacture in any part of the world that has been more admired and celebrated than the fine gold and silver fillagree of Sumatra: and what renders it a matter of greater curiosity is the coarseness of the tools employed in the workmanship, and which, in the hands of an European, would not be thought sufficiently perfect for the most ordinary purposes. The whole of this ingenious process is circumstantially related in Marsden's Account of Sumatra, p. 141.

The work usually executed by young ladies in this country under the title of fillagree, and of which tea-caddies, vases, work-baskets, &c. are constructed, is formed of narrow slips of coloured paper gilt at the edges, and curiously rolled up and glued in various fanciful forms, with the gilt edge outwards.

FI′LLER. *s.* (from *fill.*) 1. Any thing that fills up room without use (*Dryden*). 2. One whose employment is to fill vessels of carriage (*Mortimer*).

FI′LLET. *s.* (*filet*, French.) 1. A band tied round the head or other part (*Dryden*). 2. The fleshy part of the thigh: applied commonly to veal (*Dryden*). 3. Meat rolled together and tied round (*Swift*).

Fillet, or Filet, in architecture, denotes a little square member or ornament used in divers places and on divers occasions, but generally as a sort of corona over a greater moulding.

Fillet, in heraldry, a kind of orle or bordure, containing only a third or fourth part of the breadth of the common bordure. It is supposed to be withdrawn inwards, and is of a different colour from the field. It runs quite round, near the edge, as a lace over a cloak. It is also used for an ordinary, drawn like a bar, from the sinister point of the chief, across the shield, in manner of a scarf.

Fillets, in the manage, the loins of a horse; seated above the flank, beyond the last rib, and in a transverse line with the hip-bone. A horse long in the back, narrow across the loins, and tucked up (greyhound like) in the carcase, is said to be badly made in the fillets, or, in other words, weak in the loins.

To Fi′llet. *v. a.* (from the noun.) 1. To bind with a bandage or fillet. 2. To adorn with an astragal (*Exodus*).

To FI′LLIP. *v. a.* To strike with the nail of the finger by a sudden spring (*Bacon*).

Fi′llip. *s.* A jerk of the finger let go from the thumb.

FILLY, the female produce of a horse and mare: she is called a filly foal, the first year; a yearling the second; and a filly till four years old.

FILM. *s.* (ꝼýlmeƿa, Saxon.) A thin pellicle or skin (*Graunt*).

To Film. *v. a.* (from the noun.) To cover with a pellicle or thin skin (*Shakspeare*).

FILMER (Sir Robert), an English writer, born in Kent at the beginning of the 17th century, and educated at Trinity college, Cambridge. His works are; 1. The Anarchy of a limited and mixed Monarchy. 2. Patriarcha; in which he strives to prove, that all government was at first monarchical, even in the patriarchal ages. 3. The Freeholder's Grand Inquest. He died about 1688.

FI′LMY. *a.* (from *film.*) Composed of thin membranes or pellicles (*Pope*).

To FI′LTER. *v. a.* (*filtro*, low Latin.) 1. To defecate by drawing off liquor by depending threads. 2. To strain; to percolate (*Grew*).

Filter, or Filtre, in chemistry, &c. a piece of woollen cloth, linen, paper, or other matter, some of which are in the form of hollow inverted cones, used to filtrate or strain liquors through. The filter has the same use and effect with regard to liquids that the sieve or scarce has on dry substances. Filters are of two sorts. The first are simple pieces of paper or cloth, through which the liquor is passed without farther trouble. The second are twisted up like a skain or wick, and first wetted, then squeezed, and one end put in the vessel that contains the liquor to be filtrated; the other end is to be out, and hang down below the surface of the liquor: by means hereof the purest part of the liquor distils drop by drop out of the vessel, leaving the coarser part behind. This filter acts as a siphon.

Water is freed from various impurities by means of basins made of porous stones, through which the water descends by percolation and becomes purified. But as filtering stones of this kind are not always to be readily procured, other contrivances have been devised; one or two of which we shall here describe.

A patent was granted to Mr. Joshua Collier of Southwark, for a most ingenious method of filtering and sweetening water, oil, and every other liquid. The following is the contrivance which combines the application of machinery with the antiseptic properties of charcoal. Fish oil is one of the liquids which he had particularly in view, to free it from every thing disagreeable, either in taste, smell, or colour, to accomplish which he poured a quantity of oil into a convenient vessel, heated to the temperature of 120° of Fahrenheit's thermometer, adding caustic mineral alkali of the specific gravity of 1·25. He then agitated the mixture, afterwards allowing it to stand till the sediment subsided, and then drew it off into another vessel, with a sufficient quantity of burnt charcoal finely powdered, and a small quantity of diluted sulphuric acid, to decompose the saponaceous matter still suspended in the oil, when the oil became clear at the surface; he then agitated the contents of this vessel, and left the coally, saline, and aqueous particles to subside; afterwards passing it through proper strainers, when it became quite transparent and fit for use.

The principle of the improved filtering machines consists in combining hydrostatic pressure with the mode of filtering *per ascensum*, which procures the peculiar advantage of causing the fluid and its sediment to take opposite directions. The filtering surface remains the same, while the dimensions of the chamber in which the sediment is received may be varied. To adapt the machines to every purpose for which they are intended, chambers must be provided of various capacities, for the precipitated matter. The space required is very great with respect to the oil trade, and as all dimensions will be required occasionally, no particular limits can be fixed. For distilleries and breweries they may be smaller in proportion, and a very small chamber will be sufficient for domestic economy. If water is to be freed from noxious particles, it must be made to pass through an iron box in its way to the filtering chamber, and the box must contain charcoal finely powdered; the water is received into this box, and delivered by two apertures, which are opened and closed by cocks. Another part of the invention consists in filtering machines in the form of stills, in which charcoal may be repeatedly burnt after any fluid substances have passed through it, for the porpose of freeing them from noxious particles, or discharging their colouring matter.

To the filtering apparatus of Mr. Collier, instruments are attached for discovering the comparative qualities of oils, which depend in some measure on their specific gravities; spermaceti oil, when compared with fish oils, being as 875 to 920. To do this a glass vessel of any shape most convenient is employed, with a glass bubble, and a thermometer. If the oil is pure, the bubble sinks, when the mercury rises to a particular standard. When spermaceti oil is impure, the bubble floats, though of the temperature required. To determine the tendency of oils, used for burning, to congeal in cold weather, a freezing mixture may be put into a phial of thin glass, into which let a thermometer be immersed, and a single drop of the oil permitted to fall on the outside of the vessel, where it will instantly congeal. As the cold produced by the mixture decreases, let the temperature be observed, by the thermometer, at which the oil becomes fluid, and runs down the side of the glass.

When we reflect on the method which nature pursues in the filtration of water, we find that such waters as descend from hills, though passing through sand and rocks, are seldom perfectly pure; but that those are the most limpid which, by ascending, ooze out near the foot of a mountain. The cause of this difference appears to be owing to the circumstance, that if the water only descend through sand, the finest and most weighty foreign particles gradually penetrate through the sandy strata; on the contrary, when it is forced to rise through sand, all such ponderous ingredients settle at the bottom; because, from their greater specific gravity, they cannot ascend to the top. The lighter particles of fluids, consequently, in both cases remain in the upper strata of the earth or sand.

From these considerations Professor Parrot, jun. of Paris, was induced to give his filtering machine the form represented in Plate 68. fig. 9.

The principal part of the machinery consists of a square vessel, bent in the form of an inverted syphon. The curve may be circular, elliptic, or in any other direction. This vessel is filled with fine pure sand, till nearly the height of the dotted line x, y, which denotes the ascent of the water to D, whence it flows into the receiver. The part marked A, B, should always project above this line, according to the size of the filtering machine. To A, B, there is attached a woollen bag, which is open at the top, and the lower part of which touches the sand. It serves the purpose of collecting the coarsest impurities, and thus preserves the sand for a longer time from becoming foul. The bag, therefore, may occasionally be removed, and rinsed in clean water. It is evident that the water flows at A, through the bag into the filtre, and rises at the place marked D, which is considerably lower than the former. It affords a very agreeable sight to observe the most limpid fluid penetrating the uppermost stratum of sand, perfectly similar to that oozing from the purest natural spring.

Professor Parrot remarks, that he procured a filtering machine made of block-tin, for ascertaining, by experiments, the purity, and quality of water that may thus be obtained in a given time. It consisted of the following dimensions: the small diameter B, E, was eight Paris inches; the large of the whole machine, eleven inches; consequently the thickness of the vessel A, B, was one inch and a half; the breadth of it, two inches and seven-eighths. The perpendicular height of the lower side, from C, its basis, to the rim D, whence the water issues, was four inches and one-twelfth; the opposite height of the mouth A, B, eight inches and three-fourths; and the height of the sand on the side marked D, was three inches and one-sixth.

Although, in experiments of this nature, much depends on the relative size and purity of the sand, which necessarily afford different results, yet professor Parrot has, after repeated trials, deduced the following conclusions, which appear to be well founded.

1. That the difference of the *niveau*, or water-level, has an essential influence on the quantity of the purified water thus obtained. 2. That a prolongation of the stratum of sand does not considerably diminish the product of the filtre, but remarkably contributes to the purity of the fluid. 3. That if the water be forced to pass through the sand with increased velocity, it will be less pure than by allowing it a proper time for its passage; and, 4. That a machine of the dimensions above described will furnish about three quarts of water in an hour, or eighteen gallons in twenty-four hours. This quantity, however, being too large in proportion to the size of the machine, it is advisable, either to lessen the difference of the water-fall; or, which is still better, to prolong the stratum of sand, in order to reduce the filtration of the water to half the quantity above stated, and to obtain it in greater purity. Thus, a filtering apparatus eighteen inches long from A to D,

two inches thick, and four broad, would afford every hour six pints of very pure water. If, therefore, so small a machine, containing a very moderate stratum of sand, and requiring only a difference of two or three inches in the height of the water, furnishes a clear and pure fluid, it follows, that an apparatus on a larger scale, provided with a bed of sand from five to six feet long, and admitting of a difference from twelve to eighteen inches in the fall of the water, might be usefully employed in public wells, hydraulic machines, and even in camps, for the supply of an army.

In the construction of large filtering machines, professor Parrot justly observes, that they should not be extended in the direction A, C, D, to a greater length than is absolutely necessary; as, in this case, they will not require any considerable difference in the fall and rise of the water: on the other hand, their breadth and thickness may be accordingly increased. Thus the diameter of such a machine would still more resemble that of a syphon.

A very simple filtering apparatus may be easily made by any common carpenter. It is nothing more than a vessel of wood in form of a frustum of a square pyramid, of which the smaller end is to be downwards, and to have a grated bottom. Over this let there be laid a layer of charcoal, and upon that another of sand. The water thus strained through the sand and charcoal will be purified: and both sand and charcoal may be changed for fresh whenever the impurities they have detained are so accumulated as to render such change necessary.

Filter is also a charm, supposed to have a virtue of inspiring love. The word is derived from φιλτρον, which signifies the same thing, of φιλεω, *amo*, I love. The Greeks, when their love was without success, had several arts to procure the affections of their beloved. The Thessalian women were famous for their skill in this as well as other magical practices. The means whereby it was effected were of various sorts; it was sometimes done by potions called φιλτρα, which are frequently mentioned in authors of both languages. Juvenal speaks thus:

> "Hic magicus affert cantus, hic Thessala
> vendit
> Philtra, quibus valeant mentem vexare
> mariti."

Their operations were violent and dangerous, and commonly deprived such as drank them of their reason. Plutarch and Cornelius Nepos report, that Lucullus, the Roman general, first lost his reason, and afterwards his life, by one of them.

FILTERING STONE. See Marmor and Arenarius.

FILTH. *s.* (ꝼılð, Saxon.) 1. Dirt; nastiness (*Sandys*). 2. Corruption; grossness; pollution (*Tillotson*).

FI'LTHILY. *ad.* (from *filthy.*) Nastily; foully; grossly (*L'Estrange*).

FI'LTHINESS. *s.* (from *filthy.*) 1. Nastiness; foulness; dirtiness (*Sidney*). 2. Corruption; pollution (*South*).

FI'LTHY. *a.* (from *filth.*) 1. Nasty; foul; dirty (*Shakspeare*). 2. Gross; polluted (*Dryden*).

To FI'LTRATE. *v. a.* (from *filter.*) To strain; to percolate (*Arbuthnot*).

FILTRATION, a process employed in pharmacy and chemistry to separate fluids from substances suspended in them. In many instances this is performed by throwing the whole upon a conical bag made of any porous materials, such as flannel, linen, or paper, which detains the solid part, and allows the fluid to pass through clear. When the quantity of materials is large, and the solid of a nature not easily to be suspended in water, a flannel or linen bag is preferable, as being more expeditious than paper; and of flannel or linen the latter is most advantageous where the liquor is required to be preserved, as the former is apt to soak up a large quantity; while, when the solid residue is the only valuable part, as in filtrating the citrat of lime, formed by chalk and lemon juice, flannel answers as well, and is more speedy.

In small quantities, and where accuracy is required, the material of the filter is generally a square, thin, unsized paper, first doubled from corner to corner, into a triangle, and the latter again doubled into half the size, making another triangle. This when opened forms a paper cone, into which the liquor is poured, and which must be supported by being put into a glass funnel.

The substances that cannot be filtered in the common way are those which act too powerfully upon the paper and other materials employed. The concentrated acids and alkaline solutions are of this kind. Where it is required to filter these, which is not often the case, they must be poured through a stratum of coarsely powdered glass, or well washed white sand, in a glass funnel.

FI'MBLE HEMP. *s.* (corrupted from *female.*) The light summer hemp, that bears no seed is called *fimble hemp* (*Mortimer*).

FIMBRIÆ. (*fimbria, quasi finibria*, from *finis*, the extremity.) In anatomy. The extremities of the Fallopian tubes.

FIMBRIATE, in botany; Fringed, which see.

FIN, in natural history, a well known part of fishes, consisting of a membrane supported by rays, or little bony or cartilaginous ossicles.

The number, situation, and figure of fins, are different in different fishes. As to number, they are found from one to ten, or more; with respect to situation, they stand either on the back only, the belly only, or on both; and as to figure, they are either of a triangular, roundish, or oblong square form. Add to this, that in some they are very small; whereas, in others, they are almost equal to the whole body in length.

Fin-fish, in ichthyology. See Balæna.

Fin-footed. *a.* Palmipedous; having feet with membranes between the toes (*Bro.*).

FI′NABLE. *a.* (from *fine.*) That admits a fine; that deserves a fine (*Hayward*).

FINÆUS (Orontius), or Fine′, professor of mathematics in the Royal college at Paris. He was born in 1494, and early distinguished himself by a turn for philosophy and mathematics. But, notwithstanding his great reputation, he lived all his life in poverty, and left a family greatly distressed. He died in 1555. His works were printed in three vols. 4to.

FI′NAL. *a.* (*final*, French.) 1. Ultimate; last (*Milton*). 2. Conclusive; decisive (*Davies*). 3. Mortal; destructive (*Spenser*). 4. Respecting the end or motive (*Collier*).

Final cause. See Cause.

Final letters, among Hebrew grammarians, five letters so called, because they have a different figure at the end of words from what they have in any other situation. These are caph, mem, nun, phe, tzade, all comprehended in the word camnephatz, and which, at the end of words, are written thus, ך, ם, ן, ף, ץ; whereas, in any other situation, their form is thus, צ, פ, נ, מ, כ; on which account they are likewise called biform. Many of the modern oriental alphabets have, in like manner, different figures for several of their letters when finals: the Arabic alphabet gives a different form to almost every letter regarded as initial, final, or connected.

Final, a town of Genoa, in Italy, seated on the shore of the Mediterranean. It was sold to the Genoese by the emperor Charles VI. in 1713. It is 30 miles S.W. of Genoa. Lat. 44. 14 N. Lon. 8. 4 E.

FINALE, a town of Italy, in the Modenese. Lat. 44. 46 N. Lon. 11. 25 E.

Finale. (Italian.) A word signifying the last composition performed in any act of an opera, or part of a concert. (*Busby*).

F IN ALT, in music, the seventh above G in alt.

FI′NALLY. *ad.* 1. Ultimately; lastly; in conclusion (*Milton*). 2. Completely; without recovery (*South*).

FI′NANCE. *s.* (French.) Revenue; income; profit (*Bacon*).

FI′NANCIER. *s.* (French.) One who collects or farms the public revenue.

FI′NARY. *s.* (from *to fine.*) The second forge at the iron mills.

FINCH. *s.* (ꝼinc, Saxon.) A small bird of which we have three kinds, the goldfinch, chaffinch, and bullfinch. See Fringilla.

To FIND. *v. a.* (ꝼyndan, Saxon.) 1. To obtain by searching or seeking (*Milton*). 2. To obtain something lost (*Shakspeare*). 3. To obtain something desired (*Milton*). 4. To meet with; to fall upon (*Pope*). 5. To know by experience (*Cowley*). 6. To come to; to attain (*Milton*). 7. To discover by study (*Dryden*). 8. To discover what is hidden (*Cowley*). 9. To hit on by chance; to perceive by accident (*Cowley*). 10. To gain by any mental endeavour (*Pope*). 11. To remark; to observe (*Milton*). 12. To detect; to deprehend; to catch (*Locke*). 13. To reach; to attain (*Job*). 14. To meet (*Cowley*). 15. To settle; to fix any thing in one's own opinion (*Cowley*). 16. To determine by judicial verdict (*Shakspeare*). 17. To supply; to furnish (*Bacon*). 18. (In law.) To approve; *as, to find a bill.* 19. *To* Find *himself.* To be; to fare with regard to ease or pain (*L'Estr.*). 20. *To* Find *out.* To unriddle; to solve (*Ecc.*). 21. *To* Find *out.* To discover something hidden (*Newton*). 22. *To* Find *out.* To obtain the knowledge of (*Dryden*). 23. *To* Find *out.* To invent; to excogitate (*Chronicles*).

FI′NDER. *s.* (from *find.*) 1. One that meets or falls upon any thing (*Shakspeare*). 2. One that picks up any thing lost (*Crashaw*).

FINDFA′ULT. *s.* (*find* and *fault.*) A censurer; a caviller (*Shakspeare*).

FINDHORN, a river of Scotland, which rises in Invernessshire, and crossing Nairneshire and the N.W. corner of Murrayshire, forms a bay, to which it gives name, and which opens into the frith of Murray, at the town of Findhorn.

FINDY. *a.* (ꝼynðig, Saxon.) Plump; weighty; firm; solid: not used (*Junius*).

FINE. *a.* (*finne*, French.) 1. Not coarse (*Spenser*). 2. Refined; pure; free from dross (*Ezra*). 3. Subtile; thin; tenuous (*Bacon*). 4. Refined; subtilely excogitated (*Temple*). 5. Keen; thin; smoothly sharp (*Bacon*). 6. Clear; pellucid; transparent (*Johnson*). 7. Nice; exquisite; delicate (*Davies*). 8. Artful; dexterous (*Bacon*). 9. Fraudulent; sly; knavishly subtle (*Spenser*). 10. Elegant; beautiful in thought or language (*Dryden*). 11. Beautiful with dignity. 12. Accomplished; elegant of manners (*Felton*). 13. Showy; splendid (*Swift*).

Fine. *s.* (*fin*, Cimbr.) 1. A mulct; a pecuniary punishment (*Davies*). 2. Penalty (*Shakspeare*). 3. Forfeit; money paid for any exemption or liberty (*Pope*). 4. The end; conclusion (*fin*, Fr.) (*Sidney*).

Fine, in law, hath various applications. Sometimes it is used for a formal conveyance of lands or tenements, or of any thing inheritable, being in *esse temporis finis*, in order to cut off all controversies. Others define it to be a final agreement between persons, concerning any lands or rents, &c. of which any suit or writ is depending between them in any court.

Fine, sometimes signifies a sum of money paid for entering lands or tenements let by lease; and sometimes a pecuniary mulct for an offence committed against the king and his laws, or against the lord of the manor.

Fines for alienation, in feodal law; one of the attendants or consequences of tenure by vassalship. Knight-service, according to Blackstone, was that of fines due to the lord for every alienation, whenever the tenant had occasion to make over his land to another. This depended on the nature of the feodal connection; it not being reasonable nor allowed, that a feudatory should transfer his lord's gift to another, and substitute a new tenant to do the service in his own stead, without the consent of the lord: and, as the feodal obligation was considered as reciprocal, the lord also could not alienate his seignory without the consent of his tenant, which consent of his was called an attornment. This restraint upon the lord soon wore away; that upon the tenant continued longer. For when every thing came in process of time to be bought and sold, the lords would not grant a licence to their tenants to aliene, without a fine being paid; apprehending that, if it were reasonable for the heir to pay a fine or relief on the renovation of his paternal estate, it was much more reasonable that a stranger should make the same acknowledgment on his admission to a newly-purchased feud.

To Fine. *v. a.* (from the adjective.) 1. To refine; to purify (*Job*). 2. To embellish; to decorate: not used (*Shakspeare*). 3. To make less coarse (*Mortimer*). 4. To make transparent (*Mortimer*). 5. To punish with pecuniary penalty (from the substantive) (*Locke*).

To Fine. *v. n.* To pay a fine (*Oldham*).

To FI′NEDRAW. *v. a.* (*fine* and *draw*.) One whose business is to sew up a rent.

FINE-DRAWING or Rentering, a dexterous sewing up or rejoining the parts of any cloth, stuff or the like, torn or rent in the dressing, wearing, &c. It is prohibited to fine-draw pieces of foreign manufacture upon those of our own, as has formerly been practised. See Rentering.

FI′NEFINGERED. *a.* (*fine* and *finger*.) Nice; artful; exquisite (*Spenser*).

FI′NELY. *ad.* (from *fine*.) 1. Beautifully; elegantly (*Addison*). 2. Keenly; sharply; with a thin edge or point (*Peacham*). 3. Not coarsely; not meanly; gayly (*Bacon*). 4. In small parts; subtilely; not grossly (*Boyle*).

FI′NENESS. *s.* (from *fine*.) 1. Elegance; beauty; delicacy (*Sidney*). 2. Show; splendour; gayety of appearance (*Decay of Piety*). 3. Subtilty; artfulness; ingenuity (*Shaksp.*). 4. Purity; freedom from dross or base mixtures (*Bacon*).

FI′NER. *s.* (from *fine*.) One who purifies metals (*Proverbs*).

FI′NERY. *s.* (from *fine*.) Show; splendour of appearance; gayety of colours (*Southern*).

Finery, in the iron works, is one of the two forges at which they hammer the sow or pig iron.

Into the finery they first put the pigs of iron, placing three or four of them together behind the fire, with a little of one end thrust into it; where, softening by degrees, they stir and work them with long bars of iron, and expose at different times the different parts to the blast of the bellows, in order to refine it as equally as possible, till the metal runs together with a round mass or lump, which they call a half-bloom. They then take this out and give it a few strokes with their sledges; afterwards they carry it to a great heavy hammer, raised by the motion of a water wheel; where, applying it dexterously to the blows, they presently beat it out into a thick short square. This they put into the finery again, and heating it red-hot, they work it out under the same hammer till it comes to be in the shape of a bar in the middle, but with two square nobs at the ends, which they call an ancony. It is then carried into the other forge called the chafery.

FINEERING. See Veneering.

FINE′SSE. *s.* (French.) Artifice; stratagem.

FI′NGER. *s.* (ꝼinᵹen, Saxon.) 1. The flexible member of the hand by which men catch and hold (*Keil*). 2. A small measure of extension; the breadth of a finger (*Wilkins*). 3. The hand; the instrument of work (*Wal.*).

To Fi′nger. *v. a.* (from the noun.) 1. To touch lightly; to toy with (*Grew*). 2. To touch unseasonably or thievishly (*South*). 3. To touch an instrument of musick (*Shakspeare*). 4. To perform any work exquisitely with the fingers (*Spenser*).

Finger-board, that thin, black covering of wood laid over the neck of a violin, violoncello, &c. on which, in performance, the strings are pressed by the fingers of the left-hand, while the right manages the bow.

FINGERED LEAF, in botany. See Digitate.

FINGERING, in music, the disposing of the fingers in a convenient, natural, and apt manner, in playing any instrument; but more especially the organ and piano-forte. Just and true fingering are of the first importance to the musician; but can scarcely ever be attained, particularly with regard to the abovementioned instruments, without the directions of a skilful master.

FI′NGLEFANGLE. *s.* (from *fangle*). A trifle: a burlesque word (*Hudibras*).

FINGRIGO, in botany. See Pisonia.

FI′NICAL. *a.* (from *fine*.) Nice; foppish (*Shakspeare*).

FI′NICALLY. *ad.* Foppishly.

FI′NICALNESS. *s.* (from *finical*.) Superfluous nicety; foppery.

FINING. See Clarification.

To FI′NISH. *v. a.* (*finir*, French.) 1. To bring to the end purposed; to complete (*Luke*). 2. To make perfect (*Broome*). 3. To perfect; to polish to the excellency intended (*Blackmore*). 4. To end; to put an end to.

FI′NISHER. *s.* (from *finish*.) 1. Performer; accomplisher (*Shakspeare*). 2. One that puts an end; ender (*Hooker*). 3. One that completes or perfects (*Milton*).

FINISTERRE, the most westerly cape or promontory of Spain, in 9. 17 W. lon. and 42. 51 N. lat. This cape is likewise the most westerly part of the continent of Europe.

Finisterre, a department of France, which includes part of the late province of Bretagne. Its name corresponds to our word, the Land's End, it being the most westerly part of France. Quimper is the episcopal town.

FI′NITE. *a.* (*finitus*, Latin.) Limited; bounded; terminated (*Brown*).

FI′NITELESS. *a.* (from *finite*.) Without bounds; unlimited (*Brown*).

FI′NITELY. *ad.* (from *finite*.) Within certain limits; to a certain degree (*Stilling.*.

FI′NITENESS. *s.* (from *finite*.) Limitation; confinement within certain boundaries (*Norris*).

FI′NITUDE. *s.* (from *finite.*) Limitation; confinement within certain boundaries (*Chey.*).

FINLAND, a province of Sweden, having the Gulph of Bothnia on the W. Russia on the E. the Gulph of Finland on the S. and Bothnia and Lapland on the N. The inhabitants differ from the Swedes, both in their manners and language. In the beginning of 1793, a tract of land, of the circumference of 392,000 Swedish ells, suddenly sunk to the depth of 15 fathoms.

FI′NLESS. *a.* (from *fin.*) Wanting fins.

FI′NLIKE. *a.* (*fin* and *like.*) Formed in imitation of fins (*Dryden*).

FI′NNED. *a.* (from *fin.*) Having broad edges spread out on either side (*Mortimer*).

FI′NNY. *a.* (from *fin.*) Furnished with fins; formed for the element of water (*Blackmore*).

FINOCHIO, in botany. See ANETHUM.

FINSCALE, in ichthyology. See CYPRINUS.

FINTO, a term in music, applied to the preparation for a cadence which is not executed.

FI′NTOED. *a.* (*fin* and *toe.*) Palmipedous; having a membrane between the toes (*Ray*).

FIONDA, an ancient episcopal town of Natolia, in Asiatic Turkey. Lat. 36. 45 N. Lon. 31. 57 E.

FIORENTINO, an episcopal town of Campagna di Roma, in Italy, belonging to the Ecclesiastical State. It is 44 miles S.E. of Rome. Lat. 41. 46 N. Lon. 13. 27 E.

FIORENZO (St.) a maritime town of Corsica, near the gulph of the same name. Lat. 42. 35 N. Lon. 9. 20 E.

FI′PPLE. *s.* (from *fibula,* Latin.) A stopper (*Bacon*).

FIR-TREE. See PINUS.

FIRE. *s.* (fẏꞃ, Saxon.) 1. The igneous element (*Dryden*). 2. Any thing burning (*Cowley*). 3. A conflagration of towns or countries (*Gra.*). 4. Flame; light; lustre (*Shakspeare*). 5. Torture by burning (*Prior*). 6. The punishment of the damned (*Isaiah*). 7. Any thing that inflames the passions (*Shakspeare*). 8. Ardour of temper (*Atterbury*). 9. Liveliness of imagination; vigour of fancy; force of expression; spirit of sentiment (*Cowley*). 10. The passion of love (*Shadwell*). 11. Eruption or imposthumation: as *St. Anthony's* fire. 12. *To set* FIRE *on*, or *set on* FIRE. To kindle; to inflame (*Taylor*).

To FIRE. *v. a.* (from the noun.) 1. To set on fire; to kindle (*Hayward*). 2. To inflame the passions; to animate (*Dryden*). 3. To drive by fire (*Shakspeare*).

To FIRE. *v. n.* 1. To take fire; to be kindled. 2. To be inflamed with passion. 3. To discharge any firearms (*Smith*).

FIRE, in natural philosophy. Combustion; the decomposition of combustible bodies accompanied with light and heat.

This definition agrees equally with the popular idea attached to the term, and the sense in which it is employed in modern science.

The word, however, has been used in various senses by philosophers of various schools; and hence, in works of close reasoning, has of late been generally exchanged for that of combustion; as a term affording a more definite meaning, and one less liable to mistake. See the article COMBUSTION.

Fire, under this view of the subject, is not a substance, but a quality. It supposes an igneous or combustible body; it supposes such body to be consuming or wasting away by a new action introduced into it; and it supposes this action to be attended with a copious emission of light and heat. All these may exist separately; but it is a compound operation resulting from the union of the whole that alone produces combustion or fire.

Heat may exist without fire, for water itself may be made to contain a very large portion of heat. In like manner, light may exist in a separate state; for many putrescent substances elicit light without any sensible change in their temperature; the female glow-worm secretes it from an organ near its tail, the fire-fly from its body generally, and the pausus sphærocerus from the globules of its antennas; yet the light thus secreted neither consumes the insect that secretes it, nor produces any sensible heat upon the object from which it is reflected. In the same manner the light of the moon is totally unconnected with fire; nor when collected by a convex lens into the most powerful focus do its rays manifest the least portion of sensible heat. The change produced in a combustible body in consequence of combustion, or its being set on fire, may also be produced by another cause, and occur without any emission of light or heat; but such a change cannot be called fire, because it takes place without the essential properties of fire, which are light and heat. It has, indeed, been called *slow combustion*, but even this term is highly incorrect; for though the result is the same, the phænomena of combustion do not enter into the change: and hence, this last effect has, with much more precision, been of late years denominated deoxydation. The only body we are acquainted with that possesses all these separate powers in itself is the sun: for the sun is now clearly ascertained to emit three distinct sets of rays; one set colorific, another calorific, and a third deoxydizing; and hence, by different contrivances, the sun may be made to enlighten without heating, to heat without enlightening, and to deoxydize without producing either of the other effects.

Under most of the old systems of philosophy, however, fire was employed not merely to express combustion, but in the sense in which the term heat or caloric is employed in the present day: and it was, on this account, necessary to distinguish the direct sense in which the term was used by some previous adjunct, and to describe it as elementary or latent, and sensible or actual: and by such philosophers it was regarded in the same manner as caloric is for the most part regarded among ourselves; as a substance *sui generis*, and not as a mere privation of cold in the ignited body. See the article CALORIC.

Such was the language of Democritus, Epicurus, and most of the Greek philosophers: and such was that of Boerhaave, Homberg, and Crawford before the term caloric was introduced into the philosophical vocabulary. It was conceived to be a simple substance reared from a combination of primordial atoms uniting in a peculiar mode, like any other simple substance, and rendered obvious or sensible by aggregation. This tenet of the Epicurean philosophy, however, was controverted by Aristotle and the Peripatetics, who maintained that there was no such thing as elementary fire, but that heat is in every instance produced by a commotion of the elementary particles of the heated body. This latter tenet, together with the general philosophy of Aristotle, descended to a very late period of European learning; it formed a part of the creed of Bacon, Boyle, des Cartes, and Newton; and after a sleep of nearly a century, has again been in some degree revived by count Rumford and Mr. Davy.

Fire in a sensible or collective state is well known to be one of the grandest agents of nature; and for this very reason, perhaps, was regarded amongst most nations in an early period of the world either as the creator and productive cause of all things, or, at least, as the substance from which the Creator produced all things. Hence the Persians, Ethiopians, Scythians, and Carthagenians, in the Old World, and the Mexicans and Peruvians in the New, paid divine honours to fire itself, or to the sun, which was esteemed the sublimest representation of this element. Zoroaster ordained the erection of pyrea or temples dedicated to fire throughout all Persia. And even the Hebrews imagined fire to be the grandest proof of the presence of the Deity. Under this symbol he appeared to Moses on Mount Horeb: and to the Hebrews at large on Mount Sinai, on the promulgation of the sacred law: and under this symbol he evinced his protective presence every night, by assuming the form of a fiery pillar. And, impressed with this idea, the Jews were ever anxious to preserve it in a pure and active flame upon the national altar. When, therefore, the Jews were borne away in captivity to Persia, the priests took the sacred fire of the altar and concealed it in a dry cave, with which none but themselves were acquainted; and where, on their restoration to liberty, the posterity of those priests found it on their return to Judea. (Maccab. ii. 1, 18.) Fire was regarded with an equal degree of veneration throughout Greece and Rome. Temples in every city were erected to the goddess Vesta—a name importing fire, whether derived from the Grecian ιστια, or the Hebrew אשתא, and in every temple a lambent flame was perpetually burning over the altar. And even so late as in the third century of the Christian era, when Heliogabalus anticipated his own apotheosis, and instituted the worship of himself over all the Roman empire, having erected a magnificent temple to his own divinity, he supplied its altar with sacred fire from the temple of Vesta, which he plundered for this purpose.

We cannot be much surprised, therefore, that a belief so common among the people, should become a frequent doctrine among the philosophers; and that all things should be supposed to originate from fire as an element, instead of from fire as a god. Such was the opinion of Heraclitus, who rendered himself more celebrated than any other sage of the Pyrean school, by the eloquent but obscure and dogmatic manner with which he wrote upon this subject. In modern times, the same tenet has been frequently started afresh; and if not pressed to the full extent to which it was carried by Heraclitus, exhibiting such intimate marks of analogy and association as perpetually to remind us of the Heraclitæan system. Buffon supposed the whole earth to have been at first a complete body of liquid fire; and to have consisted of a comet, and a portion of the sun's exterior limb carried off by such comet, in consequence of its having given the sun an oblique stroke in the course of its orbit. At its first origin, therefore, the earth, upon this system, was nothing more than a large vitreous mass in a state of fusion. This state of fusion constituted the chaos of which every nation has some tradition; and from the chaotic mass, as it became gradually cool, the earth in its present state was progressively developed. He conceived this operation to have been the work of a multitude of ages, and endeavoured to reconcile the chronology of Moses with that of the Pundits of Hindustan, by conjecturing that while the former only begins his date from the period when the earth first became habitable, the latter calculate from the earliest origin of the globe in its state of liquid heat. To detail the arguments which have been adduced in opposition to this and similar systems would engross too much time, as well as paper. We refer the reader, therefore, to the works of Woodward, Whitehurst, Howard, and Kirwan.

Dr. Hutton published a theory of the earth about fourteen years ago, in the Edinburgh Philosophical Transactions, in which, after contending for the existence of an immense subterraneous fire in its center, he endeavours to prove that every substance in contact with this fiery mass, is fused by its operation; and when fused, raised by the violence of its heat above the level of the sea: that all the continents we have discovered, and the most solid strata of which they consist, have been thus formed; that new continents are perpetually rearing in the same manner from the wasting particles of those at present existing; and that these new ones will ascend and appear hereafter, when those now existing shall have been entirely frittered away. This theory, which is in no small degree confused and inconsistent, has been attacked with ability and spirit by M. de Luc and Mr. Kirwan, who attribute all the phænomena of nature to aqueous solution; a theory more minutely adverted to in various notes in Book V, of Lucretius, where the poet gives his own system of cosmology.

M. de Marian has attempted to prove that the earth is infinitely more indebted for the heat it receives, to its own central fires, than to the rays of the sun. He allows that this latter, by adding some portion of heat to the surface of the earth, is the immediate cause of the vicissitude of the seasons; but asserts, that were it not for the continual ascent of an immense quantity of subterranean heat, though the sun were perpetually to illuminate two-thirds of the globe at once, with a heat equal to that at the equator, the entire orb would soon condense into one general mass of solid ice. His reasonings on this subject are too long and intricate for insertion. There is, however, much ingenuity in them, and they are to be found in the Hist. de l'Acad. des Sciences, l'ann. 1765. It is probably from this theory that Klopstock has drawn his beautiful machinery of an interior world in the earth's center, in which reside the guardian spirits of the globe, and the souls of departed saints: it is a paradise, where celestial breezes blow, eternal splendour smiles, and the Almighty communicates, in an especial manner, the wonders of his providence and grace to the beatified inhabitants. Here a sun, that never sets or rises, shines with pure and uninterrupted radiance; from the beams of which the surface of the earth itself is perpetually nourished and rendered fertile:

> Von ihr fliesst leben und wärme
> In die adern der erd empor. Die oberste sonne
> Bildet mit dieser vertrauten gehülfinn den blumigen frühling
> Und den feurigen sommer, von sinkinden halme belastet,
> Und den herbst auf traubengebirgen. In ihren bezirken
> Ist niemals auf, und niemals untergegangen.
> Messia's Ges.
>
> From him, through all the veins of upper earth,
> Life flows, and heat. The sun above by him,
> His fixt associate, aided, deck'd with flowers
> Rears the young spring, the fiery summer rears,
> Loaded with fruits, and autumn's vine-clad realm.
> The bright horizon he for ever gilds,
> Nor sets, nor rises.
> Good's Lucretius, Note on b. I. v. 693.

Under all these systems fire is contemplated as in a sensible state, in a state of fusion or of combustion; in both which it is, as we have already observed, rather a compound quality than an original and unigneous element.

The cause of this effect, the mode by which fire, as a quality, and more especially as a quality involving the three ideas of light, heat, and a wasting or consuming substance, is produced, is a question that has not to this hour been satisfactorily settled. We have entered at some length into the history of the different opinions that have been held upon this subject down to the system of Lavoisier, in the article Combustion, and have there hinted at a few of the objections that were offered to this elegant hypothesis upon its first appearance. The chief of these is directed against the tenet, that the light and heat transmitted during combustion, or fire in the popular acceptation of the term, are derived from the oxygen gass that is separated in the course of the operation either from the combustible body, or the air, or some other auxiliary material acting upon it. The objection that appeared to be fatal to this tenet was that the oxygen employed is often in a liquid or even in a solid state, and yet that a greater quantity of light and caloric are emitted than when it is employed in a gasseous state; and the instances alluded to were combustion taking place, upon an union of nitric acid with the essential oils of vegetables; and the spontaneous firing of gunpowder in close vessels. The difficulty was at first attempted to be removed by Brugnatelli, who conjectured that oxygen combines with bodies in two distinct states—sometimes with, and at other times without, light and caloric: that in its gasseous form it always retains these two bodies: but by no means always when combined with solid substances, though whenever it does the same result must necessarily follow in both cases. The conjecture is plausible, but still it is conjecture alone, and as such has been very far from proving satisfactory to any one. In the Journal de Chimie of Mons Vans, vols. II. and III. other explanations have been offered, but as little to the purpose. Finally, Dr. Thompson has proposed his improvement upon the theory, which is by far the best that has hitherto been advanced, but which we forbear to enlarge upon, as we have already noticed it under the article Combustion. See also the articles Light, Oxygen, Phlogiston.

Fire arms, are all sorts of arms charged with powder and ball, as cannon, musquets, carabines, pistols, blunderbusses, &c. See Cannon, Gun, &c.

Fire arrow, is a small iron dart, furnished with springs and bars, together with a match impregnated with powder and sulphur, which is wound about its shaft. It is used by privateers and pirates to fire the sails of the enemy, and for this purpose is discharged from a musket or a swivel-gun. The match being kindled by the explosion, communicates the flame to the sail, against which it is directed, where the arrow is fastened by means of its bars and springs. As this is peculiar to hot climates, particularly the West Indies, the sails being extremely dry, are instantly set on fire, and the fire is conveyed to the masts, rigging, and finally to the vessel itself.

Fire ball, in the art of war, a composition of meal-powder, sulphur, salt-petre, pitch, &c. about the bigness of a hand-grenade, coated over with flax, and primed with a slow composition of a fusee. This is to be thrown into the enemy's works in the night time, to discover where they are; or to fire houses, galleries, or blinds of the besiegers; but they are then armed with spikes, or hooks of iron, that they may not roll off, but stick or hang where they are designed to have any effect.

Fire (Balls of), in meteorology, a kind of luminous bodies, generally appearing at a great height above the earth, with a splendour surpassing that of the moon; and sometimes equalling her apparent size. They generally proceed in this hemisphere from north to south, with vast velocity, frequently breaking into several smaller ones, sometimes vanishing with a report, sometimes not. These luminous appearances no doubt constitute one part of the ancient prodigies, blazing stars or comets, which last they sometimes resemble in being attended with a train; but frequently they appear with a round and well defined disk. The first of these, of which we have any accurate account, was observed by Dr. Halley and some other philosophers at different places, in the year 1719. From the slight observations they could take of its course among the stars, the perpendicular height of this body was computed at about seventy miles from the surface of the earth. The height of others has also been computed, and found to be various; though in general it is supposed to be beyond the limits assigned to our atmosphere, or where it loses its refractive power. The most remarkable of these on record appeared on the 18th of August, 1783, about nine o'clock in the evening. It was seen to the northward of Shetland, and took a southerly direction for an immense space, being observed as far as the southern provinces of France, and one account says, that it was seen at Rome also. During its course it appeared frequently to have changed its shape; sometimes appearing in the form of one ball, sometimes of two or more; sometimes with a train, sometimes without one. It passed over Edinburgh, nearly in the zenith, and had then the appearance of a well defined round body, extremely luminous, and of a greenish colour; the light which it diffused on the ground giving likewise a greenish cast to objects. After passing the zenith it was attended by a train of considerable length, which continually augmenting, at last obliterated the head entirely; so that it looked like a wedge, flying with the obtuse end foremost. The motion was not apparently swift, by reason of its great height; though in reality it must have moved with great rapidity, on account of the vast space it travelled over in a short time. In other places its appearance was very different. At Greenwich, we are told, that two bright balls parallel to each other led the way, the diameter of which appeared to be about two feet; and were followed by an expulsion of eight others, not elliptical, seeming gradually to mutilate, for the last was small. Between each two balls, a luminous serrated body extended, and at the last a blaze issued which terminated in a point. Minute particles dilated from the whole. The balls were tinted first by a pure bright light, then followed a tender yellow, mixed with azure, red, green, &c.; which, with a coalition of bolder tints, and a reflection from the other balls, gave the most beautiful rotundity and variation of colours that the human eye could be charmed with. The sudden illumination of the atmosphere, and the form and singular transition of this bright luminary, tended much to make it awful; nevertheless, the amazing vivid appearance of the different balls, and other rich collective parts, not very easy to delineate, gave an effect equal to the rainbow in the full zenith of its glory.

Ingenious men have proposed various hypotheses to account for these phenomena. See Aeroliths.

FI'REBRAND. *s.* (*fire* and *brand.*) 1. A piece of wood kindled (*L'Estrange*). 2. An incendiary; one who inflames factions; one who causes mischief (*Bacon*).

FI'REBRUSH. *s.* The brush which hangs by the fire to sweep the hearth (*Swift*).

FIRE-COCKS, cocks fixed into pipes at proper positions, from which water may be drawn for the purpose of extinguishing fires. Churchwardens in London, and within the bills of mortality, are to fix fire-cocks at proper distances in streets, and written marks near them, and to keep in every house thus marked an instrument or key for opening the plug, and a large engine, and hand-engine for extinguishing fire, under the penalty of 10l.

All the laws relating to the prevention, &c. of fire, are reduced into one statute, and former statutes repealed, by 12 Geo. III. cap. 73.

Fire-eater, one who pretends to eat fire. We have a great number of mountebanks who have procured the attention and wonder of the public, by eating of fire, walking on fire, washing their hands in melted lead, and the like tricks. The most celebrated of these was our countryman Richardson, much talked of abroad. His secret as related in the Journal des Sçavans, of the year 1680, consisted in a pure spirit of sulphur, wherewith he rubbed his hands, and the parts that were to touch the fire, which burning and cauterising the epidermis, hardened and enabled the skin to resist the fire.

Fire-engine, is a machine for extinguishing accidental fires by means of a stream or jet of water. The common squirting fire-engine consists of a lifting pump placed in a circular or cylindric vessel of water, and wrought by two levers that act always together. During the stroke, the quantity of water raised by the piston of the pump spouts with force through a pipe joined to the pump-barrel, and made capable of any degree of elevation, by means of a yielding leather pipe, or by a ball and socket turning every way, screwed on the top of the pump. The vessel containing the water is covered with a strainer, which prevents the dirt and filth poured into it with the water from choaking the pump-work. Between the strokes of this engine the stream is discontinued, for want of an air vessel.

The late improvements made on fire-engines have been very great; but as we cannot pretend to specify them all, we shall merely describe one or two engines of the best construction; at the same time admitting that others which we do not even mention have their respective degrees of merit. The engine invented by Rowntree and Co. is very ingenious on many accounts, as the reader will judge from the following descriptions.

Fig. 1, in plate 69, presents an end view of the working part of this engine, supposing the engine cut down the middle. A is a metal cylinder. B a piston or plunger acting in a circular direction by means of the levers CC, fixed upon the ends of its axis. DD, the lower valve boxes on the outside the cylinder, with each a valve EE. These boxes are large, and so constructed as to prevent the metal cylinder being clogged up with gravel, sand, or other dirt, which frequently is the cause of other engines being useless after working a short time. These boxes have each a clack door on the outside, which screws off, for the convenience of taking out the gravel, sand, or other dirt which may have collected there; by which means the engine is always kept in a working state.

These clack-doors are shewn at A, fig. 2. E the upper box with its valves FF. G the air-vessel. H the discharge pipe, and I the pipe that conveys the water to the engine, commonly called the suction pipe.

Fig. 3. represents a side view of the working parts. A the metal cylinder. B the piston and axle. F the upper valve box. HH the discharge pipes covered with caps KK, which screw off when the engine is played, and the leather pipes and branches are screwed on. G the air-vessel. II the suction pipe. L,L,L,L, springs fixed to the side of the wood cistern. Fig. 4. is a perpendicular view, where AA represents the cylinder, B the piston and axle. D, D, the valve boxes. C, C, C, C, C, C, C, C, the levers fixed on the piston, axle, and connected by the bars P P: O O being the bearings for the piston axle. At fig. 2, the engine, in profile with its handle, &c. ready for working. M a wooden cistern. L, L, L, L, four springs firmly fixed to the side of the cistern on which the levers C, C, C, &c. strike. In working, these springs help to return the stroke, so that the arms of the men employed are effectually relieved from that heavy shock attendant on the use of other engines. P the bars which connect the levers C, C, C, &c., and at a small distance from which the wooden handles N, N, are fixed. K, K, the caps on the discharging pipes, which are to be taken off, in order to fix on the leather pipe or branches, when the engine is to be put in action. On trial, this engine has given very great satisfaction.

A very ingenious and useful fire-engine, invented by Mr. Benj. Dearborn, is described in the Trans. of the American Academy, for 1794: we extract the following particulars.—Fig. 6, plate

Published by G. Kearsley. Fleet Street, Octr. 1st 1809.

69. A B, and C D, are the edges of two planks, confined together by four bolts: *a b*, and *c d*, are two cylindrical barrels, in each of which a piston, with a valve, is fastened to the spear *e*, and is moved up and down alternately by the motion of the arms E E. Beneath each barrel a hole is made through the plank A B, which is covered with a valve. The arms E E, are suspended on the common centre *f*: there are also arms parallel to these on the opposite side; *g g* are the ends of the handles which are fastened across the ends of the arms. At *h* a bolt goes across, from arm to arm, to which the piece *i*, *k*, is affixed, and on which it plays; the lower end of this piece is fastened to the top of the spear *e*.—G, *l*, *f*, is a standard for the purpose of supporting the arms, to which there is a correspondent one on the opposite side; both are notched into the edges of the planks, where they are secured by a bolt, which passes through them at *l*, and has a nut or forelock on the opposite side. H I, H I, are square braces, answering the purpose of ducts, through which the water ascends from the barrels, passing through the plank at *m*.—K L, K L, are irons in the form of a staple, in order to confine the braces: the lower ends of these irons meet, and are secured by a bolt passing through them, and M N, [illegible] *o*, which is a piece that goes up through a mortice in the centre of the planks. This piece is square from the lower end, till it reaches the top cf the braces; whence they become cylindrical to the top, the upper end being perforated sufficiently low down, in order to communicate with the braces. O P, is an iron ring, that surrounds the tube, and has two shanks which ascend through the head, with screws on the top at *p*, *q* :—*r*, *s*, is a ferule nailed round the tube.

Fig. 7. is the same engine; the arms and standards being taken off, in order to delineate more clearly the mode of securing the braces; an object which is completely effected by a wedge driven into the mortice *a*: beneath the upper plank *b*, is a hole for admitting a passage to the bolt, which secures the standards. In this figure, a side view of the head is given, with the pipe in a perpendicular direction.

The machine is confined within a box, set on wheels, as in the common fire-engines. The whole is made of wood, excepting the spears of the pumps and a few bolts, &c. The advantages of this machine are, that it can be made in any place where common pumps are manufactured; the interior work will not exceed one-fourth of the price of those which are constructed on the usual plan; and that they are incomparably more easy to work, than the common ones; circumstances which strongly recommend the American fire-engine to the attention of the public.

Fire-escape, a contrivance for the purpose of rescuing persons in imminent danger from fire.

The following is a description of some machines for that purpose, sent to the Lyceum of Arts, that the commission appointed to examine them might ascertain which of them might be executed on a large scale, and promised to answer the public expectation.

The first, which is raised by means of simple parallelograms, supports, at its upper extremity, a pulley, into which passes a cord, whereby men, stationed on the carriage, raise and lower a basket intended to receive the persons who are in danger; but the author has not considered, that when this basket is charged, such a weight at the extremity of the parallelograms would be too great, and would infallibly break them: besides, when thus suspended, it would be impossible to bring off the sick and infirm.

The second machine consisted of a vehicle on four wheels; on planks across it are fixed the two first uprights, to which is attached a jointed ladder, in an inclined position; and which is folded together when the machine is removed. Two other uprights, placed about two-thirds of the length of the vehicle, hold a grooved frame, in a vertical position, intended to support the ladders, when unfolded at their length, from the front to the hind-part of the carriage; being in length twenty metres, and inclined forty-five degrees; so that in this position they rise in vertical height thirteen metres, or about forty feet.

To the top of the last ladder is fixed a platform, for the purpose of receiving the sufferers. But this platform when charged, would break the ladder if it had not some support; for this purpose the inventor has ingeniously contrived a framing, that rises vertically up to the platform. This framing stands on grooved planks, that cross the back part of the carriage, in such a manner, that, if the ladders are unfolded only in part, the framing rises more horizontally in proportion, to support the platform.

Along this inclined ladder mounts a basket or box, by means of a cord that passes into a pulley attached to the top of the platform. This cord is pulled by men, stationed in the body of the vehicle. The chest or box sliding the whole length of the ladder, is calculated to afford a facility of escape to the unfortunate persons, whose strength on these occasions cannot be depended on.

The principal defect of this machine is that of unfolding the ladders by means of cords, that are so liable to be entangled, and which, in moments so urgent as those of fire, might be attended with the most melancholy consequences.

Another, not less material defect, is that of attaching the platform to the top of the ladder; this platform would bend the whole ladder by its weight, and would strain the iron rods; it would be more adviseable to affix it to the upper part of the hinder framing. This machine, upon the whole, seemed too complicated.

The third is made by the same hand, and is constructed in a waggon, of common width, four metres in length. From the middle of it rise two uprights, four metres in height, and firmly fixed; their top supports an axis.

A frame, turning on this axis, is placed horizontally when the machine is removed, and vertically for actual use. Along it are folded two other frames, which, when extended in a vertical position, rise to the height of sixteen metres, or about fifty feet, a height sufficient to reach the loftiest parts of houses. The parts of this framing are extended, by means of two cords, with pulleys, each of them being pulled by one man; in the sides of this framing are placed two hooks, by which it is fixed at the height required.

The top supports a platform, which is firmly fastened to it; but as the frame rises to such a great height, the platform, when charged, would, from its unsteadiness, be extremely dangerous, had not the inventor ingeniously adapted two strong brass wires behind, and two others in the front of this platform. The two first run in a parallel direction to a capstan, placed in the back part of the waggon, and the two others to a capstan in the front; by means of which the requisite tension is given to the cords, and they firmly keep the framing vertical, in the same manner as the shrouds of a ship secure the masts in their position. These brass wires are very strong, and give the necessary security to the platform, which will thus carry several persons without any danger of tottering; it may even be relied upon, that it is kept in its position as steadily as it could be by woodwork. But these brass wires serve for another purpose; they are intended for the chests, or vehicles to slide down from the top of the platform to the bottom of the waggon, and ascend in the same manner by means of cords that pass two pulleys, adapted to the platform; the cord of the chest belonging to the rear of the waggon is pulled by a capstan, fixed in the bottom of the waggon, and another by a wheel, which serves to regulate the velocity in descending.

This chest, raised to the platform, is particularly intended to receive the unfortunate people ready to perish in the flames; the women, the children, and the infirm, who are to be placed on steps made in the chest, which will descend down the brass wires, in an inclined plane, without swing or shock: when landed at the bottom of the waggon, it is opened before, and every assistance given the sufferers.

The second chest, which is in the front of the waggon, is raised in the same manner to the top of the platform by means of a cord that passes into a pulley, adapted to the said chest; which cord is to be pulled by one or two men.

This second chest, which contains steps like the first, is for raising up to the platform the persons employed on the occasion; it may likewise be used in any exigency, for the same purpose as the first.

These chests have rails to assist in descending into the inside, and hold two or three persons: each of them is provided with four strong iron staples, through which pass the brass wires, thus keeping them perfectly steady in their course.

The platform has parapets, which fit to it according to whichever side it is necessary to place the temporary bridge, thrown across to the window of the house that is on fire; this bridge is strongly fastened to the window by means of grappling irons, and is provided with rails. But on those sides of the parapet on which the chests land, the ingenious inventor has contrived swinging gates, with parapets above them, which are pushed aside by the chest at the moment of its arrival; thus combining all the security and dispatch that can be desired.

But as too much facility cannot be given to the firemen in ascending, the artist has added a rope-ladder, fastened at top to one of the upper cross-beams of the waggon; this is joined by a ladder of wood, which stands on the bottom of the carriage. These two ladders will afford the firemen every facility to ascend with celerity to the platform. This rope-ladder might likewise be fastened to the platform on the contrary side to the fire. The waggon will be kept in its position by blocks placed under the wheels.

Instead of ropes, the above ladder, if it may be thought proper, may be made of brass, with steps of wood: as rope steps are rather difficult of ascent. The frame of the machine will serve to support the leather pipes, without detriment to its working.

When constructed on a large scale, this machine must be made of deal, particularly the frame, and likewise the bottom of the waggon. The wheels must be sufficiently strong, and of common wood; the chests of wood and ozier, and lined with velvet.

All the upper parts must be of iron, with their apparatus; the platform may be lined with iron plates underneath, to preserve it from fire. The inventor has likewise contrived an apron or skreen, also of plate iron, fitted to, and suspended before this platform, towards the house, to secure the whole of the upper part of the machine against the fury of the flames.

The commission of the Lyceum, conceiving that this machine may be executed on a large scale, and that it is calculated to answer every purpose for which it is intended, as a recompence for his labours, decreed M. Daujon a medal and a crown, at one of their late public sittings, for the invention.

A fire-escape, invented by a Mr. Maseres, is described in the 105th number of the Philosophical Magazine, or number 8 of the Retrospect. But we think it too complex for general adoption.

The method of descent by a rope, and the rapidity of motion impeded by friction, has been long known; and the oldest contrivance we remember of this nature is, we think, equal, if not superior, to Mr. Maseres's. It is described by the celebrated Galileo, in his Mechanical Dialogues, as practised by a friend of his, and is this: about a cylinder of two inches thick, and eight or ten long, he cut a notch spirally, of one turn and a half, and no more, big enough to receive the cord he designed to use, and which he put into the notch at the upper end, and brought out at the lower; afterwards he enclosed that cylinder and cord in a wooden, or rather, a tin tube, made with clasps or hinges to open or shut lengthways at pleasure. Then, having made fast the rope above, grasping the tin case with both his hands, he hung by his arms; whence, such was the compression of the cord between the ambient tube and the cylinder, that he could stop himself at pleasure by clenching his hands closer, and by loosening his hold a little, he could let himself down gently as he pleased.

If a stirrup for each foot were attached with sufficient strength to the tin case, as it might easily be, we conceive a descent by this contrivance would be far preferable to that by Mr. Maseres's: and if by any accidental circumstance the motion of the cylinder and tin case should be completely stopped, the person descending would only have to take his feet out of the stirrups, when he might slide down the rope in the usual way; whereas in Mr. Maseres's fire-escape, if a knot or other obstacle in the rope should prevent its drawing through the holes in the regulator, the person descending, having previously buckled himself in, is kept suspended in a situation little, if at all, better than the one he had just left in the consuming house. But both these contrivances, it must be observed, are liable to the objection of the person bruising himself against the wall of the house as he descends.

On this occasion we would beg leave to point out the great utility of these fringed ropes, which should be fastened to the foot of a bedstead, and extended to a sufficient length to allow of a person's descending by them, through a window, in case of fire. The custom of keeping long rope ladders in

bed-rooms must also be strongly recommended to general adoption. See farther, Mr. Bosworth's Accidents of Human Life.

Method of extinguishing Fire in Chimneys.—It is well known that the inner parts of chimneys easily take fire; the soot that kindles therein emits a greater flame, according as the tunnel is more elevated, because the current of air feeds the fire. If this current could therefore be suppressed, the fire would soon be extinguished. In order to this, some discharge a pistol into the chimney, which produces no effect. Water thrown into the chimney at top is equally useless, because it comes down through the middle of the tunnel, and not along the sides. It would be more advisable to stop, with a wet blanket, the upper orifice of the tunnel: but the surest and readiest method is to apply the blanket either to the throat of the chimney, or over the whole front of the fire-place. If there happens to be a chimney-board or a register, nothing can be so effectual as to apply them immediately; and having by that means stopped the draught of air from below, the burning soot will be put out as readily and as completely as a candle is put out by an extinguisher, which acts exactly upon the same principle.

Compositions for extinguishing Fire.—Mr. William Knox, of Gothenburg, in Sweden, made many experiments with compositions for this purpose. He divides them into simple and compound solutions. In the former class, he proposes to add to 75 gallons of water, 9 gallons of the strongest solution of wood-ashes; or 6 gallons of the finest pulverized pot-ashes; or 8¼ gallons of common salt, well dried, and finely beaten; or 8½ gallons of common vitriol or copperas, thoroughly dried and finely pulverized; or 11½ gallons of the strongest herring-pickle; or 9 gallons of alum reduced to powder; or 19 gallons of clay, well dried, well beaten, and carefully sifted.

Among the compound solutions, Mr. Knox recommends to mix 75 gallons of water with 10 quarts of clay, 10 quarts of vitriol, and 10 quarts of common salt; or a similar quantity of water, with 18 quarts of the strongest solution of wood-ashes and 18 quarts of fine clay reduced to powder; or the same proportion of water, with 15 quarts of red ochre, or the residuum of aquafortis, and 15 quarts of common salt: or, lastly, to mix 15 quarts of the strongest herring-pickle, and 15 quarts of red ochre, with 75 gallons of water. All these different solutions, Mr. Knox remarks, are equally efficacious in extinguishing fire; but he prefers the compounds, as being the "surest and most powerful for that purpose."

Another of the various inventions for extinguishing fire by chemical means, deserving of notice, is the composition prepared by M. Von Aken, and which consists of the following ingredients:

	lbs.
Burnt alum	30
Green vitriol in powder	40
Cinabrese, or red ochre, pulverized	20
Potters', or other clay, finely pounded and sifted	200
Water	630

With 40 measures of this liquor an artificial fire, which would have required the labour of twenty men, and 1500 measures of common water, was extinguished, under the direction of the inventor, by three persons. The price of this compound solution is estimated at one halfpenny per pound. See farther on this subject Gregory's Mechanics, vol. ii. pp. 178—182.

Fire-flair, in ichthyology. See Raja.

Fire-fly, in entomology. See Lampyris.

Fire-lock, a small gun, which is placed against a man's shoulder, and fired by means of a flint communicating a spark to powder in a receptacle pan, or lock.

Fire-man. 1. One who is employed to extinguish burning houses. 2. A man of violent passions.

Fi'renew. *a.* New from the forge; new from the melting-house (*Shakspeare*).

Fi'repan. *s.* (*fire* and *pan*.) 1. A pan for holding fire (*Bacon*). 2. [In a gun.] The receptacle for the priming powder.

Fire-office, an office for insurance from fire. See Assurance and Insurance.

Fire-places, are contrivances for communicating heat to rooms, as well as for answering various purposes of art and manufacture. See Chimney, Furnace, and Stove.

On the subject of the most beneficial form in which common fire-places may be constructed, the public have been lately instructed, in a valuable essay by the ingenious count Rumford:

"All chimney fire-places (says the author) without exception, whether they are designed for burning wood or coals, and even those which do not smoke, as well as those which do, may be greatly improved by making the alterations in them here recommended; for it is by no means merely to prevent chimneys from smoking that these improvements are recommended, but it is also to make them better in all other respects as fire-places; and when the alterations proposed are properly executed, which may very easily be done with the assistance of the following plain and simple directions, the chimneys will never fail to answer, I will venture to say, even beyond expectation. The room will be heated much more equally and more pleasantly, with less than half the fuel used before; the fire will be more cheerful and more agreeable; and the general appearance of the fire-place more neat and elegant, and the chimney will never smoke."

The author having stated, that these advantages will be derived merely from diminishing the capacity of the throat of the chimney, or that part just above the fire-place, proceeds to give the following explanation of the technical terms which he finds it necessary to use:

"By the throat of a chimney (says he) I mean the lower extremity of its canal, where it unites with the upper part of its open fire-place. This throat is commonly found about a foot above the level of the lower part of the mantle, and it is sometimes contracted to a smaller size than the rest of the canal of the chimney, and sometimes not. In Plate 70, fig. 5 shows the section of a chimney on the common construction, in which *d e* is the throat. Fig. 6 shows the section of the same chimney altered and improved, in which *d i* is the reduced throat.

"The breast of a chimney is that part of it which is immediately behind the mantle. It is the wall which forms the entrance from below into the throat of the chimney in front or towards the room. It is opposite to the upper extremity of the back of the open fire-place, and parallel to it; in short, it may be said to be the back part of the mantle itself. In the figures 5 and 6 it is marked by the letter *d*. The width of the throat of chimney *d e* fig. 5, and *d i* fig. 6, is taken from the breast of the chimney to the back, and its length is taken at right angles to its width, or in a line parallel to the mantle *a* fig. 5 and 6.

"The bringing forward of the fire into the room, or rather bringing it nearer to the front of the opening of the fire-place, and the diminishing of the throat of the chimney, being two objects principally had in view in the alterations in fire-places here recommended, it is evident that both these may be attained merely by bringing forward the back of the chimney. The only question therefore is, how far it should be brought forward? The answer is short, and easy to be understood; bring it forward as far as possible, without diminishing too much the passage which must be left for the smoke. Now as this passage, which, in its narrowest part, I have called the throat of the chimney, ought, for reasons which are fully explained in the foregoing chapter, to be immediately, or perpendicularly over the fire, it is evident that the back of the chimney must always be built perfectly upright. To determine, therefore, the place for the new back, or how far precisely it ought to be brought forward, nothing more is necessary than to ascertain how wide the throat of the chimney ought to be left, or what space must be left between the top of the breast of the chimney, where the upright canal of the chimney begins, and the new back of the fire-place carried up perpendicularly to that height.

"In the course of my numerous experiments upon chimneys, I have taken much pains to determine the width proper to be given to this passage, and I have found, that, when the back of the fire-place is of a proper width, the best width for the throat of a chimney, when the chimney and the fire-place are of the usual form and size, is four inches. Three inches indeed might sometimes answer, especially where the fire-place is very small, and the chimney good, and well situated.

"It may perhaps appear extraordinary, upon the first view of the matter, that fire-places of such different sizes should all require the throat of the chimney to be of the same width; but when it is considered, that the capacity of the throat of a chimney does not depend on its width alone, but on its width and length taken together; and that in large fire-places, the width of the back, and consequently the length of the throat of the chimney, is greater than in those which are smaller, this difficulty vanishes.

"And this leads us to consider another important point respecting open fire-places, and that is, the width which it will in each case be proper to give to the back. In fire-places as they are now commonly constructed, the back is of equal width with the opening of the fire-place in front; but this construction is faulty on two accounts. First, in a fire-place so constructed, the sides of the fire-place, or covings, as they are called, are parallel to each other, and consequently ill-contrived to throw out into the room the heat they receive from the fire in the form of rays; and secondly, the large open corners which are formed by making the back as wide as the opening of the fire-place in front, occasion eddies of wind, which frequently disturb the fire, and embarrass the smoke in its ascent in such a manner as often to bring it into the room. Both these defects may be entirely remedied by diminishing the width of the back of the fire-place. The width which, in most cases, it will be best to give it, is one-third of the width of the opening of the fire-place in front. But it is not absolutely necessary to conform rigorously to this decision, nor will it always be possible. It will frequently happen that the back of a chimney must be made wider than, according to the rule here given, it ought to be. This may be, either to accommodate the fire-place to a stove, which being already on hand must, to avoid the expense of purchasing a new one, be employed; or for other reasons; and any small deviation from the general rule will be attended with no considerable inconvenience. It will always be best, however, to conform to it as far as circumstances will allow.

"Where a chimney is designed for warming a room of a middling size, and where the thickness of the wall of the chimney in front, measured from the front of the mantle to the breast of the chimney, is nine inches, I should set off four inches more for the width of the throat of the chimney, which supposing the back of the chimney to be built upright, as it always ought to be, will give thirteen inches for the depth of the fire-place, measured upon the hearth, from the opening of the fire-place in front to the back. In this case thirteen inches would be a good size for the width of the back; and three times thirteen inches, or thirty-nine inches, for the width of the opening of the fire-place in front; and the angle made by the back of the fire-place and the sides of it, or covings, would be just 135 degrees, which is the best position they can have for throwing heat into the room.

"But I will suppose that in altering such a chimney it is found necessary, in order to accommodate the fire-place to a grate or stove already on hand, to make the fire-place sixteen inches wide. In that case, I should merely increase the width of the back to the dimensions required, without altering the depth of the chimney, or increasing the width of the opening of the chimney in front. The covings, it is true, would be somewhat reduced in their width, by this alteration; and their position with respect to the plane of the back of the chimney would be a little changed; but these alterations would produce no bad effects of any considerable consequence, and would be much less likely to injure the fire-place, than an attempt to bring the proportions of its parts nearer to the standard, by increasing the depth of the chimney, and the width of its opening in front: or than an attempt to preserve that particular obliquity of the covings which is recommended as the best (135 degrees), by increasing the width of the opening of the fire-place, without increasing its depth."

The provision made for the passage of the chimney-sweeper up the chimney is thus described: "In building up the new back of the fire-place, when this wall (which need never be more than the width of a single brick in thickness) is brought up so high that there remains no more than about ten or eleven inches between what is then the top of it, and the inside of the mantle, or lower extremity of the breast of the chimney, an opening, or door-way, eleven or twelve inches wide, must be begun in the middle of the back and continued quite to the top of it, which, according to the height to which it will commonly be necessary to carry up the back, will make the opening about twelve or fourteen inches high: which will be quite sufficient to allow the chimney-sweeper to pass. When the fire-place is finished, this door-way is to be closed by a tile, or a fit piece of stone, placed in it, dry, or without mortar, and confined in its place by means of a rabbet made for that purpose in the brick work. As often as the chimney is swept, the chimney-sweeper takes down this tile, which is very easily done, and when he has finished his work he puts it again into its place. The drawing, fig. 6. will give a clear idea of this contrivance; and the experience I have had of it has proved that it answers perfectly well the purpose for which it is designed.

"I observed above, that the new back, which it will always be found necessary to build in order to bring the fire sufficiently forward, in altering a chimney constructed on the common principles, need never be thicker than the width of a common brick. I may say the same of the thickness necessary to be given to the new sides, or covings, of the chimney; or if the new back and covings are constructed of stone, one inch and three quarters, or two inches in thickness, will be sufficient. Care should be taken, in building up these new walls, to unite the back to the covings in a solid manner.

"Whether the new back and covings are constructed of stone, or built of bricks, the space between them and the old back and covings of the chimney ought to be filled up, to give greater solidity to the structure. This may be done with loose rubbish, or pieces of broken bricks or stones, provided the work be strengthened by a few layers or courses of bricks laid in mortar; but it will be indispensably necessary to finish the work, where these new walls end, that is to say, at the top of the throat of the chimney, where it ends abruptly in the open canal of the chimney, by a horizontal course of bricks well secured with mortar. This course of bricks will be upon a level with the top of the door-way left for the chimney-sweeper.

"From these descriptions it is clear that where the throat of the chimney has an end, that is to say, where it enters into the lower part of the open canal of the chimney, there the three walls which form the two covings and the back of the fire-place all end abruptly. It is of much importance that they should end in this manner; for were they to be sloped outward, and raised in such a manner as to swell out the upper extremity of the throat of the chimney in the form of a trumpet, and increase it by degrees to the size of the canal of the chimney, this manner of uniting the lower extremity of the canal of the chimney with the throat, would tend to assist the winds which may attempt to blow down the chimney, in forcing their way through the throat, and throwing the smoke backward into the room; but when the throat of the chimney ends abruptly, and the ends of the new walls form a flat horizontal surface, it will be much more difficult for any wind from above, to find and force its way through the narrow passage of the throat of the chimney.

"As the two walls which form the new covings of the chimneys are not parallel to each other, but inclined, presenting an oblique surface towards the front of the chimney; and as they are built perfectly upright and quite flat, from the hearth to the top of the throat, where they end, it is evident that an horizontal section of the throat will not be an oblong square; but its deviation from that form is a matter of no consequence; and no attempts should ever be made, by twisting the covings above, where they approach the breast of the chimney, to bring it to that form. All twists, bends, prominences, excavations, and other irregularities of form, in the covings of a chimney, never fail to produce eddies in the current of air which is continually passing into and through an open fire-place in which a fire is burning; and all such eddies disturb either the fire, or the ascending current of smoke, or both; and not unfrequently cause the smoke to be thrown back into the room. Hence it appears, that the covings of chimneys should never be made circular, or in the form of any other curve; but always quite flat.

"For the same reason, that is to say, to prevent eddies, the breast of the chimney which forms that side of the throat that is in front, or nearest to the room, should be neatly cleaned off, and its surface made quite regular and smooth.

"This may easily be done by covering it with a coat of plaster, which may be made thicker or thinner in different parts as may be necessary, in order to bring the breast of the chimney to be of the proper form.

"With regard to the form of the breast of a chimney, this is a matter of very great importance, and which ought always to be particularly attended to.

"I have hitherto given no precise directions, in regard to the height to which the new back and covings ought to be carried. This will depend not only on the height of the mantle, but also, and more especially, on the height of the breast of the chimney, or of that part of the chimney where the breast ends and the upright canal begins. The back and covings must rise a few inches, five or six for instance, higher than this part, otherwise the throat of the chimney will not be properly formed; but I know of no advantages that would be gained by carrying them up still higher.

"In forming the door-way for the chimney-sweeper, the best method of proceeding is to place the tile or flat piece of stone destined for closing it in its proper place; and to build round it, or rather by the sides of it: taking care not to bring any mortar near it, in order that it may be easily removed when the door-way is finished. With regard to the rabbet, which should be made in the door-way to receive it and fix it more firmly in its place, this may either be formed at the same time when the door-way is built, or it may be made after it is finished, by attaching to its bottom and sides, with strong mortar, pieces of thin roof tiles: such as are about half an inch in thickness will be the best for this use; if they are thicker, they will diminish too much the opening of the door-way, and will likewise be more liable to be torn away by the chimney-sweeper in passing up and down the chimney."

From the foregoing extracts, it is probable, sufficient information may be drawn, to enable the reader to judge accurately of the mode of constructing these improved fire-places. We shall nevertheless proceed to describe the different delineations in plate 70, from which the subject cannot fail of being clearly understood.

Fig. 1. shows the plan of a fire-place on the common construction. A B the opening of the fire-place in front. C D the back of the fire-place. A C and B D the covings.

Fig. 2. shows the elevation, or front view of a fire-place on the common construction.

Fig. 3. shows how the fire-place represented by the fig. 1. is to be altered in order to its being improved. AB is the opening in front—CD the back, and AC and BD the covings of the fire-place in its original state. *ab* its opening in front—*ik* its back—and *ai* and *bk* its covings after it has been altered; *e* is a point upon the hearth, upon which a plumb suspended from the middle of the upper part of the breast of the chimney falls. The situation for the new back is ascertained by taking the line *ef* equal to four inches. The new back and covings are represented as being built of bricks; and the space between these and the old back and covings as being filled up with rubbish.

Fig. 4. represents the elevation or front view of the fire-place fig. 3. after it has been altered. The lower part of the door-way left for the chimney-sweeper is shown in this figure by dotted lines.

Fig. 5. shows the section of a chimney fire-place, and of a part of the canal of the chimney, on the common construction. *ab* is the opening in front; *bc* the depth of the fire-place at the hearth; *d* the breast of the chimney; *de* the throat of the chimney, and *df*, *gc*, a part of the open canal of the chimney.

Fig. 6. shows a section of the same chimney after it has been altered. *kl* is the new back of the fire-place; *li*, the tile or stone which closes the door-way for the chimney-sweeper; *di*, the throat of the chimney, narrow to four inches; *a*, the mantle, and *h*, the new wall made under the mantle to diminish the height of the opening of the fire-place in front. N.B. These two figures are sections of the same chimney which is represented in each of the four preceding figures.

Fig. 7. shows how the covings are to be placed, when the front of the covings (*a* and *b*) does not come so far forward as the front of the opening of the fire-place, or the jambs (A and B).

Fig. 8. shows how the width and obliquity of the covings are to be accommodated to the width of the back of a fire-place, in cases where it is necessary to make the back very wide.

Fig. 9. shows how an instrument called a bevel (*mn*), useful in laying out the work, in altering chimney fire-places, may be constructed.

Fig. 10. shows how, when the breast of a chimney (*d*) is too high, it may be brought down by means of a wall (*h*) placed under the mantle, and a coating of plaster, which in this figure is represented by the part marked with dots.

Fig. 11. shows how the breast of a chimney may be brought down merely by a coating of plaster.

Fire-pots, in the military art, small earthen pots, into which is put a charged grenade, and over that powder enough till the grenade is covered; then the pot is covered with a piece of parchment, and two pieces of match across lighted: this pot being thrown by a handle of match, where it is designed, it breaks and fires the powder, and burns all that is near it, and likewise fires the powder in the grenade, which ought to have no fuse, to the end its operations may be the quicker.

Fire (Securing buildings against). The earl of Stanhope has discovered and published a very simple and effectual method for this purpose. He has divided it into three parts, viz. under-flooring, extra-lathing, and inter-securing. The method of under-flooring is either single or double. In single under-flooring, a common strong lath of oak or fir, about one-fourth of an inch thick should be nailed against each side of every joist and of every main timber, supporting the floor which is to be secured. Other similar laths are then to be nailed along the whole length of the joists, with their ends butting against each other. The top of each of these laths or fillets ought to be at one inch and a half below the top of the joists or timbers against which they are nailed; and they will thus form a sort of small ledge on each side of all the joists. These fillets are to be well bedded in a rough plaster hereafter mentioned, when they are nailed on, so that there may be no interval between them and the joists; and the same plaster ought to be spread with a trowel upon the tops of all the fillets, and along the sides of that part of the joists which is between the tops of the fillets and the upper edge of the joists. In order to fill up the intervals between the joists that support the floor, short pieces of common laths, whose length is equal to the width of these intervals, should be laid in the contrary direction to the joists, and close together in a row, so as to touch one another: their ends must rest upon the fillets, and they ought to be well bedded in the rough plaster, but are not to be fastened with nails. They must then be covered with one thick coat of the rough plaster, which is to be spread over them to the level of the tops of the joists: and in a day or two this plaster should be trowelled over close to the sides of the joists, without covering the tops of the joists with it.

In the method of double-flooring, the fillets and short pieces of laths are applied in the manner already described; but the coat of rough plaster ought to be little more than half as thick as that in the former method. Whilst this rough plaster is laid on, some more of the short pieces of laths above mentioned must be laid in the intervals between the joists upon the first coat, and be dipped deep in it. They should be laid as close as possible to each other, and in the same direction with the first layer of short laths. Over this second layer of short laths there must be spread another coat of rough plaster, which should be trowelled level with the tops of the joists without rising above them. The rough plaster may be made of coarse lime and hair; or, instead of hair, hay chopped to about three inches in length may be substituted with advantage One measure of common rough sand, two measures of slacked lime, and three measures of chopped hay, will form in general a very good proportion, when sufficiently beat up together in the manner of common mortar. The hay should be put in after the two other ingredients are well beat up together with water. This plaster should be made stiff; and when the flooring-boards are required to be laid down very soon, a fourth or fifth part of quicklime in powder, formed by dropping a small quantity of water on the limestone a little while before it is used, and well mixed with this rough plaster, will cause it to dry very fast. If any cracks appear in the rough plaster-work near the joists when it is thoroughly dry, they ought to be closed by washing them over with a brush wet with mortar-wash: this wash may be prepared by putting two measures of quicklime and one of common sand in a pail, and stirring the mixture with water till the water becomes of the consistence of a thin jelly.

Before the flooring boards are laid, a small quantity of very dry common sand should be strewed over the plaster-work, and struck smooth with an hollow rule, moved in the direction of the joists, so that it may lie rounding between each pair of the joists. The plaster-work and sand should be perfectly dry before the boards are laid, for fear of the dry rot. The method of under-flooring may be successfully applied to a wooden stair-case; but no sand is to be laid upon the rough plaster-work. The method of extra-lathing may be applied to ceiling joists, to sloping roofs, and to wooden partitions.

The third method, which is that of inter-securing, is very similar to that of under-flooring; but no sand is afterwards to be laid upon it. Inter-securing is applicable to the same parts of a building as the method of extra-lathing, but it is seldom necessary.

The author of this invention made several experiments, in order to demonstrate the efficacy of these methods. In most houses it is only necessary to secure the floors; and the extra-expense of under-flooring, including all materials, is only about nine-pence per square yard, and with the use of quicklime a little more. The extra expense of extra-lathing is no more than six-pence per square yard for the timber side-walls and partitions; but for the ceiling about nine-pence per square yard. But in most houses no extra-lathing is necessary.

FIRE-SHIP, in the navy, a vessel charged with artificial fireworks, which, having the wind of an enemy's ship, grapples her and sets her on fire.

FI′RESHOVEL. *s.* The instrument with which the hot coals are thrown up (*Brown*).

FI′RESIDE. *s.* The hearth; the chimney (*Prior*).

FI′RESTICK. *s.* A lighted stick or brand (*Digby*).

FIRE-WOOD. *s.* Wood to burn; fuel.

FIRE-WORKS, are preparations made of gunpowder, sulphur, and other inflammable and combustible ingredients, used on occasion of public rejoicings and other solemnities. The invention of fire-works is by M. Mahudel attributed to the Florentines and people of Sienna; who found out likewise the method of adding decorations to them of statues, with fire issuing from their eyes and mouths. The art of preparing and managing these is called pyrotechny. See PYROTECHNY.

FI′RER. *s.* An incendiary.

FI′RING. *s.* (from *fire.*) Fuel (*Mort.*).

FIRING IN LINE, in the military art. According to regulations, the following principal heads constitute firing in line.

The object of fire against cavalry is to keep them at a distance, and to deter them from the attack: as their movements are rapid, a reserve is always kept up. But when the fire commences against infantry, it cannot be too heavy, or too quick while it lasts; and should be continued till the enemy is beaten or repulsed. This may not improperly be called offensive fire.

Defensive fire belongs principally to infantry, when posted on heights, which are to be defended by musquetry. As soldiers generally present too high, and as fire is of the greatest consequence to troops that are on the defensive, the habitual mode of firing should therefore be rather at a low level than a high one.

On these occasions the men are generally drawn up three deep; in which case the front rank kneeling, being the most efficacious as being the most raising, should not be dispensed with when it can be safely and usefully employed.

Firing by half-battalions, the line advancing. The left wings halt, and the right ones continue to march fifteen paces, at which instant the word march being given to the left wings, the right at the same time are ordered to halt, fire, and load, during which the left march on and pass them, till the right wings being loaded and shouldered receive the word march, on which the left ones halt, fire, &c. and thus they alternately proceed.

Firing by half-battalions, the line retiring. The right wings are ordered to halt, front, and when the left wings have gained fifteen paces, and have received the word halt, front, the right wings are instantly ordered to fire, load, face about, and march fifteen paces beyond the left ones, where they receive the word halt, front, on which the left wings fire, &c. and thus alternately proceed.

It is observed in the official rules and regulations, that in addition to the battalion directions, there must be a regulating battalion named, by the half-battalions of which each line will move, halt, and fire: the commander of each line will be with such half-battalion, and in giving his several commands must have an attention to the general readiness of the line, especially after loading, that the whole are prepared to step off together at the word march. The firing of the advanced wing succeeds the march, or the halt, front, of the retired wing instantly: and each half-battalion fires independent and quick, so that no unnecessary pauses being made betwixt the firing words, the fire of the line should be that of a volley as much as possible; and the whole being thereby loaded together, will be ready for the next command of movement. In these firings of the line advancing or retiring, the two first ranks will fire standing, and the rear rank support their arms.

In this manner also may the alternate battalions of a line advance or retire, and when the whole are to form, and that the last line moves up to the first, every previous help of advanced persons will be given to insure its correctness.

Fire in line advancing, is when the infantry marches in line to attack the enemy, and in advancing makes use of its fire. On these occasions it is better to fire the two first ranks only standing, reserving the third, than to make the front rank kneel and to fire the whole: but when it is necessary to fire at a considerable distance, or on a retiring enemy, volleys may be given by the three ranks, the front one kneeling.

Firing by platoons, is practised when a line is posted, or arrives at a fixed situation. In this position, battalions fire independently of one another, and the fire generally commences from the centre of each. The first fire of each battalion must be regular, and at established pauses and intervals; after which each platoon may continue to fire as soon as it is loaded, independent, and as quick as possible.

Firing by files, is generally used behind a parapet, hedge, or abbatis. In this situation the two first ranks only can fire, and that must be by the two men of the same file always firing together, with coolness and deliberation. When, however, the parapet, hedge, or abbatis, is but a little raised, platoon firing may be resorted to.

Oblique firing by battalions, or otherwise, according to the ground, is extremely advantageous when it is found expedient to give an oblique direction to part of a line, or when it is discovered that their fire can in this manner be thrown against the opening of a defile, the flanks of a column, or against cavalry or infantry that direct their attack on some particular battalion or portion of the line.

Oblique firing, is either to the right and left, or from the right and left to the centre, depending entirely on the situation of the object to be fired against. The Prussians have a particular contrivance for this purpose: if they are to level to the right, the rear ranks of every platoon are to make two quick but small paces to the left, and the body of each soldier to turn 1-8th of a circle; and are to take the same distance to the right, if they are to level to the left.

When a line halts at its point of firing, no time is to be lost in scrupulous dressing, and the firing is instantly to commence. But when a line halts, and is not to fire, the usual dressings must be attended to; and every thing will depend upon the coolness and attention of the officers and non-commissioned officers.

It should be observed with respect to firings in general, that after the march in front, and halt of the battalion, company, or platoon, firing ought invariably to begin from the centre, and not from the flank. In other cases, and in successive formations, it may begin from whatever division first arrives and halts on its own ground.

Square firing, is that method of firing where either a regiment or any body of men are drawn up in a square, each front of which is generally divided into four divisions or firings, and the flanks of the square, as being the weakest part, are sometimes covered by four platoons of grenadiers who flank the angles. The first fire is from the right division of each face, the second fire from the left division of each face, and so on; the grenadiers making the last fire.

Street firing, is the method of firing adopted to defend or scour a street, lane, or narrow pass of any kind; in the execution of which the platoon must be formed according to the width of the place, leaving sufficient room on the flanks for the platoons which have fired, successively to file round to the rear of the others.

Firing, in the veterinary art, the application of the firing iron, red hot, to some preternatural swelling, &c. of the horse, in order to discuss it. This is oftentimes done by clapping the firing iron to the skin, without piercing it.

The firing instrument or knife ought to be somewhat rounded on the edge, and gradually thicker to the back, sufficient to keep the heat of the fire for some time. It should be rubbed clean, that no dirt or ashes may stick to it; and not used until the flaming redness is in part gone off.

On the utility of this operation, Mr. John Lawrence expresses himself with modesty as follows: "I must acknowledge that I am by no means prepared to give a decided opinion on the subject of firing, or the application of the actual cautery, in strains: the truth is, I have had few horses fired, and with those few it did not succeed. Its use is said to be, to discuss swellings by promoting absorption, and in contracting the skin to form a constant bandage round the sinews, both during the cure and ever afterwards. What strikes me as the most important benefit in the measure is, the support it is apt to give to the parts after the cure. The necessary precautions respecting the operation upon the back sinews are, that the parts to be fired be not in a state of inflammation, that no cross lines be made on any account, that the fire be only given deep enough to have sufficient effect upon the skin, without burning the sheaths of the tendons; that no person be suffered to mount the horse, but that he be turned to grass, as soon as convenient, for at least three months. The windgalls, I think, should be let out previous to firing. When the operation is intended to be very effectual, the lines are drawn thick around the leg, from the bottom of the pasterns almost up to the knee. I should conceive that fewer lines would make a firmer bandage. I must remark also, that a man's common sense must naturally depict the operation of cauterizing as a very delicate one, and by no means within the power of every heavy-handed smith.

"When the pastern joints are exceedingly full and swelled, the legs gorged; the tendons enlarged, in fact the parts indurated, there seems an almost absolute necessity for blistering and firing, since no other measures will be sufficiently discutient."

The author apprehends, with respect to race-horses, that there are few but "must be shortened in their speed, if fired to any effectual purpose;" and that, after all, it is a chance "but that a force sufficient again to start the tendon must also be adequate to loosen or burst the bandage."

It is the practice at the veterinary college, in firing, to draw the lines vertically round the affected limb; the contraction of the skin in that direction forming the most effectual and uniform bandage on the part.

The use of firing, with respect to spavins, ringbones, &c. is treated of in their proper places. See the articles Spavin, &c.

Firing is also a term used by horse-dealers to express a certain cracking or discipline of the whip, by which a dull or stiffened horse is made to frisk about and appear spirited for the purpose of sale. It is so denominated because from the severity with which this cruel discipline is sometimes applied, the flanks of the horse, or some other part, appear almost as striped and mangled as if fired with hot iron.

Firing-iron, the instrument with which the operation of firing is performed in the veterinary art. It is a piece of iron about fifteen inches long, with a stem terminating in a wooden handle at one end, having a blade of three inches long, and two wide at the other. This blade is forged flat, and is at the back half an inch in thickness, becoming gradually thinner by a third part towards the edge. It is formed of different dimensions for different occasions, and three or four are introduced into the fire at the same time, and employed successively.

To FIRK. *v. a.* (from *ferio*, Latin.) To whip; to beat; to correct; to chastise (*Hudibras*).

FI'RKIN. *s.* (from ꝼeopeꞃ, Saxon.) 1. A vessel containing nine gallons (*Arbuthnot*). 2. A small vessel (*Denham*).

Firkin, an English measure of capacity, for things liquid, being the fourth part of the barrel: it contains nine gallons of beer.

FIRLOT, a dry measure used in Scotland. The oat-firlot contains 21¼ pints of that country; the wheat-firlot contains about 2,211 cubical inches; and the barley-firlot 31 standard pints. Hence it appears that the Scotch wheat-firlot exceeds the English bushel by 33 cubical inches.

FIRM. *s.* (*firmus*, Latin.) 1. Strong; not easily pierced or shaken; hard, opposed to soft (*Cleaveland*). 2. Constant; steady; resolute; fixed; unshaken (*Tillotson. Walsh*). 3. Solid; not giving way; not fluid (*Ral.*).

To Firm. *v. a.* (*firmo*, Latin.) 1. To settle; to confirm; to establish; to fix (*Knolles*). 2. To fix without wandering (*Spenser*).

Firm, in commercial nomenclature, is a term used to express the names of the principal persons engaged in any mercantile concern. Thus we speak of the brewing business conducted under the firm of "Barclay, Perkins, and Co.;" the banking business under the firm of "Ladbrokes, Watson, and Gillman;" the clothiers' business under the firm of "Beddome, Fysh, and Co."

FIRMAMENT, in the old astronomy, is the orb of the fixed stars, or the highest of all the heavens. But in scripture and common language it is used for the middle regions, or the space or expanse appearing like an arch quite round or above us in the heavens. Many ancients and moderns also accounted the firmament a fluid matter; but those who gave it the name of firmament must have taken it for a solid one.

Firmament, in various places of scripture, is used for the middle region of the air.

FIRMAME'NTAL. *a.* (from *firmament.*) Celestial; of the upper regions (*Dryden*).

FIRMIN (Thomas), an English gentleman, celebrated for his good works. He was born at Ipswich, in Suffolk, in 1632, and was apprenticed to a tradesman in London. On being out of his time, he began business for himself in the linen manufacture, in which he had good success. His benevolence was so famous, that some of the greatest divines of the age were glad of his friendship, particularly Dr. Tillotson. He erected a warehouse for the employment of the poor in the linen manufacture; and when the French protestants came over he set up another for their use at Ipswich. For the last twenty years of his life, he was one of the governors of Christ's hospital, to which he was a liberal benefactor. There was hardly, indeed, any public charity in which he had not some concern. This benevolent man died in 1697, and was buried in the cloisters of Christ's hospital. Memoirs of his life have been published by Mr. Cornish.

FI'RMLY. *ad.* (from *firm.*) 1. Strongly; impenetrably; immoveably. 2. Steadily; constantly (*Addison*).

FI'RMNESS. *s.* (from *firm.*) 1. Hardness; compactness; solidity (*Burnet*). 2. Durability; stability (*Hayward*). 3. Certainty; soundness (*South*). 4. Steadiness; constancy; resolution (*Roscommon*).

FIRST. *s.* (ꝼıꞃꞅꞇ, Saxon.) 1. The ordinal of one (*Shakspeare*). 2. Earliest in time (*Prior*). 3. Foremost in place. 4. Highest in dignity (*Daniel*). 5. Great; excellent (*Shak.*).

First. *ad.* 1. Before any thing else; earliest (*Dryden*). 2. Before any other consideration (*Bacon*). 3. *At* First. At the beginning (*Bentley*). 4. First *or last*. At one time or other (*Dryden*).

First, in music, is applied to the upper part in a duet, trio, &c. In the score it is customary to place the first immediately above the second, the second in the stave above the third, and so on.

First-begot. First-begotten. *s.* (from *first* and *begot.*) The eldest of children (*Milton*).

First-born. *s.* Eldest; the first by the order of nativity (*Locke*).

First-fruits. *s.* (*first* and *fruits.*) 1. What the season earliest produces or matures of any kind (*Prior*). 2. The first profits of any thing (*Bacon*). 3. The earliest effect of any thing (*Milton*).

FI'RSTLING. *a.* (from *first.*) That is first produced or brought forth (*Deuteronomy*).

Fi'rstling. *s.* (from *first.*) 1. The first produce or offspring (*Milton*). 2. The thing first thought or done (*Shakspeare*).

FISC, in the civil law, the treasury of a prince. It differs from the ærarium, which was the treasury of the public or people; thus, when the money arising from the sale of condemned persons' goods was appropriated for the use of the public, their goods were said *publicari*; but when it was destined for the support of the prince they were called *confiscari*.

FISCAL, in the civil law, something relating to the pecuniary interest of the prince or people. The officers appointed for the management of the fisc were called *procuratores fisci*, and *advocati fisci*; and among the cases enumerated in the constitutions of the empire, where it was their business to plead, one is against those who have been condemned to pay a fine to the fisc on account of their litigiousness, or frivolous appeals.

FISCUS. See Fisc.

FISH. *s.* (ꝼiꞅc, Saxon.) 1. An animal that inhabits the water. *Fish* is used collectively for the race of *fishes* (*Shakspeare*). 2. The flesh of fish, opposed to that of terrestrial animals, called flesh (*Brown*).

To Fish. *v. n.* 1. To be employed in catching fishes. 2. To endeavour at any thing by artifice (*Shakspeare*).

To Fish. *v. a.* To search water in quest of fish, or any thing else (*Swift*).

Fish, in a ship, a plank or piece of timber, fastened to a ship's mast or yard, to strengthen it; which is done by nailing it on with iron spikes, and winding ropes hard about them.

Fish-glue. See Ichthyocalla.

Fish (Gold). See Cyprinus.

Fish-pond, a small pool for the breeding and feeding of fish.

Fish river (Great), a considerable river of Africa, which rises in the unknown interior regions, divides Caffraria from the country of the Hottentots, and falls into the Indian ocean, in Lat. 30. 30 S. The deepest parts of this river are inhabited by the hippopotamus, and the adjacent woods by elephants, rhinoceroses, and buffaloes.

FI'SHER. *s.* (from *fish.*) One who is employed in catching fish.

Fisher (John), an English prelate. He was born at Beverly, in Yorkshire, in 1459, and educated at Cambridge. On entering into orders he became confessor to Margaret countess of Richmond, mother of Henry VII. who by his advice founded St. John's and Christ's colleges, Cambridge. He was afterwards chosen chancellor of that university, and was a liberal encourager of learning. In 1504 he was made bishop of Rochester, from which he would never remove to a better see. He was a zealous opponent of the reformation; and when the business of the king's divorce was agitated, Fisher spoke with great freedom in behalf of the queen, as he also did for the pope's supremacy. Every effort was made to bring him over to an approbation of the king's proceedings, but all these proving ineffectual he was sent to the Tower, and attainted of high treason. While he lay in confinement the pope made him a cardinal, which so provoked Henry, that he prohibited the hat from being brought into his dominions, and sent Cromwell to the bishop to sound whether he intended accepting it. His answer being in the affirmative, the king exclaimed, "Yea, is he so lusty? Well, let the pope send him a hat when he will, mother of God, he shall wear it on the shoulders then; for I will leave him never a head to set it on." The tyrant was as good as his word, for the bishop was brought to his trial, condemned, and beheaded, in 1535. Erasmus says, that he was a man of integrity, deep learning, sweetness of temper, and greatness of soul. He wrote several books, some against Luther, and others of a practical nature.

FI'SHERBOAT. *s.* (*fisher* and *boat.*) A boat employed in catching fish.

FI'SHERMAN. *s.* One whose employment and livelihood is to catch fish (*Waller*).

FI'SHERTOWN. *s.* A town inhabited by fishermen (*Clarendon*).

FISHERY, a place where great numbers of fish are caught.

The principal fisheries for salmon, herring, mackrel, pilchards, &c. are along the coasts of England, Scotland, and Ireland; for cod, on the banks of Newfoundland; for whales, about Greenland; and for pearls in the East and West Indies.

Fishery (Free), in law, or an exclusive right of fishing in a public river, is a royal franchise; and is considered as such in all countries where the feudal polity has prevailed; though the making such grants, and by that means appropriating, what it seems unnatural to restrain, the use of running water, was prohibited for the future by Magna Charta; and the rivers that were fenced in king John's time were directed to be laid open, as well as the forests to be disforested.

Fishery, denotes also the commerce of fish, more particularly the catching them for sale. Were we to enter into a very minute consideration of the fisheries established in this kingdom, this article would swell beyond its proper bounds; however, since fisheries, if successful, are not only objects of great commercial importance, but also contribute materially to our naval strength, by becoming permanent nurseries for seamen, we shall take notice of some of the most considerable of the British fisheries, and the institutions set on foot for their support.

The situation of the British coasts is the most advantageous in the world for catching fish; the Scottish islands, particularly those to the north and west, lie most commodious for carrying on the fishing trade to perfection; for no country in Europe can pretend to come up to Scotland in the abundance of the finest fish, with which its various creeks, bays, rivers, lakes, and coasts are replenished. Of these advantages, the Scots seem indeed to have been abundantly sensible; for their traffic in herrings is even noticed in history so early as the ninth century. The frequent laws which were enacted in the reigns of James III. IV. and V. discover a steady determined zeal for the benefit of the country, and the full restoration of these fisheries, which the Dutch had found means to engross.

Anchovy-Fishery.—The anchovy is caught in the months of May, June and July, on the coasts of Catalonia, Provence, &c. at which season it constantly repairs up the straits of Gibraltar into the Mediterranean. Collins says they are also found in plenty on the western coasts of England and Wales.

The fishing for them is chiefly in the night-time, when a light being put on the stern of their little fishing-vessels, the anchovies flock round, and are caught in the nets. But then it is asserted to have been found by experience, that anchovies taken thus by fire, are neither so good, so firm, nor so proper for keeping, as those which are taken without fire.

When the fishery is over, they cut off the heads, take out their gall and guts, and then lay them in barrels, and salt them. The common way of eating anchovies is with oil, vinegar, &c. in order to which they are first boned, and the tails, fins, &c. slipped off. Being put on the fire, they dissolve almost in any liquor. Or they are made into sauce by mincing them with pepper, &c. Some also pickle anchovies in small delft or earthen pots, made on purpose, of two or three pounds weight, more or less, which they cover with plaster to keep them the better. Anchovies should be chosen small, fresh pickled, white on the outside, and red within. If genuine, they have round backs; for those which are flat or large are often nothing but sardines. See Clupea.

Cod Fishery.—There are two kinds of cod-fish; the one green or white cod, and the other dried or cured cod; though it is all the same fish, differently prepared; the former being sometimes salted and barrelled, then taken out for use; and the latter having lain for a competent time in salt, and then dried in the sun or smoke.

The chief fisheries for *green* cod are in the bay of Canada, on the great bank of Newfoundland, and on the isle of St. Peter, and the isle of Sable; to which places vessels resort from many parts both of Europe and America. They are from 100 to 150 tons burden, and will catch between 30,000 and 40,000 cod each. The most essential part of the fishery is, to have a master who knows how to cut up the cod, one who is skilled to take off the head properly, and, above all, a good salter, on which the preserving of them, and consequently the success of the voyage, depends. The best season is from the beginning of February to the end of April; the fish, which in the winter retire to the deepest water, coming then on the banks, and fattening extremely. What are caught from March to June keep well; but those taken in July, August, and September, when it is warm on the banks, are apt to spoil soon. Each fisher takes but one at a time, yet the most expert will take from 350 to 400 in a day; but that is the most, the weight of the fish and the great coldness on the bank fatiguing very much. As soon as the cod are caught, the heads are taken off; they are opened, gutted, and salted: and the salter stows them in the bottom of the hold, head to tail, in beds a fathom or two square; putting layers of salt and fish alternately, but never mixing fish caught on different days. When they have lain thus three or four days to drain off the water, they are placed in another part of the ship, and salted again; where they remain till the vessel is loaded. Sometimes they are cut in thick pieces, and put in barrels, for the greater convenience of carriage.

The principal fishery for dry cod is, from Cape Rose to the Bay des Exports, along the coast of Placentia, in which compass there are several commodious ports for the fish to be dried in. These, though of the same kind with the fresh cod, are much smaller, and therefore fitter to keep, as the salt penetrates more easily into them. The fishery of both is much alike; only this latter is most expensive, as it takes up more time and employs more hands, and yet scarce half so much salt is spent in this as in the other. The bait is herring, of which great quantities are taken on the coast of Placentia. When several vessels meet, and intend to fish in the same port, he whose shallop first touches ground becomes entitled to the quality and privileges of admiral: he has the choice of his station, and the refusal of all the wood on the coast at his arrival. As fast as the masters arrive, they unrig all their vessels, leaving nothing but the shrouds to sustain the masts: and in the mean time the mates provide a tent on shore, covered with branches of trees, and sails over them, with a scaffold of great trunks of pines, 12, 15, 16, and often 20 feet high, commonly from 40 to 60 feet, and about one-third as much in breadth. While the scaffold is preparing, the crew are a-fishing: and, as fast as they catch, they bring their fish ashore, and open and salt them upon moveable benches; but the main salting is performed on the scaffold. When the fish have taken salt, they wash and hang them to drain on rails; when drained, they are laid on a sort of stages, which are small pieces of wood laid across, and covered with branches of trees, having the leaves stripped off for the passage of the air. On these stages they are disposed of a fish thick, head against tail, with the back uppermost, and are turned carefully four times every twenty-four hours. When they begin to dry, they are laid in heaps ten or twelve thick, in order to retain their warmth; and every day the heaps are enlarged, till they become double their first bulk; then two heaps are joined together, which they turn every day as before: lastly, they are salted again, beginning with those first salted; and being laid in huge piles, they remain in that situation till they are carried on board the ships, where they are laid on the branches of trees disposed for that purpose, upon the ballast, and round the ship, with mats to prevent their contracting any moisture.

The cod supplies four kinds of commodities, viz. the zounds, the tongues, the roes, and the oil, which is extracted from its liver. The first is salted at the fishery, together with the fish, and put in barrels of from 600 to 700 pounds. The tongues are cured in like manner, and brought in barrels of from 400 to 500 pounds. The roes are also salted in barrels, and serve to cast into the sea to draw fish together, and particularly pilchards. The oil comes in barrels of from 400 to 520 pounds, and is used in dressing leather. See Gadus.

Coral-Fishery. See Coral.

Herring-Fishery. The herring is a small salt-water fish, with a blueish back and a white silvered belly, not unlike a little shad-fish; whence it is called in Latin *alosa minor.* Rondeletius calls it *harengus.*

They usually make two fishing seasons for herrings; the first in June, July, and August; the second in autumn; the latter of these is the more considerable, on account of the fogs, which are very favourable to this kind of fishing.

About the beginning of June, a shoal of herrings, exceeding in bulk not less than the whole extent of Great Britain and Ireland, comes from the North, on the surface of the sea; and their approach is known to the Shetlanders by several tokens in the air and water. It is not certainly known from whence they come; though it is probable that their winter rendezvous is within the arctic circle, where the seas swarm with insect food in greater abundance than in our warmer latitudes. But when they arrive in these seas, they cast their spawn; for they come to us full, and are shotten long before they leave us. As the great shoal formed by the migrating herrings, and divided into distinct columns, five or six miles in length, and three or four in breadth, reflecting in bright weather many splendid colours, passes between the shores of Greenland and the North Cape, it is probably much straitened, and as it reaches the extremities of Great Britain, it is separated into two parts; one part steers west or south-west, and, leaving the islands of Orkney and Shetland to the left, passes on towards Ireland; where, being interrupted by that island, this part is again divided; some, keeping to the coast of Britain, go southward down St. George's or the Irish channel, and the others edging off for want of room to the west and south-west, go along the Hibernian ocean, and, keeping on the coast, reach the south shore of Ireland, from whence they steer southward, and join the rest in the Irish channel. The other part of the first division made in the north, parting a little to the east and south-east, come down into the German ocean: they pass by Shetland, and make the point of Buchaness, and the coast of Aberdeen, filling the bays, friths, rivers, and creeks, with their innumerable multitudes. Hence they proceed southward, pass by Dunbar, and rounding the high shores of St. Tobbs and Berwick, are seen again off Scarborough, and not before; but not in bulk, till they come to Yarmouth roads in England, and thence to the mouth of the Thames; from whence passing the British channel, they are seen no more in any number. The herrings are found again upon the shores of North America, though not in such quantities as with us; and they are seen no farther south than the rivers of Carolina. Whether these may be part of that large shoal, which, at their first coming by the coast of Greenland, keep to the coasts of America on the north-west side, or whether they are the remainder of those that pass our channels, is uncertain; but we know that they are not seen in quantities in any of the southern kingdoms, as Spain, Portugal, or the south parts of France, on the side of the ocean, or in the Mediterranean, or on the coast of Africa.

The following account of the *herring* fishery, as carried on by the Lowestoft merchants, is taken from Gillingwater's History of Lowestoft, p. 94, &c. "The herring season begins on the eastern coast of England, about a fortnight before Michaelmas, and continues till Martinmas. The number of boats annually employed at Lowestoft in this fishery, upon an average, from 1772 to 1781, was about 33; and the quantity of herrings caught in each of these years was about 714 lasts (of 10,000 herrings each), or 21 lasts to a boat, which makes the quantity of herrings caught by the Lowestoft boats during that period to be 7140 lasts. These herrings were sold, upon an average, at 12*l*. 10*s*. per last, which makes the whole produce arising from the sale of the said fish to be 89,250*l*. After the year 1781, the number of boats employed in this fishery was rather less, occasioned by the war with the Dutch and other powers.

"At the beginning of the season the boats sail off to sea about 13 leagues N.E. from Lowestoft, in order to meet the shoals, or second part of the first division of herrings (mentioned above), which separated off the north part of Scotland. Being arrived on the fishing ground, in the evening (the proper time for fishing) they shoot out their nets, extending about 2200 yards in length and 8 in depth, which by the help of small casks, called bowls, fastened on one side at the distance of 44 yards from each other, cause the nets to swim in a position perpendicular to the surface of the water. If the quantity of fish caught in one night amounts only to a few thousands, they are salted, and the vessels, if they have no better success, continue on the fishing ground two or three nights longer, salting the fish as they are caught, till they have obtained a considerable quantity, when they bring them into the roads, where they are landed and lodged in the fish-houses. Sometimes, when the quantity of fish is very small, they will continue on the fishing ground a week or ten days; but in general they bring in the fish every two or three days, and sometimes oftener, especially when the quantity amounts to 6 or 7 lasts, which frequently happens, and instances have been known where a single boat has brought into the roads at one time 12 or 14 lasts.

"As soon as the herrings are brought on shore, they are carried to the fish-houses, where they are salted, and laid on the floors in heaps about two feet deep; after they have continued in this situation about fifty hours, the salt is washed from them by putting them in baskets, and plunging them into water, from whence they are carried to an adjoining fish-house, where, after being pierced through the gills by small wooden spits about 4 feet long, they are handed to the men in the upper part of the house, who place them at proper distances as high as the top of the roof, where they are cured or made red.

"The upper part of the house being thus filled with herrings, many small wood fires are kindled underneath, upon the floor, whose number is in proportion to the size of the room, and the smoke which ascends from these fires is what dries or cures the herrings. After the fish have hung in this manner about 7 days, the fires are extinguished, that the oil and fat may drip from them, and in about two days after the fires are rekindled, and after two or more such drippings, the fires are kept continually burning until the herrings are perfectly cured, which requires a longer or a shorter time, according as they are designed either for foreign or home consumption.

"After the herrings have hung a proper time, they are taken down (which they call striking), and are packed in barrels, containing 800 or 1000 each, and then shipped off for market." See Clupea.

Lobster-Fishery.—Lobsters are taken along the British channel, and on the coast of Norway, whence they are brought to London for sale; and also in the frith of Edinburgh, and on the coast of Northumberland. See the article Cancer. By 10 and 11 W. III. c. 24. no lobster is to be taken under eight inches in length, from the peak of the nose to the end of the middle fin of the tail; and by 9 Geo. II. c. 33. no lobsters are to be taken on the coast of Scotland from the first of June to the first of September. See Cancer.

Mackrel-Fishery.—The mackrel is a summer fish of passage, found in large shoals, in different parts of the ocean, not far north; but especially on the French and English coasts. The fishing is usually in the months of April, May, and June, and even July, according to the place. See Scomber.

They enter the English channel in April, and proceed up to the straits of Dover as the summer advances; so that by June they are on the coasts of Cornwall, Sussex, Normandy, Picardy, &c. where the fishery is most considerable. They are an excellent food fresh; and not to be despised, when well prepared, pickled, and put up in barrels; a method of preserving them chiefly used in Cornwall. The fish is taken in two ways; either with a line or nets: the latter is the more considerable, and is usually performed in the night-time. See SCOMBER.

Oyster Fishery.—This fishery is principally carried on at Colchester in Essex; Feversham and Milton in Kent; the Isle of Wight; the Swales of the Medway; and Tenby on the coast of Wales. From Feversham, and adjacent parts, the Dutch have sometimes loaded a hundred large hoys with oysters in a year. They are also taken in great quantities near Portsmouth, and in all the creeks and rivers between Southampton and Chichester; many of which are carried about by sea to London and to Colchester, to be fed in pits about Wavenhoe and other places. See OSTREA.

Fishery (*Pearl*). See PEARL FISHERY.

Pilchard Fishery. The pilchard is a small salt-water fish, bigger than the anchovy, but less than the herring, which in other respects it resembles. Its head is yellow; its belly white; and its back a sea-green. It eats admirably, fresh, or lightly salted.

There are certain seasons for fishing the pilchard; which, like the herring and anchovy, is a fish of passage; and its arrival is indicated by similar signs with that of the herrings. They are prepared and salted much as the anchovy is; with this difference, that the head is cut off the latter; but the pilchard were distinguishable from the anchovy, even though its head were off likewise; the pilchard having a very flat back, and the anchovy a round one.

The chief pilchard fisheries are along the coasts of Dalmatia, to the south of the island Issea; on the coasts of Bretagne, from Belle island as far as Brest; and along the coasts of Cornwall and Devonshire.

It is a saying of the Cornish men, with regard to the pilchard, that it is the least fish in size, most in number, and greatest in gain, of any they take out of the sea. This observation is amply confirmed by Dr. Borlase's account of this fishery; for besides the great number of persons employed by it, the poor are fed with the offals of the captures, the land with the refuse of the fish and salt, the merchant finds the gains of commission and commerce, and the fisherman the gains of the fish. The usual produce of the number of hogsheads exported each year, for ten years, from 1747 to 1756, inclusive, from the four ports of Fowey, Falmouth, Penzance, and St. Ives, amounted to 29,795 hogsheads. Every hogshead for ten years last past, together with the bounty allowed for each hogshead exported, and the oil made out of each, has amounted, one year with another, at an average, to the price of 1l. 13s. 3d.; so that the cash paid for pilchards exported has, at a medium, annually amounted to the sum of 49,532l. 10s. See CLUPEA.

Salmon-Fishery. For a description of this fish, see the article SALMO. The chief salmon fisheries in Europe are in England, Scotland, and Ireland, in the rivers, and sea-coasts adjoining to the river mouths. The most distinguished for salmon in Scotland are, the river Tweed, the Clyde, the Tay, the Dee, the Don, the Spey, the Ness, the Bewly, &c. in most of which it is very common, about the height of summer, especially if the weather happens to be very hot, to catch four or five score salmon at a draught. The chief rivers in England for salmon are, the Tyne, the Trent, the Severn, and the Thames. The fishing is performed with nets, and sometimes with a kind of locks or wears made on purpose, which in certain places have iron or wooden grates so disposed, in an angle, that being impelled by any force in a contrary direction to the course of the river, they may give way and open a little at the point of contact, and immediately shut again, closing the angle. The salmon, therefore, coming up into the rivers, are admitted into these grates, which open, and suffer them to pass through, but shut again, and prevent their return. The salmon is also caught with a spear, which they dart into him when they see him swimming near the surface of the water. It is customary likewise to catch them with a candle and lanthorn, or whisps of straw set on fire; for the fish naturally following the light, are struck with the spear, or taken in a net spread for that purpose, and lifted with a sudden jerk from the bottom.

"The capture of salmon in the Tweed, about the month of July (says Mr. Pennant) is prodigious. In a good fishery, often a boat load, and sometimes near two, are taken in a tide: some few years ago there were above 700 fish taken at one haul, but from 50 to 100 is very frequent. The coopers in Berwick then begin to salt the salmon thoroughly in pipes and other large vessels, and afterwards barrel them to send abroad, having then far more than the London markets can take off their hands." See SALMO

Sturgeon-Fishery. The greatest sturgeon-fishery is in the mouth of the Volga, on the Caspian sea; where the Muscovites employ a great number of hands, and catch them in a kind of inclosure formed by huge stakes representing the letter Z repeated several times. These fisheries are open on the side next the sea, and close on the other; by which means the fish ascending in its season up the river is embarrassed in these narrow angular retreats, and so easily killed with a harping-iron. Sturgeons, when fresh, eat deliciously; and in order to make them keep, they are salted or pickled in large pieces, and put up in cags from 30 to 50 pounds. But the great object of this fishery is the roe, of which the Muscovites are extremely fond, and of which is made the cavear, or kavia, so much esteemed by the Italians. See CAVEAR and ACCIPENSER.

Whale-Fishery.—These immense fish are chiefly caught in the North sea. The largest sort are found about Spitzbergen, some of them being there two hundred feet in length. Those on the coasts of America are about ninety or a hundred; and those on the coasts of Guyenne, and the Mediterranean, are the smallest of all.

The legislature, justly considering this trade as of great national importance, bestowed upon it at different periods very considerable encouragements. In particular, every British vessel of 200 tons or upwards, bound to the Greenland seas on the whale-fishery, if found to be duly qualified according to the act, obtained a licence from the commissioners of the customs to proceed on such voyage: and on the ship's return, the master and mate making oath that they proceeded on such voyage and no other, and used all their endeavours to take whales, &c. and that all the whale-fins, blubber, oil, &c. imported in their ship, were taken by their crew in those seas, there was allowed 40s. for every ton according to the admeasurement of the ship.

It was afterwards found, however, that so great a bounty was neither necessary to the success of the trade, nor expedient with regard to the public. In 1786, therefore, the acts conferring the said emoluments being upon the point of expiring, the subject was brought under the consideration of parliament; and it was proposed to continue the former measures, but with a reduction of the bounty from 40s. to 30s. In proposing this alteration, it was stated, "that the sums which this country had paid in bounties for the Greenland fishery amounted to 1,265,461l.; that in the last year we had paid 94,858l.; and that, from the consequent deduction of the price of the fish, the public at present paid 60 per cent. upon every cargo. In the Greenland fishery there were employed 6000 seamen, and these seamen cost government 13l. 10s. per man per annum, though we were never able to obtain more than 500 of that number to serve on board our ships of war. Besides, the vast encouragement given to the trade had occasioned such a glut in the market, that it was found necessary to export considerable quantities; and thus we paid a large share of the purchase-money for foreign nations, as well as for our own people, besides supplying them with the materials of several important manufactures." This proposition was opposed by several members, but was finally carried; and the propriety of the measure became very soon apparent. At that time (1786) the number of ships employed from England in the whale-fishery to Davis's Straits and the Greenland seas amounted to 139, besides 15 from Scotland. The proposed alteration took place the next year (1787): and notwithstanding the diminution of the bounty, the trade increased, the number of ships employed the same year from England amounting to 217, and the next year (1788) to 222.

To give some idea of the manner and importance of this trade, we shall here subjoin the discipline for a long time observed in the whale-fishery; the method of fishing; the cargo and equipage of a vessel; and the produce thereof.

The discipline is adjusted by a standing regulation, consisting of twelve articles; the principal whereof are:

That in case a fishing-vessel be shipwrecked, and the captain and crew saved, the next vessel they meet shall take them in; and the second vessel take half of them from the first; but that no vessel shall be obliged to take any of the loading of a vessel shipwrecked; that the effects of a shipwrecked vessel, which are absolutely relinquished, and which another captain shall find, and take up, upon his arrival in Holland, he shall account for one half of them to the proprietors of the shipwrecked vessel, clear of all expences; that, if the crew desert a shipwrecked vessel, they shall have no claim to any of the effects saved, but the whole shall go to the proprietor; but if they be present when the effects are saved, and assist therein, they shall have one-fourth thereof; that if a person kill a fish on the ice, it shall be reputed his own, so long as he leaves any person with it; but the minute he leaves it, it becomes the due of the first captain that comes that way; but that, if a fish be tied to an anchor, or a rope fastened to the shore, it shall remain to its first proprietor, though he leaves it alone; that if any person be wounded or lamed in the service, the commissioners of the fishery undertake to procure him a reasonable satisfaction; to which the whole fleet shall contribute.

Besides this general regulation, to the observance of which all the captains, pilots, and masters of vessels, are obliged to swear, before they put to sea, there is also a particular one for each ship's crew, which they are all sworn to execute, in presence of one of the commissioners, who goes aboard every ship, to receive the oath.

This regulation is a kind of charter-party, importing, that they will attend prayers morning and evening, on pain of an amercement, at the discretion of the captain; that they will not get drunk, nor draw their knives, on forfeiture of half of their wages; nor fight, on forfeiture of the whole; that no one shall lay wagers on the good or ill success of the fishing, nor buy or sell, on these conditions, in case we take one or more fish, on penalty of twenty-five florins; that they will be contented with the provisions allowed them; and that they will never light fire, candle, or match, by night or day, without the captain's leave, on the like penalty.

After the reading of this regulation, the crew are all called, to receive the customary gratuity before their setting out, with an assurance of another sum at their return, in proportion to the success of the fishing.

The captain, on this occasion, receives from a hundred to a hundred and fifty florins; the pilot from forty to sixty; each harpooner from forty to fifty florins; the other officers from twenty-six to thirty-six florins; the elder sailors twenty; and the younger twelve.

The fleet, which consists mostly of fluyts, from two to three hundred tons, and from thirty-six men to forty-two, usually sets sail about the beginning of April, and takes its course by the isles of Iceland, from 60 to 61 degrees of latitude; after which, leaving them to the west, it steers northward, through 73, 74, and 75 deg. of latitude, where they begin to find the ice.

It is among these huge heaps of ice, wherewith the whole quarter is filled, that they first begin to spy the whales; and there most of the vessels fix their abode for the fishing. But as the fish are larger and fatter the farther north they go, some captains will venture as far as 80 or 82° of north lat. Each vessel of three hundred tons has six shalloops; and each shalloop has six harpooners, with five seamen to row it. To every shalloop there are seven lines, of three inches circumference; five of them in the hind part of the vessel, and two before. The hind lines together make six hundred fathoms, and, with the addition of the other two, eight hundred and eighty. If the whale dive deeper, or run farther underneath the ice than this stint, the line must be cut, lest the shalloop be drawn after it.

In the English whale-fishery every ship has six or seven boats; each of which has one harpooner, one boat-steerer, one manager of the line, and four seamen to row it. In each boat there are two or three harpoons, several lances, and six lines fastened together, each line being one hundred and twenty fathom long. To each harping-iron is fastened a strong stick, about six feet long, and a soft pliable line, about six fathom long, called the fore-gauger, which is fastened to the lines in the boat. When more line is wanted, the lines of a second boat are fastened to those of the first. See BALÆNA.

The instrument, wherewith the whale is struck, is a harping-iron, or javelin, five or six feet long, pointed with steel, in a triangular shape, like the barb of an arrow.

The harpooner, upon sight of the fish, from one end of the shalloop where he is placed, flings the harping-iron with all his might against his back: and, if he be so happy as to make it penetrate the skin and fat into the flesh, he lets go a string fastened to the harping-iron, at the end whereof is a dry gourd, which swimming on the water, discovers whereabouts the whale is; for the minute he is struck, he plunges to the bottom, commonly swimming against the wind.

If the whale return to breathe in the air, the harpooner takes occasion to give him a fresh wound, till, fainting by the loss of blood, the men have an opportunity of approaching him, and thrusting a long steeled lance under his gills into his breast, and through the intestines, soon dispatch him; and when the carcase begins to float, they cut holes in the fins and tail: and tying a rope in these holes, they tow him to the vessel, where he is fastened along the larboard side of the ship, floating upon his back almost level with the sea. They then begin to take the blubber or fat, and the fins as they are called, or whale-bone.

In order to this, several men stand upon the fish, with a kind of iron calkers, or spurs, to prevent their slipping, and cut off the tail, which is hoisted upon deck, and then cut out square pieces of blubber, weighing two or three thousand pounds, which are hoisted on board with the capstan, where each piece is again cut into smaller pieces, each of two or three hundred pounds weight, and these are thrown into the hold, and left to drain for three or four days. When all the blubber is cut from the belly of the fish, it is turned on one side, by means of a piece of blubber, left in the middle, called the cant or turning-piece; and then they cut out this side in large pieces, called hockies, as before, and also the whale-bones with the gums, which are preserved entire, and hoisted on deck, where the blades are cut and separated, and left till they have time to clean and scrape them. The fish is next turned on his back, and the blubber cut out from the back and crown bone; and last of all they cut the blubber from the other side, as before. They then cut out the two large jaw-bones, situated in the under-lip, which are hoisted on deck, cleansed and fastened to the shrouds, and tubs are placed under them to receive the oil which they discharge; this oil belongs to the captain, and likewise the tail and fins. The carcase is left to float, and supplies food for Greenland birds, called mallemucks, &c. In three or four days, they hoist the pieces of blubber out of the hold, chop them, and put small pieces through the bung-holes into their casks.

A whale, the longest blade of whose mouth is nine or ten feet, generally fills thirty buts with blubber; but one of the largest fish will fill seventy buts and more. A good large whale is valued at about 1000l. sterling. A full ship of three hundred tons is worth, clear of all expense, at least 5000l. There is a premium assigned to every person in the ship for every whale: the captain has three guineas; the mate, one; each harpooner, one; the surgeon, one; carpenter, one; cook and boat-steerers, half a guinea each; a common man, a crown; and each boy, half a crown. The captain and harpooners have no wages; but the captain is allowed twenty-five pounds, and the harpooners, nine guineas each. In a successful voyage they have six shillings for every ton of oil boiled in Greenland-dock; but the rest of the ship's company have monthly wages, besides the fish-money, but no oil-money.

Nothing now remains, but to sail homewards, where the fat is to be boiled, and melted down into train-oil.

The whale-fishery of the Caroline islands is more easy and agreeable than that of all other places, and beside the great profit, affords a pleasant spectacle to multitudes of people on the shores.

There are ten or twelve of these isles disposed in form of a circle, so that they make a sort of port, in which the sea is perpetually calm and pleasant.

When a whale appears in this gulf, the people all get into their canoes, and rowing toward the sea, keep between the creature and its retreat, and drive him forward towards the isles at the bottom of the port. They drive him in this manner before them into the shallows, where they plunge into the water themselves, and some get ropes and chains about him, while others dart him with their spears. Their agility and address is wonderful in this. The creature can never get away when they have once got him fastened, but is soon killed, and got to the shore.

The whale-fishery begins in May, and continues through the months of June and July; but whether the ships have had good or bad success, they must come away and get clear of the ice by the end of August; so that in the month of September at farthest they may be expected home; but the more fortunate ships may return in June or July. See BALÆNA, PHYSETER, and DELPHINUS.

FISHES. See PISCES.

FISHES (Breeding of). Fishes are an object of general attention in regard to sport, food, and ornament. The first of these three heads, or that of sport, is the foundation of the art of ANGLING, and has already been discussed at some length under that article. The two remaining heads, which we shall now enter upon, relate chiefly to the breed of fishes, fishing-ponds, and fish-streams. In breeding fishes, there seems to be no small degree of caprice, for the most promising ponds do not always prove serviceable: one of the best indications of a breeding pond is, when there is good quantity of rush and grazing about it, with gravelly shoals, such as those of horse-ponds; so that when a water takes thus to breeding, with a few milters and spawners, two or three of each, a whole country may often be stocked in a short time. Eels and perches are of very good use to keep down the stock of fishes; for they prey much upon the spawn and fry, and generally destroy their superfluity of them. Pike, perch, tench, roach, &c. are observed to breed in almost any waters, and very numerously; eels never breed in standing-waters, without springs; and in such, are neither found, nor increase, but by putting in; yet where springs exist, they are never wanting, though not put in. And which is truly extraordinary, no person ever saw in an eel the least token of propagation, either by melt or spawn; so that the mode of their breeding and propagation are questions mysterious, and unresolved. The fecundity of fishes is wonderful: a pike caught in the Rhine, weighing only nine pounds, had 148,000 ova in it; and Petit mentions a carp with upwards of 348,000.

In feeding fishes take the following remarks: —1. In a stew, thirty or forty carps may be kept up from October to March, without feeding; and by fishing with trammels or flews in March, or

April, you may take from your great waters to recruit the stews; but you must not fail to feed all summer, from March to October again, as constantly as cooped chickens are fed, and it will turn to as good an account.

2. The care of feeding is best committed to a butler or gardener, always at hand, because the constant and regular serving the stew conduces very much to the thriving of the fishes.

3. Boiled grain is rich to feed with, especially pease, and malt coarse ground; the grains after brewing, while fresh and sweet, are very proper; but one bushel of malt not brewed will go as far as two of grains; chippings of bread and scraps off a table, steeped in tap droppings of strong beer or ale, are an excellent food for carp; and of these the quantity of two quarts to thirty carp every day is sufficient, and a small meal morning and evening is better than a larger once a day only.

4. There is a sort of food for fishes that may be called accidental, which is no less improving than the best that can be provided; and that is, when the ponds happen to receive the wash of commons, where many sheep have pastured; the water is enriched by the soil, and will feed a greater number of carp than it otherwise would do. In like manner, the dung that falls from cattle standing in the water in hot weather is a very valuable nutriment.

5. The most proper food to raise pikes to an extraordinary fatness is eels, without which it is not to be done but in a long time; small perches are the next best meat you can give them. Bream put into a pike-pond breed exceedingly, and are fit to maintain pikes, that will take care they shall not increase too largely; the numerous fry of roaches and rouds, which come from the greater pools into a pike's quarters, will likewise be a good diet for him.

6. Pike in all streams, and carp in hungry springing waters, being fed at certain times, will come up and take their meat almost from your hand; and it is diverting to see the greediness and contention that will exist among them for the good bits, with the boldness they will attain to by constant and regular feeding.

7. The most convenient feeding place is towards the mouth of the pond, at the depth of about half a yard; for by that means the deep will be kept clean and neat, as it were a parlour to retire to and rest in: the meat, thrown in this place into the water, without other trouble, will be picked up by the fishes, and nothing will be lost; yet there are several ingenious devices for giving them food, especially peas: as a square board let down with the meat upon it by the four corners, whence a string proceeds, made fast to the end of a stick, like a scale, which may be readily managed.

8. When fishes are fed in the larger pools or ponds, where their numbers are also great, there will require some expense as well as pains; but as soon as they are taken out, and it appears how much they have thriven, it will appear also how well both have been employed; either malt boiled or fresh grains is the best food in this case. Thus carp may be fed and raised like capons, and tench will feed as well, but perch are not proper for a stew in feeding time.

If cattle graze near your great pools, they will delight to come and stand in the water, which conduces much to the thriving of the cattle, as well as to the feeding of your fishes by their dunging, as has been already hinted: it is therefore advisable to have ponds in cow-pastures and grazing-grounds.

With respect to sowing oats in the bottom of a pond, take care to dry your great water once in three, or at most four, years, and that at the end of January, or beginning of March, which (if the year do not prove very unseasonable) will be time enough. After Michaelmas following, you may put in a great stock of fishes, and thin them in succeeding years, as the feed declines. See Pond.

In selecting a spot for ponds, it may be sufficient to observe here, that those grounds are best which are full of springs or apt to be moorish: the one breeds fishes well, and the other preserves them from being stolen.

The situation of the pond is likewise to be considered, and the nature of the currents that fall into it; as also whether it can be refreshed from a little brook, or rain water falling from an adjacent hilly ground. Those ponds which receive the stale and dung of horses breed the largest and fattest fishes.

In forming the pond, observe that the head be placed at the lowest part of the ground; and that the trench of the flood-gate, or sluice, have a good swift fall, that it may not be long in emptying.

If the pond carry six feet of water, it is enough; but it must be eight feet deep to receive the freshes and rains that should fall into it.

It would also be advantageous to have shoals on the sides, for the fishes to sun themselves in, and lay their spawn on; and in other places, certain holes, hollow banks, shelves, roots of trees, islands, &c. to serve as their retiring places. If your pond be naturally adapted for breeding, never expect any large carps from it, as the greatness of the number of spawn will overstock it.

For large carps a store-pond is ever accounted the best: and, to make a breeding-pond become a store-pond, observe what quantity of carp it will contain; then put in all milters or all spawners, whereby in a little time you may have carps that are both large and exceedingly fat. Thus by putting in one sex alone there is an impossibility of a farther increase, except in roaches, which, notwithstanding this precaution, will multiply. Reserve some great waters for the head-quarters of the fishes, whence you may take, or wherein you may put any quantity at pleasure. And be careful to have stews, and other auxiliary waters, so that you may convey any part of the stock from one to the other, and lose no time in the growth of the fishes, but employ your water, as you do your land, to the best advantage. View the grounds, and find out some fall between the hills, as near a flat as may be, so as to leave a proper current for the water. If there be any difficulty of judging of such, take an opportunity, after some sudden rain, or breaking up of a great snow in winter, and you will plainly see which way the ground casts; for the water will take the true fall, and run accordingly.

The condition of the place must determine the quantity of the ground to be covered with water. For example, fifteen acres in three ponds, or eight acres in two, and not less; and these ponds should be placed one above another, so that the point of the lower may almost reach the head or bank of the upper, which contrivance is no less beautiful than advantageous.

The head, or bank, which by stopping the current is to raise the water, and so make a pond, must be built with the clay and earth taken out of the pan, or hollow, dug in the lowest ground above the bank, the shape of the pan to be half an oval, whereof the flat to come to the bank and the longer diameter to run square from it.

For two large ponds of three or four acres apiece, it is advisable to have three or four stews, each two rods wide and three long. The stews are usually in gardens, or near the house, to be more handy, and better attended to. The method of making them, is to carry the bottom in a continual decline from one end, with a mouth to favour drawing the net.

FISHES. (Method of preserving for cabinets.) Linnéus's method is to expose them to the air; and when they acquire such a degree of putrefaction that the skin loses its cohesion to the body of the fish, it may be slid off almost like a glove: the two sides of this skin may then be dried upon paper like a plant, or one of the sides may be filled with plaster of Paris to give the subject a due plumpness. A fish may be prepared, after it has acquired this degree of putrefaction, by making a longitudinal incision on the belly, and carefully dissecting the fleshy part from the skin, which is but slightly attached to it in consequence of the putrescency. The skin is then to be filled with cotton and some antiseptic powder, as directed for birds; and, lastly to be sewed up where the incision is made. See PREPARATION OF ANIMALS.

FISHES, in heraldry, are the emblems of silence and watchfulness; and are borne either upright, imbowed, extended, endorsed respecting each other, surmounting one another, fretted, &c. In blazoning fishes, those borne feeding should be termed devouring; all fishes borne upright and having fins, should be blazoned hauriant; and those borne transverse the escutcheon, must be termed naiant.

FISHGARD, or FISCARD, a seaport town of South Wales, in the county of Pembroke, at the mouth of the river Gwaine, on a bay of St. George's Channel, to which it gives name, where vessels may ride safely in five or six fathoms water. The inhabitants carry on a good trade in herrings, of which they, with Newport, cure above 1000 barrels annually. Lon. 4. 58 W. Lat. 51. 55 N.

FI'SHFUL. *a.* (from *fish.*) Abounding with fish; stored with fish (*Camden*).

To FI'SHIFY. *v. a.* (from *fish.*) To turn to fish: a cant word (*Shakspeare*).

FISHING, in general, the art of catching fishes, whether by means of nets, of spears, or of the line and hook. That which is performed by the net, spear, or harpoon, for fishes that go in shoals, has been explained in the preceding articles. That performed by the rod, line, and hook, for solitary fish, is usually termed angling.

FISHING (Chinese). We venture to give this appellation to some very ingenious contrivances of the people of China for catching in their lakes, not only fishes, but water-fowl. For the purpose of catching fish they have trained a species of pelican, resembling the common corvorant, which they call the Leu-tze, or fishing-bird. It is brown, with a white throat, the body whitish beneath, and spotted with brown; the tail is rounded, the irides blue, and the bill yellow. Sir George Staunton, who, when the embassy was proceeding on the southern branch of the great canal, saw those birds employed, tells us, that on a large lake, close to the east side of the canal, are thousands of small boats and rafts, built entirely for this species of fishery. On each boat or raft are ten or a dozen birds, which, at a signal from the owner, plunge into the water; and it is astonishing to see the enormous size of fishes with which they return, grasped within their bills. They appeared to be so well trained, that it did not require either ring or cord about their throats to prevent them from swallowing any portion of their prey, except what their master was pleased to return to them for encouragement and food. The boat used by these fishermen is of a remarkably light make, and is often carried to the lake, together with the fishing birds, by the men who are there to be supported by it.

The same author saw the fishermen busy on the great lake Wee-chaung-hee; and he gives the following account of a very singular method practised by them for catching the fish of the lake without the aid of birds, of net, or of hooks.

To one side of a boat a flat board, painted white, is fixed, at an angle of about 45 degrees, the edge inclining towards the water. On moonlight nights the boat is so placed that the painted board is turned to the moon, from whence the rays of light striking on the whitened surface, give to it the appearance of moving water; on which the fishes being tempted to leap, as on their element, the boatmen, raising with a string the board, turn the fishes into the boat.

Water-fowl are much sought after by the Chinese, and are taken upon the same lake by the following ingenious device. Empty jars or gourds are suffered to float about upon the water, that such objects may become familiar to the birds. The fowler then wades into the lake with one of those empty vessels upon his head, and walks gently towards a bird; and lifting up his arm, draws it down below the surface of the water without any disturbance or giving alarm to the rest, several of whom he treats in the same manner, until he fills the bag he had brought to hold his prey. The contrivance itself is not so singular, as it is that the same exactly should have occurred in the new continent, as Ulloa asserts, to the natives of Carthagena, upon the lake Cienega de Teñas.

FISHING-FLIES, are both natural and artificial; the natural are almost innumerable, and of these the chief are, the dun-fly, the stone or may-fly, the tawny-fly, the vine-fly, the shell-fly, the cloudy and blackish-fly, the stag-fly; next caterpillars, canker-flies, bear-flies, &c. all which appear either sooner or later, according as the spring proves forward or tardy; and these flies are all good in their season, for fishes that rise at the fly.

The better to know the fly the fish covets most, when you come to the river side in the morning, beat the bushes with your rods, and take up as many various sorts as you can, and make a trial of them: upon many of them we have already made some remarks in the article ANGLING; and to this article we still refer our readers; for though they will sometimes change their fly, this is only when they have glutted themselves with that sort they like best.

There are two ways of fishing with these natural flies, viz. either on the surface of the water, or a little underneath it.

If you angle for chevin, roach, or dace, move not the natural fly swiftly when you see the fish make at it, but rather let it glide freely towards him with the stream; but if it be in a still and slow water, draw the fly slowly side-ways by him, and this will induce him to pursue it eagerly.

The artificial fly is seldom used but in blustering weather, when the waters are so disturbed by the wind, that a natural fly cannot well be seen, nor rest upon them.

There are twelve sorts of dubs or artificial flies, of which the following are the principal:—

1. For March, the dun-fly; made of dun-wool, and the feathers of the partridge's wing; or the body made of black wool, and the feathers of a black drake.

2. For April, the stone-fly; the body made of black wool, dyed yellow under the wings and tail.

3. For the beginning of May, the ruddy fly; made of red wool, and bound about with black silk, with the feathers of a black capon hanging dangling on his sides, next his tail.

4. For June, the greenish fly; the body of black wool, with a yellow list on either side, the wings taken off the wings of the buzzard, bound with black broken hemp.

5. The moorish-fly; the body of duskish wool, and the wings of the blackish mail of the drake.

6. The tawny-fly, good till the middle of June; the body made of tawny wool, the wings in opposition to each other, of the whitish mail of a white drake.

7. For July, the wasp-fly; the body of black wool, cast about with yellow silk, and the wings of the drake's feathers.

8. The steel-fly, good in the middle of July; the body of greenish wool, cast about with the feathers of a peacock's tail, and the wings of those of the buzzard.

9. For August, the drake-fly; the body of black wool cast about with black silk, his wings of the mail of a black drake, with a black head. For the different kinds of Fishes, and directions for taking them, see each under its proper article.

Directions for artificial Fly-Fishing.

1. Fish in a river that has been somewhat disturbed by rain, or in a cloudy day, when the waters are moved by a gentle breeze; if the wind be low, the best angling will be in swift streams, but if it blow rather strong, yet not so but that you may conveniently guard your tackle, the fish will rise in plain deeps.

2. Always angle with a small fly and clear wings, in clear rivers; but use larger in muddy places.

3. Keep at as good distance from the water-side as you can, and fish down the stream with the sun in your face, and touch not the water with your line.

4. When the water becomes brownish after rain, use an orange fly; and in a clear day, a light-coloured fly, and a dark fly for dark waters, &c.

5. Have several of the same of every sort of flies differing in colour, to suit the colour of different waters and weathers.

6. Let the fly fall first into the water, and not the line, which last would be apt to frighten the fish.

7. Let your line be twice the length of your rod, unless the river be encumbered with wood.

8. In slow rivers, or still places, cast the fly across the river, and let it sink a little in the water, and draw it gently back with the current.

9. Use a quick eye and nimble hand, in striking with the rising of the fish, lest he should have time to reject the hook.

All who delight in fly-fishing should especially learn the way of making the two chief sorts of artificial flies, the palmer, ribbed with silver or gold, and the may-fly.

In making the palmer-fly, arm your line on the inside of the hook, and cut off as much of a mallard's feathers to make the wing as you find necessary.

Then lay the outer part of the feather next the hook, and the point of the feather towards its shank, whip it three or four times about the hook with the same silk you armed your hook with, and make the silk fast.

Take the hackle of the neck of a cock or capon, (but a plover's top is preferable) and strip off one side of the feather, and then take the hackle, silk, or gold or silver thread, and make all fast at the bent of the hook, working them up to the wings, shifting your fingers at every turn, and then stopping: the gold will in this way fall right, and must be made fast.

After this, take the hook betwixt your fingers and thumb, in the left hand, and with a needle or pin part the wings in two; next with the arming silk (having fastened all hitherto) whip it about as it falls across between the wings, and with your thumb turn the point of the feather towards the bent of the hook, then work it three or four times about the shank, and fasten it; and view the proportion for other flies.

If you make the grounds of hog's wool, sandy, black, or white, or bear's wool, or of a red bullock, work these grounds on a waxed silk, and arm and set on the wings as before directed.

The body of the may-fly must be wrought with some of these grounds, and will appear admirably well, when ribbed with black hair or silk.

Others make their flies with sandy hog's wool, ribbed with black silk, and winged with a mallard's feather according to the angler's fancy.

The oak-fly must be made with orange tawny, or orange coloured crewel, black for the body, and the brown of the mallard's feathers for the wings.

There is also another fly, the body of which is made of the strain of a peacock's feather.

March is the month in which to begin fly-fishing, but if the weather prove windy or cloudy, there are several sorts of palmers that are good at that time: the first is a black palmer ribbed with silver; the second a black palmer with an orange tawny body; a third, whose body is all black; and a fourth a red palmer, ribbed with gold, and a red hackle, mixed with orange crewel.

Observe, that the lightest flies are for cloudy and dark weather, and the darkest for bright and light, and the rest for indifferent seasons.

Salmon flies should be made with their wings standing one behind the other, whether two or four, and of the gaudiest colours that can be, for he delights in such; and this chiefly in the wings, which must be long as well as the tail.

There are twelve kinds of artificial flies for angling with upon the top of the water, and the fittest season for using these, is a blustering windy day, when the waters are so troubled that the natural fly cannot be seen, or rest upon them. The first is the dun-fly of March, the body of which is made of dun-wool, the wings of the partridge's feathers. The second is another dun-fly, the body of black wool, and the wings of the black drake's feathers, and of the feathers under his tail. The third is the stone-fly of April, the body of black wool, made yellow under the wings and under the tail, from the wings of the drake. The fourth is the ruddy fly of the beginning of May, the body of red wool wrapt about with black silk; the feathers from the wings of the drake, with the feathers of a red capon also, which hang dangling on his sides next the tail. The fifth, the yellow or greenish fly, in May likewise; the body made of yellow wool, and the wings of the red cock's hackle or tail. The sixth, the black fly, in May also; the body of black wool, and lapt about with the herle of a peacock's tail; the wings of the wings of a brown capon, with his blue feathers in his head. The seventh the sad yellow fly in June; the body of black wool, with a yellow list on either side, and the wings from the wings of a buzzard, bound with black braked hemp. The eighth, the moorish-fly; the body of duskish wool, and the wings of the blackish male of the drake. The ninth, the tawny-fly, good until the middle of June; the body of tawny wool, the wings contrary opposed to each other, of the whitish male of the wild drake. The tenth, the wasp-fly in July; the body made of black wool, lapt about with yellow silk, the wings of the feathers of the drake or of the buzzard. The eleventh, the shell-fly, good in Mid-July; the body of greenish wool, lapt about with the herle of a peacock's tail, and the wings of the wings of a buzzard. The twelfth, the dark drake-fly, good in August; the body with black wool, lapt about with black silk; his wings of the peacock's feather, and grounds of such wool and crewel as may form the grasshopper; and remember that usually the smallest flies are the best; as also, that the light fly commonly makes most sport in a dark day, and the darkest and least fly in a bright or clear day; lastly, you are to repair upon any occasion to your magazine-bag, and vary and make them lighter or darker according to your fancy or the appearance of the day.

The May-fly may be found in and about that month, near river sides, especially against rain; the oak-fly on the butt or body of an oak or ash, from the beginning of May to the end of August; it is a brownish insect, easy to be discovered, and appears usually with its head downwards towards the root of the tree; the small black-fly, or hawthorn-fly, is to be had on any hawthorn-bush after the leaves are off. With these and a short line you may dap or dop, behind a tree, or in any deep hole, still making it move on the top of the water as if it were alive, and keeping yourself out of sight; by which you will certainly have sport if there be trout.

The two chief salmon-flies are the dragon and the king's-fisher, about two inches long, which may be supplied according to fancy, from the most gaudy feathers that exist, especially from the peacock's; for they will rise at any thing gaudy, and, where they are plentiful, at trout-flies.

There are likewise two moths, great killers about twilight in a serene evening, and the humble-bee a famous chub-killer for any time of the day. They are dubbed in the following manner: the brown moth must be winged from the feather of a brown owl, dubbed with light mohair, with a dark grizzle cock's hackle for the legs, and a red head. The white moth, dubbed with the white strands of an ostrich's feather, its wings of the feather of a white pigeon's wing, a white hackle for the legs, and a black head.

The humble-bee, dubbed with black spaniel's fur, a black cock's hackle whipped over it, the tag of the tail to be of a deep orange colour, and the wings of the feather made of a crow's wing.

Fishing pastes are variously compounded, almost according to the angler's own fancy; but there should always be a little cotton wool, shaved lint, or fine flax intermixed, to keep the parts together, that it may not fall off the hook. White bread and honey will make a proper paste for carp and tench: fine white bread alone, with a little water, will serve for roach and dace: and mutton suet, and soft new cheese, for barbel. Strong cheese, with a little butter, and coloured yellow with saffron, will make a good winter paste for chub.

To make the Palmer and May-Fly.

In the first place, lay the following materials at your side: half a yard of fine round even silk-worm gut, half a yard of red silk, well waxed with wax of the same colour, a hook and needle, some strands off an ostrich's feather, and a fine red hackle; then take the hook, and hold it by the bent between the fore-finger and thumb of your left hand, and with the point and beard of the hook not under your fingers, but nearly parallel with the tops of them; afterwards take the silk and hold it likewise about its middle with your hook, one part lying along the inside of it to your left hand, the other to your right; then take that part of the silk which lies towards your right hand, and, holding the part towards your left tight along the inside of the hook, whip that to the right three or four times round the shank of the hook towards the right hand; after which take the silk-worm gut, and lay either of its ends along the inside of the shank of the hook, till it come near the bent; then hold the hook, silk, and gut, tight between the fore-finger and thumb of your left hand, and afterwards give the part of the silk to your right hand three or four times more over both hook and gut till it come near the end of the shank, and make a loop and fasten it tight; then whip it neatly again over both silk and gut and hook till it come near the bent of the hook, after which make another loop, and fasten it again; then, if the gut should reach further than the bent of the hook, cut it off, and your hook will be whipped on, and the parts of the silk hang from the bent of it.

Having proceeded thus far, wax the longest end of the silk again, and take three or four strands of an ostrich's feather; and holding them and the hook as in the first position, the feathers to the left hand, and the roots of them in the bent of the hook, with the silk that you waxed last, whip them three or four times round; make a loop, and fasten them tight: then turning the strands to the right hand, and twisting them and the silk together with the fore-finger and thumb of your right hand, wind them round the shank of the hook till you come to the place where you first fastened, then make a loop, and fasten them again; if the strand should not be long enough to wind as far as is necessary round the shank, when the silk gets bare you must twist others over it. Having performed this, take your scissors, and cut the body of the palmer into an oval shape, that is, small at the bent and the end of the shank, but full in the centre; but be careful not to cut too much of the dubbing off. Both the ends of the silk being now separated, one at the bent, another at the end of the shank, wax them both again; then take the hackle, hold the small end of it between the fore-finger and thumb of your left hand, and stroke the fibres of it with those of your right, the contrary way from which they are formed; hold your hook as in the first position, and place the point of the hackle in its bent, with that side which grows nearest the cock upwards; and then whip it tight to the hook; but in fastening it, tie as few fibres in as you can: the hackle being fast, take it by the great end, and, keeping the side nearest the cock to the left hand, begin with your right to wind it up the shank upon the dubbing; stopping every second turn, and holding what you have wound tight with your left fingers, whilst with the needle you pick out the fibres you have unavoidably taken in; proceed in this manner till you come to the place where you first fastened, and where there is an end of the silk; then clip off those fibres of the hackle which you held between the finger and thumb, close to the stem; and hold the stem close to the hook; after that take the silk in your right hand, and whip the stem very fast to the hook; then make a loop, and fasten it tight. Take your penknife; and if the part of the stem next the shank of the hook be as long as that of the hook which is bare, pare it fine, wax your silk, and bind it neatly upon the remaining bare part of the hook; then fasten the silk tight, and spread some shoe-maker's wax very lightly on your last binding; after that clip off the ends of the remaining silk, both at the shank and bent of the hook, and all fibres that start or stand ill-conditioned, and the whole is completed. This is called the palmer-fly, or plain hackle, and may, instead of the ostrich's feather above-mentioned, be dubbed with black spaniel's fur. It is an excellent killer. There are three more palmers, which are all to be made in the same manner, only with different articles, which are as follow: When you make the palmer-fly, suit the colour of the silk to the hackle you dub with: a dun hackle requires yellow silk; a black hackle sky-blue silk; a brown or red hackle, red silk; when you make flies that are not palmers, dub with silk that resembles the colour most predominant in the fly; and in making your flies, remember to mix bear's hair and hog's down with your other dubbing, because they repel the water; make your flies always in hot sun-shiny weather, for your waxed silk will then draw kindly, and when you take the dubbing to imitate a fly, always wet it, and then you will be perfect in your imitation; for, though the dubbing when dry may suit, when it is wet it may be quite another colour. Marten's fur is the best yellow you can use.

Great Palmer, or *Hackle*. Dubbed the same as the plain hackle, with the strands of an ostrich's feather, or a black spaniel's fur, and warped with red peacock's hackle untrimmed, that is, leaving the whole length of the hackle staring out (for sometimes the fibres of the hackle are to be shortened all over, sometimes barbed only a little, and sometimes close underneath) with the whole length of fibres on the top or back of the fly, which makes it swim better; and in this manner, on a whirling water, it will kill large fishes.

Golden Palmer, or *Hackle*. The same dubbing, ribbed with gold-twist, and a red hackle over all.

Silver Hackle. Made with a black body also, silver twist above, and a red hackle over all.

The variation that is to be observed in making the gold and silver palmers is this, that when you whip the end of the hackle to the bent of the hook, do the same also to the gold or silver twist, and first wind either of them on the dubbing, observing that they lie flat on it, and then fasten off; afterwards proceed with the hackle as directed; or wind the hackle on the dubbing first, and rib the body with either of the twists afterwards.

These are the standard hackles in fly-fishing, and are taken any month in the year from nine to eleven in the morning, and from one to three in the afternoon, and upon any water; though you must have different sizes of them, and dubbed with different colours, that you may always be able to suit either a dark or clear water, or a bright or cloudy atmosphere; observing that small light-coloured flies are for clear waters and skies, and the larger for dark and cloudy ones. The angler should always try the palmers first, when he fishes in a river that he is unaccustomed to; even in that which he constantly uses, unless he knows what fly is on the water, and it should not be changed till he does know. See Nat. Hist. Pl. XC. XCI. XCII.

FISHING-FROG, in ichthyology. See **LOPHIUS**.

FISHING-STREAMS. The chief sporting-rivers for this purpose in England are the Thames, Severn, Trent, Tyne, Tweed, Medway, Tees, Dove, Isis, Tame, Willey, Avon, Lea, Trevel, Nen, Welland, Darwent, Calder, Wharf, Nid, Don, Swale, Hull, Ouse, and Are. The rivers in Wales are reckoned at above two hundred, the principal of which are the Dee, Wye, Conway, Tivy, Chedley-day, Cluid, Usk, Tovy Taff, and Dovy. Several rivers in England run under ground, and then rise again, as a branch of the Medway in Kent; the Mole in Surrey; Hans in Staffordshire; the little rivers Allen in Denbighshire, and Deveril in Wiltshire: the river Recall hides itself under ground near Elmsley in the North Riding of Yorkshire: at Chelder near Axbridge, in Somersetshire, is a spring that drives twelve mills in a quarter of a mile. In the midst of the river Nen, south of Peterborough, in Northamptonshire, is a deep gulph called Medeswell, so cold, that in summer no swimmer is able to endure it, yet it is not frozen in the winter.

Of all these rivers, we shall chiefly notice the Thames, as well because it is the largest, and noblest, as because it affords the greatest diversity of sporting. The higher an angler goes up the Thames, if within about four miles from London, the more sport and the greater variety of fishes he will meet with; but as few citizens go so far from home, we shall mention the best places for angling from London-bridge to Chelsea: but remember that if the air be cold and raw, the wind high, the water rough, or if the weather be wet, it is totally useless to angle in any part of the Thames; but when the sky is serene, the air temperate, and the water smooth, you may expect success. Remember also that the proper hours for angling are from the time that the tide is half ebbed, to within two hours of high-water, provided the land-floods flow. Always pitch your boat under the wind; that is, if the wind be in the south, always keep on the Surrey shore; if north, on the London side.

The best places then for pitching a boat to angle in the Thames are about one hundred and fifty yards from York-stairs, the Savoy, Somerset-house, Dorset-stairs, Blackfriars-stairs, the Dung-wharf near Water-lane, Trig-stairs, and Essex-stairs. On the Surrey side, Falcon-stairs, Barge-houses, Cuper's, *vulgo* Cupid's stairs; the Windmill, and Lambeth.

When you go to angle at Chelsea, on a calm, fair day, the wind being in a right corner, pitch your boat almost opposite to the church, and angle in six or seven feet water, where, as well as at Battersea-bridge, you will meet with plenty of roach and dace.

Mortlake deeps are the next place where roach principally resort, when the weeds are rotten: and here good carp are very often taken.

From the sides of the Aits, opposite to Brentford, Isleworth, and Twickenham, there is famous angling for roach, dace, gudgeons, and perch; very often you will meet with trout and carp.

Teddington banks are remarkable for good gudgeons, roach, &c.

Kingston-wick and Kingston are famous for barbel, roach, and dace.

At Hampton and Sunbury there is good angling for barbel, roach, dace, chub, gudgeons, and skeggers: and from the Aits for trout and perch.

Walton-deeps and Shepperton-pool abound with large barbel and dace.

At and about Windsor is a vast variety of all sorts of fishes; but if a man be found angling in another's water (without leave) he is fined very high by the court of that town, if he only catch a single gudgeon.

Of the rivers that empty themselves into the Thames, and of others which are not far from it, we may observe as follows:

1. In Ilford-river, the upper part abounds with roach, dace, and some perch; but between Ilford and the Thames, especially about three miles from that town, there is pike.

2. Woodford-river is stored with perch, chub, roach, and dace.

3. Stratford-river affords the angler good diversion for roach, dace, chub, perch, &c.

4. Bow-river has the same fishes in it as the Stratford-river.

5. Hackney-river has plenty of large barbel, chub, roach, dace, gudgeon, eels, and lampreys. In this river the barbels, eels, and gudgeons, are very fine.

6. Waltham-river, besides large barbel, chub, roach, dace, gudgeon, and eels, has good store of fine pike, and some carp.

7. The New-river is pretty well stored with chub, roach, dace, gudgeon, and eels.

8. Brentford-river was a good one formerly, but is now much abused by poachers: yet the angler may meet with some chub, roach, dace, and perch.

9. Hounslow-river is well stored with roach, dace, perch, pike, and gudgeon.

The Powder-mill-tail, near Hounslow, is an excellent place for angling.

10. Colne-river abounds with chub, roach, dace, perch, trout, and pike.

11. Uxbridge-river is excellent for large eels and fat trouts: but, as the water is rented, not only leave must be obtained to angle in it, but must pay so much per pound for what you kill. Denham, near Uxbridge, is a very famous place.

These all lie north of the Thames: on the south we shall notice,

1. Deptford-river, now very much decayed, and having but few fishes in it, as roach, dace, and flounders: though by chance you may meet with a trout.

2. Lewisham-river, in which are some good trouts, large roach, chub, gudgeon, perch, and dace.

3. Wandsworth-river, well stored with gudgeons, dace, flounders, perch, pike, and some carp and trouts; very large silver eels are often taken here.

4. Mitcham-river, its principal fish is trout.

5. Martin-river, trout also.

6. Carshalton-river, abounding with trout and other white fishes.

7. Moulsey-river, yielding perch, jacks, roach, dace, chub, gudgeons, eels, flounders, barbels, and trouts.

8. Esher-river, good for jacks, perch, chub, roach, dace, gudgeons, eels, flounders, barbels, and trouts.

9. Cobham-river, stored with plenty of good trout, fat and large, as also dace, perch, chub, jacks, and gudgeons.

10. Weybridge-river, affording good diversion for carp, some of which weigh eight or nine pounds; also jack, roach, dace, flounders, popes, large bleak, barbel, and gudgeons.

11. Byfleet-river, in which are very large pikes, jack, and tench; perch, of eighteen inches long; good carp, large flounders, bream, roach, dace, gudgeons, popes, large chub, and eels.

Fishing-wiles. Fishes are enticed by peculiar odours, and may in consequence be taken with ease. For this purpose, mix the juice of houseleek with nettles and cinquefoil chopped small, rub your hands with the mixture, and distribute it in quantities in the water; put your hand into the water, and the fishes will suffer themselves to be taken with ease.

Fishes may be drawn into any place or part of a river, by throwing in the following composition:—Take goat's, bullock's, and sheep's blood, which is found curdled among the entrails in the body of the animal fresh killed; pound well with these, thyme, marjoram, origan, flour, garlic, wine-lye, and suet, and let the whole be made into masses or large bolusses; these must be scattered into the pond discretionally, where you wish to entice the fish.

Pound nettles with joubarbe and a small quantity of cinquefoil grass; to these add wheat boiled in marjoram, and thyme water; pound the whole together, and drop it into the net.

Take heart-wort and slack-lime, make them into a paste, which throw into standing water; this will fix them, and cause them to be taken at pleasure.

Make a paste of coculus indicus, cummin, old cheese, wine-lye, and wheat flour; throw small pieces of it into clear and undisturbed parts of the pond or river, and every fish that swallows one of these bolusses will become so intoxicated as to swim upon the surface of the water, and suffer itself to be taken. This intoxication will cease in a short time; hence those who use this method must take them quickly.

A pond at Faringdon, in Berkshire, which was well stocked with carp, tench, and perch, was poisoned in this manner in the night, and in the morning most of the fishes were found floating on the surface of the water. They were taken out and put into a small stewpond full of clear spring water, when the carp and tench recovered, but all the perch died; but this might possibly be owing to the coldness of the water. See the article Stew.

Take fishers' berries, pound them in a mortar, and with water make them into a paste; throw pills of this into the water, and it will have the same effect as the former.

Pound marjoram, marigolds, wheat flour, and rancid butter, and it will allure fishes of all kinds to the net.

Take gum ivy, and put a good deal of it into a box made of oak, and rub the inside of it with this gum. When you angle put three or four worms into it, but they must not remain there long; for if they do it will kill them: then take them out, and fish with them, putting more in their place, as you may want them, out of your worm bag. Gum ivy is a tear which drops from the body of large ivy trees, on being wounded, and is of a yellowish red colour, of a strong scent, and sharp taste; that which is sold in the shops is counterfeit, and good for nothing. Therefore, to get gum ivy, about Michaelmas, or in the spring, drive several great nails into large ivy stalks, wriggle the same till they become very loose, and let them remain, and the gum will thence issue. Slit also, at the same seasons, several great ivy stalks, and visit them once a month, and gather the gum which flows from the wounded part. This will very much improve the angler's success.

Take assafetida three drachms, camphor one, Venice turpentine one; pound the whole together in a mortar, with some drops of oil of lavender or spike. When you angle anoint eight inches of your line with it, next your hook, and it will prove excellent for a trout in muddy water, and for gudgeons in clear.

Dissolve gum ivy in oil of spike, and anoint your bait for a pike with it, and he will take it the sooner.

Take heron's fat, the best assafetida, and mummy, finely powdered, of each two drachms; cummin-seed, finely powdered, two scruples; camphor, galbanum, and Venice-turpentine, of each one drachm, civet two grains. Make them into a thinnish ointment, with oils of lavender, aniseed, and camomile, and keep the mixture in a narrow-mouthed and well-glazed gallipot, close covered with a bladder and leather, and it may be preserved two years. When you want to use it, put some into a small taper pewter box, and anoint your line with it, about eight or nine inches from the hook, and when it is washed off repeat the unction.

Take fresh horse-dung, and put it into a bag, or net, throw it into the water, and the fishes will gather about it.

Boil barley in water till it bursts, then boil it with liquorice, a little mummy and honey; beat all together in a mortar, till it is stiff as paste, which put into boxes close stopped; when you fish, take about the quantity of a walnut of it, and boil it in an earthen pot, with two handfuls of fresh barley, and a little liquorice, leaving it till it is almost dry; then throw it into the places where you would have the fish come, and they will gather together.

Take the herb dragon-wort, from which extract the juice, with it rub your hands, and fishes will approach and suffer themselves to be taken in the water; the proper hour for fishing is from five till six in the morning.

Take a piece of heron's flesh, and put it into a bottle close covered with clay, or wax, with some musk, amber, and civet; put the pot into a kettle full of water, and make it boil till you are sure the flesh is converted into oil, then take out the bottle, and pour out the oil; with which rub your line, and all the fish will come to be taken.

Take fat of a heron, mummy, galbanum, each two drachms, musk one grain, aqua vitæ two ounces; mix all together, in an earthen porringer over a gentle fire, and stir till it is thick; keep it in a leaden porringer, and with it rub the hook, or the ends of the line, or cork, and the fish will come so that you may take them with your hands.

Take the belly of a heron, that is, the bowels or entrails, cut in pieces, and put it into a glass phial, which stop close with wax: then bury it in hot horse-dung, and let it turn to oil, which will be within ten or fifteen days; then take an ounce of assafetida, and mixing it with the oil, it will all thicken like honey; with which anoint your line, stick, or rod, or the bait you put upon the hook.

FI′SHKETTLE. *s.* (*fish* and *kettle.*) A caldron made long for the fish to be boiled without bending (*Grew*).

FI′SHMEAL. *s.* Diet of fish (*Sharp*).

FI′SHMONGER. *s.* A dealer in fish (*Carew*).

FI′SHY. *a.* (from *fish.*) 1. Consisting of fish. 2. Inhabited by fish (*Pope*). 3. Having the qualities or form of fish (*Brown*).

FI′SSILE. *a.* (*fissilis*, Latin.) Having the grain in a certain direction, so as to be cleft (*Newton*).

FISSI′LITY. *s.* (from *fissile.*) The quality of admitting to be cloven.

FISSU′RA MAGNA SLYLVII. The anterior and middle lobes of the cerebrum on each side are parted by a deep narrow sulcus, which ascends obliquely backwards, from the temporal ala of the os sphenoides, to near the middle of the os parietale, and this sulcus is thus called.

FI′SSURE. *s.* (*fissura*, Latin; *fissure*, French.) A cleft; a narrow chasm where a breach has been made (*Woodward*).

To FI′SSURE. *v. a.* (from the noun.) To cleave; to make a fissure (*Wiseman*).

FI′SSURE. (*fissura.*) In surgery, the species of fracture in which the bone is slit, but not completely divided.

FIST. *s.* (ꝼıꞅꞇ, Saxon.) The hand clenched with the fingers doubled down (*Denham*).

To FIST. *v. a.* 1. To strike with the fist (*Dryden*). 2. To gripe with the fist (*Shakspeare*).

FISTELLA, a fortified town of Morocco, whose inhabitants carry on a brisk trade in fine garments. Lat. 32. 27 N. Lon. 5. 55 W.

FISTIC NUT. See PISTACHIO NUT.

FI′STICUFFS. *s.* (*fist* and *cuff.*) Battle with the fist; blows with the fist (*More*).

FISTUCA, in antiquity, a wooden instrument used in driving piles, and fitted with two handles.

FISTULA. (*fistula*, *quasi fusula*, from *fundo*, to pour out.) A term in surgery, applied to a long and sinuous ulcer that has a narrow opening, and sometimes leads to a larger cavity.

FISTULA LACHRYMALIS. See SURGERY.

FISTULA, in ancient music, a wind instrument. Some of these had holes, others none: some consisted of a single pipe, others of many.

FISTULA PANIS, pipes of Pan, or mouth-organ, consists of a range of pipes bound together side by side, and gradually lessening with

NATURAL HISTORY,

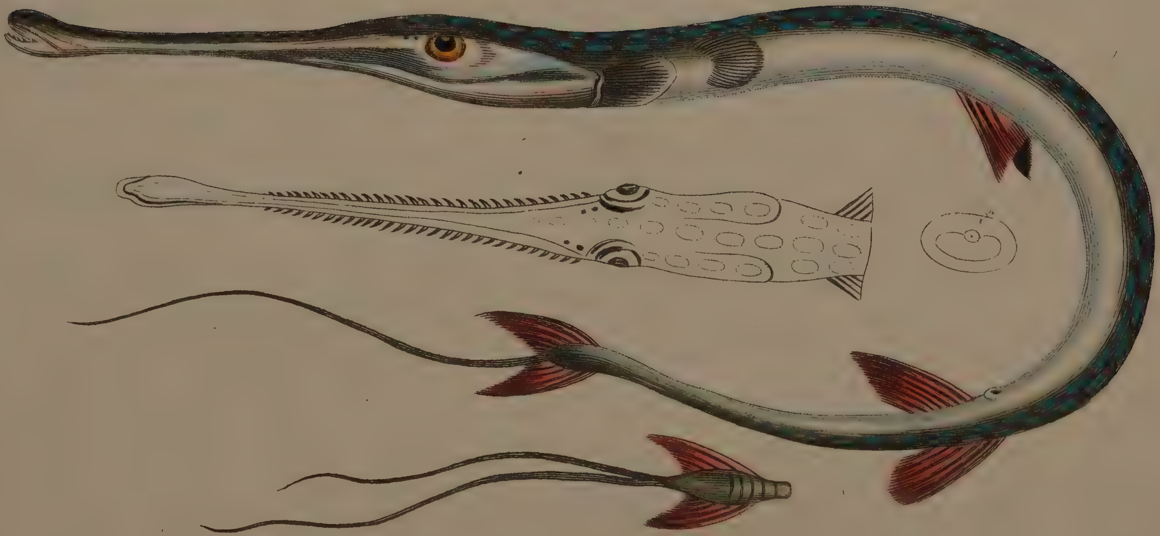
Fistularia Tabacaria.

Tobacco Pipe Fish.



London Published by Sherwood & C^o. Paternoster Row [illegible]

respect to each other, in length and diameter. The longest pipe is about six inches, and the shortest about two inches in length. In performance it is held in the hand, and the pipes are blown into by the mouth at one end.

Fistula pastorica, the name given by Cicero, and others, to the oaten pipe used, by the audience at the Roman theatres, to express their disapprobation.

FI'STULAR. *a.* (from *fistula.*) Hollow like a pipe.

FI'STULARIA. Tobacco-pipe-fish. In zoology, a genus of the class pisces, order abdominales. Snout cylindrical; jaws distant from the eyes; gill membrane with seven rays: body round, gently tapering from the jaws to the tail. Three species, as follow:

1. F. tabacaria. Tail bifid; ending in a slender, taper whip, of the consistence of whale-bone, and about four inches long from the middle of it. Inhabits America and Japan: is about a foot long, and has the general appearance of an eel: lives on smaller fishes, sea-insects, and worms, which it dextrously drags from the cavities of rocks by the peculiar construction of its snout. See Nat. Hist. Pl. CXV.

2. F. chinensis. Tail rounded without the long appendage of F. tabacaria. Inhabits India: longer than the former; habits much the same.

3. F. paradoxa. Body reticulate with prominent lines; tail lanceolate. Inhabits Amboyna: two inches long: has some resemblance to a syngnathus; body whitish-ash, with obsolete brown rivulets; the first dorsal fin and tail blackish; compressed and spinous at the intersections of the lines; back perfectly triangular; belly towards the ventral fins nearly triangular, and behind them narrow, and equally six-sided; tail slenderer, compressed, and seven-sided.

FISTULOUS STEM, in botany, hollow like a pipe or reed. Opposed to farctate, stuffed, or full. Fistulosum folium, a fistulous leaf; as in œnante fistulosa: and fistulous nectary; as in aconitum.

FIT. *s.* 1. A paroxysm or exacerbation of any intermittent distemper (*Sharp*). 2. Any short return after intermission; interval (*Rogers*). 3. Any violent affection of mind or body (*Spenser*). 4. Disorder; distemperature (*Shakspeare*). 5. It is used for the hysterical disorders of women, and the convulsions of children.

Fit. *a.* 1. Qualified; proper (*Cowley*). 2. Convenient; meet; proper; right (*Addison*).

To Fit. *v. a.* (*vitten*, Flemish.) 1. To accommodate to any thing; to suit one thing to another (*Denham*). 2. To accommodate a person with any thing (*Wiseman*). 3. To be adapted to; to suit any thing (*Boyle*). 4. *To* Fit *out.* To furnish; to equip (*Dryden*). 5. *To* Fit *up.* To furnish; to make proper for the use or reception of any (*Pope*).

To Fit. *v. n.* To be proper; to be becoming.

Fits of easy reflection, &c. in optics. Sir Isaac Newton calls the successive disposition of a ray to be reflected through different thicknesses of a plate of air, or any other substance, the returns or fits of easy reflection, and the disposition of the same ray to be transmitted in the same manner through the intervening spaces, returns or fits of easy transmission. Thus, a ray of light is in a fit of easy reflection, when it falls on a plate of any kind of matter, whose thickness is one of the terms of the series 1, 3, 5, 7, &c. taking the smallest thickness capable of reflecting such ray for unit; and, in the same way, it is in one of its fits of easy transmission when the thickness is one of the terms of the series 2, 4, 6, 8, &c. See Optics.

FITCH. *s.* A small kind of wild pea; commonly *vetch*. See Cicer.

FITCHET, in mastiology. See Viverra.

FI'TFUL. *a.* (*fit* and *full.*) Varied by paroxysms (*Shakspeare*).

FI'TLY. *ad.* (from *fit.*) 1. Properly; justly; reasonably (*Tillotson*). 2. Commodiously; meetly (*Donne*).

FI'TMENT. *s.* (from *fit.*) Something adapted to a particular purpose: not used (*Shakspeare*).

FI'TNESS. *s.* (from *fit.*) 1. Propriety; meetness; justness; reasonableness (*Hooker*). 2. Convenience; commodity; the state of being fit (*Shakspeare*).

FI'TTER. *s.* (from *fit*). 1. The person or thing that confers fitness for any thing (*Mortimer*). 2. A small bit (from *fettu*, Italian.)

FITZ. *s.* (Norman). A son; as *Fitzherbert*, the son of Herbert; *Fitzroy*, the son of the king. It is commonly used of illegitimate children.

FITZHERBERT (Sir Anthony), a very learned lawyer in the reign of king Henry VIII. was descended from an ancient family, and born at Norbury in Derbyshire. He was made one of the judges of the court of common-pleas in 1523, and distinguished himself by many valuable works, as well as by such an honourable discharge of the duties of his office, as made him esteemed an oracle of the law. His writings are, The Grand Abridgement; The Office and Authority of Justices of Peace; The Office of Sheriffs, Bailiffs of Liberties, Escheators, Constables, Coroners, &c.; Of the Diversity of Courts; The New Natura Brevium; Of the Surveying of Lands; and The Book of Husbandry. He died in 1538.

FIVE. *a.* (ꝼıꝼ, Saxon.) Four and one; half of ten. The number five has this peculiar property, that when multiplied by an odd number, the product will always terminate with five; and if multiplied by an even number, it will terminate with a cypher. Hence, every power of five necessarily terminates with five.

Five Churches, an episcopal town of Lower Hungary; subject to the house of Austria. It is 85 miles S. of Buda. Lat. 46. 5 N. Lon. 18. 13 E.

Five-cleft, in botany, quinquifidus. See Cleft.

Five-fold leaves, in botany, quinate; quintuple. In fives; growing by fives; or five and five together.

Five-lobed leaf, in botany, quinquelobed; quinquelobatum folium. See Lobate and Lobed.

Five-parted leaf, in botany, quinquepartitum folium. Five-parted corol. Corolla quinquepartita. See Partitum.

Five-leaved grass. See Pentaphyllum.

Five-toothed, in botany, quindentate. Applied to petal and capsule. See Dentate.

Five-valved, in botany, quinvalve. Applied to the capsule. See Valve.

Fives. *s.* 1. A kind of play with a bowl. 2. A disease of horses (*Shakspeare*).

FIUM, the capital of a province of the same name, in Egypt, Africa. The inhabitants are numerous, and they maintain a bishop here. Their principal trade is in flax, linen-cloth, mats, raisins, and figs. It is 70 miles S. W. of Cairo. Lat. 29. 2 N. Lon. 30. 49 E.

FIUME, or St. Viet, a seaport town of Istria, noted for wine and figs. Lat. 45. 40 N. Lon. 14. 46 E.

To FIX. *v. a.* (*fixer*, Fr. *fixus*, Lat.) 1. To make fast, firm, or stable (*Milton*). 2. To settle; to establish invariably (*Locke*). 3. To direct without variation (*Dryden*). 4. To deprive of volatility (*Locke*). 5. To pierce; to transfix (*Sandys*). 6. To withhold from motion.

To Fix. *v. n.* 1. To determine the resolution (*Locke*). 2. To rest; to cease to wander (*Waller*). 3. To lose volatility, so as to be malleable.

FIX-FAX, a name given by farriers to the cervical ligament of a horse, a tough, white, flat, and long substance, attached to the muscles of the neck, and stretching itself in the direction of the mane. In some counties it is called tax-wax.

FIXA'TION. *s.* (French.) 1. Stability; firmness; steadiness (*K. Charles*). 2. Residence in a certain place (*Raleigh*). 3. Forbearance of excursion (*Watts*). 4. Want or destruction of volatility (*Bacon*). 5. Reduction from fluidity to firmness (*Glanville*).

FIXED AIR. See Carbonic acid.

Fixed bodies. Chemists give this name to those substances which cannot be caused to pass by a strong rarefaction from the liquid state to that of an elastic fluid.

Fixed stars are such as constantly retain the same apparent distance from each other in the concave surface of the heavens; and probably the same absolute position and distance with respect to each other. These are what we properly call stars, the others being spoken of under the peculiar denominations of Comet and Planet.

FI'XEDLY. *ad.* (from *fixed.*) 1. Certainly; firmly (*Locke*). 2. Stedfastly (*Burnet*).

FI'XEDNESS. *s.* (from *fixed.*) 1. Stability; firmness. 2. Want or loss of volatility (*Locke*). 3. Solidity; coherence of parts (*Bentley*). 4. Steadiness; settled opinion (*K. Charles*).

FIX'IDITY. *s.* Coherence of parts (*Boyle*).

FI'XITY. *s.* (*fixité*, French.) Coherence of parts, opposed to volatility (*Newton*).

FIXLMILLNER (Placidus), a celebrated German astronomer, was born at Achleitan in Hither Austria, in May 1721. He conceived an early attachment to the mathematics, and took so much pains in delineating mathematical figures, that his mother, out of derision, called him the almanac maker. He commenced his education at the convent of Kremsmunster, and completed it at Saltzburgh. In 1737 he publicly took the vows in the convent at Kremsmunster; and about 1740 obtained the degree of doctor in theology. In 1745 he was appointed professor of canon law, an office which he held forty-eight years, but resigned it a short time before his death. In this department his knowledge was very extensive. He published in 1760 a theological work, called Reipublicæ Sacræ Origines Divinæ; but he acquired much more celebrity by his astronomical labours, both as an observer and a writer. In 1762 he was appointed astronomer at Kremsmunster, and applied with great zeal to the duties of this new station. He soon acquired a considerable rank among astronomical writers. In 1765 he published his Meridianus Speculæ Astron. Cremifanensis, in which he established the first elements of his observatory, and determined its longitude and latitude. In 1776 he published his second astronomical work, called Decennium Astronomicum, which contained the observations made by him at Kremsmunster from 1765 to 1775, and which is replete with important and useful information. His third work, on which he was employed towards the close of his life, and which was printed after his death, contains a valuable collection of observations made between the years 1776 and 1791, together with a great many calculations and treatises, which still add to his celebrity in this department. Besides these, many important articles written by him are to be found in the Journal des Savans; Bernoulli's Epistolary Correspondence; the French Ephemerides des Move; the Astronomical Almanac of Berlin; the Astronomical Ephemerides of Vienna; and the Memoirs of the Royal Academy of Sciences at Paris. Fixlmillner made a great number of excellent observations upon Mercury, which enabled Lalande to complete his accurate tables of that planet: he was the first who supported Bode's conjecture, that the star 34, in Taurus, observed by Flamsteed, and afterwards lost, was the planet Herschel. Fixlmillner died in August 1791, in his 71st year. To uncommon industry he united great penetration and deep reflection, as is proved by the great many excellent remarks and discoveries to be found in his works. It must here be added, that this able astronomer lived in a remote part of the country, at a distance from all literary helps, and from others who pursued the same studies; that is to say, from all those things which could animate his zeal; and yet he continued, till the last day of his life, a singular instance of perseverance and attachment to his favourite study.

FI'XTURE. *s.* (from *fix.*) 1. Position (*Shakspeare*). 2. Stable pressure (*Shakspeare*). 3. Firmness; stable state (*Shakspeare*).

FI'ZGIG. *s.* A kind of dart or harpoon with which seamen strike fish (*Sandys*).

FLA'BBY. *a.* (*flaccidus*, Lat.) Soft; not firm; easily shaking (*Arbuthnot*).

FLA'BILE. *a.* (*flabilis*, Latin.) Subject to be blown.

FLA'CCID. *a.* (*flaccidus*, Latin.) Weak; limber; not stiff; lax; not tense (*Holder*).

FLACCI'DITY. *s.* (from *flaccid.*) Laxity; limberness; want of tension (*Wiseman*).

FLACOURTIA, in botany, a genus of the class monoecia, order icosandria. Male: calyx five-parted; corolless; stamens very numerous. Female: calyx many-leaved; corolless; germ superior; styles from five to nine; berry many-celled. One species; a thorny shrub of Madagascar, with red pubescent petioles.

To FLAG. *v. n.* (*flaggeren*, Dutch.) 1. To hang loose without stiffness or tension. 2. To grow spiritless or dejected (*Swift*). 3. To grow feeble; to lose vigour (*B. Jonson*).

To **Flag.** *v. a.* 1. To let fall into feebleness; to suffer to droop (*Prior*). 2. To lay with broad stone (*Sandys*).

Flag. *s.* (from the verb.) 1. A water plant with a bladed leaf and yellow flower (*Sandys*). 2. The colours or ensign of a ship or land forces (*Temple*). 3. A species of stone used for smooth pavements (*flache*, old French.) (*Woodward*).

Flag, a general name for colours, standards, ancients, banners, ensigns, &c. which are frequently confounded with each other.

The fashion of pointed, or triangular flags, as now used, came from the Mahometan Arabs, or Saracens, upon their seizing of Spain, before which time all the ensigns of war were stretched or extended on cross pieces of wood, like the banners of a church. The pirates of Algiers, and throughout the coasts of Barbary, bear an hexagonal flag.

Flag is more particularly used at sea, for the colours, ancients, standards, &c. borne on the top of the masts of vessels, to notify the person who commands the ship, of what nation it is, and whether it is equipped for war or trade.

The admiral in chief carries his flag on the main-top; the vice-admiral on the fore-top; and the rear-admiral on the mizen-top.

When a council of war is to be held at sea, if it be on board the admiral, they hang a flag in the main-shrouds; if in the vice-admiral, in the fore-shrouds; and if in the rear-admiral, in the mizen-shrouds.

Beside the national flag, merchant-ships frequently bear lesser flags on their mizen-mast, with the arms of the city where the master ordinarily resides: and on the fore-mast, with the arms of the place where the person who freights them lives.

To lower, or strike the flag, is to pull it down upon the cap, or to take it in, out of respect or submission, due from all ships or fleets inferior, to those any way justly their superiors. To lower or strike the flag in an engagement is a sign of yielding.

The way of leading a ship in triumph is to tie the flags to the shrouds or the gallery, in the hind part of the ship, and let them hang down towards the water, and to tow the vessels by the stern.

To heave out the flag, is to put out, or put abroad, the flag.

To hang out the white flag, is to ask quarter; or it shews when a vessel is arrived on a coast, that it has no hostile intention, but comes to trade, or the like. The red flag is a sign of defiance and battle.

Flag, or Flag-flower. See **Iris.**

Flag (Sweet-scented). See **Acorus.**

Flag (Corn). See **Gladiolus.**

Flag-officers, those who command the several squadrons of a fleet, such as the admirals, vice-admirals, and rear-admirals.

The flag-officers in our pay are the admiral, vice-admiral, and rear-admiral, of the white, red, and blue. See the article **Admiral.**

Flag-ship, a ship commanded by a general or flag-officer, who has a right to carry a flag, in contradistinction to the secondary vessels under its command.

Flag-staves, are staves set on the heads of the top-gallant-masts, serving to let fly or unfurl the flag.

Flags, in falconry, are the feathers in a hawk's wing, near the principal ones.

Flag is used for sedge, a kind of rush; and for the upper part of turf, pared off to burn.

FLAGELLA'TION. *s.* (from *flagello*, Latin.) The use of the scourge (*Garth*).

FLAGELLANTES, a sect of wild fanatics who chastised and disciplined themselves with whips in public. The sect of the Flagellantes had its rise in Italy in the year 1260: its author was one Rainier, a hermit; and it was propagated from hence through almost all the countries of Europe. It was in all probability no more than the effect of an indiscreet zeal. A great number of persons of all ages and sexes made processions, walking two by two with their shoulders bare, which they whipped till the blood ran down, in order to obtain mercy from God, and appease his indignation against the wickedness of the age. They were then called the *devout*; and having established a superior, he was called *the general of the devotion*. Though the primitive Flagellantes were exemplary in point of morals, yet they were joined by a turbulent rabble, who were infected with the most ridiculous and impious opinions; so that the emperors and pontiffs thought proper to put an end to this religious phrensy, by declaring all devout whipping contrary to the divine law, and prejudicial to the soul's eternal interest.

FLAGELLA'RIA, in botany, a genus of the class hexandria, order trigynia. Calyx six-parted; corolless; berry superior, one-seeded.

Two species; natives of India: one a creeping herbaceous plant, the other a shrub with flowers in a terminal panicle.

FLAGE'LLIFORM. Whip-like. In botany. See Runner. Hence a sort of cactus has the name of flagelliformis, because it resembles the lash of a whip, flagellum.

FLAGEOLET, a small pipe or flute, the notes of which are exceedingly clear and shrill. It is generally made of box or other hard wood, though sometimes of ivory, and has six holes for the regulation of its sounds, besides those at the bottom and mouth-piece, and that behind the neck. (*Busby*).

FLA'GGINESS. *s.* (from *flaggy*.) Laxity; limberness; want of tension.

FLA'GGY. *a.* (from *flag*.) 1. Weak; lax; limber; not tense (*Dryden*). 2. Weak in taste; insipid (*Bacon*).

FLAGI'TIOUS. *a.* (from *flagitius*, Latin.) 1. Wicked; villanous; atrocious (*Roscom.*). 2. Guilty of crimes (*Pope*).

FLAGI'TIOUSNESS. *s.* (from *flagitious*.) Wickedness; villany.

FLA'GON. *s.* (*flaçon*, French.) A vessel of drink with a narrow mouth (*Roscommon*).

FLA'GRANCY. *s.* (*flagrantia*, Lat.) Burning; heat; fire (*Bacon*).

FLA'GRANT. *a.* (*flagrans*, Lat.) 1. Ardent; burning; eager (*Hooker*). 2. Glowing; flushed (*Pope*). 3. Red; imprinted red (*Pri.*). 4. Notorious; flaming into notice (*Smith*).

FLAGRA'TION. *s.* (*flagro*, Lat.) Burning.

FLAIL, an instrument for thrashing corn. A flail consists of the following parts: 1. The hand-staff, or piece held in the thrasher's hand. 2. The swiple, or that part which strikes out the corn. 3. The caplins, or strong double leathers, made fast to the tops of the hand-staff and swiple. 4. The middle-band, being the leather thong, or fish skin, that ties the caplins together.

FLAIR, in the sea language. When a ship is housed in near the water, so that the work above hangs over too much, it is said to flair over. This makes the ship more roomy aloft, for the men to use their arms.

FLAKE. *s.* (*floccus*, Latin.) 1. Any thing that appears loosely put together, like a flock of wool (*Grew*). 2. A stratum; layer; film; lamina (*Sandys*).

To Flake. *v. a.* (from the noun.) To form in flakes, or bodies loosely connected (*Pope*).

To Flake. *v. n.* To break into laminæ; to part in loose bodies.

Flake, in the cod-fishery, a sort of scaffold or platform, made of hurdles, and supported by stanchions, and used for drying codfish in Newfoundland. These flakes are usually placed near the shores of fishing-harbours.

Flake, in gardening, a name given by the florists to a sort of carnations, which are of two colours only, and have very large stripes, all of them going quite through the leaves.

FLA'KY. *a.* (from *flake*.) 1. Loosely hanging together (*Blackmore*). 2. Lying in layers or strata; broken into laminæ.

FLAM. *s.* (a cant word.) A falsehood; a lie; an illusory pretext (*Hudibras*).

To Flam. *v. a.* (from the noun.) To deceive with a lie (*South*).

FLAMBEAU, a kind of large taper, made of hempen wicks, by pouring melted wax on their top, and letting it run down to the bottom. This done, they lay them to dry; after which they roll them on a table, and join four of them together by means of a red-hot iron; and then pour on more wax, till the flambeau is brought to the size required. Flambeaus are of different lengths, and made either of white or yellow wax. They serve to give light in the streets at night, or on occasion of illuminations.

FLAMBOROUGH HEAD, a lofty promontory in Yorkshire, whose snow-white cliffs are seen far out at sea. Its rocks afford shelter to innumerable multitudes of sea-fowls. Lat. 54. 9 N. Lon. 0. 4 E. This was the Fleamburg of the Saxons; so called, as some think, from the lights made on it to direct the landing of Ina, who in 547 joined his countrymen in these parts with a large reinforcement from Germany, and founded the kingdom of Northumberland.

FLAME. *s.* (*flamma*, Latin.) 1. Light emitted from fire (*Newton*). 2. Fire (*Cowley*). 3. Ardour of temper or imagination; brightness of fancy; vigour of thought (*Waller*). 4. Ardour of inclination (*Pope*). 5. Passion of love (*Cowley*).

To Flame. *v. n.* (from the noun.) 1. To shine as fire; to burn with emission of light (*Milton*). 2. To shine like flame (*Prior*). 3. To break out in violence of passion.

Flame, in the first of the above senses, has been conjectured by Newton to be a vapour red-hot. This we think imperfect. We should rather say, that flame is an instance of combustion, whose colour will be determined by the degree of decomposition which takes place. If it be very imperfect, the most refrangible rays only will appear. If it be very perfect, all the rays will appear, and the flame will be brilliant in proportion to this perfection. There are flames, however, which consist of burning particles, whose rays have partly escaped before they ascended in the form of vapour. Such would be the flame of a red-hot coal, if exposed to such a heat as would gradually disperse it into vapour. When the fire is very low under the furnace of an iron-foundery, at the upper orifice of the chimney a red flame of this kind may be seen, which is different from the flame that appears immediately after fresh coals have been thrown on the fire; for, in consequence of adding such a supply to the burning fuel, a vast column of smoke ascends, and forms a medium so thick as to absorb most of the rays excepting the red. On this subject the reader may advantageously peruse the Rev. G. C. Morgan's Observations and Experiments on the Light of Bodies in a State of Combustion, Phil. Trans. vol. 75, or New Abridg. vol. 15, p. 668.

When oxygen gas is decomposed slowly,

the heat is imperceptible, because the caloric is dissipated as soon as generated. When the decomposition goes on faster, the bodies concerned become sensibly warm. A quicker decomposition of the gas heats the bodies so as to render them red hot, which state is called ignition; and when the process is attended with the production of certain fluids, as hydrogen, &c. and the decomposition of oxygen air affords a sufficient developement of caloric, then the fluids themselves are ignited, and decomposed, which constitutes flame, and is thence termed inflammation. When a candle is first lighted, which must be done by the application of actual flame, a degree of heat is given to the wick sufficient to destroy the affinity of its constituent parts: some of the tallow is instantly melted, volatilized, and decomposed, its hydrogen takes fire, and the candle melts. As this is destroyed by combustion, another portion melts, rises and supplies its place, and undergoes a like decomposition. In this way combustion is maintained in a candle. The most brilliant flame is exhibited in oxygen gas, and in this flames of different colours may be produced: thus a mixture of nitrate of strontia and charcoal powder, previously ignited, burns with a rose-coloured flame: one part of boracic acid, and three of charcoal mixed, will burn green: one part of nitrate of barytes and four of charcoal powder burn with a yellow flame: equal parts of nitrate of lime and charcoal powder burn orange red.

As the artificial light of lamps and candles is afforded by the flame they exhibit, it seems a matter of considerable importance to society to ascertain how the most luminous flame may be produced with the least consumption of combustible matter. There does not appear to be any danger of error in concluding, that the light emitted will be greatest when the matter is completely consumed in the shortest time. It is, therefore, necessary, that a stream of volatilized combustible matter of a proper figure, at a very elevated temperature, should pass into the atmosphere with a certain determinate velocity. If the figure of this stream should not be duly proportioned, that is to say, if it be too thick, its internal parts will not be completely burned for want of contact with the air. If its temperature be below that of ignition, it will not burn when it comes into the open air. And there is a certain velocity at which the quantity of atmospherical air which comes in contact with the vapour will be neither too great nor too small; for too much air will diminish the temperature of the stream of combustible matter so much as very considerably to impede the desired effect, and too little will render the combustion languid.

We have an example of a flame too large in the mouths of the chimneys of furnaces, where the luminous part is merely superficial, or of the thickness of about an inch or two, according to circumstances, and the internal part, though hot, will not set fire to paper passed into it through an iron tube: the same defect of air preventing the combustion of the paper, as prevented the interior fluid itself from burning. And in the lamp of Argand we see the advantage of an internal current of air, which renders the combustion perfect by the application of air on both sides of a thin flame. So likewise a small flame is whiter and more luminous than a larger; and a short snuff of a candle giving out less combustible matter in proportion to the circumambient air, the quantity of light becomes increased to eight or ten times what a long snuff would have afforded.

FLAMECO'LOURED. *a.* (*flame* and *colour.*) Of a bright yellow colour (*Peacham*).

FLA'MEN. *s.* (Latin.) A priest; one that officiates in solemn offices (*Pope*).

Flamen, in Roman antiquity, the name of an order of priests, instituted by Romulus or Numa; authors not being agreed on this head. They were originally only three, viz. the Flamen Dialis, Flamen Martialis, and Flamen Quirinalis.

The wife of the Flamen Dialis was called *Flaminica*, and wore a flame-coloured habit, on which was painted a thunderbolt, and above her head-dress she had green oak boughs, to indicate that she belonged to Jupiter the thunderer, to whom the oak was sacred. The Flamines wore each of them a hat or cap called *Flammeum* or *Apex*.

FLAMINGO, in ornithology. See Phœnicopterus.

FLAMINIA VIA, a celebrated road which led from Rome to Ariminum and Aquileia. It received its name from

FLAMINIUS (C.), a Roman consul of a turbulent disposition, who was drawn into a battle near the lake of Thrasymenus, by the artifice of Annibal. He was killed in the engagement, with an immense number of Romans, B. C. 217. *Polyb. Liv.* &c.

Flaminius (T. Q.), or Flamininus, a celebrated Roman, raised to the consulship A. U. C. 554, was trained in the art of war against Annibal. He was sent against Philip, king of Macedonia, and in his expedition he met with uncommon success. The Greeks declared themselves his supporters, and he totally defeated Philip on the confines of Epirus, and made all Locris, Phocis, and Thessaly, tributary to the Roman power. He proclaimed all Greece independent at the Isthmian games. This celebrated action procured him the name of father and deliverer of Greece. He was afterwards sent ambassador to Prussias, king of Bythinia, where, by his prudence and artifice, he soon caused Annibal, who had taken refuge at his court, to dispatch himself. Flaminius was found dead in his bed, after he had imitated with success the virtues of his model Scipio. (*Plut.*)—Lucius, the brother of the preceding, signalized himself in the wars of Greece.—Calp. Flamma, a tribune, who at the head of 300 men saved the Roman army in Sicily, B. C. 258, by engaging the Carthaginians, and cutting them to pieces.

FLAMMABI'LITY. *s.* (*flamma*, Latin.) The quality of admitting to be set on fire (*Brown*).

FLAMMA'TION. *s.* (*flammatio*, Latin.) The act of setting on flame (*Brown*).

FLA'MMEOUS. *a.* (*flammeus*, Lat.) Consisting of flame; resembling flame (*Brown*).

FLAMMI'FEROUS. *a.* (*flammifer*, Lat.) Bringing flame.

FLAMMI'VOMOUS. *a.* (*flamma* and *vomo*, Lat.) Vomiting out flame.

FLAMMULA. (*flammula*, dim. of *flamma*, a fire, named from the burning pungency of its taste.) Small water crow-foot, or spearwort. The roots and leaves of this common plant, ranunculus flammula; foliis ovatis-lanceolatis, petiolatis, caule declinato of Linnéus, taste very acrid and hot, and, when taken in a small quantity, produce vomiting, spasms of the stomach, and delirium. Applied externally, they vesicate the skin. The best antidote after clearing the stomach is cold-water acidulated with lemon-juice, and then mucilaginous drinks. See RANUNCULUS.

FLAMMULA JOVIS. (*flammula jovis*, so called from the burning pungency of its taste.) Upright virgin's bower. Clematis recta; foliis pinnatis, foliolis ovato lanceolatis integerrimis, caule erecto, floribus pentapetalis tetrapetalisque of Linnéus, of the class polyandria, and order of polygynia. More praises have been bestowed upon the virtue which the leaves of this plant are said to possess, when exhibited internally as an antivenereal by foreign physicians, than its trials in this country can justify. The powdered leaves are sometimes applied externally to ulcers as an escharotic. See CLEMATIS.

FLAMSTED, a town of Hertfordshire, in England, five miles from St. Alban's and Dunstable, stands on the river Verlam, and was of old called Verlamstede.

FLAMSTEED (John), a celebrated English astronomer, born at Derby in 1646, and educated at the grammar-school of that town. When very young he discovered a great turn for mathematical learning, and in 1666 he calculated an eclipse of the sun which was about to happen. This being shewn to a gentleman of genius in that line, he greatly encouraged young Flamsteed in his studies, and lent him several books on astronomy. He made so good an use of these, that in 1669 he sent to the royal society calculations of some remarkable eclipses of the fixed stars by the moon, for which he received the thanks of that learned body. The year following he went to London, where he was greatly caressed by the most learned mathematicians of the time. From thence he went to Cambridge, and entered himself of Jesus college. One of his best friends was sir Jonas Moore, who introduced him to the king, and most of the nobility at court. In 1674 that gentleman procured for him the place of astronomer royal, and the same year he entered into holy orders. In 1675 the foundation stone of the royal observatory was laid, and then Mr. Flamsteed removed with all his apparatus to the queen's house at Greenwich, where he resided till his death in 1719. All the church preferment he ever received was the living of Burstow, in Surrey. In 1725 appeared his great work, entitled Historia Celestis Britannica, in 3 vols. folio. In the Philosophical Transactions are many of his papers, and in sir Jonas Moore's System of Mathematics is a tract by Mr. Flamsteed, on the Doctrine of the Sphere. Dr. Wotton, in his Reflections upon Ancient and Modern Learning, styles our author one of the most accurate observers of the planets and stars, and says he calculated tables of the eclipses of the several satellites, which proved very useful to the astronomers. And Mr. Molyneux, in his Dioptrica Nova, gives him a high character; and, in the admonition to the reader prefixed to the work, observes, that the geometrical method of calculating a ray's progress is quite new, and never before published; and for the first hint of it, says he, I must acknowledge myself obliged to my worthy friend Mr. Flamsteed. He wrote several small tracts, and had many papers inserted in the Philosophical Transactions, viz. several in almost every volume, from the 4th to the 29th, too numerous to be mentioned in this place.

FLA'MY. *a.* (from *flame.*) 1. Inflamed; burning; blazing (*Sidney*). 2. Having the nature of flame (*Bacon*).

FLANDERS, a country of the Netherlands, divided into Dutch, Austrian, and French Flanders; the last now included in the department of the North. It is 60 miles long, and 50 broad; bounded on the north by the German ocean and the United Provinces; on the east by Brabant; on the south by Hainault and Artois; and on the W. by Artois and the German ocean. It is a level country, pretty fertile. The manufactures are fine linen, lace, and tapestry.

FLANEL, or FLANNEL, a kind of slight, loose, woollen stuff, composed of a woof and warp, and woven on a loom with two treadles, after the manner of bays. Dr. Black assigns as a reason why flanel and other substances of the kind keep our bodies warm, that they compose a rare and spongy mass, the fibres of which touch each other so slightly, that the heat moves slowly through the interstices, which being filled only with air, and that in a stagnant state, gives little assistance in conducting the heat. Count Rumford, however, has inquired farther into the matter, and finds that there is a relation betwixt the power which the substances usually worn as clothing have of absorbing moisture, and that of keeping our bodies warm. Having provided a quantity of each of those substances, mentioned below, he exposed them, spread out upon China plates, for the space of twenty-four hours to the warm and dry air of a room, which had been heated by a German stove for several months, and during the last six hours had raised the thermometer to 85° of Fahrenheit: after which he weighed equal quantities of the different substances with a very accurate balance. They were then spread out upon a China plate, and removed into a very large uninhabited room upon the second floor, where they were exposed forty-eight hours upon a table placed in the middle of the room, the air of which was at 45° of Fahrenheit. At the end of this space they were weighed, and then removed into a damp cellar, and placed on a table in the middle of the vault, where the air was at the temperature of 45°, and which by the hygrometer seemed to be fully saturated with moisture. In this situation they were suffered to remain three days and three nights: the vault being all the time hung round with wet linen cloths, to render the air as completely damp as possible. At the end of three days they were weighed, and the weights at the different times were found as in the following table.

	Weight after being dried in the hot room.	Weight after coming out of the cold room.	Weight after remaining 72 hours in the vault.
Sheep's wool - -	1000 parts	1084	1163
Beaver's fur - -		1072	1125
The fur of a Russian hare - - -		1065	1115
Eider down - -		1067	1112
Silk: Row single thread -		1057	1107
Silk: Ravellings of white taffety		1054	1103
Linen: Fine lint -		1046	1102
Linen: Ravellings of fine linen		1044	1082
Cotton wool - -		1043	1089
Ravellings of silver lace		1090	1000

On these experiments our author observes, that though linen, from the apparent ease with which it receives dampness from the atmosphere, seems to have a much greater attraction for water than any other; yet it would appear, from what is related above, that those bodies which receive water in its inelastic form with the greatest ease, or are most easily wet, are not those which in all cases attract the moisture of the atmosphere with the greatest avidity. "Perhaps (says he), the apparent dampness of linen to the touch arises more from the ease with which that substance parts with the water it contains, than from the quantity of water it actually holds: in the same manner as a body appears hot to the touch, in consequence of its parting freely with its heat; while another body, which is really at the same temperature, but which withholds its heat with greater obstinacy, affects the sense of feeling much less violently. It is well known that woollen clothes, such as flanels, &c. worn next the skin, greatly promote insensible perspiration. May not this arise principally from the strong attraction which subsists between wool and the watery vapour which is continually issuing from the human body? That it does not depend entirely on the warmth of that covering, is clear; for the same degree of warmth, produced by wearing more clothing of a different kind, does not produce the same effect. The perspiration of the human body being absorbed by a covering of flanel, it is immediately distributed through the whole thickness of that substance, and by that means exposed, by a very large surface, to be carried off by the atmosphere; and the loss of this watery vapour, which the flanel sustains on the one side by evaporation, being immediately restored from the other, in consequence of the strong attraction between the flanel and this vapour, the pores of the skin are disencumbered, and they are continually surrounded by a dry and salubrious atmosphere."

Our author expresses his surprise, that the custom of wearing flanel next the skin should not having prevailed more universally. He is confident it would prevent a number of diseases; and he thinks there is no greater luxury than the comfortable sensation which arises from wearing it, especially after one is a little accustomed to it. "It is a mistaken notion (says he), that it is too warm a clothing for summer. I have worn it in the hottest climates, and at all seasons of the year; and never found the least inconvenience from it. It is the warm bath of perspiration confined by a linen shirt, wet with sweat, which renders the summer heats of southern climates so insupportable; but flanel promotes perspiration, and favours its evaporation; and evaporation, as is well known, produces positive cold."

It has been observed that new flanel, after some time wearing, acquires the property of shining in the dark, but loses it on being washed. See Philos. Trans. No. 483. § 7.

FLANK. *s.* (*flanc*, French.) 1. That part of the side of a quadruped near the hinder thigh (*Peacham*). 2. (In men.) The latter part of the lower belly (*Pope*). 3. The side of any army or fleet (*Hayward*).

To FLANK. *v. a.* 1. To attack the side of a battalion or fleet. 2. To be posted so as to overlook or command any pass on the side (*Dry.*). 3. To secure on the side (*Dryden*).

FLANK, in war, is used by way of analogy for the side of a battalion, army, &c. in contradistinction to the front and rear. To attack the enemy in flank, is to discover and fire upon them on one side. See FILE.

FLANK, in fortification, is a line drawn from the extremity of the face towards the inside of the work. Or, flank is that part of a bastion which reaches from the curtain to the face, and defends the opposite face, the flank, and the curtain. See FORTIFICATION.

FLANKS, in veterinary language, the sides of a horse. In a strict sense, the flanks are the extremities of the belly, where the ribs are wanting, and below the loins. The distance between the last rib and haunch-bone, which is properly the flank, should be short: this is termed *well coupled*. Such horses are most hardy, it is said, and will endure labour longest. A horse is said to have no flank, if the last of the short ribs be at a considerable distance from the haunch-bone; although such horses may at the time have very good bodies, yet, when they are hard laboured, they will lose them. A horse also is said to have no flank when his ribs are too much straitened in their compass, which is easily perceived by comparing their height with that of the haunch-bones; for they ought to be as high and equally raised up as the latter, or but very little less, when the horse is in good case.

A horse is likewise said to have scanty flanks, to be gaunt-bellied, and thin-gutted, when his flank turns up like a greyhound's, and his ribs are flat, narrow, and short. A well-flanked horse is one that has wide and well-made ribs, with a good body.

FLA′NKER. *s.* (from *flank.*) A fortification jutting-out so as to command the side of a body marching to the assault (*Knolles*).

To Fla′nker. *v. a.* (*flanquer*, French.) To defend by lateral fortifications.

FLA′NNEL. *s.* (*gwlanen*, Welsh.) A soft nappy stuff or wool (*Shakspeare*).

FLAP. *s.* (læppe, Saxon.) 1. Any thing that hangs broad and loose (*Brown*). 2. The motion of any thing broad and loose. 3. A disease in horses (*Farrier's Dict.*).

To Flap. *v. a.* (from the noun.) 1. To beat with a flap, as flies are beaten. 2. To move with a flap or noise (*Tickel*).

To Flap. *v. n.* 1. To play the wings with noise (*L'Estrange*). 2. To fall with flaps or broad parts depending (*Gay*).

FLA′PDRAGON. *s.* A play in which they catch raisins out of burning brandy, and eat them. 2. The thing eaten at flapdragon (*Shakspeare*).

To Fla′pdragon. *v. a.* (from the noun.) To swallow; to devour (*Shakspeare*).

FLAPE′ARED. *a.* (*flap* and *ear.*) Having loose and broad ears (*Shakspeare*).

To FLARE. *v. n.* (from *flederen*, Dutch.) 1. To flutter with a splendid show (*Shaks.*). 2. To glitter with transient lustre (*Herbert*). 3. To glitter offensively (*Milton*). 4. To be in too much light (*Prior*).

FLASH. *s.* (φλοζ, *Minshew.*) 1. A sudden, quick, transitory blaze (*Roscommon*). 2. Sudden burst of wit or merriment (*Rogers*). 3. A short transient state (*Bacon*). 4. A body of water driven by violence.

To Flash. *v. n.* 1. To glitter with a quick and transient flame. 2. To burst out into any kind of violence (*Shakspeare*). 3. To break out into wit, merriment, or bright thought (*Felton*).

To Flash. *v. a.* To strike up large bodies of water from the surface (*Carew*).

FLA′SHER. *s.* (from *flash.*) A man of more appearance of wit than reality.

FLA′SHILY. *ad.* (from *flashy.*) With empty show; without real power of wit.

FLA′SHY. *a.* (from *flash.*) 1. Empty; not solid; showy without substance (*Digby*). 2. Insipid; without force or spirit (*Bacon*).

FLASK. *s.* (*flasque*, French.) 1. A bottle; a vessel (*King*). 2. A powder iron (*Shakspeare*).

FLA′SKET. *s.* (from *flask.*) A vessel in which viands are served (*Pope*).

FLAT. *a.* (*plat*, French.) 1. Horizontally level without inclination (*Add.*). 2. Smooth; without protuberances (*Bacon*). 3. Not elevated; fallen (*Milton*). 4. Level with the ground (*South*). 5. Lying prostrate; lying along (*Daniel*). 6. (In painting.) Wanting relief; wanting prominence of the figures. 7. Tasteless; insipid; dead (*Philips*). 8. Dull; unanimated; frigid (*Bacon*). 9. Depressed; spiritless; dejected (*Milton*). 10. Unpleasing; tasteless (*Atterbury*). 11. Peremptory; absolute; downright (*Spenser*). 12. Not shrill; not sharp in sound (*Bacon*).

Flat leaf, in botany. Folium planum. Having an even surface; in opposition to channelled, grooved, &c. When applied to succulent leaves, it has both surfaces parallel, neither convex nor concave, in opposition to gibbous.

Flat. *s.* 1. A level; an extended plane (*Wotton*). 2. Even ground; not mountainous (*Milton*). 3. A smooth low ground exposed to inundations (*Shakspeare*). 4. Shallow; strand; place in the sea where the water is not deep (*Raleigh*). 5. The broad side of a blade (*Dryden*). 6. Depression of thought or language (*Dryden*). 7. A surface without relief, or prominences (*Bentley*).

Flat, a kind of additional or half note, contrived together with sharps to correct the defects in musical instruments. A flat implies that the note which it stands against is to be played or sung half a note lower than it would be without such flat. Thus E ♭, or E flat, signifies a semitone below E natural, and when placed at the beginning of a line or space, shews that all the notes on that line or space are to be sung or played half a note lower throughout the whole piece, unless it be contradicted by a natural.

The whole octave in the diatonic scale is divided into twelve degrees, each being a semitone; and as the distance between each two nominals of the scale, except between B and C and between E and F, is equal to a tone; flats and sharps were found necessary in this case also, to denote the semitonic intervals.

Flat, or minor, key, in music, that key, the third, sixth, and seventh, of which are minor. See Key.

Flat-third, in music, the third minor.

To Flat. *v. a.* (from the noun.) 1. To level; to depress; to make broad and smooth (*Creech*). 2. To make vapid (*Bacon*).

To Flat. *v. n.* 1. To grow flat: opposed to *swell* (*Temple*). 2. To render unanimated or evanid (*King Charles*).

FLA′TLONG. *ad.* (*flat* and *long.*) With the flat downward; not edgewise (*Shaksp.*).

FLA′TLY. *ad.* (from *flat.*) 1. Horizontally; without inclination. 2. Without prominence or elevation. 3. Without spirit; dully; frigidly. 4. Peremptorily; downright (*Daniel*).

FLA′TNESS. *s.* (from *flat.*) 1. Evenness; level extension. 2. Want of relief or prominence (*Addison*). 3. Deadness; insipidity; vapidness (*Mortimer*). 4. Dejection of fortune (*Shakspeare*). 5. Dejection of mind; want of life (*Collier*). 6. Dulness; insipidity; frigidity (*Pope*). 7. The contrary to shrillness or acuteness of sound (*Bacon*).

FLATTED. Compressus. In botany.

Better expressed by COMPRESSED, which see.

To FLA'TTEN. *v. a.* (from *flat.*) 1. To make even or level, without prominence or elevation. 2. To beat down to the ground (*Mortimer*). 3. To make vapid. 4. To deject; to depress; to dispirit.

To FLA'TTEN. *v. n.* 1. To become even or level. 2. To grow dull and insipid (*L'Est.*).

FLA'TTER. *s.* (from *flat.*) The workman or instrument by which bodies are flattened.

To FLA'TTER. *v. a.* (*flatter*, French.) 1. To sooth with praises; to please with blandishments (*Shakspeare*). 2. To praise falsely (*Young*). 3. To please; to sooth (*Dryden*). 4. To raise false hopes (*Milton*).

FLA'TTERER. *s.* (from *flatter.*) One who flatters; a fawner; a wheedler (*Swift*).

FLA'TTERY. *s.* (*flaterie*, French.) False praise; artful obsequiousness; adulation (*Young*).

Some persons distinguish between compliment and flattery. He who *compliments* is said to deliver truths relative to the characters, the virtues and excellencies of others, for the sake of gratifying them by shewing them that he knows their value: he who *flatters*, deals in exaggerations and falsehoods for the sake of pleasing those of whom he thinks meanly enough to imagine they will be gratified by praise which is not their due. True delicacy of mind makes a man shrink even from being complimented, lest he should thereby be brought to think of himself more highly than he ought: and true delicacy of sentiment will make a man cautious how he deals even in compliments, lest by blunting his perception through long habit, he should unawares pass the barrier, and glide from pleasing truths to untruths meant to please, that is, degenerate from compliment into flattery.

FLA'TTISH. *a.* (from *flat.*) Somewhat flat; approaching to flatness (*Woodward*).

FLAT'ULENCY. *s.* (from *flatulent.*) 1. Windiness; fulness of wind (*Arbuthnot*). 2. Emptiness; vanity; levity; airiness (*Glanv.*).

FLA'TULENT. *a.* (*flatulentus*, Latin.) 1. Turgid with air; windy (*Arbuthnot*). 2. Empty; vain; big without substance or reality; puffy.

FLATUO'SITY. *s.* (*flatuosité*, French.) Windiness; fulness of air (*Bacon*).

FLA'TUOUS. *a.* (from *flatus*, Latin.) Windy; full of wind (*Bacon*).

FLA'TUS. *s.* (Latin.) Wind gathered in any cavities of the body (*Quincy*).

FLA'TWISE. *ad.* With the flat downward; not the edge (*Woodward*).

FLAVEL (John), an eminent nonconformist minister, was educated at University college in Oxford; and became minister of Deptford, and afterwards of Dartmouth in Devonshire, where he resided the greatest part of his life, and was admired for his preaching. Though he was generally respected at Dartmouth, yet in 1685 several of the aldermen of that town, attended by the rabble, carried about a ridiculous effigy of him, to which were affixed the Bill of Exclusion and the Covenant. Upon this occasion, he thought it prudent to withdraw from the town; not knowing what treatment he might meet with from a riotous mob, headed by magistrates who were themselves among the lowest of mankind. Part of his Diary, printed with his Remains, must give the reader an high idea of his piety. He died in 1691, aged 61; and after his death, his works, which consisted of many pieces of practical divinity, were printed in two volumes folio. Among these the most famous are his Navigation Spiritualized, or a New Compass for Seamen, consisting of 32 points of pleasant observations and serious reflections, of which there have been several editions in 8vo.; and his Husbandry Spiritualized, &c. with occasional meditations upon beasts, birds, trees, flowers, rivers, and several other objects, of which also there have been many editions in octavo.

FLAVIGINI, a town of France, in the department of Cote d'Or, with a late celebrated Benedictine abbey. Lat. 47. 26 N. Lon. 4. 37 E.

To FLAUNT. *v. n.* 1. To make a fluttering show in apparel (*Milton*). 2. To be hung with something loose and flying (*Pope*).

FLAUNT. *s.* Any thing loose and airy (*Shakspeare*).

FLA'VOUR. *s.* 1. Power of pleasing the taste (*Addison*). 2. Sweetness to the smell; odour; fragrance (*Dryden*).

FLA'VOROUS. *a.* (from *flavour.*) 1. Delightful to the palate (*Dryden*). 2. Fragrant; odorous.

FLAUTINO, in music, an octave flute, or one whose pitch is an octave above that of the German flute.

FLAUTO, in music, a flute. Sometimes this term is used to denote the part which is to be played upon a flute.

FLAW. *s.* (φλαω, to break.) 1. A crack or breach in any thing (*Boyle*). 2. A fault; defect (*Dryden*). 3. A sudden gust; a violent blast (*Chapman*). 4. A tumult; a tempestuous uproar (*Dryden*). 5. A sudden commotion of mind (*Shakspeare*).

To FLAW. *v. a.* (from the noun.) 1. To break; to crack; to damage with fissure (*Boyle*). 2. To break; to violate: not used (*Shakspeare*).

FLA'WLESS. *a.* (from *flaw.*) Without cracks; without defects (*Boyle*).

FLAWN. *s.* (ꝼlena, Saxon.) A sort of custard; a pie baked in a dish (*Tusser*).

To FLA'WTER. *v. n.* To scrape or pare a skin.

FLA'WY. *a.* (from *flaw.*) Full of flaws.

FLAX. *s.* (ꝼleax, ꝼlex, Saxon.) 1. The plant of which the finest thread is made. (See LINUM.) 2. The fibres of flax cleansed and combed for the spinner (*Dryden*).

FLAX (Toad.) See ANTERRHINUM.

FLAX-LEAVED DAPHNE. See THYMELÆA.

FLAX (Purging.) See LINUM CATHARTICUM.

FLAX (Spurge.) See THYMELÆA.

beards of the needles, and having done this, draw the frame over the arch, and proceed in finishing the course as before directed. Hosiery may be coated by any of these methods, not only with wool and jersey, but also with silk, cotton, flax, hemp, hair, or other things of the like nature, raw or unspun, but the method first described fixes them most firmly. The common stocking-frame is mentioned above, but any other frame, upon a similar principle, may answer the purpose. The method of making the false or downy calves in stockings, is by working raw or unspun wool or jersey, or any other raw or unspun materials, into the calves of stocking, in the different methods before described, and to any required form or thickness." The latter use to which this invention is applied, we may be allowed to say, is somewhat ludicrous.

To FLEER. *v. n.* (ꝼleaꞃꝺian, to trifle, Saxon.) 1. To mock; to gibe; to jest with insolence and contempt (*Swift*). 2. To leer; to grin with an air of civility.

FLEER. *s.* (from the verb.) 1. Mockery expressed either in words or looks (*Shakspeare*). 2. A deceitful grin of civility (*South*).

FLE'ERER. *s.* (from *fleer*). A mocker; a fawner.

FLEET, FLEOT, FLOT. Are all derived from the Saxon ꝼleoꝺ, which signifies a bay or gulf (*Gibson's Camden*).

FLEET. *s.* (ꝼloꞇa, Saxon.) A company of ships; a navy (*Prior*).

FLEET. *s.* (ꝼleoꞇ, Saxon.) A creek; an inlet of water (*Mortimer*).

FLEET. *a.* (*fliotur*, Islandish.) 1. Swift of pace; quick; nimble; active. 2. (In the husbandry of some provinces.) Light; superficially fruitful (*Mortimer*). 3. Skimming the surface (*Mortimer*).

To FLEET. *v. n.* (ꝼloꞇan, Saxon.) 1. To fly swiftly; to vanish (*Shakspeare*). 2. To be in a transient state (*Digby*).

To FLEET. *v. a.* 1. To skim the water (*Spenser*). 2. To live merrily, or pass time away lightly (*Shakspeare*). 3. (In the country.) To skim milk.

FLEET, commonly implies a company of ships of war, belonging to any prince or state; but sometimes it denotes any number of trading-ships, employed in a particular branch of commerce.

In sailing, a fleet of men of war is usually divided into three squadrons; the admiral's, the vice admiral's, and the rear-admiral's squadron, all which, being distinguished by their flags and pendants, are to put themselves, and, as near as may be, to keep themselves in their customary places, viz. the admiral, with his squadron, to sail in the van, that so he may lead the way to all the rest in the day-time, by the sight of his flag on the maintopmast-head; and in the night-time by his lights or lanterns. The vice-admiral and his squadron are to sail in the centre, or middle of the fleet. The rear-admiral and the ships of his squadron, to bring up the rear. But sometimes other divisions are made; and those composed of the lighter ships and the best sailers are placed as wings to the van, centre, and rear.

Merchant-fleets generally take their denomination from the place they are bound to, as the Turkey fleet, East India fleet, &c. These, in time of peace, go in fleets for their mutual aid and assistance: in time of war, besides this security, they likewise procure convoys of men of war; either to escort them to the place whither they are bound, or only a part of the way, to a certain place or latitude, beyond which they are judged out of danger of privateers, &c.

FLEET, a prison in London, to which persons are committed for contempt of the king and his laws, particularly of his courts of justice; or for debt, where any person will not, or is unable to pay his creditors. There are large rules, and a warden belonging to the Fleet prison, which had its name from the float or fleet of the river or ditch on the side whereof it stands.

FLEET, a river in Kircudbrightshire, which winds through a beautiful valley, and enters Wigton Bay, at Gatehouse. On the W. side of the river are the vestiges of a camp, a druidical circle, and a vitrified fort.

FLE'ETINGDISH. *s.* (from *fleet* and *dish*.) A skimming bowl.

FLE'ETLY. *ad.* (from *fleet*.) Swiftly; nimbly; with swift pace.

FLE'ETNESS. *s.* (from *fleet*.) Swiftness of course; nimbleness; celerity.

FLEETWOOD (William), a very learned English bishop in the beginning of the 18th century, of an ancient family in Lancashire. He distinguished himself during king William's reign, by his *Inscriptionum Antiquarum Sylloge*, by several sermons he preached on public occasions, and by his Essay on Miracles. It was designed by king William to give him a canonry of Windsor. The grant did not pass the seals before the king's death; but the queen gave it him, and he was installed in 1702. In 1703 he took a resolution to retire; and in 1707 published, without his name, his *Chronicon Pretiosum*. In 1708 he was nominated by the queen to the see of St. Asaph. The change of the queen's ministry gave him much regret. In 1715 he published a pamphlet, intitled "The 13th chapter of Romans vindicated from the abusive senses put upon it." In 1714 he was translated to the bishopric of Ely; and died in 1723, aged 67. He published several other sermons and tracts, and was a man of great learning and exemplary piety.

FLEMISH, or the FLEMISH TONGUE, is that which we otherwise call Low Dutch, to distinguish it from the German, whereof it is a corruption and a kind of dialect. (See GERMAN.) It differs from the Walloon, which is a corruption of the French language. The Flemish is used through all the provinces of the Netherlands.

FLEMISH-BRICKS, a neat, strong, yellow

kind of bricks, brought from Flanders, and commonly used in paving yards, stables, &c. being preferable for such purposes to the common bricks.

FLENSBURG, a large town of Sleswick, in Holland. Lat. 54. 50 N. Lon. 9. 47 E.

FLESH. *s.* (ꝼlœc, Saxon.) 1. The body distinguished from the soul (*Shak.*). 2. The muscles distinguished from the skin, bones, and tendons (*New Test.*). 3. Animal food distinguished from vegetable (*Locke*). 4. The body of beasts or birds used in food, distinct from fishes (*Brown*). 5. Animal nature (*Genesis*). 6. Carnality; corporeal appetites (*Smalridge.*) 7. A carnal state; worldly disposition (*Romans*). 8. Near relation (*Gen.*). 9. The outward or literal sense. The Orientals termed the immediate or literal signification of any precept or type *the flesh*, and the remote or typical meaning *the spirit* (*John*).

Flesh, in anatomy, a fibrous part of the animal body, soft and bloody, being that of which most of the other parts are composed, and by which they are connected together; or, more properly, it is that part of the body where the blood-vessels are so small as only to retain blood enough to preserve their colour red.

By chemical analysis it is found that muscular flesh is composed of a great number of fibres or threads, commonly of a reddish or whitish colour; but its appearance is too well known to require any description. Hitherto it has not been subjected to a perfectly accurate chemical analysis. From the facts ascertained by Thouvenel and Fourcroy, it appears that the muscles are composed chiefly of fibrin, to which they owe their fibrous structure and their form; and that they contain also

2. Albumen
3. Gelatin
4. Extractive
5. Phosphat of soda
6. Phosphat of ammonia
7. Phosph. of lime and carb. of ditto.

For the discovery of the last ingredients we are indebted to Mr. Hatchett, who found that 500 parts of beef-muscle left, after combustion, a residuum of 25.6 parts, consisting chiefly of these salts. When muscles are long boiled in water, Mr. Hatchett found that the greater part of the phosphat of lime, as well as of the alkaline phosphats, was dissolved; for the muscle, after this treatment, when dissolved in nitric acid, yielded scarcely any phosphat of lime; whereas if it were dissolved directly in nitric acid a precipitate of phosphat of lime was thrown down by ammonia. Hence it would appear, either that the phosphat of lime is united to gelatin, or that it is rendered soluble by means of it. The carbonat of lime still remains after the action of water, and is converted into oxalat when the muscle is treated with nitric acid.

The muscles of different animals differ exceedingly from each other in their appearance and properties, at least as articles of food; but we know little of their chemical differences. The observations of Thouvenel were alone directed to that object, and they are imperfect. The flesh of the ox contains, according to him, the greatest quantity of insoluble matter, and leaves the greatest residuum when dried: the flesh of the calf is more aqueous and mucous: the land and water turtle yield more matter to water than the muscle of the ox; but Thouvenel ascribes this difference to foreign bodies, as ligaments, &c. mixed with the muscle of the turtle: snails yield to water a quantity of matter intermediate between that given by beef and veal: with them the muscles of frogs, cray-fishes, and vipers, agree nearly in this respect; but the muscles of fresh-water fishes, notwithstanding their softness, yield a considerably smaller proportion.

When meat is boiled, it is obvious that the gelatin, the extractive, and a portion of the salts, will be separated, while the coagulated albumen and fibrin will remain in a solid state. Hence the flavour and the nourishing nature of soups is derived from the extractive and gelatin. When meat is roasted, on the other hand, all these substances continue in it, and the taste and odour of the extractive are greatly heightened by the action of the fire. Hence the superior flavour of roasted meat.

To Flesh. *v. a.* 1. To initiate (*Government of the Tongue*). 2. To establish in any practice (*Sidney*). 3. To glut; to satiate (*Shak.*).

FLE'SHBROTH. *s.* (*flesh* and *broth.*) Broth made by decocting flesh (*Wiseman*).

FLE'SHCOLOUR. *s.* (*flesh* and *colour.*) The colour of flesh (*Locke*).

FLE'SHFLY. *s.* (*flesh* and *fly.*) A fly that feeds upon flesh, and deposits her eggs in it (*Shakspeare*).

FLE'SHHOOK. *s.* (*flesh* and *hook.*) A hook to draw flesh from the caldron (*Samuel*).

FLE'SHLESS. *a.* (from *flesh.*) Without flesh.

FLE'SHLINESS. *s.* (from *fleshy.*) Carnal passions or appetites (*Ascham*).

FLE'SHLY. *a.* (from *flesh.*) 1. Corporeal (*Denham*). 2. Carnal; lascivious (*Milton*). 3. Animal; not vegetable (*Dryden*). 4. Human; not celestial; not spiritual (*Milt.*).

FLE'SHMEAT. *s.* (*flesh* and *meat.*) Animal food; the flesh of animals prepared for food (*Floyer*).

FLE'SHMENT. *s.* (from *flesh.*) Eagerness gained by a successful initiation (*Shak.*).

FLE'SHMONGER. *s.* (from *flesh*). One who deals in flesh; a pimp (*Shakspeare.*)

FLE'SHPOT. *s.* (*flesh* and *pot.*) A vessel in which flesh is cooked; thence plenty of flesh (*Taylor*).

FLE'SHQUAKE. *s.* (*flesh* and *quake.*) A tremour of the body (*Ben Jonson*).

FLE'SHY. *a.* (from *flesh.*) 1. Full of flesh; fat; musculous (*Ben Jonson*). 2. Pulpous; plump (*Bacon*).

Fleshy-footed. A horse is said to be fleshy footed, when that part of the bottom of the foot on each side of the frog (called the outer sole) is preternaturally prominent, constituting a convexity above the wall or crust of the hoof, where the shoe should have its proper bearing upon the foot of the horse. In feet of this description, the outer sole, from repeated bruising and battering in constant work upon hard roads, or from an injudicious and destructive paring away with the butteris, is so exceedingly thin as to be indented with the slightest impression, and being too weak to resist the action of the interior vessels, projects and becomes bulbous. Great care is required in shoeing horses labouring under this defect: the inner part of the web of the shoe should be so completely hollowed as not to admit the least chance of bearing upon the prominent part; if it do, tenderness and pain (if not lameness) must inevitably ensue. In cases of this kind, neither the butteris nor drawing-knife should be permitted; they are a worse remedy than the disease.

Fleshy leaf. In botany. Folium carnosum. Full of pulp within: as in sedum and other succulent plants. The substance more stiff than in the pulpy leaf: folium pulposum. Applied to the capsule in mesembryanthemum—and to the root, in valerian, &c.

FLETA, the name given to an unknown writer, who lived about the end of the reign of Edward II. and beginning of that of Edward III.; and who, being a prisoner in the Fleet, wrote there an excellent treatise on the common law of England.

FLETCHER. See Beaumont.

Fle'tcher. *s.* (from *fleche*, an arrow, French.) A manufacturer of bows and arrows (*Mortimer*).

FLET. The participle passive of *To fleet*. Skimmed; deprived of the cream (*Mortimer*).

FLEURI (Claude), one of the best French critics and historians of his age, was born at Paris in 1640. He applied himself to the law, was made advocate for the parliament of Paris, and attended the bar nine years; he then entered into orders, and was made preceptor to the princes of Conti. In 1689 the king made him sub-preceptor to the dukes of Burgundy, Anjou, and Berry; and in 1706, when the education of those young princes was completed, the king gave him the priory of Argenteville belonging to the Benedictines in the diocese of Paris. In 1716 he was chosen counsellor to Louis XV. and died in 1723. He was the author of a great number of esteemed French works: the principal of which are, 1. An ecclesiastical history, in 20 volumes, the last of which ends with the year 1441. 2. The manners of the Israelites and Christians. 3. Institutions of ecclesiastical law. 4. An historical catechism. 5. On the choice and method of study. 6. The duties of masters and servants, &c.

FLEURS, a small town of Namur, in the Austrian Netherlands, 15 miles W. of Namur. Lat. 50. 30 N. Lon. 4. 36 E.

FLEW. The preterit of *fly*.

Flew. *s.* The large chaps of a deep-mouthed hound (*Hanmer*).

FLE'WED. *a.* (from *flew.*) Chapped; mouthed (*Shakspeare*).

FLEXA'NIMOUS. *a.* (*flexanimus*, Lat.) Having power to change the disposition of the mind (*Howel*).

FLEXIBI'LITY. *s.* (*flexibilité*, French.) 1. The quality of admitting to be bent; pliancy (*Newton*). 2. Easiness to be persuaded; ductility of mind; compliance; facility (*Hammond*).

FLE'XIBLE. *a.* (*flexibilis*, Latin.) 1. Possible to be bent; not brittle; pliant; not stiff (*Bacon*). 2. Not rigid; not inexorable; complying; obsequious (*Bacon*). 3. Ductile; manageable (*Locke*). 4. That may be accommodated to various forms and purposes (*Rogers*).

FLE'XIBLENESS. *s.* (from *flexible.*) 1. Possibility to be bent; not brittleness; easiness to be bent; pliancy (*K. Charles*). 2. Facility; obsequiousness; compliance. 3. Ductility; manageableness (*Locke*).

FLE'XILE. *a.* (*flexilis*, Latin.) Pliant; easily bent; obsequious to any power or impulse (*Thomson*).

FLE'XION. *s.* (*flexio*, Latin.) 1. The act of bending. 2. A double; a bending (*Bacon*). 3. A turn toward any part or quarter (*Bacon*).

FLEXOR, in anatomy. (*flexor.*) The name of several muscles whose office it is to bend parts into which they are inserted.

F. accessorius digitorum pedis. See Flexor longus digitorum pedis.

F. brevis digitorum pedis, perforatus, sublimis. Perforatus seu sublimis of Douglas. A flexor muscle of the toes, situated on the foot. It arises by a narrow tendinous and fleshy beginning from the inferior protuberance of the os calcis. It likewise derives many of its fleshy fibres from the adjacent aponeurosis, and soon forms a thick belly, which divides into four portions. Each of these portions terminates in a flat tendon, the fibres of which decussate, to afford a passage to a tendon of the long flexor, and afterwards re-uniting, are inserted into the second phalanx of each of the four smaller toes. This muscle serves to bend the second joint of the toes.

F. brevis minimi digiti pedis. Parathenar minor of Winslow. This little muscle is situated along the inferior surface and outer edge of the metatarsal bone of the little toe. It arises tendinous from the basis of that bone, and from the ligaments that connect it to the os cuboides. It soon becomes fleshy, and adheres almost the whole length of the metatarsal bone, at the anterior extremity of which it forms a small tendon that is inserted into the root of the first joint of the little toe. Its use is to bend the little toe.

F. brevis pollicis manus. Flexor secundi internodii of Douglas. Thenar of Winslow. This muscle is divided into two portions by the tendon of the flexor longus pollicis. The outermost portion arises tendinous from the anterior part of the os trapezoides and internal annular ligament. The second, or innermost and thickest portion, arises from the same bone, and likewise from the os magnum, and os cuneiforme. Both these portions are inserted tendinous into the sesamoid bones, and second bone of the thumb. The use of this muscle is to bend the second joint of the thumb.

F. brevis pollicis pedis. A muscle of the great toe, that bends the first joint of the great toe. It is situated upon the metatarsal bone of the great toe, arises tendinous from the under and anterior part of the os calcis, and from the under part of the os cuneiforme externum. It soon becomes fleshy and divisible into two portions, which do not separate from each other till they have reached the anterior extremity of the metatarsal bone of the great toe, where they become tendinous, and then the innermost portion unites with the tendon of the abductor, and the outermost with that of the adductor pollicis. They adhere to the external os sesamoideum, and are finally inserted into the root of the first joint of the great toe. These two portions, by their separation, form a groove, in which passes the tendon of the flexor longus pollicis.

F. carpi radialis. This, which is the radialus internus of Albinus and Winslow, is a long thin muscle, situated obliquely at the inner and anterior part of the fore-arm, between the palmaris longus and the pronator teres. It arises tendinous from the inner condyle of the os humeri, and, by many fleshy fibres, from the adjacent tendinous fascia. It descends along the inferior edge of the pronator teres, and terminates in a long, flat, and thin tendon, which afterwards becomes narrower and thicker, and after passing under the internal annular ligament, in a groove distinct from the other tendons of the wrist, it spreads wider again, and is inserted into the fore and upper part of the metacarpal bone that sustains the fore finger. It serves to bend the hand, and its oblique direction may likewise enable it to assist in its pronation.

F. carpi ulnaris. Ulnaris internus of Winslow and Albinus. A muscle, situated on the cubit or fore arm, that assists the former in bending the arm. It arises tendinous from the inner condyle of the os humeri, and by a small fleshy origin, from the anterior edge of the olecranon. Between these two portions we find the ulnar nerve passing to the fore-arm. Some of its fibres arise likewise from the tendinous fascia that covers the muscles of the fore-arm. In its descent it soon becomes tendinous, but its fleshy fibres do not entirely disappear till it has reached the lower extremity of the ulna, where its tendon spreads a little, and, after sending off a few fibres to the external and internal and annular ligaments, is inserted into the os pisiforme.

F. longus digitorum pedis, profundus perforans. A flexor muscle of the toes, situated along the posterior part and inner side of the leg. It arises fleshy from the back part of the tibia, and after running down to the internal ancle, its tendon passes under a kind of annular ligament, and then through a sinuosity at the inside of the os calcis. Soon after this it receives a small tendon from the flexor longus pollicis pedis, and about the middle of the foot it divides into four tendons, which pass through the slits of the flexor brevis digitorum pedis, and are inserted into the upper part of the last bone of all the lesser toes. About the middle of the foot this muscle unites with a fleshy portion, which, from the name of its first describer, has been usually called massa carnea Jacobi Sylvii: it is also termed flexor accessorius digitorum pedis. This appendage arises by a thin fleshy origin, from most part of the sinuosity of the os calcis, and likewise by a thin tendinous beginning from the anterior part of the external tubercle of that bone; it soon becomes all fleshy, and unites to the long flexor just before it divides into its four tendons. The use of this muscle is to bend the last joint of the toes.

F. longus pollicis manus. This muscle, which is so named by Winslow and Albinus, is the flexor tertii internodii of Douglas. It is placed at the side of the last described muscle, and is covered by the extensores carpi radiales. It arises fleshy from the anterior surface of the radius, immediately below the insertion of the biceps, and is continued down along the oblique ridge, which serves for the insertion of the supinator brevis, as far as the pronator quadratus. Some of its fibres spring likewise from the neighbouring edge of the interosseous ligament. Its tendon passes under the internal annular ligament of the wrist, and after running along the inner surface of the first bone of the thumb, between the two portions of the flexor brevis pollicis, goes to be inserted into the last joint of the thumb, being bound down in its way by the ligamentous expansion that is spread over the second bone. In some subjects we find a tendinous portion arising from the inner condyle of the os humeri, and forming a fleshy slip that commonly terminates near the upper part of the origin of this muscle from the radius. The use of this muscle is to bend the last joint of the thumb.

F. longus pollicis pedis. This muscle is situated along the posterior part of the leg. It arises tendinous and fleshy a little below the head of the fibula, and its fibres continue to adhere to that bone almost to its extremity. A little above the heel, it terminates in a round tendon, which, after passing in a groove formed at the posterior edge of the astragalus, and internal and lateral part of the os calcis, in which it is secured by an annular ligament, goes to be inserted into the last bone of the great toe, which it serves to bend.

F. ossis metacarpi pollicis. Opponens pollicis. Flexor primi internodii of Douglas. This muscle is situated under the abductor brevis pollicis, which it resembles in its shape. It arises tendinous and fleshy from the os scaphoides, and from the anterior and inner part of the internal annular ligament. It is inserted tendinous and fleshy into the under and anterior part of the first bone of the thumb. It serves to turn the first bone of the thumb upon its axis, and at the same time to bring it inwards opposite to the other fingers.

F. parvi minimi digiti manus. Abductor minimi digiti Hypothenar Riolani of Douglas. The situation of this muscle is along the inner surface of the metacarpal bone of the little finger. It arises tendinous and fleshy from the hook-like process of the unciform bone, and likewise from the anterior surface of the adjacent part of the annular ligament. It terminates in a flat tendon, which is connected with that of the abductor minimi digiti, and inserted into the inner and anterior part of the upper end of the first bone of the little finger. It serves to bend the little finger, and likewise to assist the abductor.

F. profundus perforans. Profundus of Albinus. Perforans of Douglas. It is a muscle situated on the fore arm, immediately under the perforatus, which it greatly resembles in its shape. It arises fleshy from the external side, and upper part of the ulna for some way downwards, and from a large portion of the interosseous ligament. It splits into four tendons a little before it passes under the annular ligament of the wrist, and these pass through the slits in the tendons of the flexor sublimis, to be inserted into the fore and upper part of the third or last bone of all the four fingers, which joint they bend.

F. sublimis perforatus. This muscle, which is the perforatus of Cowper, Douglas, and Winslow, is by Albinus and others named sublimis. It has got the name of perforatus from its tendons being perforated by those of another flexor muscle of the fingers, called the perforans. They who give it the appellation of sublimis consider its situation with respect to the latter, and which, instead of perforans, should have been distinguished by the name profundus. It is a long muscle, situated most commonly at the anterior and inner part of the fore-arm, between the palmaris longus and the flexor carpi ulnaris; but, in some subjects, we find it placed under the former of these muscles, between the flexor carpi ulnaris and the flexor carpi radialis. It arises, tendinous and fleshy, from the inner condyle of the os humeri, from the inner edge of the coronoid process of the ulna, and from the upper and fore part of the radius, down to near the insertion of the pronator teres. A little below the middle of the fore-arm its fleshy belly divides into four portions, which degenerate into as many round tendons, that pass altogether under the internal annular ligament of the wrist, after which they separate from each other, become thinner and flatter, and running along the palm of the hand, under the aponeurosis palmaris, are inserted into the upper part of the second bone of each finger. Previous to this insertion, however, the fibres of each tendon decussate near the extremity of the first bone, so as to afford a passage to a tendon of the perforans. Of these four tendons, that of the middle-finger is the largest, that of the fore-finger next in size, and that of the little-finger the smallest. The use of this muscle is to bend the second joint of the fingers.

F. tertii internodii. See FLEXOR LONGUS POLLICIS MANUS.

FLE'XUOUS. *a.* (*flexuosus*, Latin.) 1. Winding; full of turns and meanders; tortuous (*Digby*). 2. Bending; variable; not steady (*Bacon*).

FLEXUOUS. (*zigzag*, with.) In botany. Changing its direction in a curve—from joint to joint, or from bud to bud, in the stem, as in ptelea, smilax, solidago flexicaulis—from flower to flower in the peduncle, as in aira flexuosa and some other grasses.

FLE'XURE. *s.* (*flexura*, Latin.) 1. The form or direction in which any thing is bent (*Ray*). 2. The act of bending (*Shakspeare*). 3. The part bent; the joint (*Sandys*). 4. Obsequious or servile cringe (*Shakspeare*).

FLEXURE (Contrary), in the geometry of curves, is where the bending of the line becomes directed a different way, as about the middle point of the printing letter S. For the determination of points of contrary flexure, see INFLECTION.

To FLI'CKER. *v. a.* (*fligheren*, Dutch.) To flutter; to play the wings (*Dryden*).

FLI'ER. *s.* (from *fly*). 1. One that runs away; a fugitive; a runaway (*Shakspeare*). 2. That part of a machine which, by being put into a more rapid motion than the other parts, equalizes and regulates the motion of the rest; as in a jack (*Swift*).

FLIGHT. *s.* (from *to fly*.) 1. The act of flying or running from danger (*Denham*). 2. The act of using wings; volation (*Spenser*). 3. Removal from place to place by means of wings (*Esdras*). 4. A flock of birds flying together (*Bacon*). 5. The birds produced in the same season: as the harvest flight of pigeons. 6. A volley; a shower (*Chevy Chase*). 7. The space past by flying. 8. Heat of imagination; sally of the soul (*Denham*). 9. Excursion on the wing (*Tillotson*). 10. The power of flying (*Shakspeare*).

FLI'GHTY. *a.* (from *flight*.) 1. Fleeting; swift (*Shakspeare*). 2. Wild; full of imagination.

FLI'MSY. *a.* 1. Weak; feeble. 2. Mean; spiritless; wanting force (*Pope*).

To FLINCH. *v. n.* (corrupted from *fling*.) 1. To shrink from any suffering or undertaking (*South*). 2. To fail (*Shakspeare*).

FLI'NCHER. *s.* (from the verb.) He who shrinks or fails in any matter.

To FLING. *v. a.* preter. *flung*; part. *flung* or *flong*. (from *fligo*, Lat. *Skinner*.) 1. To cast from the hand; to throw (*Dryden*). 2. To dart; to cast with violence (*Denham*). 3. To scatter (*Pope*). 4. To drive by violence (*Burnet*). 5. To move forcibly (*Addison*). 6. To cast (*Addison*). 7. To force into another condition (*Spenser*). 8. *To* FLING *away*. To eject; to dismiss. 9. *To* FLING *down*. To demolish; to ruin. 10. *To* FLING *off*. To baffle in the chase.

To FLING. *v. n.* 1. To flounce; to

wince; to fly into violent and irregular motions (*Tillotson*). 2. *To* Fling *out.* To grow unruly or outrageous (*Shakspeare*).

Fling. *s.* (from the verb.) 1. A throw; a cast. 2. A gibe; a sneer; a contemptuous remark (*Addison*).

Fling. In the manage, is a term used to express the fiery and obstinate action of an unruly horse. To fling like a cow, is to raise only one leg, and give a blow with it. To fling or kick with both the hind-legs is called yerking. See Yerk.

FLI'NGER. *s.* (from the verb.) 1. He who throws. 2. He who jeers.

FLINT. See Pyromachus.

Flint, a town of North Wales, and capital of a county to which it gives name; situated a small distance from the river Dee; with a castle, where the unfortunate Richard II. was deposed by the duke of Lancaster: united with several other places, it returns one member to the British parliament. Lat. 53. 16 N. Lon. 3. 2. W.

FLINTSHIRE, a county of North Wales, bounded on the N. by the Irish Sea, on the N. E. by the river Dee, on the E. by Cheshire, on the S. and W. by Denbighshire; about 27 miles long, and from 7 to 10 broad. Besides this, there is a part of Flintshire no way united with the rest of the county; bounded on the N. by Cheshire, on the E. and S. by Shropshire, and on the West by Denbighshire, which is 8 miles long, and 6 broad. The county is divided into 5 hundreds, in which are two market towns, 28 parishes, 7780 houses, and 48,100 inhabitants. The country is mountainous, the hills being generally barren on the surface, but abounding with lead ore, calamine, coals, &c. The valleys are fertile. The whole county contains 160,000 acres, of which 25,000 are uncultivated, including wood-lands. The county sends one member to the British parliament, besides the one sent by the county town, in conjunction with the other towns: The principal rivers are the Clwyd, Dee, Elwy, Sevion, and Wheeler.

FLI'NTY. *a.* (from *flint.*) 1. Made of flint; strong (*Dryden*). 2. Full of stones (*Bacon*). 3. Hard of heart; cruel; savage; inexorable (*Shakspeare*).

FLIP. *s.* (A cant word.) A liquor much used in ships, made by mixing beer with spirits and sugar (*Dennis*).

FLI'PPANT. *a.* (Of no great authority.) 1. Nimble; moveable. It is used only of the act of speech (*Addison*). 2. Pert; petulant; waggish (*Thomson*).

FLI'PPANTLY. *ad.* (from the adjective.) In a flowing prating way.

To FLIRT. *v. a.* (*Skinner* thinks it formed from the sound.) 1. To throw any thing with a quick elastic motion (*Swift*). 2. To move with quickness (*Dorset*).

To Flirt. *v. n.* 1. To jeer; to gibe at one. 2. To run about perpetually; to be unsteady and fluttering.

Flirt. *s.* (from the verb.) 1. A quick elastic motion (*Addison*). 2. A sudden trick (*Ben Jonson*). 3. A pert hussy (*Addison*).

FLIRTA'TION. *s.* (from *flirt.*) A quick sprightly motion (*Pope*).

To FLIT. *v. n.* (*flitter*, Danish). 1. To fly away (*Spenser*). 2. To remove; to migrate (*Hooker*). 3. To flutter; to rove on the wing (*Dryden*). 4. To be flux or unstable (*Dryden.*)

Flit. *a.* (from *fleet.*) Swift: not used (*Spenser*)

FLITCH. *s.* (ꝼlicce, Saxon.) The side of a hog salted and cured (*Swift*).

FLI'TTERMOUSE. *s.* The bat.

FLI'TTING. *s.* (ꝼlıꞇ, Saxon.) An offence; a fault; a failure (*Psalms*).

FLIX. *s.* (corrupted from *flax.*) Down; fur; soft hair (*Dryden*).

To FLOAT. *v. n.* (*flotter*, French.) 1. To swim on the surface of the water (*Shakspeare*). 2. To move without labour in a fluid (*Dry.*). 3. To pass with a light irregular course (*Locke*).

To Float. *v. a.* To cover with water (*Pope*).

Float. *s.* (from the verb.) 1. The act of flowing; the flux (*Hooker*). 2. Any body so contrived or formed as to swim upon the water (*L'Estrange*). 3. The cork or quill by which the angler discovers the bite of a fish (*Walton*). 4. A cant word for a level (*Mortimer*).

Float-boards, those boards fixed to water-wheels of under-shot-mills, serving to receive the impulse of the stream, whereby the wheel is carried round. (See the articles Wheel and Mill.) It is no advantage to have too great a number of float-boards; because, when they are all struck by the water in the best manner that it can be brought to come against them, the sum of all the impulses will be but equal to the impulse made against one float-board at right angles, by all the water coming out of the penstock through the opening, so as to take place on the float-board. The best rule in this case is, to have just so many, that each of them may come out of the water as soon as possible, after it has received and acted with its full impulse. As to the length of the float-board, it may be regulated according to the breadth of the mill.

FLOATING BODIES, are those which swim on the surface of a fluid, the most interesting of which are ships and vessels employed in war and commerce. It is known to every seaman of what vast moment it is to ascertain the stability of such vessels, and the positions they assume when they float freely on the surface of the water. To be able to accomplish this, it is necessary to understand the principles on which that stability and these positions depend. A floating body is pressed downward by its own weight in a vertical line passing through its centre of gravity; and it is supported by the upward pressure of a fluid, which acts in a vertical line that passes through the centre of gravity of the part which is under the water; and without a coincidence between these two lines, in such a manner as that both centres of gravity may be in the same vertical line, the solid will turn on an axis, till it gains a position in which the equilibrium of floating will be permanent. From this it is obviously necessary to find what proportion the part immersed bears to the whole, to do which the specific gravity of the floating body must be known, after which it must be found by geometrical method, in what positions the solid can be placed on the surface of the fluid, so that both centres of gravity may be in the same vertical line, when any given part of the solid is immersed under the surface. These things being determined, something is still wanting; for positions may be assumed in which the circumstances now mentioned concur; and yet the solid will assume some other position wherein it will permanently float. However operose and difficult (says the late Mr. English) the calculations necessary to determine the stability of nautical vessels may, in some cases, be, yet they all depend upon the four following simple and obvious theorems, accompanied with other well known stereometrical and statical principles.

Theorem 1. Every floating body displaces a quantity of the fluid in which it floats, equal to its own weight; and consequently, the specific gravity of the fluid will be to that of the floating body, as the magnitude of the whole is to that of the part immersed.

Theorem 2. Every floating body is impelled downward by its own essential power, acting in the direction of a vertical line passing through the centre of gravity of the whole; and is impelled upwards by the re-action of the fluid which supports it, acting in the direction of a vertical line passing through the centre of gravity of the part immersed; therefore, unless these two lines are coincident, the floating body thus impelled must revolve round an axis, either in motion or at rest, until the equilibrium is restored.

Theorem 3. If by any power whatever a vessel be deflected from an upright position, the perpendicular distance between two vertical lines passing through the centres of gravity of the whole, and of the part immersed respectively, will be as the stability of the vessel, and which will be positive, nothing, or negative, according as the metacentre is above, coincident with, or below the centre of gravity of the vessel.

Theorem 4. The common centre of gravity of any system of bodies being given in position, if any one of these bodies be moved from one part of the system to another, the corresponding motion of the common centre of gravity, estimated in any given direction, will be to that of the aforesaid body, estimated in the same direction, as the weight of the body moved is to that of the whole system. From whence it is evident, that in order to ascertain the stability of any vessel, the position of the centres of gravity of the whole, and of that part immersed, must be determined; with which, and the dimensions of the vessel, the line of floatation, and angle of deflection, the stability or power either to right itself or overturn, may be found.

Those who wish to acquaint themselves more minutely with this interesting branch of hydrostatic theory, may consult Mr. Atwood's valuable paper in vol. 80. of the Philosophical Transactions, and chap. 3. book iii. Gregory's Mechanics.

FLO'ATY. *a.* Buoyant and swimming on the surface (*Raleigh*).

FLOCK. *s.* (ꝼlocc, Saxon.) 1. A company; usually a company of birds or beasts (*Shakspeare*). 2. A company of sheep, distinguished from *herds*, which are of oxen (*Addison*). 3. A body of men (*Maccabees*). 4. (from *floccus.*) A lock of wool (*Dryden*).

To Flock. *v. n.* (from the noun.) To gather in crowds or large numbers (*Suckling*).

To FLOG. *v. a.* (from *flagrum*, Latin.) To lash; to whip (*Swift.*)

FLOOD. *s.* (ꝼloꝺ, Saxon.) 1. A body of water; the sea; a river (*Dryden*). 2. A deluge; an inundation (*Shakspeare*). 3. Flow; flux; the swelling of a river by rain or inland flood (*Davies*). 4. The general deluge (*Br.*). 5. Catamenia (*Harvey*).

To Flood. *v. a.* (from the noun.) To deluge; to cover with waters (*Mortimer*).

FLO'ODGATE. *s.* (*flood* and *gate.*) Gate or shutter by which the watercourse is closed or opened at pleasure (*Sidney*).

FLOOK. *s.* (*pflug*, a plough, German.) 1. The broad part of the anchor which takes hold of the ground. 2 A flounder; a flat river fish.

FLOOR. *s.* (ꝼloꞃ, ꝼloꞃe, Saxon.) 1. The pavement: a pavement is always of stone, the floor of wood or stone (*Sidney*). 2. A story; a flight of rooms (*Ben Jonson*).

To Floor. *v. a.* (from the noun.) To cover the bottom with a floor (*Chronicles*).

Floor, in building, the underside of a room, or that part we walk on. Floors are of several sorts; some of earth, some of brick, others of stone, others of boards, &c. For an account of brick and stone floors, see Pavement. For boarded floors, it is observable, that the carpenters never floor their rooms with boards till the carcase is set up, and also inclosed with walls, lest the weather should injure the flooring. Yet they generally rough-plane their boards for the flooring before they begin any thing else about the building, that they may set them up to dry and season, which is done in the most careful manner. The best wood for flooring is the fine yellow deal well seasoned, which, when well laid, will keep its colour for a long while; whereas the white sort becomes black by often washing, and looks very bad. Floors are measured by squares of 10 feet on each side, so that taking the length and breadth and multiplying them together and cutting off two decimals, the content of a floor in squares will be given. Thus 18 by 16 gives 288 or 2 squares, and 88 decimal parts.

Floors (Earthen), are commonly made of loam, and sometimes, especially to make malt on, of lime, and brooksand, and gun-dust, or anvil-dust from the forge. Ox-blood and fine clay tempered together, sir Hugh Plat says, make the finest floor in the world. The floors of the new prisons at Dartmoor are made of gypsum.

Floor of a ship, so much of her bottom as she rests on when aground.

Floor-timbers, in a ship, are those parts of a ship's timbers which are placed immediately across the keel, and upon which the bottom of the ship is framed; to these the upper parts of the timbers are united, being only a continuation of floor-timbers upwards.

Floor, in malting, a name given to the malt when it is spread upon the floor, after it is taken from the cistern. Barley when steeped in the cistern, swells about one-fourth part; it is then called a couch, and bears that name till it has been 30 hours out of the cistern: when it has been out more than 30 hours, it generally sprouts and increases so much as to be double what it was before wetting; it is then called a floor. It is therefore settled by law, that 4 neat bushels shall be reckoned equivalent to 5 couch bushels, or 8 floor bushels.

FLO'ORING. *s.* (from *floor.*) Bottom; pavement (*Addison*).

To FLOP. *v. a.* (from *flap.*) To clap the wings with noise (*L'Estrange*).

FLORA, the goddess of flowers and gardens among the Romans, such as the Chloris of the Greeks. She was worshipped among the Sabines, long before the foundation of Rome, and Tatius was the first who raised her a temple in the city of Rome. It is said that she married Zephyrus, and received from him the privileges of presiding over flowers, and of enjoying perpetual youth. She was represented as crowned with flowers, and holding in her hand the horn of plenty.

FLO'RAL. *a.* (*floralis*, Latin.) Relating to Flora, or to flowers (*Prior*).

Floral bud. In botany. Containing the flowers. In opposition to foliate or leafy, containing the leaves. (See Bud.) Floral leaf. Immediately attending the flower, but different from the Bracte, which see.

FLORALIA, games in honour of Flora at Rome. They were instituted about the age of Romulus, but not regularly celebrated until the year U.C. 580. They were observed yearly, and exhibited a scene of the most unbounded licentiousness.

FLO'REN. *s.* A gold coin of Edward III. in value six shillings.

FLO'RENCE. *s.* (from the city *Florence.*) A kind of cloth.

Florence, an ancient, large and celebrated city of Italy, capital of Tuscany. It is a very beautiful city. Exclusive of the churches and palaces, some of which are magnificent, the architecture of the houses in general is in a good taste. The streets are remarkably clean, and paved with large broad stones, chiselled so as to prevent the horses from sliding. This city is divided into two unequal parts by the river Arno, over which are no less than four bridges in sight of each other. That called the Ponte della Trinità is uncommonly elegant. It is built entirely of white marble, and ornamented with four beautiful statues, representing the four seasons. The quays, the buildings on each side, and the bridges, render that part of Florence through which the river runs by far the finest. The streets, squares, and fronts of the palaces, are adorned by a great number of statues; some of them by the best modern masters, Michael Angelo, Bandinelli, Donatello, Giovanni di Bologna, Benvenuto Cellini, and others. Some of the Florentine merchants, formerly, were men of vast wealth, and lived in a magnificent manner. One of them, about the middle of the 15th century, built that noble fabric which from the name of its founder is still called the Palazzo Pitti. He was ruined by the prodigious expence of this building, which was immediately purchased by the Medici family, and has continued ever since to be the residence of the grand dukes of Tuscany. The gardens belonging to this palace are on the declivity of an eminence. On the summit is a kind of a fort, called Belvedere, from which, and some of the higher walks, is a complete view of the city of Florence, and the beautiful vale of Arno, in the middle of which it stands. The prospect is bounded on every side by an amphitheatre of fertile hills, adorned with country-houses and gardens. The Palazzo Pitti is on the opposite side of the Arno from the famous gallery. It has been enlarged since it was purchased from the ruined family of Pitti. The furniture is rich and curious; but the most valuable ornaments are the paintings. The gallery just mentioned attracts universal attention. One of the most interesting parts of it, in the opinion of many, is the series of Roman emperors from Julius Cæsar to Gallienus, which is almost complete. The celebrated Venus of Medici, the standard of taste in female beauty and proportion, is in a room called the Tribunal. The inscription on the pedestal ascribes it to Cleomenes, an Athenian, the son of Apollodorus. It is of white marble, and surrounded by other masterpieces of sculpture, said to be the works of Praxiteles and other Greek masters. Florence is a place of some strength, and contains an archbishop's see, and a university. Lat. 43. 46 N. Lon. 11. 15 E.

FLORENTINE EXPERIMENT, the name given, by way of distinction, to an experiment made by the Academi del Cimento, at Florence; in which water, when violently squeezed, made its way through the fine pores of a hollow sphere of gold, rather than yield to the compression. It was inferred from this experiment, gross and inadequate as it was, that water was incompressible; but our ingenious countryman, Mr. Canton, devised a set of experiments, by which the contrary was satisfactorily shewn. See Phil. Trans. for 1762 and 1764.

FLORENTINO, one of the three provinces into which Tuscany is divided. Its chief town is Florence.

FLORES BENZOES. See Benzoic acid.

Flores sulphuris. See Sulphur.

Flores sulphuris loti. When sublimed sulphur is boiled and washed in water, it forms the flores sulphuris loti of the pharmacopœias. Analogous to this preparation is the sulphur precipitatum; they possess eccoprotic, diaphoretic, and antipsorical virtues, and are administered in obstipation where there are piles, colica pictonum, worms, &c. The new name is sulphur lotum.

FLO'RET. *s.* (*fleurette*, French.) A small imperfect flower.

FLO'RID. *a.* (*floridus*, Latin.) 1. Productive of flowers; covered with flowers. 2. Flushed with red (*Taylor*). 3. Embellished; splendid (*Dryden*).

Florid song, in music, the same as figurate descant.

Florid style of writing, is that in which the ornaments are too rich and gaudy in proportion to the subject; when they return upon us too fast, and strike us either with a dazzling lustre or a false brilliancy. In a young author this is pardonable; nay it is often a promising symptom. *Volo se efferat in adolescente fecunditas*, &c. says Quintilian: "In youth I wish to see luxuriancy of fancy. Much of it will be diminished by years; much will be corrected by ripening judgment; some of it by the mere practice of composition, will be worn away. Let there be only sufficient matter at first that can bear some pruning and lopping off. At this time of life let genius be bold and inventive, and pride itself in its efforts, though these should not as yet be correct. Luxuriance can easily be cured; but there is no remedy for barrenness."

Florid Gothic, in architecture, distinguishes itself by an exuberance of decoration, by roofs where the most delicate fret-work is expressed in stone, and by a certain lightness of finishing, as in the roof of the choir at Gloucester, where it is thrown like a web of embroidery over the old Saxon vaulting. Many monumental shrines afford exquisite specimens of this style. We have also a remarkable one in the superb chapel of Henry VII. at Westminster.

FLORIDA, a country of North America, bounded on the N. by Georgia, on the E. by the Atlantic ocean, on the S. by the gulf of Mexico, and on the W. by the Mississippi. It is 600 miles long, and 130 broad, lying between 25 and 31 N. lat. and 82 and 92 W. lon. It is divided into E. and W. Florida. St. Augustine is the capital of the former, and Pensacola of the latter. The country about St. Augustine is by far the most unfruitful; yet even here two crops of Indian corn are annually produced. The banks of the rivers are of a superior quality, and well adapted to the culture of rice and corn. The interior country, which is high and pleasant, abounds with wood of almost every kind; particularly white and red oak, pine, hiccory, cypress, red and white cedar. The intervals between the hilly parts are very rich, and produce spontaneously the fruits common to Georgia and the Carolinas. Florida was discovered by Sebastian Cabot. It now belongs to the Spaniards.

FLORI'DITY. *s.* (from *florid.*) Freshness of colour (*Floyer*).

FLO'RIDNESS. *s.* (from *florid.*) 1. Freshness of colour. 2. Embellishment; ambitious elegance (*Boyle*).

FLORI'FEROUS. *a.* (*florifer*, Lat.) Productive of flowers.

FLORIN, is sometimes used for a coin, and sometimes for a money of account. Florin, as a coin, is of different values, according to the different metals and different countries where it is struck. The gold florins are most of them of a very coarse alloy, some of them not exceeding thirteen or fourteen carats, and none of them seventeen and a half. (See Money-table.) Florin, as a money of account, is used by the Italians, Dutch, and Germans: it admits of different divisions in different places.

FLORINIANI, in church history, one of the names given to the Gnostics.

FLORIS (Francis), a painter of Antwerp, born in 1520. He studied the works of Michael Angelo in Italy, and on his return to his own country, became so greatly employed as to acquire a good fortune. He has been called the Flemish Raphael. He died at the age of fifty.

FLO'RIST. *s.* (*fleuriste*, French.) A cultivator of flowers (*Pope*)

FLO'RULENT. *a.* (*floris*, Lat.) Flowery; blossoming.

FLORUS (Lucius Annæus), a Latin historian, of the same family as Seneca and Lucan. He wrote an abridgment of the Roman History, in four books, which is concise and elegant, but composed in a florid, poetical style. He flourished A.D. 116. The best editions of Florus are Dicker's, two vols. 8vo. Bat. 1722, and that of Fischer's, 8vo. Leip. 1760.

FLOS (Flower), in botany. See Flower.

Flos adonis, in botany. See Adonis.

FLOSCULAR FLOWER, in botany, a term of Tournefort's, for which Linnéus substitutes tubulous. It is opposed to the semi flosculous—ligulate of Linnéus. See Tubulous.

FLOSCULE, in botany. See Floret.

FLO'SCULOUS. *a.* (*flosculus*, Lat.) Composed of flowers.

FLOTA, or Flotta, fleet, a name the Spaniards give particularly to the ships which they send annually from Cadiz to the port of Vera Cruz, to fetch thence the merchandizes gathered in Mexico for Spain.

The name flotilla is given to a number of ships, which get before the rest in their return, and give information of the departure and cargo of the flota and galleons.

To FLOTE. *v. a.* (See *To fleet.*) To skim.

FLO'TSON. *s.* (from *flote.*) Goods that swim without an owner on the sea.

FLOUR MILL.

FLOTTEN. *part.* (from *flote.*) Skimmed.

To FLOUNCE. *v. n.* (*plonsen*, Dutch.) 1. To move with violence in the water or mire; to struggle in the water (*Addison*). 2. To move with weight and tumult (*Prior*). 3. To move with passionate agitation (*Swift*).

To FLOUNCE. *v. a.* To deck with flounces.

FLOUNCE. *s.* (from the verb.) Any thing sewed to the garment, and hanging loose, so as to swell and shake (*Pope*).

FLO′UNDER. *s.* (*flynder*, Danish.) A small flat fish. See PLEURONECTES.

To FLO′UNDER. *v. n.* (from *flounce.*) To struggle with violent and irregular motions (*Dryden*).

FLOUR, the meal of wheat-corn, finely ground and sifted. Flour, when carefully analyzed, is found to be composed, 1. Of fecula, which is insoluble in cold water, but soluble in hot water. 2. Of gluten. 3. Of a saccharine matter, susceptible of the spirituous fermentation. The grain itself is not only subject to be eaten by insects in that state; but, when ground into flour, it gives birth to another race of destroyers, who eat it unmercifully, and increase so fast in it, that it is not long before they wholly destroy the substance. The finest flour is most liable to breed these, especially when stale or ill prepared. In this case, if it be examined in a good light, it will be observed to be in continual motion, and on a nicer inspection there will be found in it a great number of little animals of the colour of the flour, and very nimble. If a little of this flour is laid on the plate of the double microscope, the insects are very distinctly seen in great numbers, very brisk and lively, continually crawling over one another's backs, and playing a thousand antic tricks together; whether in diversion, or in search of food, is not easy to be determined. These animals are of an oblong and slender form; their heads are furnished with a kind of trunk or hollow tube, by means of which they take in their food, and their body is composed of several rings. They do vast mischief among magazines of flour laid up for armies and other public uses. When they have once taken possession of a parcel of this valuable commodity, it is impossible to drive them out; and they increase so fast, that the only method of preventing the total loss of the parcel is to make it up into bread as soon as can be done. The way to prevent their breeding in the flour is to preserve it from damp: nothing gets more injury by being put up in damp than flour; and yet nothing is more frequently put up so. It should be always carefully and thoroughly dried before it is put up; and the barrels also dried into which it is to be put; then, if they are placed in a room tolerably warm and dry, they will keep it well. Too dry a place never does flour any hurt, though one too moist almost always spoils it.

The proportion of flour, which a bushel of grain affords, greatly varies. A bushel of Essex wheat, Winchester measure, weighs upon an average about 60*lbs.* which, when ground, will yield (exclusive of the loss incured by the grinding and drying) 45½*lbs.* of the flour called seconds, which alone is used for baking throughout the greater part of England, and which affords the most wholesome, though not the whitest bread. Beside the seconds, such a bushel of wheat yields 13*lbs.* of pollard and bran: the total loss in grinding seldom exceeds one pound and a half.

FLOUR-MILLS are put into motion in various ways: sometimes the first mover is wind, at others water, at others the force of steam, at others the muscular energy of animals. The mechanism of the grinding part of most of these is nearly the same, and well understood: so that it will not be necessary to enter much into minutiæ, but merely to present a general description of a well-constructed mill, with any first mover; and subjoin to this description a few theorems.

A flour-mill of the most improved kind is shewn in Plate 71, which contains two figures, an elevation fig. 1, and a plan fig. 2.

The mill is adapted to be driven by an overshot water-wheel AA, though if the local circumstances of the situation required an undershot-wheel, its place relative to the rest of the machinery would be the same. The water-wheel is suspended by the pivots, inserted into the ends of its axis upon pieces of brass let into short beams, technically termed headstocks: these are firmly bedded upon masonry to give them the requisite stability to support so heavy a piece of machinery as a loaded water-wheel. The headstock B in the plan is placed upon the wall of the pit called the wheel race, in which the water-wheel works: the other C, is supported on a similar wall of the cog-pit within the building, and shewn in the plan by a dark space. In this pit the large iron cog-wheel D, which is fixed upon the axis of the water-wheel, works: it has 72 bevelled cogs fixed into its circumference, by which it turns a small twilled-wheel E, of 19 teeth, fixed upon a vertical iron axis, as is also a large iron spur-wheel F, which, therefore, revolves at the same time, and by its teeth, 72 in number, turns the two pinions or nuts GG, fixed upon the axes of the upper millstones H, between which and the nether or lower stones, I, the wheat or corn is ground.

The millstones are of a cylindric form, as shewn by the section at H, in fig. 1, and by the plan at fig. 3. The upper one has a cylindric hole through it called the eye of the stone; it is supported upon the upper end of its axis by an iron cross, the four ends of which are let into the stone, and the centre of the cross is fitted upon the upper end of the square iron axis, on which the pinion G is fixed. The lower stone I is of a similar figure, but about one inch larger all round than the upper or running stone H; the hole through its centre is not so large, and has a piece of wood let into it, which fits closely round the upper part of the spindle. The two stones are enclosed in a cylindrical tub K, which fits the lower stone: upon the top of this tub a slight frame is erected to support the hopper *d*, which receives the corn to be ground; it has a loose trough *a*, called the shoe, suspended beneath the aperture in its vortex to convey the corn and let it fall into the eye of the millstone. To facilitate the conveyance of the corn, the shoe is continually shaken from one side to the other by a small axis *b*, which is fitted upon the square end of the spindle: the centre of the axis is divided into three small rods, and bent outward from the axis; these three projecting rods successively press against the shoe and move it one way, and it is returned as soon as the rod has passed by, by means of a wooden spring: the outer end of the shoe is suspended by a string *e*, which is conveyed down to the ground floor and wound round a pin which the miller can reach, and by turning it he raises or lowers the shoe so as to regulate the quantity of corn which shall pass through the stones, by enlarging or diminishing the aperture in the lower part of the hopper. A trough of wood is placed, leading from the space between the tub K, and the running stone H, down to a chest which is placed in the house at N, in the plan before the machinery; or in some cases, the mouth of a sack is suspended under this trough to receive the meal. The corn is kept in a store-room over the mill-stones, and by a trough is conveyed into the hopper, and thence it is shaken into the eye of the shoe, and falling between the arms of the iron cross, shewn in fig. 3, it is thrown by the centrifugal force into the small cavities between the two stones IH, their adjacent surfaces being cut into channels, as represented in fig. 3; and the running-stone turning round while the lower one remains fixed, the faces of these channels meet each other, and the corn getting between, is cut or ground into innumerable fragments. The centrifugal force constantly throws the corn or rather meal farther from the centre till at length it comes completely out from the stones into the space between them and the tub K, here it is carried round by the motion of the stone, and falls down through the trough before mentioned into the sack or chest on the ground.

The friction caused in the operation of grinding creates a considerable degree of heat in the flour; and if the velocity of the stone is too great, the flour will be spoiled by causing it to ferment, and turn sour when stowed in sacks. To avoid this the miller must regulate the quantity of water upon his wheel, and also the quantity of corn, by raising or falling the shoe as before described. The fineness of the flour depends upon the distance the stones are from one another; and this is regulated by raising or lowering the upper stone H. For this purpose, the spindle P is supported on a beam O, called the bridge-tree; one end of this, *h*, is a centre, and the other slides up and down between two vertical posts seen in the elevation, and the end of it is supported upon a screw, the head of which goes through the floor above. By turning this screw, the miller raises and lowers the bridge-trees O, and sets the stones finer or coarser at pleasure. The flour, after being ground, is dressed or separated from its bran, by the BOLTING-MACHINE. (See that article). This is put in motion by means of a vertical axis placed over the one in the elevation and being a continuation of it, near the cieling of the upper room. It has a bevilled cog-wheel fitted on it, turning another on an horizontal axis, upon which is a pulley driving the bolting-machine by an endless rope or strap. Another pulley on the same axis is usually adapted to move a dressing-machine, which is a cylinder of wire cloth of different degrees of fineness; within it a cylinder covered with hair brushes revolves and drives the meal through the wires, separating it into different degrees of fineness in the same manner as the bolting-machine.

It will not be expected that we should allot much space to the theory of flour-mills, though it may not be adviseable to pass it over entirely. We shall therefore give two or three theorems for a single flour-mill of the common construction, which may be applied with facility, so far as they are useful, to double or triple mills.

Let the weight of the upper stone when furrowed be $= \mathrm{W}$, the resistance of the corn reduced to the distance of the centre of gyration, or at $\frac{2}{3}$ of the radius of the upper stone $= \mathrm{R}$, then, according to Belidor, $\mathrm{R} = \frac{\mathrm{W}}{35}$, while according to Fabre $\mathrm{R} = \frac{\mathrm{W}}{23}$. But when the upper stone, to work most advantageously in every respect, goes round 60 times in a minute, we have

$$\mathrm{R} = \frac{60}{\mathrm{N}} \cdot \frac{2\,\mathrm{W}}{35} = \frac{60}{450 \div \mathrm{D}} \cdot \frac{2\,\mathrm{W}}{35} = \frac{\mathrm{D\,W}}{131\frac{1}{4}}.$$

This, however, would require an upper mill-stone of about $7\frac{1}{2}$ feet diameter: for when the diameter of that stone is D in feet, and N the most advantageous number of rotations in 1 minute, we have from many observations, $\mathrm{N} = \frac{450}{\mathrm{D}}$, as introduced into the preceding theorem; and this, when $\mathrm{N} = 60$, gives $\mathrm{D} = 7\frac{1}{2}$.

Let the whole friction when reduced to $\frac{2}{3}$ of the radius of the upper stone be represented by F, and the effective distance of the force or power from the axe on which the stone revolves $= r$, the number of teeth in the first or commanding wheel $= \mathrm{M}$, and the number of staves in the trundle $= m$, the number of revolutions of the water-wheel in 1 minute $= n$, the power which at the distance r from the axe of the water-wheel is necessary to retain the whole load in equilibrium $= p$; so shall we have

$$rp = \frac{\mathrm{M}}{m} \cdot \tfrac{2}{3}\,\mathrm{D}\,(\mathrm{R} + \mathrm{F})$$

$$\text{whence, } p = \frac{2\mathrm{MD}}{3mr}\,(\mathrm{R} + \mathrm{F})$$

$$\text{or, because } \frac{\mathrm{M}}{m} = \frac{\mathrm{N}}{n}$$

$$\text{we have } p = \frac{2\mathrm{ND}}{3nr}\,(\mathrm{R} + \mathrm{F}).$$

Let the time in seconds in which the water-wheel revolves be $= t$, the velocity with which any point in its circumference moves $= v$, the height due to this velocity being $= h$, $\pi = 3{\cdot}141593$, and $g = 16\frac{1}{12}$ feet, then is

$$t = \frac{2\pi r}{v} = \frac{\pi r}{\sqrt{gh}}, \text{ and } n = \frac{60}{t} = \frac{60\sqrt{gh}}{\pi r}.$$

$$\text{But it is also } n = \frac{m}{\mathrm{M}}\,\mathrm{N} = \frac{m}{\mathrm{M}} \cdot \frac{450}{\mathrm{D}}$$

$$\text{therefore } \frac{450m}{\mathrm{DM}} = \frac{60\sqrt{gh}}{\pi r}, \text{ and } r = \frac{10\mathrm{DM}\sqrt{gh}}{450\pi m}.$$

An undershot-wheel produces the greatest useful effect, when the height due to the velocity of the impinging water being H, we have $h = \frac{1}{5}\,\mathrm{H}$, or $v : \mathrm{V} :: \sqrt{\tfrac{1}{5}} : 1 :: 2 : 4$ nearly: retaining these as sufficiently exact for practice, the most advantageous radius of the undershot water-wheel, the water pushing against shovels or float-boards, is

$$\varrho = \frac{60\mathrm{DM}\sqrt{\frac{1}{5}g\mathrm{H}}}{450\pi\mathrm{M}} = \frac{0{\cdot}019\mathrm{DM}\sqrt{g\mathrm{H}}}{m}$$

$$\text{or again } \varrho = \frac{{\cdot}0101\mathrm{DMV}}{m},$$

where V is the velocity of the impinging water.

But in undershot-mills the fall is seldom, if ever, more than 15 or 16 feet: in that case the most advantageous position of the work is to have

$$\frac{\mathrm{M}}{m} = \frac{122{\cdot}27}{\mathrm{DV}}$$

Further, let L = the number of pounds of meal which are produced every hour, s = the specific gravity of the upper mill-stone, that of water being unity, and B the solid content of the stone in cubic feet: the remaining letters having the same acceptation as before: then

$$\text{or rye and wheat } L = 0{\cdot}021\, D^2\, sB\frac{Mv}{mr} \text{ pounds.}$$

$$\text{for old barley } L = 0{\cdot}06\, D^2\, sB\frac{Mv}{mr} \text{ pounds.}$$

For more on the subject of flour-mills, the reader may consult Brewster's Ferguson, vol. ii. Gray's Millwright, and Gregory's Mechanics, vol. ii.

Flour (St.) An episcopal town of France, in the department of Cantal. Here is a manufacture of knives. Lat. 45. 2 N. Lon. 3. 11 E.

To FLO'URISH. *v. n.* (*floreo*, Lat.) 1. To be in vigour; not to fade (*Pope*). 2. To be in a prosperous state (*Dryden*). 3. To use florid language (*Baker*). 4. To describe various figures by intersecting lines (*Pope*). 5. To boast; to brag. 6. (In music.) To play some prelude.

To Flo'urish. *v. a.* 1. To adorn with vegetable beauty (*Fenton*). 2. To adorn with figures of needlework. 3. To work with a needle into figures (*Bacon*). 4. To move any thing in quick circles or vibrations (*Crashaw*). 5. To adorn with embellishments of language (*Bacon*). 6. To adorn; to embellish (*Shakspeare*).

Flou'rish. *s.* (from the verb.) 1. Bravery; beauty (*Crashaw*). 2. An ostentatious embellishment; ambitious copiousness (*Bacon. More*). 3. Figures formed by lines curiously or wantonly drawn (*Boyle*).

Flourish, in music, an appellation given to the decorative notes which a singer or instrumental performer adds to a passage, with the double view of heightening the effect of the composition, and of displaying his own flexibility of voice or finger. There is nothing of which a sensible performer will be more cautious than of the introduction of flourishes, because he is never so much in danger of mistaking, as when he attempts to improve his author's ideas. See Busby's Mus. Dict.

FLO'URISHER. *s.* (from *flourish.*) One that is in prime or in prosperity (*Chapman*).

To FLOUT. *v. a.* (*fluyten*, Dutch.) To mock; to insult; to treat with mockery and contempt (*Walton*).

To Flout. *v. n.* To practise mockery; to behave with contempt; to sneer (*Swift*).

Flout. *s.* (from the verb.) A mock; an insult; a word or act of contempt (*Calamy*).

FLO'UTER. *s.* (from *flout.*) One who jeers.

To FLOW. *v. n.* (flopan, Saxon.) 1. To run or spread as water (*Swift*). 2. To run; opposed to standing waters (*Dryden*). 3. To rise; not to ebb (*Shakspeare*). 4. To melt (*Isaiah*). 5. To proceed; to issue (*South*). 6. To glide smoothly without asperity (*Hakewill*). 7. To write smoothly; to speak volubly (*Dryden*). 8. To abound; to be crowded (*Chapman*). 9. To be copious; to be full (*Pope*). 10. To hang loose and waving (*Spectator*).

To Flow. *v. a.* To overflow; to deluge (*Mortimer*).

Flow. *s.* (from the verb.) 1. The rise of water; not the ebb (*Brown*). 2. A sudden plenty or abundance (*Pope*). 3. A stream of diction (*South*).

FLO'WER. *s.* (*fleur*, French.) 1. The part of a plant which contains the seeds (*Cowley*). 2. An ornament; an embellishment (*Hakewill*). 3. The prime; the flourishing part (*Pope*). 4. The edible part of corn; the meal (*Spenser*). 5. The most excellent or valuable part of any thing; quintessence (*Addison*).

Flower, in botany, the organs of generation in vegetables, with their coverings. A flower, when complete, consists of a calyx, stamen, and pistil; but the essential parts are the anther and stigma, which are sufficient to constitute a flower, either together in hermaphrodite flowers, or separate in male and female flowers.

Flower-stalk. See Peduncle.

Flower (Gentle), in botany. See Amaryllis.

Flower of an hour, in botany. See Hibiscus.

Flower de luce, in botany. See Iris.

Flower (Bastard), in botany. See Adenanthera.

Flower (Eternal), in botany. See Xeranthemum.

Flower (Sun), in botany. See Helianthus.

Flower (Sultan), in botany. See Cyanus.

Flower (Trumpet), in botany. See Bignonia.

Flower (Wind), in botany. See Anemone.

Flower of the capital, is an ornament of sculpture, in form of a rose, in the middle of the sweep of the Corinthian abacus.

To Flo'wer. *v. n.* (*fleurir*, French.) 1. To be in flower; to bloom (*Milton*). 2. To be in the prime; to flourish (*Spenser*). 3. To froth; to ferment; to mantle (*Bacon*). 4. To come as cream from the surface (*Milton*).

To Flo'wer. *v. a.* (from the noun.) To adorn with fictitious or imitated flowers.

Flowers, a term formerly applied by chemists to the fine parts which are sublimated from certain bodies, as the flowers of benjamin, sulphur, zinc, &c. See Benzoic acid, &c.

Flowers (Geometrical), figures which are curved like a number of leaves expanding from one centre, returning regularly from the circumscribing perimeter. These flowers are commonly named from the number of their leaves, *folios*, *trifolios*, *tetrafolios*, *pentafolios*, *hexafolios*, &c. The properties of some of these are investigated under the name of Rhodonean curves, in *Phil. Trans.* No. 378.

Flowers (*Blumen*, Germ.), in chemistry, a term now becoming obsolete, to denote several substances, both metallic and otherwise, procured by sublimation in the form of slightly cohering powder, or spicular crystals. Thus we find mention made of flowers of antimony, arsenic, zinc, and bismuth, which are the sublimed oxyds of these metals, either pure or combined with a little sulphur or muriatic acid; we also find mention made of flowers of sulphur, of benzoin, and of sal-ammoniac.

Flowers (Preserving of). The method of preserving flowers in their natural beauties through the whole year has been much sought after by many people. Some have attempted it by gathering them when dry, and not too much opened, and burying them in dry sand; but this, though it preserves their figure well, takes off from the liveliness of their colour. Muntingius prefers the following method to all others. Gather roses, or other flowers, when they are not yet thoroughly open, in the middle of a dry day; put them into a good earthen vessel glazed within; fill the vessel up to the top with them; and, when full, sprinkle them over with some good French wine, with a little salt in it; then set them by in a cellar, tying down the mouth of the pot. After this they may be taken out at pleasure; and on setting them in the sun, or within reach of the fire, they will open as if growing naturally; and not only the colour, but the odour also, will be preserved.

The flowers of plants are by much the most difficult parts to preserve in any tolerable degree of perfection; of which we have instances in all the collections of dried plants, or horti sicci. In these the leaves, stalks, roots, and seeds of the plants, appear very well preserved; the strong texture of these parts making them always retain their natural form, and the colours in many species naturally remaining. But where these fade the plant is little the worse for use as to knowing the species. But it is very much otherwise in regard to the petals: these are naturally by much the most beautiful parts of the plant to which they belong; but they are so much injured in the common way of drying, that they not only lose, but change their colours into one another, by which means they give occasion to many errors; and they usually also wither up, so as to lose their very form and natural shape. The primrose and cowslip kinds are very eminent instances of the change of colours in the flowers of dried specimens: for those of this class of plants easily dry in their natural shape; but they lose their yellow, and, instead of it, acquire a fine green colour, much superior to that of the leaves in their most perfect state. The flowers of all the violet kind lose their beautiful blue, and become of a dead white: so that in dried specimens there is no difference between the blue-flowered violet and the white-flowered kinds.

Sir Robert Southwell has communicated to the world a method of drying plants, by which this defect is proposed to be in a great measure remedied, and all flowers preserved in their natural shape, and many in their natural colours. For this purpose, two plates of iron are to be prepared of the size of a large half-sheet of paper, or larger for particular occasions: these plates must be made so thick as not to be apt to bend; and there must be a hole made near every corner for the receiving a screw to fasten them close together. When these plates are prepared, lay in readiness several sheets of paper, and then gather the plants with their flowers when they are quite perfect. Let this be always done in the middle of a dry day; and then lay the plant and its flower on one of the sheets of paper doubled in half, spreading out all the leaves and petals as nicely as possible. If the stalk is thick, it must be pared or cut in half, so that it may lie flat; and if it is woody, it may be peeled, and only the bark left. When the plant is thus expanded, lay round about it some loose leaves and petals of the flower, which may serve to complete any part that is deficient. When all is thus prepared, lay several sheets of paper over the plant, and as many under it; then put the whole between the iron plates, laying the papers smoothly on one, and laying the other evenly over them: screw them close, and put them into an oven after the bread is drawn, and let them lie there two hours. After that, make a mixture of equal parts of aquafortis and common brandy; shake these well together, and when the flowers are taken out of the pressure of the plates, rub them lightly over with a camel's-hair pencil dipped in this liquor; then lay them upon fresh brown paper, and covering them with some other sheets, press them between this and other papers with a handkerchief till the wet of these liquors is dried wholly away. When the plant is thus far prepared, take the bulk of a nutmeg of gum-dragon; put this into a pint of fair water cold, and let it stand twenty-four hours, it will in this time be wholly dissolved; then dip a fine hair-pencil in this liquor, and with it daub over the back sides of the leaves, and lay them carefully down on a half-sheet of white paper fairly expanded, and press them down with some more papers over these. When the gum-water is fixed, let the pressure and papers be removed, and the whole work is finished. The leaves retain their verdure in this case, and the flowers usually keep their natural colours. Some care, however, must be taken that the heat of the oven be not too great. When the flowers are thick and bulky, some art may be used to pare off their backs, and dispose the petals in a due order; and after this, if any of them are wanting, their places may be supplied with some of the supernumerary ones dried on purpose; and if any of them are only faded, it will be prudent to take them away, and lay down others in their stead: the leaves may be also disposed and mended in the same manner.

Another method of preserving both flowers and fruit sound throughout the whole year is also given by the same author. Take saltpetre, one pound; armenian bole, two pounds; clean common sand, three pounds. Mix all well together; then gather fruit of any kind that is not fully ripe, with the stalk to each; put these, one by one, into a wide-mouthed glass, laying them in good order. Tie over the top with an oil-cloth, and carry them into a dry cellar, and set the whole upon a bed of the prepared matter of four inches thick in a box. Fill up the remainder of the box with the same preparation; and let it be four inches thick all over the top of the glass, and all round its sides. Flowers are to be preserved in the same sort of glasses, and in the same manner; and they may be taken up after a whole year as plump and fair as when they were buried.

Flower de lis, or Flower de luce, (*fleur de lis*), in heraldry, a bearing representing the lily, called the queen of flowers, and the true hieroglyphic of royal majesty; but of late it is become more common, being borne in some coats one; in others three, in others five, and in some semee, or spread all over the escutcheon in great numbers. The arms of France are, three flower-de-lis, or, in a field azure. It is observed by antiquarians, that flower de Louis is the proper name, having been borne by St. Louis on his shield, and that it is not a lily but an iris.

FLO'WERAGE. *s.* (from *flower.*) Store of flowers.

FLO'WERET. *s.* (*fleuret*, Fr.) A flower; a small flower (*Dryden*).

FLO'WERGARDEN. *s.* (*flower* and *garden.*) A garden in which flowers are principally cultivated (*Mortimer*).

FLO'WERINESS. *s.* (from *flowery.*) 1. The state of abounding in flowers. 2. Floridness of speech.

FLO'WERINGBUSH. *s.* A plant.

FLO'WERY. *a.* (from *flower.*) Full of flowers; adorned with flowers real or fictitious (*Milton*).

FLO'WINGLY. *ad.* (from *flow.*) With volubility; with abundance.

FLOWK. *s.* (*fluke*, Scott.) A flounder (*Carew*).

FLO'WKWORT. *s.* A plant.

FLOWN. The participle of *fly*. 1. Gone away (*Prior*). 2. Puffed; inflated; elate (*Milton*).

FLUAT. In chemistry, a compound salt, formed by the union of Fluoric acid (which see) with any alkaline or salifiable base. Our knowledge of this genus of salts is as yet very imperfect, both because few experiments have been made on the subject, and because the acid employed has never been pure, but always more or less combined with silica, by which its effect in many instances is very materially modified.

The following are the fluats at present known:

1. Fluat of Potash
2. ...... Soda
3. ...... Ammonia
4. ...... Lime
5. ...... Baryte
6. ...... Magnesia
7. ...... Alumine
8. ...... Silex

The first three, or those composed of a base of alkaline salts, are produced by a mixture of such base salts with fluor spar, or with fluoric acid. If the spar be employed, the potash should be caustic potash, the soda carbonat of soda, the ammonia sulphat of ammonia.

Fluat of lime is nothing more than fluor spar prepared artificially, the latter name being usually restricted to this salt in its natural state. It is obtained by adding lime-water, or a solution of any calcareous salt, to any other of the fluats, except perhaps fluat of magnesia; but the purest regenerated fluor is prepared by adding fluat of ammonia to nitrat of lime, the fluat of lime falls to the bottom, and when properly edulcorated, is in all probability entirely pure.

Fluat of baryte is prepared by adding fluoric acid, or, which is better, an alkaline fluat to nitrat or muriat of baryte; the fluat is precipitated in a pulverulent form.

Fluat of magnesia is obtained by adding carbonat of magnesia to fluoric acid; and fluat of alumine, by adding to it the earth of alum.

Fluat of silex. When fluoric acid is prepared by the usual process in glass vessels, it dissolves a portion both of the earth and alkali of which they are formed, and produces a gelatinous fluid, which is thus denominated. Felspar, and perhaps all minerals that contain silex and potash, are acted upon in the same manner. Opal has no alkali, and is attacked with considerable difficulty.

FLU'CTUANT. *a.* (*fluctuans*, Latin.) Wavering; uncertain (*L'Estrange*).

To FLU'CTUATE. *v. n.* (*fluctuo*, Latin.) 1. To roll to and again, as water in agitation (*Blackmore*). 2. To float backward and forward. 3. To move with uncertain and hasty motion (*Milton*). 4. To be in an uncertain state (*Addison*). 5. To be irresolute; to be undetermined.

FLUCTUA'TION. *s.* (*fluctuatio*, Latin.) 1. The alternate motion of the water (*Brown*). 2. Uncertainty; indetermination (*Boyle*).

Fluctuation. A term often used by surgeons to express the undulation of a fluid; thus when pus is formed in an abscess, or when water accumulates in the abdomen, if the abscess or abdomen be lightly pressed with the fingers, the motion of fluctuation may be distinctly felt.

FLUE. *s.* 1. A small pipe or chimney to convey air. 2. Soft down or fur.

FLUE'LLIN. *s.* The herb speedwell. See Elatine.

FLU'ENCY. *s.* (from *fluent.*) 1. The quality of flowing; smoothness; freedom from harshness or asperity (*Garth*). 2. Readiness; copiousness; volubility (*King Charles*). 3. Affluence; abundance: obsolete (*Sandys*).

FLU'ENT. *a.* (*fluens*, Latin.) 1. Liquid (*Bacon*). 2. Flowing; in motion; in flux (*Ray*). 3. Ready; copious; voluble (*Bacon*).

Flu'ent. *s.* Stream; running water (*Philips*).

Fluent, or flowing quantity, in the doctrine of fluxions, is the variable quantity which is considered as increasing or decreasing; or the fluent of a given fluxion, is that quantity whose fluxion being taken, according to the rules of that doctrine, shall be the same with the given fluxion. See FLUXIONS.

FLUENTS (Contemporary), are such as flow together, or for the same time. And the same is to be understood of contemporary fluxions. When contemporary fluents are always equal, or in any constant ratio, then also are their fluxions respectively either equal, or in that same constant ratio. That is, if $x = y$, then is $\dot{x} = \dot{y}$; or if $x : y :: n : 1$. then is $\dot{x} : \dot{y} :: n : 1$; or if $x = ny$, then is $\dot{x} = n\dot{y}$.

FLU'ENTLY. *ad.* With ready flow; volubly; readily.

FLU'ID. *a.* (*fluidus*, Latin; *fluide*, French.) Having parts easily separable; not solid (*Newton*).

FLUID, is the name given to a body whose moleculæ have so little mutual adherence that they yield to the slightest pressure, and slide or roll with the greatest facility one over another. A fluid adapts itself in every respect to the vessel which contains it.

Among the fluids presented to us by nature, some cannot be sensibly compressed by known means: these are called liquids, or incompressible fluids. Others are extremely compressible, but impalpable and invisible: these are named elastic, or compressible, or aëriform fluids; and sometimes, indeed, simply fluids.

The physical nature, laws, and effects of incompressible fluids, at rest, and in motion, are referred to the branch of science called HYDROSTATICS, and HYDRODYNAMICS, or HYDRAULICS: those that relate to aëriform fluids appertain to PNEUMATICS.

Most, if not all bodies, may be made to assume three different states, according to the temperature in which they are placed,—solidity, liquidity, and aëriform fluidity. In one substance this is exhibited in the three states of ice, water, and elastic vapour.

FLUID (Calorific). See CALORIC.

FLUID (Electric). See ELECTRICITY.

FLUID (Luminous). See LIGHT.

FLUID (Magnetic). See MAGNETISM.

FLUIDS OF THE BODY. The drying of any part of the human body demonstrates, that by far the greater part consists of fluid. The quantity of fluid in a man of one hundred and sixty pounds weight is estimated at one hundred and thirty-five pounds. The fluids of the human body are divided into, 1. Crude, or those which have not yet put on the animal nature, as the chyme and chyle; 2. Sanguineous, to this is referred the blood, or the cruor of the blood; 3. Lymphatic, which are those of the lymphatic vessels, and the nutritious jelly; 4. Secreted, to this head are referred all those separated from the blood, which are very numerous; 5. Excrementitious, which are eliminated from the body, as the alvine fæces, urine, cutaneous and pulmonary perspirable matter.

The secreted humours are divided into, 1. Lacteal, which are white, as the milk, juice of the prostate and thymus glands; 2. Aqueous, as the aqueous humour of the eye; 3. Mucous, as the mucus of the nostrils and primæ viæ; 4. Albuminous, as the serum of the blood; 5. Oleous, as the oil of the adipose membrane; 6. Bilious, as the bile and wax of the ears.

The fluids of the human body are also divided from their motion into, 1. Circulating, which continually circulate in the vessels; 2. Commorant, which circulate with a slow motion, as the oil of the adipose membrane, and male semen: 3. Stagnant, which remain for a certain time in any receptacle, as cystic bile, urine, and the alvine fæces.

FLUIDITY, a property in virtue of which the particles of a body yield to the least pressure, and move independently of one another.

Fluidity in bodies is an accidental and variable property; being due to the presence of caloric. It would seem that the moleculæ of fluids are spherical; but this form is as accidental to the particles of fluids, as the fluidity itself: at least this is probable. But our knowledge on this point is very circumscribed; and much remains to be done and to be discovered before any thing can be affirmed with certainty and confidence.

All solid bodies, a very small number excepted, may be converted into liquids by heating them sufficiently; and on the other hand, every liquid, except spirit of wine, is convertible into a solid body, by exposing it to a sufficient degree of cold. All liquid bodies may, by heating them, be converted into elastic fluids, and a great many solids are capable of undergoing the same change; and, lastly, the number of elastic fluids which by cold are condensible into liquids or solids, is by no means inconsiderable. These facts have led philosophers to this general conclusion, "that all bodies, if placed in a temperature sufficiently low, would assume a solid form; that all solids become liquids when sufficiently heated; and that all liquids, when exposed to a certain temperature, assume the form of elastic fluids." The state of bodies then depends upon the temperature in which they are placed; in the lowest temperatures they are all solid, in higher temperatures they are converted into liquids, and in the highest of all they become elastic fluids. The particular temperatures at which bodies undergo those changes are exceedingly various, but they are always constant for the same bodies. Thus we see that heat produces changes on the state of bodies, converting them all, first into liquids, and then into elastic fluids.

When solid bodies are converted by heat into liquids, the change in some cases takes place at once. There is no interval between solidity and liquidity: but in other cases a very gradual change may be perceived; the solid becomes first soft, and it passes slowly through all the degrees of softness, till at last it becomes perfectly fluid. The conversion of ice into water is an instance of the first change, for in that substance there is no intervening state between solidity and fluidity. The melting of glass, of wax, and of tallow, exhibits instances of the second kind of change; for these bodies pass through every possible degree of softness before they terminate in perfect fluidity. In general, those solid bodies which crystallize or assume regular prismatic figures have no interval between solidity and fluidity, while those that do not usually assume such shapes have the property of appearing successively in all intermediate states.

Solid bodies never begin to assume a liquid form till they are heated to a certain temperature; this temperature is constant in all. In the first class of bodies it is very well defined; but in the second, though it is equally constant, the exact temperature of fluidity cannot be pointed out with such precision on account of the infinite number of shades of softness through which the bodies pass before they acquire their greatest possible fluidity. But even in these bodies we can easily ascertain that the same temperature always produces the same degree of fluidity. The temperatures at which this change from solidity to liquidity takes place, receive different names according to the usual state of the body thus changed. When the body is usually observed in a liquid state, we call the temperature at which it assumes the form of a solid, its freezing point, or congealing point. Thus the temperature in which water becomes ice, is called the freezing point of water; on the other hand, when the body is usually in the state of a solid, we call the temperature at which it liquifies its melting point: thus 212° is the melting point of sulphur, 442° the melting point of tin.

The following table contains a list of the melting points of a considerable number of solid bodies:

Substances.	Melting point.
Lead - -	594°
Bismuth - -	576
Tin - -	442
Sulphur - -	212
Wax - -	142
Spermaceti -	133
Phosphorus -	100
Tallow - -	92
Oil of anise -	50
Olive-oil - -	36
Ice - - -	32
Milk - - -	30
Vinegar - -	28
Blood - - -	25
Oil of bergamot -	23
Wines - -	20
Oil of turpentine -	14
Sulphuric acid -	36
Mercury - -	39
Liquid ammonia -	46
Ether - -	46
Nitric acid - -	66

Before Dr. Black began to deliver his chemical lectures in Glasgow, in 1757, it was universally supposed that solids were converted into liquids by a small addition of heat, after they had been once raised to the melting point, and that they returned again to the solid state on a very small diminution of the quantity of heat necessary to keep them at that temperature. An attentive view of the phenomena of liquefaction and solidification gradually led this sagacious philosopher to observe their inconsistence with the then received opinions, and to form another, which he verified by direct experiments, and drew up an account of his theory, and the proofs of it, which was read to a literary society in Glasgow, on April 23, 1762; and every year after he gave a detailed account of the whole doctrine in his lectures.

The opinion which he formed was, that when a solid body is converted into a liquid, a much greater quantity of heat enters into it than is perceptible immediately after by the thermometer. This great quantity of heat does not make the body apparently warmer, but it must be thrown into it in order to convert it into a liquid; and this great addition of heat is the principal and most immediate cause of the fluidity induced. On the other hand, when a liquid body assumes the form of a solid, a very great quantity of heat leaves it without sensibly diminishing its temperature; and the state of solidity cannot be induced without the abstraction of this great quantity of heat. Or, in other words, whenever a solid is converted into a fluid, it combines with a certain dose of caloric, without any augmentation of its temperature; and it is this dose of caloric which occasions the change of the solid into a fluid. When the fluid is converted again into a solid, the dose of caloric leaves it, without any diminution of its temperature; and it is this abstraction which occasions the change. Thus the combination of a certain dose of caloric with ice causes it to become water, and the abstraction of a certain dose of caloric from water causes it to become ice. Water then is a compound of ice and caloric; and in general all fluids are combinations of the solid, to which they may be converted by the application of cold, and a certain dose of caloric.

Dr. Black has rendered it exceedingly probable also, that the softness of such bodies as are rendered plastic by heat, depends upon a quantity of latent heat which combines with them. Metals also owe their malleability and ductility to the same cause. Hence the reason why they become hot and brittle when hammered.

Thus it appears that the conversion of solids into liquids is occasioned by the combination of a dose of caloric with the solid. But there is another change of state still more remarkable, to which bodies are liable when exposed to the action of heat. Almost all liquids, when raised to a certain temperature, gradually assume the form of an elastic fluid, invisible like air, and possessed of the same mechanical properties. Thus water, by boiling, is converted into steam, an invisible fluid, 1800 times more bulky than water, and as elastic as air. These fluids retain their elastic form as long as their temperature remains sufficiently high; but when cooled down again, they lose that form, and are converted into liquids. All liquids, and even a considerable number of solids, are capable of undergoing this change when sufficiently heated.

By the experiments of Dr. Black and his friends, it was ascertained that not only water, but all other liquids, during their conversion into vapour, combine with a dose of caloric, without any change of temperature; and that every kind of elastic fluid during its conversion into a liquid, gives out a portion of caloric without any change of temperature. Dr. Black's law then is very general, and comprehends every change in the state of a body. The cause of the conversion of a solid into a liquid is the combination of the solid with caloric; that of the conversion of a liquid into an elastic fluid is the combination of the liquid with caloric. Liquids are solids combined with caloric; elastic fluids are liquids combined with caloric. This law, in its most general form, may be stated as follows: whenever a body changes its state, it either combines with caloric, or separates from caloric.

No person will dispute that this is one of the most important discoveries hitherto made in philosophy. Science is indebted for it entirely to the sagacity of Dr. Black. Other philosophers indeed have laid claim to it; but these claims are either without any foundation, or their notions may be traced to Dr. Black's lectures, as their opinions originated many years posterior to the public explanation of Dr. Black's theory in the chemical chairs of Glasgow and Edinburgh.

A very considerable number of bodies both solids and liquids, may be converted into elastic fluids by heat; and as long as the temperature continues sufficiently high they retain all the mechanical properties of gasseous bodies.

It is exceedingly probable, that if we could command a heat sufficiently intense, the same change might be produced on all bodies in nature. This accordingly is the opinion at present admitted by philosophers. But if all bodies are convertible into elastic fluids by heat, it is exceedingly probable that all elastic fluids in their turn might be converted into solids or liquids, if we could expose them to a sufficiently low temperature. In that case, all the gasses must be supposed to owe their elasticity to a certain dose of caloric: they must be considered as compounds of caloric with a solid or liquid body. This opinion was first stated by Amontons, and it was supported with much ingenuity both by Dr. Black and Lavoisier, and his associates. It is at present the prevailing opinion; and it is certainly supported not only by analogy, but by several very striking facts.

If its truth is admitted, we must consider all the gasses as capable of losing their elasticity by depriving them of their heat: they differ merely from the vapours in the great cold which is necessary to produce this change. Now the fact is, that several of the gasses may be condensed into liquids by lowering their temperatures. Oxymuriatic acid gas becomes liquid at a temperature not much under 40°; and at 32° it even forms solid crystals. Ammoniacal gass condenses into a liquid at 45°. None of the other gasses have been hitherto condensed.

It is well known, that the condensation of vapours is greatly assisted by pressure; but the effect of pressure diminishes as the temperature of vapours increases. It is very likely that pressure would also contribute to assist the condensation of gasses. It has been tried without effect indeed in several of them. Thus air has been condensed till it was heavier than water: yet it showed no disposition to lose its elasticity. But this may be ascribed to the high temperature at which the experiment was made relative to the point at which air would lose its elasticity.

At the same time it cannot be denied, that there are several phenomena scarcely reconcileable to this constitution of the gasses, ingenious and plausible as it is. One of the most striking is the sudden solidification which ensues when certain gasses are mixed together. Thus when ammoniacal gass and muriatic acid gass are mixed, the product is a salt acid; yet the heat evolved is very inconsiderable, if we compare it with the difficulty of condensing these gasses separately, and the great cold which they endure before losing their elasticity. In other cases too, gasseous bodies unite, and form a new gass, which retains its elasticity as powerfully as ever. Thus oxygen gass and nitrous gass combined form a new gass, namely, nitric acid, which is permanent till it comes into contact with some body on which it can act. (*Gregory*, *Libes*, *Robison*.)

FLU'IDNESS. *s.* (from *fluid.*) The quality in bodies opposite to solidity (*Newton*).

END OF THE FOURTH VOLUME.

T. DAVISON, Whitefriars,
London.
